‘They’ll Go On To Get Real Jobs’: The Transitional Contract Between The Core And Student Workers In retail

Leppänen, Vesa (1); Sellerberg, Ann-Mari (2)

1: Kristianstad University, Sweden; 2: Lund University, Sweden
vesa.leppanen[at]hkr.se, ann-mari.sellerberg[at]soc.lu.se

In recent years it has become more usual for students to work while they are at University. Many of them take jobs in retail, and most stay a while before proceeding to other professions. This paper examines the social relationships between core retail employees and students. The empirical data consists of 39 interviews with owners, managers, and employees at ten supermarkets in southern Sweden. The relationship between the core and student workers result in a particular form of social contract, a transitional contract, in which both parties expect that students as a matter of course are only temporary

staff, and will go on to ‘real’ jobs when their studies end. This transitional contract is evident in the supermarkets’ organisation, with students working different working hours and having different tasks than the core. At the same time, their daily work offers the opportunity to move beyond the transitional contract to closer relationships with co-workers. This gives rise to a special social dynamic in which both groups distance themselves from one another. This distancing is understood here to be a defence mechanism, avoiding engagement that might threaten to disappoint both the core employees and the students. It is also be an obstacle to recruiting students to the core.

RN17_05a | Theoretical and Methodological Challenges

Organizational Responses To Active Labour Market Policies

Hiller, Petra

University of Applied Sciences Nordhausen, Germany
petra.hiller[at]hs-nordhausen.de

This paper takes up the discussion about increasingly permeable boundaries of organizations and questions the assumption in research on active labour market policies that networked organizations have an increased "openness" to their environment. Based on an empirical case study on the implementation of active labour market policies in a German job centre, this paper shows that the boundaries of networked organizations do not tend to become more permeable and therefore controllable by their environment. On the contrary, the empirical data indicate: inter-organizational collaboration in the implementation of active labour market policies triggers a redesign of internal structures, which in the case of the examined job centre is aimed at stabilizing the organizational boundaries. How is this empirical finding to be explained? To answer this question, the paper proposes to broaden the prevailing perspective. Unlike the open-systems perspective in active labour market research, we assume that organizations as social systems are cognitively open and operatively closed at the same time. If this assumption is correct, then the openness observed in networked organizations relates to the cognitive dimension of the organizational system. However, this does not mean that organizations are becoming more permeable at their borders because at the operational level, formalisation and closure of the system remains.

Feasible Work as a New Perspective on Employment Mutations. Exploring the Experiences of the Unemployed People

Demaziere, Didier (1); Zune, Marc (2)

1: Sciences Po, France; 2: Université de Louvain, Belgium
didier.demaziere[at]sciencespo.fr, marc.zune[at]uclouvain.be

New forms of employment and work are developing, both in salaried work and on its boundaries with informal or self-employment. We explore these changes from the standpoint of unemployment, based on the experiences of the unemployed. These people undergo the uncertainties of searching for a job and wonder what they can expect and demand. Our core hypothesis is that what employment means evolve through the experience of unemployment, and we propose to theorize this evolution with the concept of “feasible work”. An intensive fieldwork (in-depth interviews with fifty-five unemployed individuals) makes it possible to identify what the “feasible work” they are aiming for means to them. The analysis is then focused on alternative projections to the standard employment norm: different kinds of non-salaried positions, often defined with weak statuses, on the edges of free-lance work and informality. This movement towards autonomous work is invested with two opposite meanings: as a mobilizing alternative, or as a resigned withdrawal. The careers and biographical resources of the unemployed people explain this differentiation. Finally, we conclude that our approach makes it possible to enrich knowledge of the dynamic of social statuses and the norms that organize them. It underscores the extent to which unemployment is a matrix of enforced socialization into the most fragile forms of paid work. The theoretical value of the concept of feasible work is that it helps to understand the inconspicuous spreading of employment mutations that are usually described by macro sociological approaches.

A Conceptual Model For Understanding Meaning In Working Life

Alvinzi, André Sebastian

Örebro University, Sweden
andre.alvinzi[at]oru.se

In recent years, scholars have addressed the topic of what meaning employees experience in their jobs. Some argue that a large quantity of paid work performed in Western societies is meaningless in terms of its societal contribution. Others claim that paid work in itself is an intrinsically meaningless activity. Studies imply that large numbers of Swedish and British employees think their jobs are meaningless. However, the majority of studies examining the meaning of work use a quantitative design and typically neglect nuanced understandings of meaning. What is seldom taken into consideration in existing studies are purposive and existential dimensions of meaning. This paper contributes with a nuanced conceptual model for understanding meaning at work. I argue

that in order to develop our understandings of meaning in working life, scholars will benefit from including additional concepts of meaning. The paper focuses on current concepts of meaning in relation to work; what is lacking in these concepts; and how existing concepts of meaning can be developed into including existential and purposive dimensions. Given the link between meaningfulness and employee engagement, public health and quality of life, knowledge about nuanced meanings of different jobs could potentially benefit society and individuals.

RN17_05b | New and Old Forms of Industrial Conflict

Threat of Strike: Notice of Industrial Action and Strikes in Sweden 1980-2015

Jansson, Jenny; Uba, Katrin

Uppsala University, Sweden
jenny.jansson[at]statsvet.uu.se, katrin.uba[at]statsvet.uu.se

In the post-industrial era work stoppages are rarely used in collective bargaining processes. However, this trend does not indicate that employers and unions no longer have different interests. Rather we suggest that the contentious struggle on the labor market takes a different form today, namely through notice of industrial action. Work stoppages are costly for both parties and require considerable mobilization of members to go on strike whereas threatening to start work stoppages (i.e. submit a notice of industrial action) requires other types of power resources and yet can be used as an effective means to put pressure on the counterparty in collective bargaining. Research has until now neglected this important institution in collective bargaining. By using unique data about notices of industrial action and strikes in Sweden (1980-2015) we show that even though strikes have decreased, notices of industrial action - threat of strike - have not. In the paper we analyze and compare unions that frequently submit notices in collective bargaining to those who start strikes, and we examine why notices are used in collective bargaining. Whereas male dominated occupations in the private sector (particularly in transportation sector) frequently submitted notices and started strikes throughout the entire time period, female dominate public sector occupations, notably health care personnel (both workers and white-collar workers), have come to use notices more frequently over time.

The Italian Labor-Capital Conflict During and after the Crisis. Between Trade Unionism and Social Movement unionism

Perra, Margherita Sabrina (1); Frazzetta,
Federica (2); Pilati, Katia (3)

1: University of Cagliari, Italy; 2: University of Catania, Italy; 3:
University of Trento, Italy
mperra[at]unica.it, federica_frazzetta[at]hotmail.it,
katia.pilati[at]unitn.it

The paper aims to explore the reappearance of labor-related protests in European countries during and in the aftermath of the 2008 economic crisis. We join the social movement scholarship, the socio-economic literature and the industrial relations debate to explore the capacity of trade unions to manage the capital-labour conflict in Italy. Italy has indeed witnessed fragmented and isolated trade unions, with marked competition between the three traditional union confederations. In this framework, workers' protests have been often coordinated by independent and more radical trade unions. Following the well-established literature on Protest Event Analysis (PEA) we have collected data regarding the characteristics of labor-related collective actions involving workers or related to labor-issues occurred in Italy between December 2007 and 31st December 2010. We aim to investigate the repertoire of actions, the actors engaged, their degree of organization and alliances with other civil society groups to understand whether some dynamics of social movement unionism is at work, the issues claimed. Our preliminary results show major patterns of change: 1) prevailing labor-related actions are strikes. However, in the second half of 2010, data show an increasing presence of disruptive actions, squatting principally. 2) labor-related actions are mainly coordinated by organized actors, mostly traditional trade unions. However, almost at an equal rate, workers engaged in labor-related actions participate through informal and spontaneous groups. 3) Claimed issues concern both economic and political issues, the latter especially rising during 2010.

The Displacement Hypothesis Revisited: Insights from the Italian Logistics Sector

Cini, Lorenzo; Goldmann, Bartek

Scuola Normale Superiore, Italy
lorenzo.cini[at]sns.it, bartosz.goldmann[at]sns.it

One of the characteristic features of industrial relations in the neoliberal era has been the crisis of trade unions and traditional forms of worker representation. This apparent demobilisation of labour is reflected in falling rates of union membership, and strikes, the classic indicators of collective expressions of discontent. These patterns have been variously explained with reference to the pacification of class conflict, the concomitant rise of individualised interests, and a

commitment to partnership and consensus by trade union leaders. However, scholars have already pointed to the dangers of interpreting the decline of collective forms of action as unequivocal proof of a decline of collective interests, or of perceptions of injustice on the part of workers (Gall, 2008; Gall & Hebdon, 2008; Kirk, 2018). Instead what these scholars have suggested is a hypothesis of 'method displacement', namely that these grievances have not disappeared, but that the traditional institutional pathways for their collective expression have become blocked, and that instead, they have found alternative, individual forms of expression, such as proceeding to litigation in courts against the firm. We extend this theory by suggesting a third pathway: conflictual collective action. We illustrate our argument in the context of ongoing struggles in the Italian logistics sector, highlighting the dynamics of control, resistance and consent in the workplace, whereby the inefficacy of traditional means of contestation has led workers to adopt more militant repertoires of action such as road blocks and occupations of warehouses.

RN17_06a | Change in Work and Labour: Changing Environment and Context

Employer Changes After Childbirth: Can Family Friendly Arrangements Bind Mothers?

425

Frodermann, Corinna; Bächmann, Ann-
Christin

Institute for Employment Research, Germany
corinna.frodermann2[at]iab.de, ann-
christin.baechmann[at]iab.de

Family-related employment interruptions after childbirth are a critical point in the employment histories of women as they often result in negative career consequences. Previous research has shown that these career consequences are even worse, if the re-entry to the labour market comes along with an employer change. In addition, also the former employer is interested in avoiding employer changes as the loss of an employee means that all investments in the human capital of the employee get lost, too. Against this backdrop, we analyse which organizational characteristics can reduce employer changes of mothers after childbirth. Therefore, we build theory-based hypotheses upon rational choice considerations combined with social epidemiology and test these hypotheses empirically using the linked employer-employee dataset LIAB of the Institute for Employment Research in Germany. Our results based on almost 10.000 women reveal that family friendly arrangements in establishments, like flexible working hours or childcare opportunities reduce the likelihood of employer changes when re-entering the labour market. Additionally, with increasing establishment size and share of women, the probability of employer changes decreases, too.

Old Company's New Leaders: Employment Proposition for Millennial Leadership in Luxury Retail

Gibbons, Mark; Karmowska, Joanna

Oxford Brookes University, United Kingdom
ma_gibbons[at]hotmail.com, jkarmowska[at]brookes.ac.uk

Recent Advancements in technology have enabled relatively young organisations to grow at a speed, and to a scale, that enables them to reach a comparable level of employer brand equity and make them as attractive to work for as much more established organisations. As a result, traditional luxury organisations compete against younger, non-luxury companies for talent that might have been considered easier to attract previously. The study builds on the existing literature about the impact of generational differences on management practices, within the specific industry context. Whereas there is considerable literature pertaining to the wants and needs of the Millennial generation, research with the specific lens of traditional luxury retail leadership is scarce. A case study has been conducted in a well-established luxury retail organization, using semi-structured interviews as well as document analysis. The analytical dimensions inherent in the literature constituted the initial framework of analysis, with refinements then emerging from the data. The impact of generational differences on organizations has been widely discussed in contemporary literature (see for example Bennett, Beehr and Ivanitskaya, 2017; Cogin, 2012). Our study contributes to these discussions in two ways: (1) it reveals new aspects of the phenomenon in an under-research sector of luxury retail and (2) it highlights misalignment in perceptions between older generation of current leaders (Baby Boomers) and younger generation of future leaders (Millennials). This extends the existing theory, but also offers implications for practice of organizations, in particular in the sector of luxury retail.

Reforming Small Occupations: Continuity and Change

Baumeler, Carmen; Engelage, Sonja;
Strebel, Alexandra

Swiss Federal Institute for Vocational Education and Training,
Switzerland
carmen.baumeler[at]ehb.swiss, sonja.engelage[at]ehb.swiss,
alexandra.strebel[at]ehb.swiss

Collective skill formation systems, such as those in Germany, Austria, Denmark, and Switzerland, are collectively organised vocational education and training regimes: firms, intermediary associations (for example, employers' associations, trade unions, and occupational associations), and the state cooperate in the process of skill formation (Busemeyer & Trampusch 2012). These systems provide transferable, certified occupational skills and training. Schools and companies share responsibility for education and training, usually as so-called dual apprenticeship training. An occupation (Beruf) can be conceived of an institution (Lawrence 2004; Abraham & Hinz 2008) emerging from the institutional work of occupational associations. In Switzerland,

occupational associations are responsible for defining the occupations' training content. They are important for fostering companies' VET contribution (Culpepper 2003), representing their members' interests and working together with public authorities to design and implement VET policies. In the wake of the Swiss VET policy reform of 2004, all occupations needed to be reformed and the number of occupations reduced. The increased educational requirements and administrative workload put small occupational associations under pressure. However, after ten years, different outcomes (creation, maintenance, and disruption of occupations) have become visible. Drawing from the theoretical framework of institutional work (Lawrence & Suddaby 2006; Lawrence, Suddaby & Leca 2009; 2011; Lawrence, Suddaby & Zilber 2013) and based on a qualitative comparative case study (Patton 2005), this contribution depicts the reform processes of three small occupational associations. It addresses the following research questions: Which different practices did small occupational associations develop to deal with the recent Swiss VET reform and which commonalities and differences can be identified? We discuss the implications that our results have on the broader literature on institutional work and occupational associations.

Analysis of Social Situation in Relation to the Car Manufacturing at Technological Zone, East Bohemia Region” (CEE)

Tošner, Michal

University of Hradec Králové, Czech Republic
michal.tosner[at]uhk.cz

This contribution presents project “Analysis of Social Situation in Relation to the Car Manufacturing at Technological Zone in East Bohemia Region” (CEE) which is supported by the Technological Agency of the Czech Republic at ETA programme supporting research, experimental development and innovation of applied social sciences. In line with the policy of so-called national priority research promotes the incorporation of social sciences and humanities into projects of applied research, experimental development and innovation, which are beneficial for maintaining and improving the quality of human life in response to dynamic social, economic, globalization, cultural and technological transformations. Mixed methods research is focusing on various interests organized around local car manufacturing subsidiary of the multinational automotive company. In particular, the research interrogates production of Skoda brand cars, which was originally a Czech brand which was overtaken through foreign direct investment during era of post-socialist transition at CEE. It is now linked in the global chain production at the low level of global value chain in global production of the German multinational automotive company (VW). Global sales and increase in demand for produced models of cars implies constant increase of the production and subsequent urgent need for more manual workers, who are attracted by offerings of significantly higher wages than are usual on labour market within wider area (post-socialist countries/CEE). We are researching governmentality in forms of policy making, “government interventions” from public sources in order to support producer to gain regional prosperity. Further it not only attracts workers from nearby areas (CZE) but also long-distance commuters (e.g. Polish workers) or migrant workers from more distant territories.

RN17_06b | Local, Sectoral, National, and European Labour Market Institutions and Processes in Flux

Index of Organisational (Un)friendly Flexibility in Five European Countries: Embeddedness of Organisational Practices in Economic and Institutional Environment

Ignjatović, Mirosljub; Kanjuo Mrčela, Aleksandra

University of Ljubljana, Slovenia
mirosljub.ignjatovic[at]fdv.uni-lj.si, aleksandra.kanjuo-mrcela[at]fdv.uni-lj.si

Flexibilisation of employment and work practices have been one of the main features of global economic framework and “one of the hallmarks of modern organisations” (Brewster and Larsen, 2000:125) for several decades. Although universally present, the scope and forms of flexibility differ in different types of organisations and in economies that follow different economic models. Furthermore, the combination of different forms of flexible employment and work affects the quality of work and frequently increases the incidence of precarious work (Kalleberg 2009). In this article we will analyse data collected in big companies (in the 2015 CRANET –international survey of HRM policies and practices) in five geographically close European countries (Austria, Croatia, Hungary, Serbia and Slovenia) that have been in different ways politically and economically connected. Data show that ratio of employees’ friendly and unfriendly forms of flexibility (Index of Organisational (Un)friendly Flexibility) differ in these countries considerably. Our analysis will reflect upon that organisational data using data base on living and working conditions in selected five countries provided by the European Foundation for the improvement of Living and Working conditions (Eurofound). This qualitative analysis will show what (set of) features of economic and institutional framework could explain variation in organisational practices. Results of the analysis that is based on two large comparative data bases could feed the discussion on flexibility that will bridge the gap between two streams of literature: human resource management on the one side and industrial relation/economic sociology/of work on the other side.

Labour Flexibility in the Swedish Building Sector

Ahlstrand, Rasmus

Lund University, Sweden
rasmus.ahlstrand[at]soc.lu.se

Recent changes in the way labour is organised in the Swedish building sector are driven by demands for flexible and innovative labour market solutions from contractors and subcontractors, resulting in increased outsourcing. This paper identifies parallel systems of outsourcing and other forms of organising labour flexibility. A centralised system is identified in which contractors make use of employment agencies to hire workers mainly as a complement to a core base of their own labour force. This system aspires to follow the Swedish model of industrial relations and collective agreements. Other systems are characterised by de-centralisation, where subcontractors are contracted and responsible for hiring workers and completing specific tasks. This option limits the contractors' own labour force to a minimum. Based on qualitative interviews and observations from three project sites, the empirical findings suggest that employment agencies' possibilities to expand in the building sector, and to organise labour according to the centralised system, are limited. Rather, de-centralised systems are pre-dominantly used. It is also suggested that through measures of subcontracting, there is a social acceptance and normalisation of employments not covered by collective agreements, driving institutional change in the Swedish building sector. The result is a fragmented labour market, with groups of workers – self-employed, sub-contracted, and migrant workers – working alongside each other on the same project site, on different forms of employment, and with different employers. The variety of actors involved in the production process is also clouding social responsibilities, shifting risks towards the employees.

The Fluid Nature of Recruitment and Selection Criteria in Skilled Occupations

Tholen, Gerbrand

City, University of London, United Kingdom
gerbrand.tholen[at]city.ac.uk

The paper examines to what extent employers' requirements are subject to negotiation when they evaluate job candidates. It draws on a wider study on the recruitment and selection process within different fields. The study comprises of fifty semi-structured interviews with external professional recruit consultants in engineering, public sector, marketing, finance and professional services. Recruitment consultants have been chosen, as opposed to employers, because of their wide experience in these fields and the reduced likelihood of desirability bias that some have associated with how employers share their views on their own practices (Pager and Quillian, 2005). Recruiters were all based in London and had various levels of experience. The findings show that technical criteria often not neatly defined. The employers that

consultants deal with do not necessarily know what they want and what they need. The criteria and requirements for R&S can be highly malleable, negotiated and constructed over time by consultants, HR and hiring managers as well as the pool of applicants. Therefore, the uncertainty and lack of reliable information often attached to evaluating candidates can also be applied variably to the demands of employers. The social negotiation around job requirements and specifications profoundly compromises the mainstream view of R&C and invites new sociological theorisation of the how jobs are allocated in contemporary skilled labour markets. Pager, D., & Quillian, L. (2005). Walking the Talk? What Employers Say Versus What They Do. *American Sociological Review*, 70(3), 355–380.

Collective Actors' Strategies for Wages at the Bottom End of the Wage Scale

Dingeldey, Irene

University of Bremen, Institute Labour and Economy, Germany
dingeldey[at]uni-bremen.de

Globalisation and the liberalisation of labour regulations have contributed to a rise in wage inequality and to an increase in low-paid work in industrialised countries. Minimum wages or mandatory extensions of collective agreements, among other strategies, can have moderating effects on these developments. Thus, it is not surprising that institutional settings, and more specifically the inclusiveness of wage-setting institutions, are the focus of many studies. However, recent research suggests that the segmentation of industrial relations and labour markets at the sectoral level cannot be explained by institutional accounts alone. Against this background, this study takes an actor-centred approach in combination with power resource theory to explain which strategies were used by collective actors to influence wages at the bottom end of the wage distribution and whether these strategies differ across sectors or countries. The study compares three countries – Germany, the Netherlands, and Austria – and three sectors – the metal industry, commercial cleaning, and retail – and roughly covers the period between the mid-2000s and today. Based on 40 semi-structured interviews with experts and professionals, we find that sector characteristics have a more profound influence on actors' strategies than national institutions. Hence, we find greater similarities between actors' wage-setting strategies across countries than within countries. Employers use, among others, indirect strategies such as exploiting institutional loopholes, while trade unions counter by mobilising public support.

RN17_07a | Trade Unions and Employers' Organizations

Firms Resistance to Unionism and its Determinants: Evidence from a Field Experiment

Nüß, Patrick (1,2)

1: Kiel University, Germany; 2: Hans-Böckler-Foundation
patrick-nuess[at]boeckler.de

Using a correspondence experiment we submit 5200 fictitious job applications to real vacancies for two years, the paper analyses firms resistance to unionism by revealing trade union membership in the hiring process. Due to the institutional structure of Germany as well as the available firm and labor market characteristics, the paper is able to link all potential mechanisms to the industrial relations literature on management opposition, organizing and labor disputes. Firms resistance against trade union members in Germany exists for all tested occupations and regions with an average decline in job invitations of up to 50%. Preliminary results provide evidence for union distaste related to the presence of a collective agreement, firm size and union density. This suggest, that union distaste is partly based on the threat of unions strike activity. However, the most powerful explanatory variable for union distaste is not current union density but the share of previous union members in a sector. This indicates union distaste as a proxy for management opposition has been an important driver for decreasing union density in Germany. The analysis will be extended by the direct effect of strike activity with the availability of the strike data in Summer 2019.

Employers' Organizations And Their Policies And Discourses Since the 1970s – The Dutch Case

Boumans, Saskia

University of Amsterdam, Netherlands, The
s.boumans[at]uva.nl

We are witnessing a qualitative change of the system of industrial relations and collective bargaining in several European countries. The causes for this change are still debated, but a consensus seems to be emerging that the general direction is into a more neoliberal and less coordinated system. And even though the role of organised employers within this process is broadly recognised, we do not have much knowledge yet on their reasons, motivations and internal debates. In this paper I present the Dutch case. Dutch industrial relations have been characterised as stable and robust for decades, with a high coverage of collective agreements based upon high employer density as an important feature. Since a couple of years though the practice of collective bargaining and the national social dialogue are under strain. Declining union membership, a shift of power between unions and employers, and changing union strategies

are often mentioned as main causes. The strategies and interests of the three national employers' organizations are unknown, and therefore their role within the current changes as well. Are they pursuing less coordination, as often thought, and why (not)? How does this relate to the high coverage? What are their policy goals? In this paper I present the first findings from an analysis of policy documents on collective bargaining and the social dialogue of Dutch employers' organizations since the 70s. The aim of the paper is to gain an understanding of the goals, arguments and interests of organized employers, and it's development over time.

Court Ban on Strike Action and Its Possible Consequences for Trade Unions

Rakowska, Katarzyna

University of Warsaw, Poland
k.rakowska[at]is.uw.edu.pl

In my presentation I address the issue of institutional change – the shift of the right to strike from labour law to civil law – and its possible consequences for trade unions participation in collective bargaining process. I use the concept of sources of bargaining power of trade unions as described by Erik O. Wright. Bargaining power is willingness and ability to strike. I also use the concept of capital fixes introduced by Harvey and further developed by Silver. Silver claims that capital is subjected to certain fixes in space, technology, product and finance and is not infinitely flexible. On the other hand, in order to fight various kinds of workers' bargaining power, capital fixes (adjusts) itself in space, technology, product and finance. I introduce a new type of fix: institutional fix. I claim that capital answers to bargaining power of trade unions using legal framework fix by taking bargaining process to court. My preliminary findings include ten companies with 12 civil court cases where the right to strike was disputed. First instance courts prohibited strike actions seven times, four times employers plea was dismissed, and one case ruling remains unknown. Bans on strike action had great impact on negotiation process between trade unions and employers, causing stoppage of ongoing strike action twice, four call-offs of scheduled strikes and leading four companies to dismissal of union leaders.

Public Service trade Unions and Employment Relations in a Context of Crisis. The Case of NHS Midwifery

Guillaume, Cecile (1); Kirton, Gill (2)

1: University of Roehampton, United Kingdom; 2: Queen Mary University of London
cecileguillaume94[at]gmail.com, g.kirton[at]qmul.ac.uk

The research presented in this paper investigates the work, career and union experiences of midwives in the NHS, the largest employer of women in Europe and one of the most racially/ethnically diverse. The research utilises multiple methods, including 20 semi-structured interviews with RCM reps and paid-officers, 3 focus groups with RCM reps and a union reps survey that will be completed in April 2019. The preliminary findings drawn from our qualitative data offer contrasting views on workplace unionism with some good examples of initiatives to revive local (dormant) branches, to encourage membership involvement and to encourage people to step forward for rep roles. Equally many reps expressed frustration regarding member passivity and servicing expectations. Midwives are often viewed as individualistic and lacking enthusiasm to support one another. Getting involved with RCM involves high individual costs (burnout, stress, emotional) for professionals who are often working shifts and nights. However, our research also gathered examples of reps feeling valued by local managers – for their problem-solving role and role in mitigating complaints and staff dissatisfaction with new policies for example. Unsurprisingly, staffing levels were a major concern in terms of effects on midwives. Bullying and harassment – generally and in some cases particularly of BAME staff – are now seen as endemic in the NHS, especially hospitals and other larger workplaces. Representing individual members was the main concern and main activity for stewards. But, many gave examples of ways that they had (often successfully) attempted to collectivise issues brought to them by individuals. Many see their main satisfaction coming from representing individuals, fighting unfair treatment.

RN17_07b | Collective Bargaining and Labour Market Regulations

Can In-work Poverty be Reduced by Investing in Occupational Welfare? Multi-level Approach on In-work Poverty in Europe

Järvi, Laura Kristiina; Mäkinen, Lauri Juhani

University of Turku, Finland
laura.jarvi[at]utu.fi, ljmaki[at]utu.fi

Since the financial crisis of 2007, in-work poverty rates have increased in almost all European Member states. The paper sets to analyse whether investments in occupational welfare (i.e. welfare that derives from the employment and is distributed by the employers) reduce in-work-poverty in Europe. Several factors, such as individual, household and institutional settings are known to be related to in-work poverty phenomenon, with welfare state measures being one of the key macro-level factors. Even though occupational welfare is likely to enhance the living standard of the employees in a more precise way than the welfare state does, the influence of occupational welfare on in-work poverty is largely unknown. The paper approaches the in-work poverty phenomenon from a multi-level perspective, using occupational welfare expenditure, public social expenditure, collective agreement coverage and union density as macro level indicators. Using LIS data with 19 countries, the paper aims to examine whether the occupational welfare has an independent relation to in-work poverty when controlled with individual, household level and macro-level factors, and whether this relation varies between countries representing different occupational welfare systems. The paper contributes to the field of poverty and welfare research by providing valuable knowledge on the relationship between occupational welfare and in-work poverty.

The Sectoral Variegated Impact of Internal Devaluation and the Reconfiguration of Collective Bargaining in Portugal

Marques, Paulo (1); Campos Lima, Maria da Paz (2); Costa, Ana (1); Teles, Nuno (3)

1: ISCTE-IUL and DINÂMIA'CET-IUL; 2: DINÂMIA'CET-IUL; 3: Universidade Federal da Bahia
paulo_miguel_marques[at]iscte-iul.pt,
pazmlima[at]gmail.com, ana.costa[at]iscte-iul.pt,
teles.nuno[at]gmail.com

Comparative European studies highlighted how the neoliberal and austerity reforms, imposed in Southern Countries corresponded to a strategy of internal devaluation, which ignored national specificities and provoked the erosion of employment regulations and collective bargaining institutions (Schulten and Müller, 2013; Marginson, 2014; Van Gyes and Schulten, 2015; Cruces et al, 2015; Koukiadaki et al, 2016; Campos Lima, 2017). In our presentation we will look at the sector variegated effects of “internal devaluation” (Rodrigues et al., 2016) in Portugal, hypothesizing that they are associated with the sectoral impacts of liberalisation and of financialization, with the sectoral impacts of economic and financial crisis of 2007-2008, and with the characteristics at sector level of industrial relations institutions and relative capacities of the actors, in particular organized labour. Furthermore, we hypothesize that sectoral variation, as hypothesized by Streeck (2009), might have been related with employers interest on keeping some degree of coordination in some sectors. Having into consideration this background, this paper will examine the sector effects of the process of internal devaluation, by looking at the reconfiguration of industrial relations institutions and at the dynamics and outcomes of collective bargaining at sector level, between 2000 and 2018, in Portugal. We will present the first results of a comparative extensive analysis comprising six sectors (Banking, Telecommunications, Metal, Clothing, Construction, and Hotels and Restaurants) and the first results of three in-depth case studies (to extract from that sample), with contrasting patterns in terms of employment and industrial relations and contrasting impacts in terms of internal devaluation.

Precarious Journalists and Collective Bargaining

Čehovin Zajc, Jožica

University of Ljubljana, Slovenia
jozica.zajc[at]fdv.uni-lj.si

Economic, political and social pressures, produced by the rapid globalization, technological advances and international competition, have led to an increasingly flexible production processes and employment systems that have been typified by the greater use of precarious work, deprived by a lower wage, employment instability, limited opportunities of employability, and limited access to social security (pension, health, unemployment insurance). Employment became less

secure in news media as well, with precarity being “a key characteristic of contemporary journalistic work”. Since good working conditions of journalists can influence their freedom of expression and their role as watchdogs and fourth estate, this issue also impacts the formation of public opinion. This study aims to identify problems that Slovenian precarious journalists face due to their precarious employment situation and their involvement in (collective) bargaining for workers’ rights. To get the insights into their experiences, nine in-depth interviews were conducted with journalists, who work in precarious relations in Slovenian mass media for seven to 17 years. Content analysis of interviews shows that precarious journalists see the potential for better working condition in collective organizing and bargaining for their rights, however they have some reservations: on one hand there is the lack of trust in the power of trade unions to improve working conditions of non-standardly employed workers, on the other hand they are afraid that individual exposure in collective fight could worsen their specific situation (as reduction of tasks, consequently lower fee, cancelling the contract etc.). Consequently, numerous precarious journalists stay passive in the current situation.

Struggles of White-collar and Blue-collar Workers in the Electromechanical Sector: A Case Study of Collective Bargaining Process in Turkey

Bozkurt Ozturk, Basak

Bahcesehir University, Turkey
basakbozkurt88[at]gmail.com

There is a widespread assumption that labor movement is in steady decline in neoliberal ages. A plenty of debates is held about the death of the working class. On the other hand, upsurges of labor and class-based mobilizations such as workers’ strikes in India and Nigeria, teachers’ strikes in Israel, miners’ resistance in South Africa, protests of precariat in the US as well as anti-austerity strikes in Europe has shown that labor struggles have not ended. Not only blue-collar workers, but also many white-collar workers from call-center agents to engineers are subjects of these struggles. In order to understand and explain labor struggles, it is necessary to analyze attitudes of different workers and solidarities among them. The aim of this study is to reveal differences, similarities and dynamics of solidarities in experiences/actions of white-collar and blue-collar workers. For this purpose, collective bargaining process of the 2016-2018 period between Turkish Employers’ Association of Electromechanical Industries (EMIS) and United Metal Workers’ Union (Birlesik Metal-Is) was examined. Given the fact that at the end of the negotiations, the parties did not reach an agreement, a strike vote was held. A majority of workers voted in favor of the strike action. However, the strike was adjourned by the Council of Ministers due to the state of emergency in Turkey. Blue collar workers didn’t recognize the government’s decision and went on a strike. In this study, in-depth interviews were conducted to investigate attitudes and solidarity among white collar and blue collar workers in EMIS workplaces.

RN17_08 | Development of the Sociology of Work in Europe

Swedish Sociology of Work

Furåker, Bengt

Dept. of Sociology and Work Science, University of Gothenburg, Sweden
Bengt.Furaker[at]socav.gu.se

Sociology of work has been a vital subfield of Swedish sociology ever since the subject became an independent University discipline about 70 years ago. It was a time with huge economic growth, peaceful industrial relations and increasing standards of living in the country. In international comparison, sociology arrived late, but already from the beginning we encounter a preoccupation with work-related research. Theoretical and empirical inspiration was taken from American sociology and social psychology. In the mid-1960s the dominant paradigm of sociology of work began to be questioned. New theoretical perspectives – especially conflict- and power-oriented approaches – made their way into the field. In the course of reevaluation, the discipline itself became more conflict-ridden. Another development was that many sociologists now approached the trade unions, thereby to some extent distancing themselves from employers. After some years, things calmed down, but the period of reorientation left its imprint on the sociology of work. Neoliberal ideology got a stronger foothold in Sweden toward the end of the 1980s, but this did not mean that sociologists became neoliberals. Most of them remained within the paradigms they had taken on board during their academic training. Eventually, however, another kind of reorientation occurred. Academic criteria became stricter, international publishing became increasingly important and differentiation and specialization took some steps forward. With the liberalization of the Swedish society and economy, sociologists met certain new topics concerning, for example, flexibility, temporary work agencies and large inflows of immigrants to the labour market. However, we also see a diminished interest among younger researchers for the sociology of work. To some extent, this may be a reaction against the subfield's strong position within the wider discipline for several decades.

Labour Sociology in Italy: Resisting Erosion Through Transformation and Dynamism

Pulignano, Valeria

KU Leuven, Belgium
valeria.pulignano[at]kuleuven.be

The paper outlines the main socio-political transformations which occurred in Italy from second World War and their impact on the sociology of work as part of labour sociology and/or industrial sociology or more generally economic

sociology. It sheds light on the historical foundations and the evolution of the sociology of work in Italy, by diversifying between three different periods (i.e. 1945- 70s; 1970s-1980s, and from late 1980s onwards) and identifies its main themes and disciplinary specificity while confronting it with the question of cross-boundary fertilization with other disciplines in social sciences, particularly gender studies and labour relations. The resulting sociology of labour which evolved is dynamic and distinctive. This occurred in an historical period in Italy characterized by important institutional and political changes, which followed the transformation of capitalism.

Toward a Sociology of Work in the UK

Stephenson, Carol

Northumbria University, United Kingdom
carol.stephenson[at]northumbria.ac.uk

The paper draws upon makes four inter-related claims in relation to the development of the sociology of work (SOW) in the UK. First, it offers a sociology of the sociology work, exploring the power bases and the social and economic structures that have shaped the discipline and led to a neglect of disadvantaged workers. Second, it challenges the view that the 1950s and 1960s heralded a 'golden age' of sociology of work. Third, it challenges the notion that the sociology of work is at its most vital when embedded within Sociology Departments and that the 'spread' of the study of work into business schools was a distraction and, at worst, a degradation of the sub-discipline. Finally, it calls for a return to a focus on the primary role that work and employment plays in the reproduction of social inequalities.

Development of the Sociology of Work in Europe: theories, methods, politics

Stewart, Robert

Grenoble Ecole de Management, United Kingdom
paul.stewart[at]grenoble-em.com

Development of the Sociology of Work in Europe: theories, methods, politics. Paul Stewart This presentation reports on the findings of the recent 11 country programme exploring the nature and form of the Sociology of Work in Europe in the period from the end of the second world war. One of the notable features to emerge from the individual stories of path-dependant development of the sub-discipline of the Sociology of Work since 1945 in Europe has been the importance of links with US sociology (and the sociology of work) and, on occasion, with other North American social sciences including social psychology and economics. Beyond North America, there has also been a degree of engagement, and at times an appropriation, of concepts from other disciplines such as history and political economy. Our review of the SoW also highlights two other significant findings: the subject is always, has always been, in a state of intellectual flux not only in every country but internally to such a degree that we might be able to argue that this state of flux, of spread, actually constitutes one feature of its ontology. It has no 'centre'—it is always and everywhere contested and reframed. This can also be seen with respect to institutional context within which the subject is practiced so that the institutional space, in addition to the intellectual boundaries, of the sub-discipline have also always been subject to spread. The other feature of the sub-discipline which our cases reveal, again with variation according to country, history and changing social relations, is that of the role of the state in relation to the way in which the sub-discipline is practiced. The latter can be seen sometimes in the extent of state provisioning of research, at other times in terms of the way in which the state frames teaching and research activities, and again, in respect of its sometimes open expectation that the SoW should be a feature of state planning. Thus, not only is the SoW not above society (let alone the state) since we know that it obviously changes its focus as society evolves. What is also interesting in terms of a putative sociology of the sociology of work, as it emerges from our studies, is that the SoW presents different faces according to the what (social relations), the where (history-social and institutional space) and the who (gender, ethnicity and class position) of those undertaking research in the sub-discipline. These all matter in determining the kinds of sociology of work we are presented with and these features vary within and between countries according to time, circumstance and the historical trajectory of each country's political economy.

RN17_09a | Migration and the Implications for the World of Work, Employment and Industrial Relations

Negotiating Moral Boundaries in Workplaces through the Lens of Work Experiences

Sivis, Selin

University of Essex, United Kingdom
ss16365[at]essex.ac.uk

This study applies 'the boundary-making approach' in the case of Syrian refugees in Turkey, the world's biggest refugee receiving country. 'The boundary-making approach' is often utilized to study how boundaries are drawn, shifted, and blurred by social actors across different contexts and types of groups. Yet, multiple dimensions of the boundary-making process particularly with respect to the perceptions of dominant groups are still under-explored in the literature. Based on preliminary micro-level study in Adana, a secure economic hub in the proximity of the conflict region, this paper explores how distinct framing strategies are employed towards Syrian workers in the workplaces, and how moral boundaries are negotiated and contested at different stages of employment by employers in manual labour economic sectors in the informal market economy. Drawing upon ethnographic observations and 30 semi-structured in-depth interviews with Turkish employers in Adana, this study finds out that attachment to morality in the workplaces is distinctively (re)constructed by employers at different stages of employment: hiring process and employment itself. Results suggest that mobilization of shared categories and classification systems such as 'work values', 'work ethic', and 'showing mercy' affect the nature of moral boundaries in the workplaces and the current local labour market dynamics and work experiences contribute to (re)making of the boundary drawing process. Also, this research sheds light on the role of socio-economic benefits and moral duty in making moral boundaries more permeable between employers and Syrians during hiring process whereas it becomes less permeable after employment since previous work experiences push employers to reconsider their approach towards them as 'potential employees'. Keywords: moral boundaries, the boundary-making approach, employment, informal market, Turkey and Syrians refugees.

Perceived And Real Insecurity. Attitudes To Migrant Workers In Denmark, 2007-2018

Hedegaard, Troels Fage; Larsen, Christian
Albrekt

Aalborg University, Denmark
troelsfh[at]dps.aau.dk, albrekt[at]dps.aau.dk

In the wake of the enlargements of the European Union in 2004 and 2007, Denmark, along with other European countries, has experienced a large influx of work related migration especially from Eastern Europe. This has had an overall positive influence on the economies of the recipient countries. However, this has also made some workers feel more uneasy about their position in the workforce, as the increased number of workers has resulted in fewer job openings and more wage competition for the existing jobs. In this article, we demonstrate that more Danes have begun to worry more about the influx of immigrants into the workforce and demand more protections for native workers in the period between 2007 and 2018. The focus of the article is on explaining this change in attitudes. Therefore, we study whether the changes in attitudes to migrants in the workforce are linked to a values general backlash, as described by Inglehart and Norris (2016), or whether it can more accurately be explained by the increasingly unsecure material position among parts of the workforce. In the article, we draw on the version of the Worlds Value Study from 2008 and 2017 combined with high quality Danish Register Data. Since the survey respondents answered have been linked to the population registers we can study the impact of factors like income, unemployment, trade, trade union membership, and taxes in great detail. This combination allows us to dig into the material background of these attitudes, and to distinguish it from a general values backlash.

Liquid Migration And Precarization Of Work. Professional Experiences Of Young Migrants From Selected Medium-sized Cities In Poland

Winogrodzka, Dominika Maria

SWPS University of Social Sciences and Humanities, Poland
dwinogrodzka[at]swps.edu.pl

The article explores the relationship between international migration and the precarization of work among young migrants from selected medium-sized cities in Poland. The author analyzes whether international migration allows for change or, on the contrary, preserves precarious work conditions. This is examined in the context of young people who try to avoid precarization by migrating from their local communities. The theoretical framework of this work concerns "liquid migration", which is based on the temporariness, flexibility, and unpredictability of life trajectories. In the professional context, "liquid migrants" have to adapt to a flexible, deregulated and increasingly transnational labor

market. Such labor markets are associated with specific challenges, one of them is the precarization of work and the fact that contemporary work signifies a number of risks. Based on the empirical material from the "Education-to-domestic and- foreign labor market transitions of youth: The role of local community, peer group and new media" project, the author are looking for the answer to the questions about the role of migration experience in the process of experiencing work precarization, both in objective and subjective terms. Key words: youth, labor market, liquid migration, precarization of work

Including Migrant And Precarious Workers In The Care Sector: Comparing Union Strategies And Labour Market Outcomes In The UK And The Netherlands

Marino, Stefania; Keizer, Arjan

University of Manchester, United Kingdom
stefania.marino[at]manchester.ac.uk,
arjan.keizer[at]manchester.ac.uk

This paper provides a comparison of inclusive strategies towards migrant and precarious workers by unions in the UK and the Netherlands. It combines insights from the literatures on labour market segmentation and trade union (revitalization) strategies, building on previous contributions in this respect (Benassi and Dorigatti, 2015, Pulignano et al., 2015). The literature on segmentation argues that migrant labour allows employers to offer low pay and working conditions in labour intensive segments, thus contributing to labour market segmentation (Anderson and Ruhs, 2010). It also considers segmentation as result of a bargaining process between capital and labour and thus dependent on their respective power (Grimshaw and Rubery, 1998). A second strand in the literature highlights the importance of an increasingly inclusive attitude towards precarious and migrant workers, while also stressing the relevance of union related variables in shaping union strategies (Marino, 2012). This paper draws on these arguments to compare union strategies and regulatory outcomes in the care sector in two countries characterized by different institutional contexts and unions' features. It relies on qualitative data consisting of semi-structured interviews and union documents related to the TUC (UK) and the FNV (the Netherlands). The paper explores the extent to which flexibilization and precarity in labour intensive sectors constitute an explanation for inclusive union strategies to promote regulation for all. Furthermore, the paper analyses the impact of union power, in particular related to institutional embeddedness, on the extent to which these inclusive strategies result in regulatory outcomes. Factors Of Social Control Over Automation

Horváth, Ágnes

Corvinus University of Budapest, Hungary
agnes.horvath06[at]gmail.com

The main question of my research is centered around the introductions of robots as labor force. What influences the success of this process, how can society collaborate or interfere with it. What is the role of politics, education, capital and civil society in determining the speed and the extent of automation in economy? When talking about labor force and the future of work, it's inevitable to discuss Marxism and its use in analyzing digital economies. The literature by Ursula Huws, Nick Dyer-Witheford, and Daniel Bell give foundation for further analysis, but the theoretical framework of Marxism is too narrow to explain the complexity of the phenomena of robots winning over humans in the labor market. This is the reason why I would like to involve Transition Management and the Wilson Quad in my research. Doing so, I will be able to give a general overview of the part different social actors play in this technological change. It is a new and continuously evolving field of research and I strongly believe that my research can contribute to it by emphasizing the importance of building frameworks that can handle the complex networks of not just one society, but global economy. We can hardly find any segment of the economy that isn't influenced by global trends may it be innovations of technologies or ideas.

The Implication Of Digital Social Networks On Organizational Gaps: The Case Of An Israeli Colleges Faculty Strike

Nissim, Gadi

Ruppin Academic Center, Israel
gadinissim[at]gmail.com

The paper asks how social network technologies (in this case – WhatsApp) may bridge over organizational and community gaps during an organizational crisis. I use the case of the recent Israeli colleges' faculty strike to explore the dynamics that took place through the faculty corresponding among themselves and with their workers' committee representatives. The findings suggest that WhatsApp groups have become the strikers' main communication platform. A first group was formed to distribute information and to coordinate protest activities. It soon expanded and have become an important arena in which faculty could share their experience, seek emotional support, discuss the managements' moves and the appropriate response, demonizing the management and

ridiculing it. Consequently, the faculty that is scattered in four separated schools and that was atomized by dedication to their carries – has turned into a united community that developed direct relations and nurtured strong affinity in very short time. The WhatsApp group also facilitated direct communication between the workers' committee's leadership and the rank and file. Yet, at the same time, by generating bottom-up pressure, it hazarded the possibility of calm decision-making and the workers' committee autonomy in leading the crisis. WhatsApp groups, therefore, enhance patterns of direct democracy while they inhibit representational democracy. The research is based on my dual position as an observer and as workers' committee's activist. Data include observations of variety of scenes as well as analysis of digital social networks.

The Impact on the Job Quality of Loan Officers of Mobile Digital Technologies introduced into Microfinance Institutions in Emerging Economies

Siwale, Juliana (1); Bisht, Nidhi (2);
Trusson, Clive (3)

1: Nottingham Trent University, United Kingdom; 2:
Management Development Institute, Gurgaon, India; 3:
Loughborough University, United Kingdom
juliana.siwale[at]ntu.ac.uk, nidhi.bisht[at]mdi.ac.in,
c.r.trusson[at]lboro.ac.uk

Recent developments in information and communication technologies have enabled work tasks previously performed at an office base to be performed remotely. This has disrupted established ways of working and afforded managers greater control over mobile workers (Vartianen, et al., 2007; Trusson, 2018). While the study of the disruptive power of digital transformation has gained traction (Boes et al., 2017), the geographical context in which such disruption occurs remains under-researched. Microfinance operates across international contexts, providing financial services to clients who are typically on low incomes. Research in this domain often draws attention to its importance for economic development in emerging economies including those of the Indian sub-continent and Africa (e.g. Siwale, 2016). An important role in microfinance is the loan officer who interfaces with individual clients as the representative of their employing microfinance institutions (MFIs). Over recent years mobile digital technologies (MDTs) have emerged to transform the work of the MFI loan officer. This study draws on interviews with loan officers and their supervisors to explore the question of 'how do MDTs impact on the job quality of MFI loan officers?' This is addressed by reference to the findings from two case studies: of an Indian MFI that had introduced mobile technologies in recent times and a Zambian MFI at an earlier, nascent stage of implementing mobile technologies. It is found that the managerial surveillance functionality of MDTs diminishes the job quality of loan officers by facilitating workload intensification and undermining autonomy in how they conduct their field work.

How does Digitalisation Challenge Medium-sized Enterprises and Change Work Life?

Weissmann, Marliese

Sociological Research Institute (SOFI) Göttingen, Germany
marliese.weissmann[at]sofi.uni-goettingen.de

In the ongoing European public and scholarly debates on work, digitalisation appears as an important trend that will radically transform work life. However, the question arises, in what ways growing technology affects labour and enterprises. The paper proposed addresses the changes and challenges of digitalisation in medium-sized enterprises by focussing on collaborative digital tools in team and project work. It draws on data from CollaboTeam, an ongoing research project in Goettingen that is exploring ways of working with collaborative applications in three medium-sized German enterprises (special machine engineering, IT consulting, software development) following a longitudinal mixed methods approach. The contribution highlights continuous, also conflicting, adaptation processes due to, e.g., technology changes, employees' usage or customer requests. Given the multitude of used applications, all enterprises try to structure their digital infrastructure by finding a "digital workplace" that offers a digital front-end integrating communication as well as knowledge applications. Furthermore, the paper describes new forms of software-supported collaborative work and changes of roles and responsibilities, e.g., to support the sharing of knowledge or the collaboration in project teams. These areas of inquiry provide insights how support systems stabilize new forms of collaboration.

RN17_10a | Changing Work and Labour Relations

Social Perception Towards Automation In Spanish Labour Market

Manzanera-Román, Salvador

University of Murcia, Spain
smanzanera[at]um.es

The main goal of this paper is to analyze the social perception towards automation process and its impact on Spanish labour market, comparing to the rest of EU countries. This aim was tackled by means of quantitative techniques. Secondary sources of statistical information were used. Firstly, the survey "Percepción social de la innovación en España" for the period 2017-2018 in Spain and secondly, the Special Eurobarometer 460 "Attitudes towards the impact of digitization and automation on daily life" made in 2017 for EU countries. Spanish labour market is facing the challenge presented by automation process. It presents structural weaknesses that are materialized in elements such as unemployment, temporary and partial-time contracts, the types of low-skilled occupations

created after the crisis. These elements put workers at risk to face the inevitable automation process. In this context, it is important to know what the impression of people and workers is on automation process and its impact on jobs, occupations and social inequality. The results show that Spanish people are more pessimistic than people of the rest of EU countries: 90% Spanish people believe that robots and artificial intelligence steal peoples' jobs; two thirds think that robots will substitute by people; nearly the half believe that lost jobs will not be compensated by new ones; however, two thirds think that can compete in the automated labour market. Therefore, most people think that innovation and automation destroy employment and increase social and economic inequality.

Factors of Successful Formation of New Employment Segments of the Population on the Depressive Labor Market

Arsentyeva, Nina

Institute of Economics and Industrial Engineering, Russian Federation
ars[at]ieie.nsc.ru

The negative changes that are characteristic of the Russian labour market become more apparent in the rural area. Peculiar to the modern rural labour market are the following features: narrow sphere of labour application, low quality of workplaces and of labour power, high level of real and registered unemployment. Practically everywhere the rural unemployment is chronic and stagnant. The economic crisis has aggravated the existing problems, which manifests itself in a further increase of unemployment and tension at the labour market, in a slowdown of workplace creation, an increase of concealed unemployment, and in a rise of accrued payroll. In the existing situation, worthy of notice is the discussion of such transformations in the complex of social policy measures that can ease the tension at the labour market by creating new working places. The study analyzes the results of activating both individual personal resources and the capabilities of external labour market institutions in creating new jobs in the context of economic depression. Among these, the support of small business and of self-employment as well as assistance to the unemployed in opening one's own business are worthy of particular attention. The study was performed as a case study. . Key words: labour market, disqualification, unemployment, labour power

How Much or Little Work is Good for You? A Shorter Working Week, Well-being and Mental Health

Kamerāde, Daiga (1,2); Wang, Senhu (2); Burchell, Brendan (2); Balderson, Ursula (2); Coutts, Adam (2)

1: University of Salford, United Kingdom; 2: University of Cambridge, United Kingdom
d.kamerade-hanta[at]salford.ac.uk, sw768[at]cam.ac.uk, bb101[at]cam.ac.uk, u.balderson[at]cbr.cam.ac.uk, apc31[at]cam.ac.uk

There are predictions that in future rapid technological development could result in significant shortage of paid work. A possible solution currently debated by academics, policy makers, trade unions and mass media, is a shorter working week for everyone. In this context, two important research questions that have not been asked so far are: what is the minimum amount of paid employment needed to get some or all of the well-being and mental health benefits that employment is shown to bring? And what is the optimum number of working hours at which the workers mental health is at its highest? Using data from 156,440 person-wave observations from the UK Household Longitudinal Study (2009-2018) we found that even a small number of working hours (usually eight or less hours a week) generates mental health and well-being benefits for previously unemployed or economically inactive individuals. The initial benefits boost is more pronounced for men than women. Our findings suggest that there is no single optimum number of working hours at which well-being and mental health are at their highest - we found that for most groups of workers working anything more than no hours per week is related to very similar levels of mental health and well-being to the current standard of 35 to 40 hours work. Our findings provide an important and timely empirical evidence for future of work planning, shorter working week policies and have significant implications for theorising the future models of organising work in society.

The Map Is Not The Territory. Contested Space In Food Delivery Work

Heiland, Heiner

Technical University Darmstadt, Germany
heiland[at]ifs.tu-darmstadt.de

Space is at the centre of food delivery platforms. Therefore, space as a contested terrain of the labour process is a key instrument of work control. On a broad and deep empirical basis, the paper outlines new control techniques in platform work. The surveillance and production of space, which has hitherto been neglected in sociology of work, is of special importance. The labour process is understood as a micropolitical confrontation in which the antagonistic actors create agency via uncertainty zones (Crozier/Friedberg 1980). Following Löw (2016) the paper analyses the contested and antagonistic practices of space constitution by the different actors via the processes of spacing and synthesis. The research is based on 35 interviews, ethnographic data through own courier work (>500h), a quantitative online survey (n= 251) and the analysis of online chat groups. In order to control work, the platforms produce the space the couriers are using. They create different delivery zones, keep their borders non-transparent and change them regularly. Since the maps' structures sometimes do not even match the territory, they cause a change in the drivers' perception of space, undermining their tacit knowledge and resources of action. Additionally, mandatory GPS-localization is a necessary information for the platforms' efficient allocation of the orders but at the same time devaluates the riders' dispersion in space as a power resource. As a counter strategy, couriers use Fake-GPS-Apps to obscure their actual location, showing that space is an object of contestation.

The Multi-Temporal Political Economy of Financialisation: The Case of UK Pensions Provision and Inter-Generational Justice

Berry, Craig Paul

Manchester Metropolitan University, United Kingdom
c.berry[at]mmu.ac.uk

The individualisation and liberalisation of pensions provision is in many ways the progenitor of the process of financialisation. Pensions provision depends on the manipulation of temporalities, by projecting a future which provision in the present seeks to serve. Past, present and future workers and savers are deemed to conform to these imagined futures, thereby situating inter-generational co-operation as the core feature of all forms of pensions saving, whether publicly or privately organised. Yet the futures imagined by pensions provision can never come to pass. The future will always be different to that which is forecast, precisely because generational change is endemic. This paper explores this issue with reference to recent developments in UK pensions provision (in a comparative context), which have seen the state pension 'simplified' and retrenched, and occupational pensions being reorganised as individualised provision. Financialisation is often seen as the root of these changes, insofar as it encompasses the reinforcement of 'shareholder value' in corporate governance, the emergence of 'asset-based welfare' and the state's increasing concern about fiscal risks. However, the intensifying contradictions of the UK's capitalist development model have undermined pensions provision, and pensions provision has actually driven financialisation elsewhere in the economy, by necessitating an expansion of financial practices to the public sector and private sector more generally. Perversely, the unspoken inter-generational bargains at the heart of pensions provision have become increasingly politicised in the UK as a result. The paper considers whether pensions provision can be rescued from the vicious circle of financialisation's political economy, and indeed whether we can rescue a 'generational' analytical lens to help us understand the temporality of financialisation, without depicting generational relations as inherently conflictual.

Literacies, Occupations and Prestige Scales. New Relationships.

Serrano, M. Angeles; Alarcon, Amado; Vidal, Antoni; Sorolla, Natxo

Rovira i Virgili University, Spain
mariadelosangeles.serrano[at]urv.cat,
amado.alarcon[at]urv.cat, antoni.vidal[at]urv.cat,
natxo.sorolla[at]urv.cat

This communication presents the main findings obtained from a cross-national empirical research aimed at analysing the role that traditional and new literacies play in current employment relations. Since information is linguistically encoded, informational capitalism makes of literacies a central issue of the production processes, demanding new skills to its workers. Literacies become, thus, a key component of productivity, employability, wages and control. This research has conducted a factorial analysis focused on the examination of the linguistic needs described in the definition of the more than 800 occupations included in the two main international systems of occupational classification (ILO and US Department of Labor). We have also considered variables from prior data bases (O'NET) such as literacy and numeracy, digital competences or social competences of communication. Finally, the different occupations have been classified according to their linguistic intensity. The compilation of the data has configured a scale of Linguistic Specialization at Work (ELT), whose outputs have been compared with those from occupational prestige scales (mainly ISEI, SIOPS and the Spanish prestige scale PRESCA 2). Results show that the mentioned prestige scales deviate when measuring the linguistic needs and competences asked in today jobs. Conclusions are aimed to show how new literacies demanded in occupations should be included to improve current and future occupational prestige scales.

“A Living Organism”: Interaction and Social Order in a Techno-social Milieu

Kurtcebe, Mehmet (1); Tüzü, Elif (2)

1: Hacettepe University, Turkey; 2: İzmir Katip Çelebi University, Turkey
kurtcebemehmet[at]hotmail.com, eliftzu[at]hotmail.com

An ever-growing strand of works on human, technology and their interaction proliferate in social sciences. Hardly do they oppose the argument that the more advanced technology becomes, the more intense interaction is but most of them tend to approach it as an embedded feature of technology. On the contrary, a highly synergistic relationship between technology and society, not to mention others, is at the core of this interaction. This paper examines the organization and social order in an ideal of team work including machines, around which they are assembled and through which they are maintained. Based on an extensive fieldwork as part of an airline staff for over a year and in-depth interviews, it explores how a flight gains meaning and scope extending beyond the concrete meaning to an abstract metaphor to include aircraft and staff. Immersed in a technology setting, teams are organized so as to manage flights working with machines. Aircraft becomes an abstract space, a virtual and social image that binds a team together. This reveals the ways in which a particular relationship and organizational form are produced, presence of a virtual, social body is invoked in flight operations and the energy is channelled to teamwork. Although human-machine interaction has been a major factor in aviation for some time, this kind of organization is aimed at meeting the needs of current flexible work place. It frames new horizons where industry, society and technology intersect.

Do Algorithms have a Right to the City? Waze and Spatial Sovereignty Fisher, Eran

The Open University of Israel, Israel
eranfisher[at]gmail.com

Waze is an epitome of contemporary algorithmic culture: it is a web application using algorithms to render massive amounts of user-generated data into real-time, personalized driving recommendations for millions of drivers. The aggregative effects of personalized recommendations have social-wide spatial ramifications. I look at one spatial effect in order to unpack the political significance of algorithms: the diversion of heavy traffic into previously serene neighborhoods. By analyzing the discourse of three stakeholders - residents, political authorities and Waze - the paper uncovers the emergence of a new spatial-political modality. Using "the right to the city" as a socio-political framework and juxtaposing it with actor-network theory as a socio-technical framework, I examine how non-human actors participate in shaping the city. Waze offers a new spatial imaginary where roads are abstracted from their immediate space and are seen as homologous to all roads in the network. This allows to strip "local" residents of their privileged position, and reposition them in a new, de-localized space subject to the privilege of all drivers. Rather than imagining roads as nodes in the construction of space - of villages and neighborhoods - Waze imagines them as connectors between nodes in an otherwise abstract network. Algorithms assert their legitimacy as political subjects and as having a genuine right to the city by proposing a new political modality that bypasses the demographic qualities of individuals (where they live, their local culture, their subjective habitat narratives) and constructing individuals as data points in an objectified system of data, processed in order to achieve efficiency.

Beyond DAPL: Drones as Counter – Narrative Tools in Journalism Practices

Casagrande, Gaia; Khaddar, Mohamed Amine

La Sapienza University of Rome, Italy
gaia.casagrande[at]uniroma1.it,
amine.khaddar[at]uniroma1.it

In the last decades, the unmanned aerial vehicles (UAVs) have turned from military to commercial product, for both professional and personal use. The different applications of UAVs in civil society are the demonstration of how drones have entered into the processes of technological convergence, becoming a physical extension remotely controllable by a mobile device. Even if the issue remains under-investigated in academic literature, lately the interest in drone journalism or dronism (Goldberg et al., 2013) has increased among scholars. Most of them are quite sure that "unmanned aerial vehicles are soon going to be a natural and ubiquitous part of our lives" (Gynnild A., Usakali T., 2018). Based on these considerations, the aims of this work – in progress paper are to investigate UAVs as potential tools of counter-narrative in journalism practices and to understand how this could affect and/or involve the audience. Starting from the case of study of North Dakota Pipeline (DAPL) (Tuck S., 2018; Rafsky S., 2017), which well exemplifies contradictions and potentials of drone journalism, we would like to go deeper in the debate. More in detail, we would like to understand if the overcoming of spatial barriers could improve a new form of journalistic storytelling, enable different forms of audience engagement, and provide a balancing asset among powers. In order to do so, we will use the theoretical concepts of media as extension (McLuhan, 1964) and of hybrid media system (Chadwick, 2013).

Algorithmic Acceleration: Towards a Fast and Slow Journalism?

A. Prodnik, Jernej

Faculty of Social Sciences, University of Ljubljana, Slovenia
jernej.amon-prodnik[at]fdv.uni-lj.si

In technological jargon algorithm can be considered as a "method for solving a problem." (Finn, 2017: 18) In this view, narrow problems are instrumentally defined by engineers and entrepreneurs that develop code with an aim of overcoming these problems. Even at first glance, it is clear such abstract definitions cannot explain why algorithms now play one of the central roles in almost all spheres of society, from politics and economy to culture and interpersonal relationships (Pasquale, 2015). Because technologies are inevitably embedded within the social context in which they develop, this paper first looks at the key characteristics of algorithms in competitive and inherently unstable capitalist society (Streeck, 2012). Basic features of algorithms in this context include: (1) opacity and complexity, (2) automatization, (3) dependency on big data, and (4) hyper-rationalisation. Obviously, social consequences of these characteristics are multifaceted. In the second part, the paper therefore looks specifically at social acceleration, which is mainly connected to automatization of processes and decisions. According to Rosa (2013; 2014), social acceleration is a constitutive part of modern societies; in late modernity, however, it becomes a self-propelling system "that incessantly drives itself." (2014: 31-33) Algorithms can be seen as an important part of technological acceleration, which is a dimension of this closed acceleration-cycle. In the field of journalism, acceleration raises new dilemmas that I deal with in the third part of the paper. They include: a) influence of algorithmic acceleration on journalism and its normative presumptions; b) (in)ability of journalism to respond to these challenges. I ask whether a differentiation between slow and fast journalism (Le Masurier, 2014; Rusbridger, 2018; Rauch, 2018) could help resolve any of these dilemmas.

Educating to Cultural Complexity of Algorithms: Is It a Possible Challenge?

Boninu, Lorenza

University of Pisa, Italy
lboninu[at]gmail.com

Algorithmic revolution involves the schools in three different ways. First, the education system is a complex organization whose functions have progressively been implemented through procedural optimization: the identification of objectives and the ensuing recruitment, allocation, and selection of the workforce, as well as the evaluation of the system and of formative outputs fall within this purview. Secondly, classrooms are often places of dissemination for the new "algorithmic faith", the so called "computational thinking", seen as essentially the sole key for reading and interpreting reality (Wing, 2006). Finally, the so-called learning management systems (LMS) adopted in the schools, which are often relying upon and controlled by digital platforms as Google, Microsoft, and Apple, may be used for collecting data and profiling users, even if they are viewed as neutral tools to

support and simplify teaching via digitalization (Scheff, 2014). My research examines the ongoing transformation of the education system under the influence of algorithmic modeling (O'Neill, 2017). In particular, I invite reflection on the potential disruptive effects such silent revolution may have on the cultural heritage the school has preserved and transmitted, as well as on the learning goals and outcomes it has set and produced thus far (Hayles, 2005). To conclude, I propose the possibility that the school itself may provide the necessary skills to understand and manage the man-machine integration born from the algorithmic software (Pireddu, 2017). This is the critical role that a new kind of school should take on. It is a difficult task, which requires avoiding no less any uncritical celebration than any aprioristic refusal of technology (Carrington, 2018).

RN18_01b | Online disconnection, Resistance and Refusal in the Post-digital Age

Cool Refusal: Rejecting Digital Technology in Late Capitalism

Kania-Lundholm, Magdalena

Uppsala University, Sweden
magdalena.kania[at]soc.uu.se

This paper explores the notions of online disconnection and media refusal in the context of cool capitalism (McGuigan, 2009) which constitutes the front region of neoliberal culture. It argues that the transition from the organized capitalism to the global neoliberal capitalism can be understood in terms of the changing role between technology and society and shifting relationship between humans and technology. In this context, technology receives an important status framed by the technological and techno-deterministic discourse supporting an understanding of technology not only as beneficial, but also inevitable and desired. This paper aims to contribute to the body of research that makes an attempt to understand online disconnection and media refusal as an inherent element of media (dis)engagement in the digital age. It proposes the notion of the logic of cool refusal which is incorporated in the capitalist modus operandi. The logic encompasses three main aspects, including lifestyle choices, workplace strategies and consumption patterns. I argue that in a similar manner as the notion of cool became incorporated into everyday life and capitalist mainstream, also cool refusal is an ideology not necessarily about resistance, but rather one which defines culturally and historically specific moment of individual coping in the era of hyperconnectivity.

Media, Truth and Expertise in a Changing Europe: Lessons from Central Europe's "Disinformationists"

Dujisin, Zoltan

Erasmus University Rotterdam, Netherlands, The
zoltan.dujisin[at]eshcc.eur.nl

This paper touches upon two timely issues: the decline of traditional media and discussions on post-truth as part of an increasingly visible collision between Russia and the West. Using in-depth interviews with journalists, scholars and experts in Hungary, Czech Republic and Slovakia, I examine the crisis of Europe and the media through the lenses of the "Russian disinformation" challenge. My research reassesses how journalistic identities, understood as journalistic constructions of truth and expertise, are shaped by their embedding in distinct networks of Russia expertise. It thus puts forth a networked, interprofessional and transnational understanding of journalistic practices. I reveal the emergence of a new class of highly-networked experts called "disinformationists", a coalition of journalists, think tank experts, scholars and state officials that share a commitment to countering Russian influence in the EU and have successfully gained a footing in its public sphere and policy making. Most prominently, disinformationists have been pivotal in establishing the Russian disinformation news-beat in Central Europe, as well as in setting up the EUvsDisinfo initiative, run by the European External Action Service East Stratcom Task Force. There are however limits to their successes. The legitimization of the "Russian disinformation" theme in the media coexists with resistance from state and EU officials, as well as with skepticism from leading Russia scholars who question the empirical soundness of disinformation studies. I argue that the above tensions can activate journalistic identities in ways that allow us to explore how news practitioners grapple with their own conceptions of truth and expertise in a changing Europe.

Digital Is Not A Technology! Exploring Digital Resistance And Meaningful Technological Encounters In The Post-Digital Society

Thorén, Claes

Uppsala University, Sweden
claes.thoren[at]im.uu.se

Recent years have witnessed an intense "analog vs. digital", and digital technology refusal debate among electronic musicians, with analog enthusiasts dismissing digital technology and software simulations as lifeless, fake and cold, instead preferring the characteristically organic and authentic sound of analogue synthesizers. The trenches seemed firmly dug by 2015: analog synthesizers are serious business; software synthesizers are for impatient utilitarians. In October of 2017, renowned musical synthesizer manufacturer Roland launched a hardware recreation of their 1987 instrument "Roland D-50", using the headline "Vintage Digital" and

describing it as "unabashedly digital" (Roland, 2017) The very idea of a "vintage" or "unique" digital technology is controversial; and alludes to distinctions made between old and new digital, much like the already established vintage and neo-analogue terminologies. This paper problematizes the relevance of analog and digital as significant concepts by exploring the idea of a revived, reconfigured or even historic "digital" by asking: What are the material and expressive negotiations that underpin what constitutes meaningful analogue and digital experiences? Drawing on a perspective of post-digital aesthetics (eg. Berry, 2015; Cramer, 2015), and Manuel DeLanda's (2016) concept of assemblage, this paper presents a qualitative case study of terminology use with findings from empirical data collected from a prominent online discussion forum to elucidate how the terms digital and analogue are evolving. Results indicate that the meanings of the terms "digital" and "analogue" are shifting from having been primarily grounded in technology and materiality to having become the expression of an aesthetic, giving new meaning to the word "digitization".

All Online, All Differently? Digital and Print Media Activity among Older Internet Users in Finland

Taipale, Sakari; Kuoppamäki, Sanna;
Karhinen, Joonas

University of Jyväskylä, Finland
sakari.taipale[at]jyu.fi, sanna.kuoppamaki[at]jyu.fi,
joonas.p.karhinen[at]jyu.fi

Older people are increasingly engaged with digital media technology, but as media users they constitute a highly heterogeneous group. Their media use is influenced by multiple factors such as ageing, changes in health status, life stage transitions, availability of social and technical support, and personal motivation. In this presentation, we study the differences and similarities in digital and print media activity among younger (ages 61 to 74) and older (ages 75 to 91) internet users in Finland. We present preliminary findings from the ACT cross-national longitudinal data 'Older audiences in digital media environment' collected among internet users aged 62 to 91 in Finland (N=1520) in later 2018 (other countries included: Austria, Canada, Denmark, Israel, the Netherlands, Romania, and Spain). Findings suggest that in Finland internet users aged 75 to 91 spend more time on reading printed newspapers, magazines and books and, conversely, use less frequently a TV with internet access and Wi-Fi radio than those aged 61 to 74. This younger age group uses mobile technology for almost all media, communication and entertainment activities more frequently than 75 to 91 year-olds. The age differences are most pronounced in mobile-based activities with an audio or video content, such as sending videos or images, watching TVs or videos or using phone as a music player. Moreover, we found that the time spent on using the internet for getting news is the highest among the oldest respondents, which may reflect their greater generational attachment to news contents. Lastly, we provide insights into cultural and geographical differences that explain digital and print media activity among older people.

RN18_02a | Public Sphere and Public Service

The Public Service Media Sector in the age of the Internet; reconsidering public options in Romania

Petre, Raluca

Ovidius University of Constanta, Romania
rpetre[at]univ-ovidius.ro

The premise of this paper is that the potential of public service media has been underused in the projects of democratizing media in emerging democracies. I aim to explore the options for the public media as hub of creative production and citizenship for content producers and beneficiaries. Recent contributions (Fuchs 2018) take a further step by opening the discussion on public service internet. It might be high time to reconsider public options in the event of failing markets and uneven results of citizen or community journalism projects. I believe that one cannot impose quality journalism where there is no market demand for it, and one can hardly invent civil society in areas where there had been none. In this paper I take a neoinstitutional and critical political economy stand and I use the contribution of Rodney Benson (2019) on the current structuration of ownership in the media in order to problematise the Romanian media sector and the specific structuration and options of the Romanian public service media field within. Romania is a fairly young democracy that has been struggling in the last three decades to overcome an authoritarian legacy and move towards a rational-legal polity. So far, media has merely managed to be the voice of change, rather than exerting agency over its own transformation (Petre, 2012). Benson, Rodney (2019) "Rethinking the Sociology of Media Ownership" in Routledge Handbook of Cultural Sociology, 2nd edition, Laura Grindstaff ed., Routledge Fuchs, Christian (2018) The Online Advertising Tax as the Foundation of a Public Service Internet. University of Westminster Press Petre, Raluca (2012) Journalism in Times of major Changes; critical perspectives. Tritonic

The privatization of the commons, The Phenomenology of Public Service Broadcasting and Facebook

Gavrila, Mihaela (1); Bevilacqua, Emiliano (2)

1: Sapienza University of Rome, Italy; 2: University of Salento
mihaela.gavrila[at]uniroma1.it,
emiliano.bevilacqua[at]unisalento.it

By focussing on the functioning of European public television and the popular social network plat-form, Facebook, this paper aims at exploring the privatization tensions at work in the concept of the Commons. The resource of common goods is considered an expression of mutuality and social collaboration (Bollier and Helfrich 2013). Internet has long been considered as the public space of sharing common goods such as knowledge, taking on the philosophy of the "public" as a tool of democracy, valorisation of common resources and guarantor of fair social distribution in terms of access (universality) and apparently overcoming the shortcomings of publicly mandated institutions. However, as what happened over time with the disappearance of the strong epistemological reference framework that once connected the "public sector" to our collective potential and nonrivalled assets (Buchanan 1954; Ostrom and Ostrom 1971), with the goal of governing and amplifying personal re-sources, a similar development has also occurred within the new online public space (Alperovitz and Daly 2008). Even though "public" signifies "belonging to people", it translates, in reality, into "gov-ernment" which is often representative of the interests of hegemonic groups which inhibit the ability of people to control their common goods. While this happens in communicative institutions, "delegated" by mandate, such as Public Service Broadcasting (David Hesmondhalgh 2013) it is also at work in social network sites such as Face-book, where audiences contribute their work, memories, passions, and lives without any control over the large shared memory database. The "common" becomes "private" when Big Data is accessed to share information in exchange for relationality.

Capitalism, Elite Publics and the Public Sphere

Slaček Brlek, Sašo

University of Ljubljana, Slovenia
saso.brlek-slacek[at]fdv.uni-lj.si

From the beginning public sphere theory has been haunted by the seemingly irreconcilable contradiction between the ideal of reasoned exchange between equals and the reality of class rule. The inherent contradiction was most succinctly put by Nancy Fraser: »Isn't economic equality—the end of class structure and the end of gender inequality—the condition for the possibility of a public sphere.« Drawing on the Amsterdam school of international political economy I propose a way to account for this paradox by acknowledging the stratified nature of the public sphere. I propose a distinction between elite publics, popular publics and counterpublics. They are defined both by the source of power in the public sphere, level of power as well as their orientation towards the public sphere. Elite publics are fractions of the bourgeoisie that possess economic power, which also grants them privileged access to the holders of political power. Accordingly, they act curtail the public sphere in two ways: by removing economic power from democratic decision making and by limiting political decision making to an exchange between elites. Popular publics – traditionally represented by the working class – possess neither economic power nor ready access to the holders of political power, but they do have numbers on their side. Their orientation is consequently a democratic one. Distinct from both of these are counterpublics, which are excluded or highly marginalised in the public sphere and organise for the purpose of inclusion.

RN18_02b | Artificial Intelligence, Big Data and Internet Culture

The Uses Of Internet And The Social Media By The Teachers' Unions In The Context Of The Actual Protest Against The Devaluation Of The Profession

Marques Alves, Paulo Jorge

ISCTE - University Institute of Lisbon, Portugal
p.alves61[at]gmail.com

Employment relations in the Portuguese public administration have changed profoundly in recent years, firstly under the "New Public Management" ideology and later with the austerity policies. This hit hard the education sector, particularly teachers' wages and careers. Much of this transformation was led by the previous right-wing government. With the change of the political situation after 2015, teachers thought that the process of devaluation of the

profession will stop. Despite the replacement of the cuts in the wages, the actual government of the Socialist Party continues to refuse the full recovery of the length of service frozen (9 years, 4 months and 2 days) only accepting to recover slightly over two years. This situation led to a deep protest, which takes place both in the real and digital worlds. In this paper we intend to analyze how the teachers' unions are using the Internet and the social media in the context of this protest. Our findings show that they are being used intensively, but with different purposes. Some unions used them mainly for mobilizing; others used them basically for information. However, there is a convergence in the fact that the use that it is made do not allow us to assert that unions have fundamentally changed the way they act in the Internet, namely in what concerns the enhancement of participation. A relative exception is STOP, a newly founded union. In this case, it takes advantage of the potential of the new media through the promotion of participation, for instance, by answering the questions or comments that are posed in Facebook.

Digital Identity Construction Of Environmental Movements Through Media Access: The Anti-Nuclear Movement In Belgium And The Anti-Pipeline Movement In Canada

Lits, Grégoire (1); Broustau, Nadège (2)

1: Université Libre de Bruxelles, Université Catholique de Louvain, Belgium; 2: Université Libre de Bruxelles, Belgium
litsgregoire[at]gmail.com, Nadege.Broustau[at]ulb.ac.be

Drawing on fieldwork (interviews and web site content analysis) realized in Belgium and in Canada about two contrasted environmental controversies, this paper analyzes the different ways environmental activists exploit digital technologies and interact with journalists and communication professionals in order to build their image in the public sphere so as to gain and to keep access to the public sphere. Our theoretical frame combines insights from social movements (Gamson 1991, Polletta and Jasper 2001, Treré 2012) and digital communication studies (Broustau 2014, Yates 2015) in order to investigate the link between communication strategies in the digital era and processes of identity construction among social movements. This frame led us to build analytical tools, an interviews grid and a grid of Web content analysis, in order to study two cases: the nuclear phasing-out controversies in Belgium (from 2013 to 2019) and the controversies surrounding the Energie-Est pipeline project in Canada (from 2014 to 2018). Interviews with activists, journalists and communication professionals in the environmental field were confronted with the analysis of the websites and social medias of environmental activists and institutions. The results of this comparative empirical work point out the dilemma of anti-system communication strategies versus the search for media legitimacy and authority. We discuss these results in light of the controversies that oppose social movement experts (Harlow 2012, Diani 2013) and media sociologists (Gerbaudo and Treré 2015) stating that the use of social network tools by social movement organizations (SMO) transform the very nature of social movements.

Social Media's Role In Fostering Online Activism In A Country With Weak Formal Civil Society Structures: The Case Of Greece

Nevradakis, Michael

Deree-The American College of Greece, Greece
mnevradakis[at]acg.edu

The years of the economic crisis in Greece saw a marked increase in activist and grassroots activity, including the formation of large-scale organized protest movements, non-governmental organizations, volunteer initiatives, activist movements, and neighborhood groups. The proliferation of such organizations and movements was especially notable in a national context where the civil society sector has, in the view of many scholars, historically been underdeveloped, highly politicized, beset by clientelism, and lacking in independence from the state and from political parties. Many of these fledgling organizations, lacking resources and access to mainstream media outlets to raise awareness about their cause, utilized social media for outreach and to publicize "unfiltered" news and information about their activities and causes, bypassing mass media "gatekeepers." To what extent, however, was social media a vital part of the day-to-day operations of such organizations and groups? More broadly, have social media contributed to a rebirth or rejuvenation of civil society in Greece? Have the organizations and movements which were formed during the economic crisis demonstrated longevity? Does social media remain as important for the operations of these organizations and groups today as it was when they were first established? Based on multi-year research performed in Greece and encompassing interviews and surveys conducted with representatives of several civil society organizations and movements, including a case study of the "Boroume" ("We Can") NGO, this research argues that social media initially did assist such organizations and movements in attaining public visibility and attracting volunteers and activists, contributing to the overall growth of civil society, but that social media's overall importance to their efforts declined over time and did not prevent many such initiatives from ultimately dissolving.

RN18_03a | Digital Movements, Activism and Protest

A critical analysis of the UK policies on Artificial Intelligence

Na, Yuqi

University of Westminster, United Kingdom
yuqi.vicky.na[at]gmail.com

Big Data and AI have become the new buzzword in the UK, sparking new waves of investment and new concerns about

the technology. As early as 2013, the UK government has selected robotics and autonomous system as one of the eight key technologies for the government to support. The government has been actively promoting the development of AI and its relevant industry in the UK. This paper will conduct a critical analysis of UK government policies regarding AI. It will try to analyse the government's main goals in developing AI. What are the understandings of AI's roles in society? What issues regarding AI are addressed in the policies? What issues are highlighted and what are neglected? This paper will further discuss the question of what could be seen as a 'good AI society' and how this society could be addressed by AI policies.

Taking Names: Patterns of Meaning and Stereotyping of Social Categories in Antagonistic Discourses on Social Media in Romania and Hungary

Meza, Radu; Mogos, Andreea; Vincze, Hanna Orsolya

Babes-Bolyai University, Romania
meza[at]fspac.ro, mogos[at]fspac.ro,
vincze.orsolya[at]fspac.ro

Facebook Pages of media institutions, public figures, political parties and causes have become arenas for public debate on current issues. As populist discourses and authoritarianism gain momentum throughout Europe, political communication on social media and interaction between people and political and media actors play a key role in the social construction of maps of meaning. The goal of the research is to use a computational discourse analysis approach to identify patterns in Facebook posts messages and subsequent comments as conversational contexts. A dataset of 325.937 posts and 2,56 million comments published in the 2016-2018 timeframe, collected from 536 public Facebook pages of public figures, media institutions, political parties and causes from Romania and Hungary will be analyzed using machine learning word2vec models to obtain word embeddings for the terms referencing social categories such as the poor, welfare recipients, pensioners, young urban professionals, the economic elite, public workers and the diaspora. Formal concept analysis and semantic networks will be used based on threshold values to represent and compare the relationship between the contents of social category stereotypes in the two cultures. An in-depth qualitative analysis of significant patterns identified will focus on the intersecting local frames and discursive strategies, emotionalization, ethnicization and the local political stakes in conjunction with particular strains of populist arguments - understanding populism as a style or political language.

Imagining technology and society in AI and Big Data research

Thaa, Helene Franziska

Albert-Ludwigs-Universität Freiburg, Germany
helene.thaa[at]posteo.de

Artificial Intelligence (AI) has come to outweigh many other technologies in visions of humanity's future. Discourse about AI, Big Data, their potentials and their applications ranges from utopian visions of a paradisiacal world of abundance (Kelly 1997; Kurzweil 2010) to dystopian images of human control by governments and corporations (cf. Wagner 2015: 17). Transcending popular discourse on future scenarios, this research aims to convey tech developers' and researchers' shared imaginaries, orientations and ideals. The development of new technologies is shaped by researchers' own understanding of technology, its role in society, ideals of its design and use and projections of its future potential. These orientations emerge in the social settings of the groups' work and are situated in a broader digital culture. Sociohistorical and discourse analyses have described this culture and political ideologies that have shaped the emergence of information technology (Barbrook, Cameron 2001; Fisher 2010; Turner 2008, 2009). In this study, I am conducting group discussions with individuals working in the realm of AI and AI-related technologies to reveal the collective shaping of understandings and orientations underlying the groups' work. This complements research on the discourse surrounding Silicon Valley's most important actors and publications and helps bridge the gap between sociological discourse analysis and research on technological practices. Contrasting the results of the group discussion analysis with predictions and scenarios of technology's impact on society, this approach can contribute to the understanding of how collective orientations and imaginaries of technology and society's future shape technological research and innovation on an everyday basis, as well as the social processes of their emergence in AI-related fields.

Discourses on Copyright and Cultural Commons as an Example of Communication-based Legality

Radomska, Ewa

Jagiellonian University, Poland
radomska.ewa[at]gmail.com

The main reason, why the copyright law is widely discussed in the public discourse is an urgent need to find a solution for the social conflict over intellectual property. Such conflict can be treated both as a result of economic tensions between creators, users and "intermediaries", and as a manifestation of contradictions between legal and social norms regulating reproduction and communication of copyright materials. The latest can be associated with the process of questioning the modern copyright policies, which can be observed in narrations presented mainly by representatives of young creators and Internet users. Some of those narrations, like for example "solidarity in the net" perspective, even challenge the

assumptions of possessive individualism embedded in modern copyright, arguing that the conception of copyright as private property fails to adequately reflect the contemporary reality of cultural creativity and cultural commons. During the presentation, the most important results of the analysis of the Polish discourse on copyright, as well findings from the nationwide survey examining Poles attitudes towards copyright law and communication of copyright materials will be provided. Both types of empirical material will form the basis for the reconstruction of communication-based legality in the area of copyright. Such reconstruction will be carried out taking into account not only the massive development of communication technologies, which is one of the most important causes of "copyright crisis" in most parts of the world, but also the Polish experiences from the communist period, especially the fact that the informal circulation of culture had played important role in overthrowing the communist regime.

RN18_03b | Nationalism, Populism and Euroscepticism

Communicating Europe

Marcucci, Debora; Pretto, Albertina

University of Trento, Italy
deboramarcucci[at]yahoo.it, albertina.pretto[at]unitn.it

Besides the territorial dimension, Europe is identified by people through an institutional and political figure: the European Union. This entity transmits (also through its constitutional institutions) its own image to European citizens, who have – or build – a positive or negative perception. This image might influence and contribute (or not) to the development of the bond that European citizens feel towards this supranational entity, a bond which is constantly instable. Even in Italy, the tie towards Europe has undergone alternating phases in accordance to the economic and political contingencies, but recent surveys show that this tie is increasing. However, political parties with anti-Europeanist views are gaining a growing consensus: in March 2018, the winners of the Italian general election were two political parties that have always mistrusted Bruxelles and the Euro. Our presentation will show the results of an ongoing research study: to better understand this phenomenon, we are analysing images of Europe that these parties promote and diffuse through their mass media, in comparison to the ones published by the EU. In the meantime, we are analysing also the representations of EU created by citizens, using the cartoons of the different editions of the contest "Una vignetta per l'Europa" ("A cartoon for Europe"), launched by the European Commission Representation in Italy in partnership with Internazionale and Voxeurop. Since the analysis is in progress, findings will be discussed just during the conference.

Alt-Right Populism and Reddit: An Analysis of Incels

Johanssen, Jacob

University of Westminster, United Kingdom
j.johanssen[at]westminster.ac.uk

My talk is based on preliminary data analysis from a research project on online misogyny on social media. I will focus on the Incel community. It consists of men who refer to themselves as 'involuntary celibate', (or incel), because they have not engaged in romantic or sexual encounters for some time (or never in some cases). The analysis will draw on Sigmund Freud's theories of sexuality and unconscious fantasy as well as Klaus Theweleit's theorisation of fascism and sexuality. I present some exemplary discourses from Reddit forums. Many of the narratives are about naming women as sluts who are only interested in being with good looking men. Consequently, the users resort to symbolically destroying such women. This may give them a sense of agency over their own (libidinal) frustration. However, at the same time there are many narratives that show self-pity and a kind of self-destruction. Users describe how ugly they are, detail mental health conditions, and a general hatred of the world. Yet, such narratives are often coupled with a description of how they would like to be. Many posts discuss genetics, specific bodily shortcomings, and how cosmetic surgery and exercise can help. At the same time, the posts adopt Alt-Right discourses and imagery (such as specific terms and memes popularised by the Alt-Right). I am interested in further exploring this connection. I therefore argue that the male fantasies of the Incel community bear some resemblance to Theweleit's theorisation of the proto-fascist male body. A male body that destroys women, while at the same time appropriating them. A male body that is obsessed about its own embodiment and signs of masculine strength.

Romanian Protests from 10 to 12 August 2018. The Radiography of a Momentum of the Romanian Hyper-Nation

Balasescu, Madalina

University of Bucharest, Faculty of Journalism and Communication Studies, Romania
madabala[at]gmail.com

10-12 August 2019 protests represent, within almost 30 years of post-communism, a significant Momentum in Romanian history close to 90s' miners' events, Club Colectiv fire tragedy, anti-Government protests from 2012 etc. The protests were marked by violence and multi-level confrontations, had large echo in Romanian and international press and still produce impact: on 17-th January 2019, one TV that reported anti-governmental was sanctioned by 10 minutes of no broadcast. The protests may be, sociologically, considered as a concentrate of the Romanian society nowadays: polarized, still marked by physical violence and symbolic as well, by social discomfort and frustration caused by ineffective and

incoherent governmental policies at systemic-structural level. In gestalt terms, the protest contains the repressed needs of collective mentality, accumulated in the past three decades of communism. The research proposes to design a radiography of those acute social manifestations of August 2018 referring to the social content of the narrative texture within their media coverage. The theoretical framework is based on: structural-systemic tools from the sociological approach (development model, social narration approach); gestalt theory and social psychology conceptualizations; constructivism and public agenda fundamentals of the mediatic perspective. Methodology: quantitative-qualitative content analysis (products/texts/speeches: media, social networking, institution, authority) and interviews (participants, journalists). The expected results are organized around getting in-depth explanations and clarifications concerning: the protests as narration, the social issues involved, the mass media role in the construction of the events in national and internationally public space. The protests radiography can give a consistent idea about the relevant valences of limits and decks of the Romanian - European identity relationship.

Nationalism and Euroscepticism discourse on Facebook in emerging countries. A case study on Romania

Stefănel, Adriana

Universitatea din București, Romania
adriana.stefanel[at]fjisc.ro

As Romania's European route become a certitude, the nationalist discourse has blurred; while being considered outdated and (dis)regarded as a nationalist-communist relic. The 2007 EU enlargement was perceived by Romanian citizens not as an opportunity but as an act of geostrategic justice (Tismăneanu, V., 1999) that reinstated the country where it rightfully belonged – in Europe, not in the vicinity of Russia. At present, the trust in EU of Romanians is still high (50% in 2018, cf. EU90) but slowly and constantly decreasing. Although nationalist and Eurosceptic parties have not yet reached the quota required for Parliament, the usage of the nationalist features is traceable in mainstream parties' discourses and has made its way up to national elections. Moreover, the nationalist and Euroscepticism rhetoric of Facebook users ("2.0 citizens") seems more articulate than ever. Following Wodak's work (Wodak, R., De Cillia, R., Reisigl, M. & Liebhart, K. (2009), the paper aims is to analyse the increase of the rhetoric of nationalism in the 2.0 Romanian public sphere. We intend to identify and measure the presence of the mythical structures associated with the nationalism and Euroscepticism in the posts of regular Facebook users, in a longitudinal perspective and in a quantitative manner. Tismăneanu, Vladimir (1998) 'Fantasies of Salvation: Democracy, Nationalism, and Myth in Post-Communist Europe' Princeton University Press Wodak, R. & Boukala, S. Discourse Of Fear And Child Protection In Russian Mainstream And Opposition Media

Gryzunova, Elena; Pronkina, Elena

National Research University Higher School of Economics,
Russian Federation
egryzunova[at]hse.ru, epronkina[at]hse.ru

Adolescent suicides and school shooting in Russia has provoked in-depth discussion in recent years. These issues are often linked to possible destructive effect of particular online content. Since 29th December 2018 media regulator Roskomnadzor is legally empowered to block so-called “groups of death” and “Columbine communities” in social media immediately and with no court decision required. However, these tragedies are also put by the media in a broader context of social problems and injustice. For example, a girl who committed suicide in November 2018 is framed by the media as the one who had written to President Putin about her family’s poverty. The aim of this study is to analyze the discourse of fear and child protection in Russian mainstream and opposition media throughout the year 2018. Discourse of fear is a mass-mediated symbolic construction which often incorporates children as icons of fear who can be both victims and victimizers (Altheide, 2002). According to Altheide, discourse of fear influences public opinion and serves the interests of agents of social control, usually the government which provides a solution, e.g. means of child protection. However, discourse of fear in the rhetoric of opposition media has not previously been in the focus of academic research. In this study we apply qualitative content analysis and frame analysis to publications in Russian mass media with different political orientation to compare the problem frames which promote discourse of fear concerning children.

Political celebrity, secrets, and morals: Polish Pudelek, British Mail Online, and US Gizmodo Media online tabloids in 2015-16 elections (and onwards)

Chmielewska-Szlajfer, Helena

Kozminski University, Poland
hchmielewska[at]kozminski.edu.pl

United States, United Kingdom, and Poland, three very different democratic states have been recently witnessing a significant right-wing shift. In all these three countries, predictions made in official polls proved wrong in face of elections: presidential and parliamentary elections in Poland in

2015, presidential elections in the US in 2016, and the British Brexit referendum in 2016. However, major online tabloids I have been studying, Gawker/Gizmodo Media in the US, Mail Online in the UK, and Pudelek in Poland, which mix celebrity and entertainment news with political coverage, showed a much more sensitive ear towards the voters, publishing articles that proved noteworthy indicators of the elections’ outcomes. In my opinion, in-depth analyses of political emotions presented in these widely-read yet generally ignored media are essential to better understand people’s political attitudes. I offer a study of opinions voiced by journalists and editors from these online tabloids, juxtaposed with the most popular opinions made by anonymous commenters under articles covering political topics during the final months of the election campaigns. This approach allows to reveal how tabloids “celebrify” political issues, how they refocus on uncovering secrets rather than keeping the public informed, and how both journalists and anonymous commenters make complex and foreign topics more emotional, familiar and homely.

Online News Media Construction of Societal Concerns. Media Representations of Risks and Moral Panic in Romania and Hungary

Mogos, Andreea ; Vincze, Orsolya Hanna;
Meza, Radu

Babeş-Bolyai University, Romania
mogos[at]fspac.ro, orsolya.vincze[at]fspac.ro,
meza[at]fspac.ro

The study proposes an analysis of the media representations of societal concerns and risks from 2016 to 2018. The study focuses on how the moral panic was constructed through the news shared by Facebook pages of the most popular Romanian and Hungarian news websites, considering the cultural and media idiosyncrasies and the wider European and international context. Our research was inspired by the Eurobarometer data on the public perception of thirteen social, political, economic, environmental concerns (immigration, terrorism, economic situation, the state of member states’ public finances, unemployment, EU’s influence in the world, crime, climate change, rising prices/ inflation/ cost of living, the environment, pensions, taxation, energy supply) at European, national and personal levels. These perceived societal and personal concerns and risks are partially determined by individual experience and partially shaped by public and media discourses. Therefore, the research aims to identify the most prominent societal concerns, as they appear in the Romanian and Hungarian news corpus, to identify a lexicon related to the concepts of fear, moral panic and risks, and to analyze the narrative structures of the most prominent societal concerns. A semi-automated content analysis will be performed on the data set extracted from Facebook via API interrogation of the most popular public Facebook pages of the Romanian and Hungarian news media outlets. The qualitative analysis of posts with the highest engagement rates will offer insights on how the Romanian and Hungarian media employed the social media in order to construct the representations of the public concerns.

Critical Perspectives on Romanian Advertising

Moraru, Madalina

University of Bucharest, Faculty of Journalism and Communication Studies, Romania
madalina.moraru[at]fjsc.ro

The paper investigates the dynamics of the Romanian advertising from a critical perspective, by using a comparative analysis of data collected by Romanian National Institute of Statistics and Media Fact Book 2012-2018 (industry's yearly publication dedicated to market evolution) regarding consumption and advertising investments. The adoption of global brands started gradually after the anti-communist revolution. Around 2000, the global advertising agencies have started to buy local agencies, implement the global campaigns, and dictate the prices for advertising. Local brands cannot compete with the global ones, in terms of media budgets for advertising campaigns. The global brands conquered the market, not adapted to it. Nowadays, we discuss about global brands, but not about global people. To control consumers' loyalty, global brands have chosen to communicate using TV (topping consumers' preferences with 66%), which cannot be afforded by local brands. Only several important market players have accepted the challenge of localization or glocalization. The others follow a global strategy. For example, the leader of mobile phone services in Romania decided to manage the brand globally. Another important FMCG global producer has recently decided to close its Romanian factory, because the corporate culture cannot be implemented here. However, it still relies on local communication services, to reach the consumers in Romania (7th country in UE, in terms of population). These facts highlight that Romania is perceived by global brands as a standardized market with no identity when it comes to consumers' culture. Promoting global brands in Romania can be seen as a form of marketing colonization that encourages consumerism by investing huge budget in communication. Local producers represent a second market fighting for its autonomy.

Mapping Spaces of Order and Transgression: Media scandals on Disability in Russia

Verbilovich, Volha

Higher School of Economics, Moscow, Russian Federation
verbilovich.olga[at]gmail.com

The paper contributes to the scientific inquiry on disability discourse research (Corker, Shakespeare, 2002; Grue, 2014) and reveals how disability can be explored through the lens of scandal theories (Thompson, 2000; Ekström M., Johansson, 2008; Adut, 2008). The term "scandal" refers to particular media events, which make hidden sensitive topics highly discussible in public sphere. The qualitative critical discourse analysis was applied to analyze media reporting on six selected cases of intensive public debates on disability in Russia between 2006 and 2017. The analysis is complemented by the in-depth interviews with journalists, NGO leaders and public figures. The most frequently met scandal cases on disability

occur because of particular discursive transgressions - an offensive speech, a slip of the tongue, the tricky figures of speech. The analysis of the selected cases has revealed the complicated structure of contexts and outcomes built on the binary relations of order and transgression, moral and non-moral, empathy and disregard. These tensions serve as the tool of disability subversion into ideological and commercial product of media and political industries. However, the fundamental function of scandal here is to define the emersion of legal spaces for multifaceted public debate. It means, firstly, that the mere idea of the polyphonic talk is open and accepted by the society, free of strict regulations, disregard or silence. Secondly, that there are publics and spaces, new media platforms which are highly competitive and oriented to agenda setting by the powerful means of scandal. It could conceivably be hypothesized that such spaces substitute the traditional procedures of organized institutional dialogue between citizens and the state, audiences and media professionals (for example, ethic committees or public court hearings).

A Swipe And A Half. A Mixed Methods Research On How Dating Apps Changed The Way We Think About Love

Antonutti, Marco; Celardi, Elvira;
Ciammella, Fabio; Amine Khaddar,
Mohamed

Sapienza University of Rome, Italy
marco.antonutti[at]uniroma1.it, elvira.celardi[at]uniroma1.it,
fabio.ciammella[at]uniroma1.it,
amine.khaddar[at]uniroma1.it

Social Medias enable new forms of relationships and create new interaction contexts (boyd and Ellison 2007, Boccia Altieri 2012, boyd 2014); given this premise we propose to investigate how the technology used for courtship, in particular Tinder, influences the creation of social representations (Moscovici, 2001) and the construction of identity. Our work explores the interdependence between two aspects: Tinder as a technological platform and dating apps as catalysts for social representations. The main objective is to explore the hypothesis of a circularity in the construction of the meanings that users share as social representations around Tinder. The research design is based on an integrated mixed methods approach (Maxwell and Lumis, 2003) aimed at understanding how the usage of dating apps influences the behaviors and beliefs of users. After an analysis of emerging literature (Ranzini and Lutz, 2016; David and Cambre, 2016; Bryant and Sheldon, 2017), we conducted two focus groups meant as a preliminary study about the habits, meanings and perceptions tinder users share about dating. This explorative research, presented at IASSR Conference (2019) highlighted meaningful research paths related to the usage of Tinder, and the self-presentation, self-perception and interaction of its users. As we keep analyzing the two-way influences between tinder as a technological object and its social implications, we built a survey which was conceptualized on the synthesis of the first results. The empirical findings suggests that further discussion and research on the topic of online dating is needed as we are approaching new ways of thinking about relationships and love.

Internet And The Women's Question: A Digital Feminist Critique From The Global South

Nampoothiri, Aparna

Indian Institute of Technology Gandhinagar, India
aparna.nampoothiri[at]iitgn.ac.in

Digital technologies have today grown to such an extent that their presence and impact are keenly felt even in the lesser developed areas of Global South. This paper is hinged on two terms: women and technology. It utilises the dynamic, fluid and contested meanings and connotations of these two terms and applies them to a situated and contextual field: the state of Kerala, India. This paper studies the relationship between digital technologies and Kerala women, through their use, appropriation and understanding of social media, smart phone applications and digital gadgets. By combining the interdisciplinary scholarship on cyber/digital feminisms and the methodologies of feminist/virtual ethnographies on both offline and online fields of Kerala, I propose new ways of understanding contemporary Indian digital feminism – one that evolves everyday through its reflection of and reaction to the socio-political and cultural fabric of the present times. The lived experiences of women regarding their online and online-influenced activities inform this paper regarding the impact of internet and communication technologies on the respondents; in terms of access, use, knowledge acquisition, leisure and destabilisation of gender stereotypes and patriarchy. Such an approach also helps to understand the power structures that influence women's use of online spaces, evaluate the digital-divide among women based on economic and educational factors and evaluate the potential of the Internet in creating liberatory spaces for women to form networks and kinship ties. The paper hopes to conclude by answering whether it is necessary to reconceptualise the use of the Internet and digital media as tools for women's empowerment.

Empowering Female By Employing Female Gaze In Cultural Production: A Case Study Of Female Pornography

Tsui, Ying Tung

Hong Kong Shue Yan University, Hong Kong S.A.R. (China)
sharontyt226[at]gmail.com

Male gaze is one of the long discussed theoretical lenses used by scholars to analyze the male protagonism and by feminists to critique the objectification of female in films and other cultural productions. However, it has been criticized (such as Kaplan, 1983) that such concept renders a "gendered binary" in which male is regarded as active spectator and female as passive object. Therefore, scholars (such as Gamman & Marchment, 1989) have articulated the concept of "female gaze", which is generally conceptualized as the adoption of female perspective in cultural productions to challenge the patriarchal status quo. In other words, such concept advocates to put female as the focus of the spectatorship and empowerment of female can be recognized through engaging

in cultural consumption. This paper employs "female gaze" to analyze pornography for female, a newly emerged genre in pornography industry in recent years targeting to female audiences in which the contents emphasize on development of love, emotion and experience (LaPlace, 1987) rather than merely the satisfaction of sexual desires for male audiences in mainstream pornography, and addresses two research questions: (1) what are the dimensionalities of female gaze in the context of pornography? And (2) to what extent do the pornography for female recognize the empowerment of female as the subject of spectatorship? The content analysis of approximately 150 purposively selected female-targeted pornographic videos produced by Japanese corporations indicates that female audiences are hardly empowered through consuming female pornography which is produced within the patriarchal social setting as female still shaped as a subordinate to male in a sexual relationship. Implications on the theoretical dichotomy of male vs. female gaze and femininity will be discussed.

Users of the World Unite: User Power and Competition/Antitrust Law

Zangvil, Arnon

Physical Web Ltd., Israel
arnonz[at]physicalweb.com

The unprecedented dominance of Internet platform vendors such as Google, Facebook, and Amazon, arose and is flourishing within a specific political, economic, and cultural configuration. Two primary factors have been the supportive regulatory and antitrust environment, and a strong consumer base largely unaware of how data about them is used. All of the software services that these vendors provide, rely on an underlying layer of "Identity and Privacy Management". It is at this layer, that a user should be able to determine what data they are willing to share, with whom, under what conditions, and to also be able to monitor and enforce data use. Today, this layer of functionality is vertically integrated into the platforms, and is purposely limited and difficult to understand since it directly contradicts the vendor's interests to maximize data collection, usage, and monetization. This was evident, for example, in Zuckerberg's testimony to the U.S. congress about Facebook's cryptic privacy settings. This paper builds on top of Lina M. Khan proposals for 'essential facility' or 'common carrier' antitrust and regulatory reform as described in "Amazon's Antitrust Paradox" (Khan, Yale Law Journal Jan 2017), by identifying that the "Identity and Privacy Management" layer is an important candidate for such regulation (e.g. requiring identity portability) and/or antitrust (divestiture) which will effectively de-integrate identity and privacy management from the existing vendors' control. An important step in this direction has already been taken by GDPR in Art. 20 Right to data portability. Importantly, this de-integration may facilitate the formation of new class of companies/non-profits/user-unions dedicated exclusively and unbiasedly to allowing users to collectively control their identity and data.

RN18_04b | Roundtable: Social Sciences, and Digital environment. From theory to practice

How Is the Collaboration of Interdisciplinary Studies of Digital Social Science Possible? A Posthumanist Perspective

Tsao, Chia Rong

Shih Hsin University, Taiwan
pastor.tsau[at]gmail.com

The digital technologies are not only prevalent in everyday life, but also involved in the production of knowledge today. Thus, in addition to the introduction of new tools, researchers in digital social sciences currently experience a fundamental transformation. This study attempts to discuss the transformation from the theoretical perspective of the posthumanism. The author argues that, from the posthumanist perspective, we can elucidate, on the one hand, how the practices and collaboration of the interdisciplinary studies are possible, and on the other hand, how researchers and their digital tools collaborate to produce knowledge. This study takes a social media research team as a case. The team was built with funding from the Ministry of Science and Technology in Taiwan since 2013. The author argues that the researchers are not independent actors anymore. Most of the time, they not only need to cooperate with data scientist, but also rely on the mediating of digital tools. In other words, the author argues that the social media research team, as interdisciplinary cooperation of digital social sciences, is a hybrid network composed of multiple relationships. First, the researchers from different disciplines need to be made interested and be enrolled in the network. Second, from the perspective of the posthumanism, the researchers using digital tools are becoming the "hybrid subjects". It means that the human and the digital tools are not separated ontologically, but becoming intra-related to each other. Besides, third, the digital tools also can "act" to mediate and affect the production of knowledge.

No Lunch Today?! An Analysis Of The Digitalization Assemblage In Higher Education During A Power Outage

Ghita, Cristina

Uppsala University, Sweden
cristina.ghita[at]im.uu.se

Digitalization processes are often seen as one of the hallmarks of modernity in Europe, as the EU continuously support the nationwide implementation of digital technologies through policies that allow citizens faster, safer, and increasingly easy access to the Internet. In Sweden, the government supports the use of digital technologies in the personal and professional every-day life, with increasingly available online-based services in such diverse contexts as healthcare, travel, and education. The way communication is conducted in higher education institutions bears the mark of these changes as well as challenges, as digital artifacts are used every day. As digitally-based means of communicating and working in universities in Sweden are becoming normative, this paper aims at uncovering the ramifications of such practices by studying the sudden inability to use digital technologies for a limited time. Drawing on new materialism, specifically assemblage theory, this paper looks at the entanglement of material and immaterial components of technology use during a power outage at one of Sweden's largest universities. Using ethnographic methods such as observations and informal interviews, results show that within the assemblage of higher education digitalization, clear expectations are created in regards to what it means to work, study, communicate, etc. When these common cultural expectations are not met, this assemblage collapses, leading not only to the impossibility to continue work, but also to symptoms of stress and anxiety, as well as creative workarounds.

Online-Mobilisation Of Right-Wing Actors In Germany

Jaekel, Laura; Siegel, Anja; Schmidt-Kleinert, Anja

Philipps Universität Marburg, Germany
laura.jaekel[at]staff.uni-marburg.de, anja.siegel[at]staff.uni-marburg.de, anja.schmidtkleinert[at]staff.Uni-Marburg.DE

The majority of immigrants from Syria and North Africa is seeking asylum in Europe, and with it in Germany. Since 2014 this influx of migrants has been (made) an issue of concern on the political agendas of democratic and anti-democratic parties Europe-wide, each trying to mobilise the public for their political goals. In this regard, Germany is not an exemption. The political discourse on migration has shifted from granting asylum towards (national) security and "Islamisation". Interrelated to that shift in discourse, we have also witnessed reactions of the broader public. All over the country, local, seemingly spontaneous demonstrations against short-term shelters for asylum seekers in their places of residence have appeared. Several demonstrations went violent and ended in physical attacks against refugees, arson on their shelters or attacks against local politicians and supporters. Some events like the knife attack on the mayor of the small city of Altena and obviously the outbursts in the city of Chemnitz last August were even covered by the New York Times. Very often, these protests are organised via social media, like Facebook or Twitter. Those developments have raised questions with regard to mobilisation strategies of right-wing actors in social media: Are those event acts organised by established right-wing structures, or spontaneous outbursts of so-called "concerned citizens", or both? And how do these group-structures influence possible violent dynamics? What kind of patterns can be observed by looking at their mobilisation strategies and furthermore do they have the potential of becoming consisting political actors? On what grounds and through which strategies can right-wing collective actors mobilise online milieus and do they have the potential of building new (virtual) social movements?

Hate speech against Muslims on social media in Italy and the United Kingdom. Evidence from European project Hatemeter

Martini, Elisa; Baratto, Gabriele

University of Trento, Italy
elisa.martini[at]unitn.it, gabriele.baratto[at]unitn.it

In the last decade, Islamophobia has gained momentum through the use of the Internet. Thanks to new media technologies - including social media platforms and global digital networks - anti-Islamic and anti-Muslim discourses reached a worldwide audience. Internet thus fostered the online or cyber-Islamophobia allowing for a platform to spread a rhetoric where xenophobic viewpoints and racist attitudes towards Muslims are being easily disseminated in the civil sphere. According to Oboler (2016), anti-Muslim hatred is

unlikely to remain purely virtual. On the contrary, online Islamophobia is likely to incite religious hatred and xenophobia leading to real world crimes. Moreover, a rise in political extremism seems likely to rise. On the one side a far right, anti-Muslim and, on the other, the radicalisation of Muslim youth responding to social exclusion. Thus, as Larsson (2007) points out, it is important to question to what extent the Internet is being used to spread and foster anti-Muslim opinions in contemporary society. Nowadays, hate speech is on the rise and, with it, xenophobia, Islamophobia, anti-Semitic and racist messages. These seem to be the result of both the migrant crisis and the terrorist attacks. Using a combination of natural language processing, machine learning and big data analytics, this paper aims to: a) underline the topics and the social network structure of the users involved in online anti-Muslim hatred in Italy and in the United Kingdom; b) make comparisons on online anti-Muslim hatred beyond language borders, thus connecting content in Italian and English.

Upside down populism. The Case of European Parliament elections in Romania

Bogdan Gruia, Ivan

University of Bucharest, Romania
bogdan.ivangruia[at]gmail.com

Recent media reports (e.g. The Guardian, 2018, Nov.20) have shown that populist parties have tripled their electoral support in Europe over the past 20 years, and this fact should be put under serious reflection, as it does not represent an exception, but a mainstream political evolution. According to academics such as Paul Taggart (Populism, 2003) or Cas Mudde (Populist Radical Right Parties in Europe, 2007), the alternation of contradictory messages that cause emotion and anger, highlighting the problems faced by ordinary citizens, outline the profile of populist politicians as "ordinary people" fighting along the people against the "corrupt elites". In Romania, things seem to be similar as in Europe, with several exceptions, which might prove important in understanding this phenomenon. To reveal this differences, but also the similarities, I will empirically analyze how populist and anti-system tendencies have evolved through the social media, and I will test the hypothesis according to which, on the European Parliamentary elections in Romania (May, 2019) both: the traditional and the alternative parties that have recently formed will use populist messages and will approach similar topics. In testing the hypothesis, I will use a quantitative analysis of a rating scale, through which we will test the frequency of specific "populist" terms used by the candidates of the traditional parties represented in the EP vs the candidates of the new parties or independent candidates. The survey will be conducted in Romania, between April 1 and May 26, and will include the analysis of official webpages of the parties, and of their social media accounts (Facebook, Tweeter, Instagram, and LinkedIn).

Second Generations And Identity: Between Research And Communication

Di Pasquale, Laura; Ceccherelli, Alessio;
Spampinato, Angelica

Tor Vergata, Italy
lauradip[at]yahoo.com, alessioceccherelli[at]gmail.com,
angelica92s[at]hotmail.it

The study presented in this paper develops in the context of the EU funded project OLTRE (ISFP- 812584) coordinated by the University Tor Vergata, with the aim of reducing the risk of radicalization of young second generation Muslim living in Italy by offering alternative narratives to radicalizing messages. During the project, issues of belonging and identity of second generation Muslim will be explored through in-depth semi structured interviews and communication workshops- using photography, video and digital methods. This paper will question and blur the line between qualitative research, action research and communication problematizing issues such as representation, knowledge, participation and change in the social sciences. Supported by critical reflections on communication and participation (A. Volterrani 2018) and on visual methods (Pink 2013. and A. Frisina 2016) the paper will compare interviews and communication workshops to show how the self-representation of second generation migrants changes in relation to context and research approach. It will also discuss how research and communication can empower target groups and involve communities/groups in new ways of making futures. The study will show how collaborative methods can provide researchers with opportunities for new knowledge on identity and belonging because of a) the focus on group rather than individuals; b) the capacity of collaborative creative methods to displace historical power relationships. On the other hand, the implications and processes activated during the communication workshops will be considered in relation to the elements that Volterrani (2018) identifies as crucial : sharing, protagonism of the actors, relationality, change, future. Key words: participatory visual methods, identity, second generations, belonging, communication, participation

The “Macerata Case” in the Italian Electoral Debate: Crime, Immigration and Media Logics

Verza, Sofia (1); Bonerba, Giuseppina (1);
Gerli, Matteo (2); Marini, Rolando (2)

1: Università degli Studi di Perugia, Italy; 2: Università per
Stranieri di Perugia, Italy
sofia.verza[at]studenti.unipg.it,
giuseppina.bonerba[at]unipg.it, matteo.gerli[at]unistrapg.it,
Rolando.Marini[at]unistrapg.it

It has already been explored how electoral campaigns can be shaped by particular events, which enter the electoral debate through the media, focusing the public attention on a particular issue or actor rather than others. The media - always

very responsive to such “key” or “trigger events” (Dearing e Rogers 1996; Boydston 2013)- can impose in the electoral debate some event-related issues. That is what happened with the “Macerata case”, namely a sequence of events that took place five weeks before the 2018 Italian national elections, composed of a murder allegedly committed by Africans and a shooting against migrants. This study investigates the role played by the press in the electoral debate, considering that some news events can be subject to politicization and emotional transformation, as underlined by studies on the relationships between entertainment and politics (van Zoonen 2005; Baum e Groeling 2008) and the so called “politics of fear” (Altheide 2006 and 2009). Through the Iramuteq software, we analysed a corpus of 3196 articles, published by 14 newspapers in the last 6 weeks of electoral campaign. The aim of this research is investigating: a) The evolution of the journalistic attention on the “Macerata case”, compared to the attention for the immigration issue; b) The evolution of the sub-issues connected to the case, in particular its politicization and the emergence of the “fascism theme”; c) The association between the issues and the political actors; d) The segmentation of different newspapers up to their distribution (local or national) and their ideological leaning.

Communication Studies in Turkey: An Inquiry on Critical Knowledge Production

Etike, Safak

Yozgat Bozok University, Turkey
safaketike[at]yandex.com

The main problematique of this study is to specify the potentialities and limitations of the recent communication studies in Turkey with respect to the production of critical knowledge of social reality. The object of study consists of the academic communication research in Turkey. The study conducts a methodological analysis of a total of 474 academic studies, which includes 130 Ph.D. theses and 344 academic papers. The findings of the study indicate the basic methodological tendencies of communication studies in Turkey. The study interprets the data collected via content analysis within their historical and social context and discusses the results of the methodological tendencies and the limitations they present to critical knowledge production. The findings reveal that the academic knowledge produced in communication field has crucial limitations for a critical scientific approach.

Personal Time Capital in the Digital Society: An Alternative Look at Social Stratification Among Three Generations of Highly Skilled Professionals in Estonia

Opermann, Signe; Kalmus, Veronika

University of Tartu, Estonia
signe.opermann[at]ut.ee, veronika.kalmus[at]ut.ee

Waves of social transformation and technological innovation have entailed profound changes in various dimensions of society, including new demands put on labour (e.g. Allmer, 2018 discusses structural transformation in the academia). As proposed by Rosa et al. (2017), the 'escalatory logics of capitalist modernity' and the increasing pace of technological advancements contribute to a climate of 'social acceleration', from which different social groups benefit to a different extent. Moreover, individual variation in technological skills, networking capabilities and adaptation to the increasing complexity and pace of life create new forms of social stratification. By using Vihalemm and Lauristin's (2017) time-bound social stratification model, we aim at analysing how highly educated professionals, often among the first labour market segments to experience rapid technological changes (e.g. digitalization), cope with social acceleration. The model is based on two dimensions of agency: 1) the capability of converting 'individual time capital' into other types of capital, as conceptualised by Preda (2013); 2) the capability of coping with societal changes and social acceleration. Empirically, our study is based on the data from a representative survey conducted in 2014 among the Estonian population aged 15–79 (N=1,503) and focus groups conducted in 2017–2018 among three generations of academic professionals (n=24). Our findings confirm the assumed importance of age-related factors: the youngest professionals (born 1989–1994) tend to be most flexible, and the middle-aged (born 1969–1974) most efficient, in developing time-use strategies to cope with social acceleration, while the oldest (born 1949–1954) win the least from rapid developments.

Bodies in Digital Space: “Grindr Tourism” in Tel Aviv, Israel

Katz, Rachel A.

The University of Manchester, United Kingdom
rachel.katz[at]postgrad.manchester.ac.uk

As an app for gay and bisexual men to interact, Grindr has become a fixture in the landscape of what is often uncritically and broadly called “the gay community.” However, narratives about a singular community used by the gay tourism industry undermine nuances of the boundaries, roles, and prejudices

that exist within LGBT+ spaces. Grindr's geolocative features make it a unique tool for tourists to interact with local LGBT+ people and spaces. Grindr reconfigures gay tourism practices away from a community-structure by allowing for a form of engagement through technology; it facilitates novel individual habitation of local spaces and interaction with the people who make them. The research project discussed examines how Grindr reconfigures practices of space specifically within tourist-local interactions in Tel Aviv. It employs a multi-method qualitative sociological approach. 19 tourists and locals in Tel Aviv, Israel were interviewed by the researcher. Prior to the interview, some also chose to complete an audio diary recording their daily Grindr routine. Participants were recruited using snowball sampling with multiple entry points: online in public forums, through email, and via posters displayed around Tel Aviv. This presentation focuses on initial findings regarding perceived spatial assumptions on Grindr, norms of interaction, and objectification. The presentation speaks to Grindr's potential as a space with alternative boundaries and regimes, but also alternative possibilities.

“Tindered” Romance: Identity, Sexuality, and Gender on Mobile Dating Applications

Kosma, Yvonne Alexia

American College of Thessaloniki, Greece
yvoko[at]act.edu

Mobile dating applications have increased in popularity in recent years, and transformed the ways in which people interact, perceive identity and form relationships. In the process of pursuing a variety of relationship goals, users negotiate romantic connections through strategies that juggle selective self-presentation, and the assessment of potential dates. To achieve their romantic goals, online daters need to construct versions of self that are attractive to potential partners, and to simultaneously decipher their potential partners' profiles, anticipating they will also attest to embellish their own images. In this framework I will discuss understandings of self-presentational practices, the shared expectations that are relied upon during mediated communication -that is how descriptive terms are typically interpreted by those in the dating community-, and how these reproduce or challenge gendered offline expectations. Drawing from research data on the use of dating apps by undergraduate students at an international institution (The American College of Thessaloniki), I will examine how users conceptualise their online dating experiences in light of the factors described above. Data was gathered during the academic year 2018-19 through questionnaires and semi-structured interviews. According to preliminary findings, especially heterosexual males tend to project traditional expectations about female users, confirming the traditional heteronormative matrix. This means that although new media offer multiple options for young people to challenge the given gender order and identify outside the gender binary, interestingly they are also a place where patriarchal perceptions are being reproduced.

From Self-representation To Self-repression: The Silent WeChat Users

Li, Jiaxun

University of Sheffield, United Kingdom
jiaxunleewill[at]gmail.com

Individuals increasingly inhabit a digital society where their self-representations take place in a highly networked and mediated landscape. Understandings of how digital environments shape and transform self-representation practices are based on dominant western platforms. Yet, other widely used platforms, such as WeChat, may transform self-representation in different ways. WeChat is an all-inclusive app which offers users integrated and wide-ranging services, including instant messaging and social sharing, payment and entertainment, transportation and food delivery. The characteristics of WeChat necessitate questioning assumptions and assertions about self-representation on digital platforms that have dominated academic debates to date. Challenging what is assumed in Western media sociology about self-representation and social media in the 'platform society' (van Dijck, Poell and Waal, 2018), this paper focuses on the role of WeChat in mediating the way we interpret our self-representations and in shaping the way we perceive connectedness. Drawing on ethnographic interviews (and linked diaries) with 41 WeChat users, I highlight how users of this platform are reluctant to engage and connect with others on WeChat, especially within WeChat groups (similar to WhatsApp groups) and in Moments (known as friend circle, equivalent to Facebook news feeds). Such 'reluctance to share' ranges from feeling disinclined to express oneself in individual chats to being passive within WeChat groups, from rarely posting on friend circle to not commenting on or liking posts. I argue that as the platform currently operates, WeChat constrains people's willingness to self-represent, and so in place of self-representation we see self-repression.

RN18_05b | Migration and Media

The Objectification Of Migrants In Television News Discourse On Slovenian Public Television

Smrdelj, Rok

University of Ljubljana, Faculty of Arts, Slovenia
rok.smrdelj[at]gmail.com

This paper provides discursive analysis of how daily TV news »Dnevnik« on Slovenian public television reported about the attempts of migrants to reach Western Europe across the Balkan borders in the period from 2015 to 2018. On the basis of the selected TV news we argue that migrant objectification in media reporting is the basis for the normalisation of migrant criminalisation. The migrant objectification is related to the effects of formal procedures of television reporting, i.e. the use of audiovisual as well as verbal techniques of television

narration and representation on viewers' perception and understanding of structural relations among instances implied in reporting. Our analysis showed that migrants are merely passive objects of control and care, mute objects when spoken of by the media, politicians, police and care providers. They are rarely allowed to actively speak on their own behalves and voice their concerns. The combined elements of voiceless migrants and discursive construction of migrants as an invisible danger, threatening to invade Slovenian and EU territory by illegally crossing Slovenian border, normalises their criminalisation. Additionally, not allowing migrants an autonomous, self-representing voice, enables a variety of other discourses, primarily humanitarian discourse and discourse related to securitisation, to be applied to them as exclusively externally defined, mute, and thus objectified topic of discourse.

Online Migrant Communities And Transnational Digital Communication Networks: Italians Of London

Matteucci, Ivana

University of Urbino Carlo Bo, Italy
ivana.matteucci[at]uniurb.it

The aim of this study was to investigate the participatory processes and aggregation/integration dynamics of migrants in online communities. We focus on the Italians of London community, analyzing the storytelling of the users on the website, discussion forums, and the Facebook social platform. The conceptual frame of the research is the narrative element, considering that experience can be translated into stories which are able to describe and preserve it. The Web is viewed as a narrative meta-medium consisting of "fragments" of narrations that, through devices and the logic of user generated content, are shared and made public. The research employs a mixed methodological approach encompassing digital ethnography, the narration of experiences and the Social Network Analysis (SNA). It was found that storytelling is strengthened by digital networks which help to enhance their performative nature, in the form of perception and action schemes that guarantee the compliance of practices and their constancy over time. This collective and connective capital of digital networks plays a key role in cross-cultural integration in the host community. The importance and the performative nature of the narratives characterize the new Italian emigration. Italian emigration, represented in online stories, is transformed from a simple reproduction to a new experimental medium in which to explore the new identity of the 21st century man.

On Migration in the Media. Comparison of Media Discourses in Poland, the United Kingdom, Ukraine, Albania and the Czech Republic

Troszynski, Marek

Collegium Civitas, Poland
mtroszynski[at]civitas.edu.pl

Attitudes towards migrants significantly differentiate the societies of EU countries (PEW Research Center 2015). Migrants and migrations are also one of the most important topics in the European media. "Refugee Crisis" is a phenomenon inscribed in the process of politicization and mediatization of immigration (Krzyzanowski, Triandafyllidou, Wodak 2018). The aim of the text is to discuss the preliminary results of "The Migrants project. Analysis of the media discourse on migrants in Poland, the United Kingdom, Ukraine, Albania and the Czech Republic". We want to show a qualitative and quantitative analysis of the discourse in the media in Poland against the background of corresponding discourses in other countries. The countries under analysis find themselves in different situations in terms of the real movement of people there. The study consists in the monitoring of the most important (the largest) media in a given country (press, internet) and then conducting a comparative analysis. The analysis includes: number of mentions; sentiment of discourse; topics of texts; differences between political discourses within the media (left-wing vs. right-wing, liberal vs conservative). The study used Natural Language Processing tools (Leetaru 2012, Manning, Schütze 1999), which allowed us to automatically assign the text to the theme and the sentiment of the utterance. This in turn made it possible to analyze not only mainstream media but also social media. The research uses the Critical Discourse Analysis approach (Wodak, Meyer 2001), which allows for a description of the communication of individual actors of the public debate (political parties, NGOs, celebrities). This method enables one to take into account the differences on the internal political scene and allows comparisons between countries.

RN18_06 | Media, Patriarchy and Gender. Perspectives on (in)visible violence

The new Information and Communication Technologies (ICTs) and the value systems about violence against women in Europe and North Africa

Rodríguez Martínez, Pilar

Universidad de Almería, Spain
pilarr[at]ual.es

Information and Communication Technologies (hereinafter, ICTs) seem to have a great influence on value systems. The main objective of our paper is to learn how the new ICTs influence on violence against women values in Europe and North Africa, and between different social groups within each country. In methodological terms, the relationships between ICTs (both traditional, press, radio and television, and new ones, ie mobile phone, internet and social media) and the violence against women attitudes will be analyzed by comparing different societies. The social center will be compared with the social periphery according to Galtung's Center-Periphery Theory. In order to undertake the proposed objectives, four main hypotheses have been formulated: H1. The social center uses new ICTs more than the social periphery (internet and social media) while the social periphery makes greater use of traditional media (television, radio, printed media); H2. Values related to violence against women of the connected citizens (who use the new ICT) differ significantly from the values of citizens who consume traditional ICTs; and H3. Values (on security and equality) of the connected citizens of the elites and the peripheries from the central countries will differ significantly, so that the elites of the central countries will be show less support than the elites of the countries in the periphery; H4 The values (about violence against women) of the unconnected citizens of the peripheries will differ significantly. The citizens of the social periphery in central countries will show less support for violence against women than the citizens of the social periphery in countries of the periphery. The main database that will be used is the World Values Survey, 2010-14 and 2017-18 waves.

Political Economy of Newspapers Coverage of Maternal and Child Healthcare Issues in Nigeria

Adeniran, Raheemat; Oso, Lai

Lagos State University, Nigeria
raheemat.adeniran[at]lasu.edu.ng, laioso[at]ymail.com

Nigeria is a developing country with varied developmental challenges. It has one of the worst indices on maternal and child healthcare (MCH), globally. The media, as a vital element within the society, has the potential to contribute to improving maternal and child healthcare through appropriate framing and communication of MCH issues. Achieving media inclusion poses a challenge as media contents are often products of varied power relations. Extant studies have established that health is often not primed in Nigerian newspapers where politics and business hold sway. News media contents are also influenced by varied factors which exists both within and outside of news media organisations. Premised on sociology of news as critical perspective, this study examines power relations in newspaper representation of maternal and child healthcare in Nigeria. Combing content analysis of MCH-related items in newspapers, with in-depth interview of newspaper health editors, it explores factors and underlying reasons driving coverage of MCH. It finds that government, local and international aid agencies, and civil societies often influence coverage of MCH issues. These groups drives media representation of MCH through established journalistic routine, and reporter-source relations often favouring priming of official news sources and 'powerful' elements within the society, as a necessity for maximising limited news media resources. This paper identifies various forms in which these groups manipulates media representation of MCH and call for the media to be more proactive in driving agenda for improved MCH for the citizenry, and not accede to satisfying peculiar interests over public interest.

Media, Patriarchy and the (in)visible Violence

Harju, Anu (1); Kotilainen, Noora (2);
Särmä, Saara (3)

1: University of Helsinki, Finland; 2: University of Helsinki,
Finland; 3: Finnish National Defence University, Finland
anu.a.harju[at]helsinki.fi, noora.kotilainen[at]helsinki.fi,
huippumisukka[at]gmail.com

Death, injury and violence are unequally represented in the media, depending largely on the nature and circumstances of the violent act. As Butler (2004) notes, not all lives are perceived to be of equal value. Furthermore, not only all lives, but not all deaths, are visible. Thus, acts or threats of violence are not neutral or stable as regards value or meaning; rather, significations are assigned to violent events through complex processes of evaluation and assessment. Here, we argue, attributes attached to the perpetrator as well as the victim – race, ethnicity, gender and one's general position in the global hierarchy – come to define (in)visibility, and therefore, the differential value assigned to violent acts and their

consequences. What follows is normalisation of certain types of violence. In order to understand the co-constitutive relationship of patriarchy and violence and how the varied responses to different types of violence sustains patriarchy (Enloe 2017), we analyse media representations of diverse types of violence: terrorist violence, gendered violence, and sexual violence. We ask, first, what types of violence are normalised in and by patriarchy and thus not worthy of attention, and, second, what types of violence are turned into spectacles. Empirically, we approach these questions through a selection of cases: we examine both the invisibility of gendered violence and the hypervisibility of racialised sexual violence in the context of the Nordic welfare state, as well as the broader context of terrorist violence in Beirut, Paris, and Turku.

Is This Just Ordinary Crime News? Reflecting On Media Representations Of Femicide In Four Italian Newspapers

Gius, Chiara; Lalli, Pina

University of Bologna, Italy
chiara.gius[at]unibo.it, pina.lalli[at]unibo.it

Gender inequality represents on of the most urgent challenges that need to address to reach a more fair and equal society. In particular, violence against women remains the most distinct manifestation of the structural imbalances of power between women and men: as such its eradication has been recognized by the EU and its member states to be a political and social priority. Our contribute will address violence against women from a socio-cultural prospective (Moscovici, 2005; Lalli 2005; Tuchman 1978b) looking, in particular, at how the representation of femicide, the most severe form of violence against women, plays a crucial role in the circulation of specific cultural discourses on femininity and masculinity (Bollock and Cubert 2002; Gillespie et al. 2013; Kuperberg and Stone 2008; Meloy and Miller 2009; Mendes 2011; Meyers 1997). Building on the results of two different qualitative researches conducted in two separates years (2012 and 2016) on the news coverage of femicides perpetuated inside a relationship of intimacy (i.e. amongst partner or ex-partners) in 4 Italian national newspapers we will show how Italian media heavily rely on traditional ideas of romantic love and passion in order to make sense of this specific crime. The implications of the use of these frameworks on issues of masculinity, femininity and power, as well as the difficulty to elaborate alternative discourses on this particular kind of violence, especially when it is perpetuated inside of a relationship of intimacy (i.e. amongst partners or ex partners), will also be discussed.

RN18_07 | Labour and Employment in Platform Capitalism

Platform Cooperativism and Social Change

Sandoval, Marisol

City, University of London, United Kingdom
marisol.sandoval.1[at]city.ac.uk

Platform cooperativism proposes to create an alternative to the corporate sharing economy based on a model of democratically owned and governed co-operatives. The idea sounds simple and convincing: cut out the corporate middleman and replace Uber with a service owned and managed by taxi drivers themselves, create a version of Airbnb run by cities, or turn Facebook into a platform democratically controlled by all users. This paper discusses the ambivalences of platform cooperativism, exploring both the movement's potentials to subvert digital capitalism from the inside and the risk of being co-opted by it. Platform cooperativism aims to foster social change by creating a People's Internet and replacing corporate owned platforms with user owned co-operatives. It yokes social activism with business enterprise. As a result, the movement is shaped by tensions and contradiction between politics and enterprise, democracy and the market, commons and commercialisation, activism and entrepreneurship. This contribution explores these tensions based on a Marxist perspective on the corrosive powers of capitalist competition on the one hand and a Foucaultian critique of entrepreneurialism on the other. It concludes with a reflection on the politics of platform cooperativism, drawing out problematic implications of an uncritical embrace of entrepreneurialism and highlighting the need to defend a politics of social solidarity, equality and public goods.

Three Interpretive Lenses on the Role of Subjectivity in Platform Capitalism

Mazali, Tatiana (1); Armano, Emiliana (2); Teli, Maurizio (3)

1: Politecnico di Torino, Italy; 2: Università degli Studi di Milano, Italy; 3: Aalborg University, Denmark
tatiana.mazali[at]polito.it, emi_armano[at]yahoo.it, maurizio[at]plan.aau.dk

In the light of the expansion of digital communications, interdisciplinary efforts to understand contemporary capitalism are growing, in which the observation and study of existing platforms are in dialogue with the production of new technologies. The paper describes three interpretive lenses relevant to the analysis of subjectivity in platform capitalism, focusing on the relational and hybrid processes producing the contemporary digital subjects in factories, in the ubérisation of work, and in the design of alternative platforms. The so-called "Industry 4.0" focuses on process innovation in relation to

manufacturing platforms, reshaping the complex relationship between machines, people and information. In particular, a socio-technical analysis will be proposed of the impact on work of innovations that enable industrial platforms, IoT systems and smart machinery. On another side, the critical vision that emphasizes the ubérisation performed by the lean platforms help to highlight and theorize the ongoing deregulation, starting with the French debate and referring to critical studies on logistics. In an action research mode, recent efforts on platform cooperativism and digital commons open new questions, both for the practice of technological design and implementation, and for the understanding of the social and economic conditions in which design takes place. In these three interpretive lenses, all the attention is placed not so much and not only on the technological dimension of the platforms' capitalism, but rather on relational processes – in particular on the logic of connection/disconnection and on connectivity – on the hybridization between human and technology, and on the production of new subjectivities.

Airbnb And The Platform City: An Ambiguous Overlap Between Digital Workers And Citizens

Brandner, Lou Therese Elisabeth; Parisi, Stefania

Sapienza University of Rome, Italy
lou.brandner[at]uniroma1.it, stefania.parisi[at]uniroma1.it

As a socio-economic actor within contemporary urban space, the digital hospitality platform Airbnb has created a network of hosts offering real estate listings for short-term rental. While the platform has undergone a widespread professionalisation, it is still often considered part of the so-called sharing economy; currently, Airbnb is propagating the idea of hosts renting out (part of) their own living space as home sharers or Airbnb citizens, positioning hosts as a hybrid form between autonomous platform workers and part of an altruistic grass-root society. This project builds on the notion of digital capitalism and its particular facet of platform capitalism, adding the dimension of platform citizenship (Parisi, 2018) as an evolution within the neoliberal frame. It explores the ways Airbnb hosts perceive their own role in relationship with the platform, and related political-economic processes, focusing on the shift from the perception of themselves as workers to that of members of the "Airbnb citizenship". We focus in a comparative perspective on the neighbourhoods of Neukölln (Berlin) and San Lorenzo (Rome) – two new urban tourism hotspots – as well as on digital "home sharer" profiles, choosing a qualitative research approach to analyse Airbnb hosts' conditions and self-perceptions as workers in relation to the concept of platform capitalism. First findings seem to confirm that hosts undertake extensive self-branding efforts, balancing professionalism and informality to attract guests. Their Airbnb activities require high flexibility with the need to always be connected. In line with conceptualisations by Fuchs (2017) and Srnicek (2016), despite the platform's insistence on the "Airbnb citizenship" narrative with a focus on community, "home sharers" de facto experience their platform work rather as self-employed entrepreneurialism.

Changing Nature of Work and Workplaces in “Digital Capitalism”: The Emergence and Growth of Coworking Spaces

Yesilyurt, Adem

Middle East Technical University, Turkey
ademyesilyurt[at]yahoo.com

Nature of organizations, work and workplaces significantly changes with the changing relationship of work with time and space, particularly because of the rising flexibility. Accordingly, coworking spaces have emerged and proliferated around the world in the last decade. “Coworking” as a concept was first used in 1999 by Bernie DeKoven in order to describe the collaborative work through computers and new technologies. Yet, contemporary “coworking” concept was first used in order to describe a physical workplace for independent and remote workers in a casual environment in 2005 by Brad Neuberg, a computer programmer who established the first coworking space in San Francisco. These spaces offer an alternative work setting combining open physical space with the characteristics of the third place (community, flexibility and social ties) and features of traditional office space (Wi-Fi, office tools, security, and consistently available space). With this combination, independent workers which constitute the fastest growing group in the labour market have started to prefer coworking spaces as an alternative to home-working and semi-public third spaces such as libraries and cafés. Since then, coworking is rapidly becoming a global urban phenomenon particularly among freelancers, creative workers, academics and micro-businesses. There exists a newly emerging literature on these spaces but mainly from a mainstream celebratory framework. This paper examines the coworking spaces and tries to situate them in “digital capitalism” from the Marxist political economy perspective. It also highlights that coworking spaces may have an emancipatory potential if they share the values and practices of commons.

RN18_08 | Neoliberalism and the Political Economy of Culture Today

Risk Factors in Google’s SEC 10-K Filings: Financialisation, Markets and Public Interest

Bilić, Paško (1); Prug, Toni (2)

1: Institute for Development and International Relations, Croatia; 2: Independent researcher
pasko[at]irmo.hr, toni.prug[at]gmail.com

Financialisation is key to the development of new business models on the internet (Lazonick, 2009). Risky businesses promise high returns for capital investors, yet actual risk bearing is not proportional to financial awards and profits distributed to capital investors (Lazonick & Mazzucato, 2013). In this presentation, we provide a diachronic analysis of risk assessments reported by Google in its SEC 10-K filings between 2005 and 2017. Formally standardized risk assessments include information about significant risks that apply to companies and their securities. We used a simple “in vivo” document coding procedure to minimize our interpretative interventions and to code risks recorded under section headings (N=58). Based on the diachronic analysis we can discern three periods of Google’s development: (1) post IPO growth and expansion (2005-2008); (2) further growth, strengthening of the market position, and investment diversification (2009-2013); (3) increasing legal struggles and international regulatory scrutiny (2014-2017). Our historical reading shows that while public strategic orientation and investments are a necessary driving force, socializing risks to develop new advanced technologies, the presence of the discourse of public interest in financial regulations and the distribution of financial rewards do not reflect this. Financial capital creates inequalities in risk and reward distribution between actors interested in the economic performance of the company, neglecting actors affected by the business model of the company, ignoring the historical and contemporary aspects of public interest in risks and rewards associated with the development of new technologies.

Chicago Boys 2.0: The Expansion of Universities as New Imperialism in Higher Education

Allmer, Thomas

University of Stirling, United Kingdom
thomas.allmer[at]uti.at

Around the turn of the millennium, social theory rediscovered the idea of imperialism. Notions such as the 'Empire' (Hardt and Negri 2000), 'New Imperialism' (Harvey 2003), and 'Empire of Capital' (Wood 2003) appeared discussing in how far contemporary capitalism can be characterised as imperialist. This paper wants to revisit the discussion by applying the theoretical notion of imperialism to the example of global University practices. Universities play a central role in informational capitalism. The realm of academia is a specific subsystem of the information and knowledge sector. Universities nowadays aim to respond to market demands and compete on a global market for students through different practices including international recruitment programmes, satellite branches, and online education technologies (McGettigan 2013). While the official claim is to promote openness, inclusiveness and diversity, it can be considered as a further strategy to access the population of countries such as India, China and Indonesia. This sheds light on higher education as instrumental training for knowledge workers to make them fit for global capitalism (Ross 2009). The overall aim of this paper is to analyse if and how global universities are engaged in quasi-imperialist practices and to contextualise universities within the global power structure of informational capitalism. I address these aims based on a critical social theory approach. In particular, the paper firstly engages with different concepts of imperialism. It then analysis if and how global universities are engaged in quasi-imperialist practices by focusing on different case studies. Thirdly, critical education of global citizens is discussed as an alternative potential to the imperialist character of global universities. The paper concludes with a summary and discussion of further implications of the findings.

Freelance Work in Media Industries: A Comparative Analysis of the UK and Turkey

Kaya Hayatsever, Ezgi

Ankara University, Turkey
ezgi.ky[at]gmail.com

Freelance work, which involves flexible hours and intermittent contracts, gradually occupies a significant role in media and cultural industries particularly in advanced capitalist countries. However, the significance of freelance work in the labour market differs greatly with respect to an economy's position in the international division of labour. This difference becomes even more pronounced in media and cultural sectors, in which the vulnerability and precariousness of working conditions vary across countries depending on how their media and cultural industries are located in the global economy. Hence, it becomes crucial to situate freelance work in particular economic and social contexts in order to shed light into the consequences of changing forms of employment. This study attempts a comparative analysis of the state of freelance work in the UK and Turkey based on a combination of data from preceding studies as well as national and EU statistics. The preliminary survey of the available data will be used to map out the similarities and differences between the place occupied by freelance work as well as appraising the place of the media sector in freelance work in both economies. In the light of this appraisal, the study will try to distinguish in which capacity freelance work is integrated into media and cultural industries and the specific characteristics assumed by freelance work in accordance with the form of integration comparatively in the UK and in Turkey. The study aims to locate and understand the discrepancies between freelance work in media industries in these two economies in order to provide a basis for a cross-national assessment of the extent and significance of social change brought about by new forms of employment.

Challenging the Primacy of 'the Digital' and Examining the Role of 'the Neoliberal' in the Practice and Study of Journalism Today

Awad, Isabel

Erasmus University Rotterdam, Netherlands, The
awad[at]eshcc.eur.nl

Academic volumes and conferences keep telling us that the future of journalism is digital and, consequently, that a (new) technological framework is the key to understand changes in the news and its social impact. This paper argues that, while useful in some respects, this perspective significantly constrains journalism studies. As an alternative, the paper proposes a more thorough engagement with neoliberalism. It makes the case that switching the focus from (primarily) digital to (primarily) neoliberal enables us to deal more productively with crucial contemporary developments in journalism and to better address urgent calls for normative debates. The first part of the paper examines the primacy of the digital in contemporary journalism studies. Although the literature acknowledges the existence of other socio-political factors shaping the conditions under which journalism operates, the dominant focus on technology obscures crucial socio-political forces. Moreover, the technological explanation tends to be a disruptive one that neglects historical continuities within journalism as well as relevant connections between journalism and other fields. The second part of the paper underscores the advantages of a neoliberal framework. There have been valuable efforts linking neoliberalism and the news. However, for the most part, journalism scholars have treated neoliberalism as a top-down economic force rather than a rationality of self-government, one that pervades a diversity of spheres and actors of society. The paper shows how the latter conceptualization is particularly useful to understand and critique current developments in journalism, including crucial shifts toward participation, de-institutionalization, innovation and entrepreneurialism (Kreiss & Brennen, 2016). Reference: Kreiss & Brennen (2016). Normative theories of digital journalism. In Witschge, Anderson, Domingo (Eds). The SAGE handbook of digital journalism (pp. 299–315).

Understanding Communication From Networks To The Digital Era: The 1972 Delos Ten Symposium

Perganti, Maria; Theologou, Kostas

National Technical University of Athens, Greece
pergantimaria[at]mail.ntua.gr, cstheol[at]central.ntua.gr

This paper deals with the works of the 1972 Athens Ekistics Month Delos Symposium (Delos Ten), in Greece, organized by Constantinos Doxiadis and the Athens Ekistics Center, and the wide range of theoretical issues about the multiple forms of communication as basic axis of all kind of networks. Communication as a part of technological systems of-course also concerned the discussions held during these Doxiadis's Symposia. At the beginnings of the 21st century, global communication networks are being powered by microelectronics, operated by fine software, and are giving birth to communication technologies not as virtual but as real extensions of the human body and mind. Nowadays, communication in our digital era expands crucially the novel societal structures. Communication as a concept concerning not merely technology but social phenomena as well was being introduced in the Delos symposiums since 1966 (Delos Four, topic: "Transport and Communication Networks in Relation to Human Settlements"). In 1972, communication was already included between the essential and required parameters for understanding networks. Greek visionary architect and urban designer Constantinos Doxiadis, Canadian communication specialist Marshall McLuhan, British philosopher of history Arnold Toynbee and several other participants, rallied their thought round the multiple meanings of communication during their longstanding and fruitful debates about physical and metaphysical networks. In the core of that multidisciplinary dialogue issues about media, arts, music, communication, experience, theories, epistemology, technology, universality, man and networks were drawing sketches of the globalization of communication and the dawn of digital era.

The Ordinary “Superleader”: the Self-Representation of Salvini on Facebook

Mazzoni, Marco; Mincigrucchi, Roberto

University of Perugia, Italy
marco.mazzoni[at]unipg.it, robertomincigrucchi[at]hotmail.it

Today’s politicians face the so called “paradox of democratic leaders” (Kane and Patapan 2012): they have to act as strong statesmen, in possession of specific skills that gave them the authority to rule, and at the same time they have to appear as common people in order to gain voter’s trust. Through this study, we analyse how the Italian Deputy Prime Minister, Matteo Salvini deals with such paradox. Salvini is the spokesman of the right-populist “League party”, and he is the politician most appreciated by Italian voters, as shown by all the polls. The main goal of our study is to answer the following question: “what kind of leadership does Salvini improve in order to maintain his high consensus?”. We investigate the pictures that Salvini publishes on his Facebook profile between July and September 2018. Despite the persuasive potential of images, they are often overlooked by scholars. Our main hypothesis is that Salvini faces the “paradox of democratic leader” thorough a strategic use of his “political body”, mixing the features of a “super leader” with the ones of ordinary people. We demonstrate that he can identify himself with the community he wants to represent thorough a strategic use of images. For a better understanding of Salvini’s leadership, we compare his Facebook pictures with the ones of other politicians (Trump, Le Pen, Orban), to assess if Salvini’s communication has features in common with foreign right-wing populist leaders.

Cultures And Information Networks In The Twitter Era

Russo, Vanessa; Agustoni, Alfredo; Maretti, Mara

russov1983[at]gmail.com, consigliatodaglielfi[at]gmail.com, ma.e.maretti[at]gmail.com

Web 2.0 is an umbrella term that include numerous typologies of technologies, devices, applications and social spaces. The structures of digital social spaces are defined by micro- and macro social phenomena and communication issues. In this framework, digital public opinion relies heavily on social media as a source of information for news. The digital public is fed by specific activities: comment, share and like. The extent of these actions determine specific subcultures (commenter, hater, conspiracy theorist) that use the computational tools to spread, polarise, amplify and distort information as professional opinion leaders. In relation to the different polarisation of opinions within the Twitter social media frame, our aim was to investigate the information flow related to specific ‘hot’ issues in Italian news. We generated a data warehouse using Twitter’s streaming API from a selection of conversational frameworks on specific events reported. The combined steps were: 1) Data collection; 2) Visualization and labelling of conversational structures of the clusters; 3)

Semantic analysis and classification of the hashtag; 4) analysis of the accounts that were most relevant for the creation of consensus or conflict; 5) Evaluation of the quality and sources of shared links. We mapped the influence of specific subcultures of information towards the orientation and reorientation of public opinion.

Choosing Sources Out Of Digital Landscape: The Criteria Of Legitimacy And Of Authority Used By Journalists In The “Black-out” Media Event Construction In Belgium

Broustau, Nadège; Lits, Grégoire

Université libre de Bruxelles, Belgium
Nadege.Broustau[at]ulb.ac.be, litsgregoire[at]gmail.com

This paper analyzes the selection and hierarchy process used by journalists in their interactions with communication officers of Belgian nuclear electricity producers and of Belgian anti-nuclear organizations in order to cover the threat of an electricity “black-out” in the Winters 2016, 2017 and 2018 in Belgium. This “black-out” threat was linked to a possible lack of electricity due to incidents in several of the 7 Belgian nuclear reactors. Using interviews with journalists and communication professionals of pro- and anti-nuclear organizations about the black-out, our study aimed at 1/ describing the digital tools that journalists use to interact and retrieve information from their pro- and anti-nuclear sources (Twitter, blog post, youtube video...), 2/ identifying the criteria used by journalists to choose and classify their sources among the digital landscape of the nuclear debate and 3/ analyzing the processes of discourse transformation throughout the different interactions between communication professionals and journalists (Guilhaumou 2006; Calabrese 2013; Turbide 2015) in the digital context. We especially focus on the interaction with actors from the civil society (anti-nuclear actors particularly active on websites and social media) in order to understand how they gain – or not - media worthiness from journalists. Our results show that different kind of arguments (emotional vs rational) corresponding to different figure (concerned citizen vs expert) are used by the different actors on different digital media (texts, video, tweet) to interact with the journalists and that the legitimacy and the authority granted to the actors by the journalists vary according these different strategies.

Instrumentalization of Emotion During the 2016 U.S. Presidential Election – A Neopragmatist Analysis of the Presidential Nominees’ Media Communication

Bartscherer, Sheena Fee

Humboldt University of Berlin, Germany
bartsers[at]hu-berlin.de

To the surprise of many and despite Hillary R. Clinton being the clear favorite to win the 2016 U.S. election, Donald J. Trump won the race for the Republican party. Trump’s campaign was defined by “nationalistic” and “populist” narratives, following a strategy of political marketing which was designed to emotionalize the political discourse, in a quality usually reserved for autocratic regimes (cf. Gillies 2018: 2). In this part-sociological, part-media communication and part-neuroscientific study I will be focusing on each candidate’s argumentative structure as well as their employment of three key emotional stimuli (sex, fear and violence) throughout their public speeches, interviews and debates. The method applied will be a qualitative discourse analysis based on the Pragmatic Sociology of Critique (PSC) according to Boltanski and Thévenot and will be further developed into a critical media analysis method, serving as a flexible framework for analyzing emotionalized political media content. By sociologically examining the occurrence of these key emotional stimuli in combination with (political) arguments, the study is introducing established neuroscientific theories (regarding the role of emotions within human attention- and memory-processes) into the realm of media and communication research. I strive to identify each campaign’s distinctive argumentative pattern as well as to highlight the importance of emotional stimuli within (political) communication and especially populism. The general goal of the paper will be to develop and introduce a neopragmatist method for media research using the example of the 2016 U.S. electoral communication. Additionally, the differences between ‘populist’ and ‘regular’ communication shall be discussed.

Warm Experts Revisited – Why Are They Still Needed?

Hänninen, Riitta (1); Taipale, Sakari (1,2)

1: University of Jyväskylä, Finland; 2: University of Ljubljana, Slovenia
riitta.j.hanninen[at]jyu.fi, sakari.taipale[at]jyu.fi

Although digitalization is renowned of its capacity to create new connections and opportunities for the majority of people, not all benefit from digitalization in the same way. It is not uncommon that especially senior people experience difficulties in keeping up with the changing landscape of ICTs. In this research, we focus especially on the ways senior members (75+) of the family have adjusted to the ongoing digitalization of family life. In this context we examine warm experts as proxies or teachers who share their technological expertise with seniors and ask why are warm experts still needed today. How do warm experts contribute to the digitalization of the senior members of family and what has changed since 2005 when Maria Bakardjieva first introduced the concept? The research data consists of twenty-two (22) reports based on extended group interviews (EGI) and observation carried out in Finland between 2014 and 2015. The total number of informants in this study is therefore 133 including the 22 key informants. All families participating in the research were studied in the context of three generations including children, siblings, spouses, parents and grandparents that typically formed the immediate family of the key informants. According to our results, warm experts do not only pass on new skills and serve as important motivators to older family members. In addition, they provide the necessary continuity to keep up with the development of technological landscape as people get older, and experience age related changes in their social circles, body, and mind.

No Standards for Balance or Fairness: the Partisan Audience

Garcia de Torres, Elvira (1); Martínez Martínez, Silvia (2); Rodríguez Luque, Cristina (3); Cebrián Enrique, Bernardino (1)

1: CEU Cardenal Herrera University; 2: Universitat Oberta de Catalunya; 3: CEU San Pablo University, Spain
elvira72001[at]yahoo.es, martinezmartinez1[at]uoc.edu, cristina.rodriguezluque[at]ceu.es, dcebrian[at]uchceu.es

The interest for journalistic principles and standards has increased in recent years due to the extensive use of new technologies in news production, a change of patterns in news consumption and the rise of partisan media (Merril, 2004; Lasorsa et al, 2013; Nelson, 2019). Moreover, studies that tackle with the social perception of both news and news media show a uncertain prospect for the future of Journalism (Gil de Zuñiga and Hinsley, 2014; Van der Wurff and Schoenbach, 2014; Lin, 2014; Mitchell et al, 2014). Within this challenging context, this study was motivated by the concern over the “Fake News media” campaign lead by Donald Trump, and its possible effect in reinforcing post-truth and negative attitudes towards mainstream news media (RQ1). To give an answer to the RQ, 892 tweets published in March-May 2018 -out of 166.700 filtered by keyword “journalism” (Slavtcheve-Petkova, 2016; Craft, Vos and Wolfgang, 2016) containing key words “Fake news” plus either [at]nytimes and [at]foxnews- were analyzed to check for the presence of a given set of “fake news” frames and Trump’s narrative keywords (Nielsen and Graves, 2017; Perreault and Newly, 2018). Results supported our hypothesis, as they showed a strong association of [at]nytimes and Trump’s narrative (MAGA, Failing, FakeNewsMedia, MS13, Fakenews CNN, Mueller) within a “poor journalism” frame, as well as worrisome post-truth constructs. We found also persistent framing of [at]fox news as “fake-news”/propaganda with an opposing narrative and alternative discourse (Impeach Trump, “Notmyresident, Resistance or Blue Tsunami).

Reconsider Visuality and Personality Cult

Wang, Eureka Shiqi

Hong Kong Baptist University, Hong Kong S.A.R. (China)
17481457[at]life.hkbu.edu.hk

Since Chinese President Xi Jinping formally took office as the top leader of the country in early 2013, there has been an excessive concentration on his personal leadership compared with his low-key predecessors. It is observed that the state propaganda strategies have witnessed a visual turn with softened tactics in fortifying Xi’s personal image online. Three biggest state media as the official mouthpieces for Chinese government play their aiding role in this process as all of them opened specialised web pages under their official websites compiling multimedia package as databases. Since in historical cases such as Lenin, Stalin and Mao, personality cult has been associated with mass media through which visual images of the

leader are disseminated as cult products, this study sets out to re-examine the relationship between visuality and personality cult through the lens of visual representations on the web pages owned by the state media. Theoretically, the leadership of President Xi constitutes one form of charismatic authority so that the formation of Xi’s cult is analyzed with the theoretical concerns that the concept of charisma encompasses. Focusing on the site of the visual image itself, the methodological framework compiles two qualitative methods, i.e. Bakhtinian dialogism and link analysis. Specifically, dialogism enables the researcher to identify a polyphony of voices in the visual products of President Xi. Further, link analysis, shedding light on the peculiarities of media infrastructure of the websites as technology, can help to map out the politics on the webpages by tracing the articulation of the voices. In the end, it is expected to find out how visuality functions in the projection of personality cult in contemporary social and media context.

RN19_02 | Autonomy despite Hybridization?

The Impact of Workplace Change on Professionals' Skills and Knowledge: Engineers in Canada

Adams, Tracey L.

The University of Western Ontario, Canada
tladams[at]uwo.ca

Professional workplaces have experienced considerable change over the last several decades, impacting professional work and workers. Although numerous changes have been identified in the literature, it is not clear what impact they have had on the work that professionals do. The proletarianization thesis, prominent in the 1980s, held that professionals were being deskilled by organizational & technological change and managerial control. This thesis was largely rejected and replaced by the now-dominant hybridity thesis, which holds that professionals are increasingly taking on managerial responsibilities, skills and training. The hybridity thesis suggests professional skills are either expanding or changing. An alternative perspective – a stratification hypothesis – argues the impact of change on skills might vary within the profession across structural location, gender, age, and race. Despite these differing accounts, there has been surprisingly little empirical exploration on this topic. Through an analysis of in-depth interviews with engineers in Ontario Canada, this paper explores engineers' perceptions of how workplace change is affecting them, and what the impact is on what they do and how they do it. Particular attention is paid to structural location, as well as gender, race, and age in their accounts. Findings suggest that trends are complex, and that structural location strongly shapes the impact of workplace change on skills. The implications of workplace change for professional work, and professional skills and knowledge more broadly, are discussed.

'Protected Professionals'? How Well-Connected Professionals Can Remain Autonomous and Authoritative

Noordegraaf, Mirko

Utrecht University, Netherlands, The
m.noordegraaf[at]uu.nl

Traditionally, professionals such as medical doctors, academics and judges are well-protected. They work within well-defined jurisdictions, belong to specialized segments, and are granted autonomies and discretionary spaces. In this way, they can be

trained and supervised, case-related considerations can be highly substantive (instead of e.g. commercial), and they can take decisions independently. Ideally, these decisions are authoritative and accepted, both by the clients and society (stakeholders). This ideal-typical but also 'ideal' imagery has always had its flaws; nowadays its shortcomings are increasingly clear. 'Protected professionalism' as well as 'protected professionals' have become outdated. Due to heterogeneity and fragmentation within professional fields, interdependencies between professional fields, and dependencies of professional actions on outside worlds, professionals can no longer isolate themselves from others and outsiders. This is fuelled by financial-economic pressures (e.g. cost control), socio-cultural transitions (e.g. multi-problems, declining trust), political turmoil (e.g. polarization), and technological innovations (e.g. social media, Google and Facebook, algorithms). This might lead to a 'decline', 'withering away' and 'hollowing out' of professionalism, stimulating a 'return to' professional values and spaces. It might also lead to a 'reconfiguration' of professionalism, with more 'hybrid', 'organized' and 'connected' professional identities and actions. This paper contributes to the debate on connective professionalism, arguing that connectivity calls for more fundamental reflections and redefinitions of professionalism/professionals. How can professional action be related to others and outsiders and remain 'autonomous' and 'authoritative' at the same time? This can no longer be 'autonomy' and 'authority' as fixed entities; these dimensions become fluid. They have to be enacted continuously, backed by certain mechanisms that accentuate (instead of 'protect') key aspects of professional acts, such as 'independence' or 'integrity'.

Unionism in the Name of Professionalism? On Solidarity, Professionalism and the European Central Bank

Schnell, Christiane

Institut für Sozialforschung an der Goethe Universität Frankfurt, Germany
ch.schnell[at]em.uni-frankfurt.de

The paper discusses the role of collective action in the field of professional work. A binary approach, distinguishing between unionism and association versus professionalism and social closure has long been refuted. But with regard to the ongoing debate on structural changes of professionalism, hybridization and the frequently discussed phenomenon of situated or organizational professionalism, occupational politics and employees' interest representation might further amalgamate and develop new patterns. Based on an empirical study the European Central Bank (ECB), which combines a bureaucratic and strictly hierarchical organization with aspects of an epistemic community, will be discussed as an example of emerging unionism in the name of professionalism.

Medical Career Systems and Professional Space. Conceptualising Clinical Autonomy from a Professions Perspective

Wrede, Sirpa (1); Olakivi, Antero (1); Parmanne, Piitu (1,2)

1: University of Helsinki, Finland; 2: Finnish Medical Association, Finland
sirpa.wrede[at]helsinki.fi, antero.olakivi[at]helsinki.fi, piitu.parmanne[at]helsinki.fi

This paper presents the evolving conceptual framework of an ongoing multi-method study of Finnish medical profession that focuses on medical work and clinical autonomy. The study that is conducted in collaboration with the Finnish Medical Association is carried out in two stages, the first of which involved semi-structured interviews with 38 doctors, half of whom were in an early career stage and the second half in a late career stage. The second stage, which is planned to begin in early 2020, builds on the analysis of several different sets of already collected survey data with representative samples of Finnish doctors. Results from the interview study have been reported in a research report and analysed in one article focusing on the early career stage from a gender perspective. This paper develops a conceptual framework based on these analyses. The paper considers insights from the qualitative interviews and from survey data, respectively for developing understandings of how medical career systems structure clinical autonomy. We argue that professional agency is shaped by the ways doctors perceive the professional space available to them in different career stages and organisational positions. We consider examples of unequal career patterns and career paths within the profession and argue for the need to consider intersecting inequality regimes as dynamics underpinning medical career systems.

RN19_03 | Digitalization in the Field of Professional Work

Modernization of Professions and Specialties. Transformation from Offline to Online Ones: Russian Case in the World's Tendency

Shatrova, Elena

State Academic University for the Humanities, Institute of Sociology Russian Academy of Sciences, Russian Federation
elenashatrova0[at]gmail.com

Today in the modern Russian society many kinds of different offline professions can be replaced by the online ones. This transformation takes a place by the performance of the

technological and digital progress. Many new resources and opportunities are becoming available by the development of the internet and new electronic devices. In Russia people are able to do daily necessary things just with the help of a computer or even a smartphone connected with the net. So there is even no need to leave the house, especially it is a great benefit for the people with limited mobility because of different reasons: disabled people, people with little children, people living in a remote regions etc. So that's why this digital breakthrough is of a great interest of sociologists. Moreover, the world of professions has also changed and the same categories of people are able now to work like all other people. Employees have bigger choice (working online) and employers can get a better worker even if he lives in another city or country. But the question is if it's already the time when there is almost no need in offline workers, or there is just a tendency of transforming offline professions into online ones. We have conducted the study with interesting results using the content analysis method to find out if the online world of professions has overcome the offline one.

Beyond Professional Employment: What Do the Young Want?

Khokhlova, Marina

Institute of World Economy and International Relations, Russian Academy of Sciences, Russian Federation
marina_khokhlova[at]mail.ru

In Russia, present day possibilities, in particular those offered by the National Digital Economy programme, as well as the availability of IT specialists and advanced technologies in this field, inspire optimism regarding motivated professional employment of young people in the regions of Russia. This enables them, in particular, to work remotely, which reduces differentiation between regions in terms of average pay. According to polls conducted in the regions of Russia in 2016 and 2017, the employment problem is indeed perceived by young people as an important modulator of their lives. It is important to note that there was no direct correlation of the replies of respondents who are satisfied with the situation and objective indicators of the lack of relevant vacancies in their respective regions. This means that people tend to assess similar situations differently, which results from the following: between the regions, in spite of common institutions, language, historical and cultural legacy, the conditions of socialisation for young people vary from region to region and as a result the young people are not at a similar starting point when it comes to implementing whatever they have planned for themselves in terms of their lives and career. This proves that pay alone is not sufficient and they need the "full package" (e.g. quality of life, availability of cultural and educational institutions, social interaction) to obtain "the feeling of happiness". The lack of professional opportunities is a self-evident fact and an essential prerequisite for a young person to participate in the community and the society, but it is not enough to have a job; their requirements are broader, which is demonstrated indirectly by the poll data.

Digital Professionalism – Opportunities and Barriers in the Care of Older People

Hirvonen, Helena

University of Eastern Finland, Finland
helena.m.hirvonen[at]uef.fi

In aging societies scarcity of public resources motivates the development of welfare service efficiency. Digitalisation of public service work is one of the factors currently influencing public policy-making by restructuring and recreating public sector institutions, including its professions. In the context of care services for older people, public service professions are expected to demonstrate trust, transparency and accountability to care managers and clients alike. New technologies are implemented with expectations of delivering these goals in an efficient and standardized manner. Meanwhile, they raise new demands about the skills and role of public service professionals. My presentation discusses the above developments in the context of care of older people in Finland. What are the opportunities and barriers digitalization poses to meaningful professional agency for care professionals in long-term care (LTC) work? The analysis is based on a qualitative interview data (n=25) collected in 2018 from registered nurses and practical nurses in Finnish LTC units. Focus on this group is important for two reasons. First, workers in LTC report high levels of work-related stress. Second, due to introduction of enterprising ideals in the management of care services, care professionals face expectations as being proactive and self-steering individuals. Preliminary results of my study suggest that digital professionalism is currently a strong managerial discourse implemented 'from above'. Nurses, however, remain critical about its possibilities especially in promoting trust between them and service users. This suggests that the promotion of digital professionalism supports organizational rather than professional forms of occupational control.

Data Science – The Answer To Everything, But What's The Question?

Zirnic, Christopher

Universität Hohenheim, Germany
christopher.zirnic[at]uni-hohenheim.de

The rapidly progressing datafication leads to a shift in the demands on employees. We will show that this change on the one hand leads to new negotiations of spheres of competences and authorities at the organizational level and on the other hand to negotiations of new capability profiles and subsequently changes in training and education contents and strategies. The requirements of many jobs today range from creative handling of unstructured data, to an economically useful interpretation of data and to the communication of results in the various areas of the company and beyond. This creates new necessities of cooperation and communication that are often not anchored in organizations, which leads to

new responsibilities. The answer to this new challenge seems to have been found in the job profile of the "data scientist", who as an all-rounder combines all the necessary skills. However, our qualitative data show that it is an ongoing negotiation as to what skills are actually in demand. Should data scientists be "translators" who extract information from data provided by the IT specialists and thus create a new level of communication within the organization? Or is a data scientist him/herself an IT specialist with special communication skills? Hence, wide-ranging and unstructured training offers arise. For employees, this means that there are no ready-made career paths and investment in education is characterized by uncertainty. The purpose of this work in progress is to clarify and analyse these imponderables on the part of companies, trainers and employees on the basis of further data.

RN19_04 | Professional Handling of Vulnerability

Public Service Professionals' Attitudes towards Socially Vulnerable Groups

Yarskaya, Valentina (2); Iarskaia-Smirnova, Elena (1)

1: National Research University Higher School of Economics, Russian Federation; 2: Saratov State Technical University, Russian Federation
jarskaja[at]mail.ru, elena.iarskaia[at]gmail.com

Modern welfare state plays an important role in social cohesion of the society, forming mechanisms of social inclusion of socially vulnerable groups. Institutions of social support and cultural integration can promote the development of such forms of public solidarity where diversity is considered a value, and individual choice is guaranteed by the law. The survey and qualitative interviews were conducted in public services in spheres of social protection, education and culture in three Russian cities in 2018. Based on the concept of inclusion and analysis of empirical data, the authors reveal the attitudes of professionals towards migrants, persons with disabilities and LGBTQ people. The hypothesis of contact is verified: the presence of representatives of socially vulnerable groups among relatives or friends of the respondents contributes to the formation of tolerant attitudes. Some differences in the assessments of the friendliness of society and organizations towards socially vulnerable have been revealed among specialists working in social protection, education and culture. It is shown that the specialists of social protection assess their institutions as the most inclusive ones, while assessing the attitude of the society towards, for instance, migrants more critically than other professional groups. The organizations of the sphere of culture, education and social protection are more friendly towards migrants as clients than as staff. The data are contextualized within the frameworks of the contemporary welfare state reforms in Russia. The task to construct an inclusive professional culture within the contexts of public services is formulated.

Professional identities in inter-professional teams. The example of the Swiss Child and Adult Protection Authorities

Emprechtinger, Julia; Favre, Elisa; Voll, Peter

HES-SO Valais-Wallis, Switzerland
julia.emprechtinger[at]hevs.ch, elisa.favre[at]hevs.ch,
peter.voll[at]hevs.ch

Within organizations, inter-professional collaboration challenges professionals both to identify with their respective professional background and to develop a common, inter-disciplinary understanding of the work to be done at the organizational level. As collaboration supposes an orientation towards the organizational mission and related tasks (Lindh Falk et al. 2017; D'amour und Oandasan 2005), it may lead to a blurring of professional boundaries in favour of a more general organizational identity. At the same time, inter-professional collaboration is inherently collaboration within and across different frames of reference and may thus contribute to sharpen the professional profile and strengthen professional identity, as Abbott 1988 convincingly argued. The Swiss Child and Adult Protection Authorities serve as an interesting example for such phenomena and the related ambiguities. Mainly legal professionals and social workers are engaged as (quasi-)judges to act as 'child and adult protectors', a trans-disciplinary concept with little common profile due to large organizational heterogeneity in the Swiss federalism. Combining ethnographic observation with data from a national survey, we focus on professionals' balancing between professional-disciplinary and organizational-transdisciplinary orientation and identity. Our data suggest three main conditional dimensions: (1) the legal conditions defining the roles and their action space; (2) the larger organizational environment specifying the overall task and thus the professional profile required, and (3) a profession's collective identification offer as support for individual positioning. Whether intra-organizational inter-professional collaboration strengthens or weakens professional identity, depends on the interplay of these dimensions.

'This Is What We've Ended Up In, So To Speak': Administrators' Perspectives On Their Professional Role After Changes In Child Maintenance Regulation In Sweden

Fernqvist, Stina

Uppsala University, Sweden
stina.fernqvist[at]soc.uu.se

This study explores the effects of the amendments in the Swedish legislation that governs maintenance support transactions between separated parents, which became effective in 2016, through the perspectives of administrators

at the governmental authority Social Insurance Agency (SIA). These amendments imply that maintenance support should to a larger extent be transformed into maintenance allowance, whereby the handling of maintenance is transferred from the SIA to the parents who are expected to initiate a dialogue to secure the best interest of the children in financial terms. However, this may be problematic. Possible occurrence of violence or threats from one parent to the other may complicate these processes and if a parent claims that s/he has been exposed to such abuse, this can be viewed as grounds for continuing maintenance transactions via the SIA. This means that the administrators to a much larger extent have to incorporate the discourse of intimate partner violence in their work after the implementation of the amendments. The study that this paper is a part of aims at exploring how experiences of violence and financial oppression has affected these processes and what implications this may have on the financial situation for parents and children. Drawing on interviews with ten SIA administrators across Sweden, this paper analyses and discusses how the administrators conceptualize the changes in their work and how the strategies they deploy in order to navigate in this in many respects new problem complex may be viewed as a form of boundary work since the administrators' work moves closer to a social work paradigm as a result of the amendments.

The Professional Parent Spit, Neeltje

University of Humanistic Studies, Netherlands, The
neeltje.spit[at]phd.uvh.nl

In many professions, including social work, professionals are expected to keep their distance from clients. Acting professionally is associated with expertise and neutrality, as opposed to getting close and becoming familiar, let alone becoming friends. We studied refugee social work in two sociologically different districts in the Netherlands. We interviewed refugees, volunteers and social workers. We found that refugees often feel quite alone, as they lost family through war or persecution, or left them behind in their native country. Hence many of them (especially the younger ones) long for someone to take on a pseudo-parental role. They need someone who cares about them as a mother or father, who contributes to their sense of security and well-being, and who helps them face a plethora of practical issues. Surprisingly, many refugee respondents found this pseudo-parent. Sometimes this was a volunteer, but in other cases professional social workers had apparently adopted a pseudo-parental role. In our paper we will discuss what this entails for the ideal of professional distance in social work. We argue that this ideal needs revision since both refugees and social workers favour a warmer, family-like relationship. In addition we will reflect on the conditions required for social workers to adopt such a parental role. Building a pseudo-parental relationship requires a supportive organisational, policy and political context. Mostly it seems to demand a small-scale organisation.

RN19_05 | New Dynamics in Academia

The Ecology of a Professional Field: Higher Education in Sweden

Agevall, Ola; Olofsson, Gunnar

Linnaeus University, Sweden
ola.agevall[at]lnu.se, gunnar.olofsson[at]lnu.se

Ever since Andrew Abbott's seminal work on the system of professions, research on the professions has acknowledged, in principle at least, the necessity to consider professions in their relation to other professions. The division of labour, jurisdictional conflicts and intra-organizational interactions between professions have received their due share of scholarly attention. But less effort has been spent on understanding other ways in which a profession can be shaped and conditioned by its relations to its professional surroundings. In this paper, we examine how the reproduction and expansion of the Swedish corps of University teachers were conditioned by the manner in which universities were intertwined with the professional labour market which they increasingly supplied with PhDs. We argue that Swedish universities depended on these labour market niches to absorb an over-production of PhDs – thereby simultaneously establishing secure career paths extra muros and securing a pool of future would-be University professors. Equally important, the University and its teacher corps were shaped by these interconnections. First, individual career trajectories served as the warp that linked the University to neighboring organizations. Second, disciplines have their specific hinterlands of employing organizations, and the extent and type of external career paths differentiates the teacher corps with regard to its conditions of reproduction and expansion.

One or Many? Scholarly Profession Inside and Outside Academia

Siekkinen, Taru (1); Pekkola, Elias (2)

1: University of Jyväskylä, Finland; 2: Tampere University, Finland
taru.siekkinen[at]jyu.fi, elias.pekkola[at]tuni.fi

Traditionally the academic profession has been considered to be heterogeneous because of its fragmentation vertically to disciplinary subcultures and horizontally to different staff categories (Teichler 2010). However, there has been a common understanding that academic profession shares at least two unifying characteristics: global academic values (Altbach 1998) and national institutional environment i.e. universities (Light 1974). However, the academic profession is reflecting the changes in its environment (Musselin 2013). One of the most fundamental changes is the change in the role of universities in a knowledge production; the knowledge is produced also in organisations and networks outside universities (Välimaa, Hoffman & Papatsiba). In addition, the role of universities' personnel policy has shifted from support

of professional inclusion and exclusion towards more open approach to support the national development of talents and human capital. In this paper, seek an answer to the question: does organization context matter for professional identity. We use the survey data collected in 2017 from PhDs working in universities, private and public sector in Finland (N=1226). Very preliminary analysis shows that PhDs work tasks are rather similar in every sector (teaching emphasised in universities). In addition, many PhDs working in other sectors than universities still felt e.g. belonging to the academic community. In all of the sectors, PhDs did not felt strong organisational commitment towards their employer organisation and they reported wide collaboration with other sectors than their own. This paper discusses on new forms of academic professionalism that is possibly emerging in collaborative network environments.

The Academic Profession In The Context of NPM. Empirical Evidences From The German University System

Janßen, Melike

University of Bremen, Germany
m.janssen[at]uni-bremen.de

During the last decades, German universities have undergone profound changes as part of governance reforms. These reformations encompassed the introduction of NPM practices that were implemented to facilitate the quantification and comparability of academic performance in order to allocate resources and to improve the "quality" (whatever this may mean) of research and teaching. As a consequence, professors are increasingly expected to provide an account of their performance and to adhere to new evaluation criteria. However, little attention has been paid to exploring the mechanisms and boundary conditions that inform individuals' perceptions, responses and acceptance or rejection of evaluations and associated criteria. Starting from a sociology of professions' perspective, I will argue that a true deterioration of long-established values and practices has not taken place since academics are still able to maintain personal standards of performance and incorporated criteria of worth. However, while some academics obtain a sense of recognition by experiencing a congruence between own performance/evaluation criteria and those installed by NPM, tensions and ambivalences similarly emerge as other academics struggle with NPM and feel that their academic identity and professional convictions become endangered by NPM. The reasons for this variance are associated with various factors: individual scientific motivation, disciplinary affiliation, career stages, and the institutional/governance context function as relevant boundary conditions. In this sense, individuals' resistance can be understood as a struggle over jurisdictions amongst and across professions and as an acrimonious fight on the predominance of values and beliefs in academia. The paper draws on 64 semi-structured interviews with University professors from five sub-disciplines, which were conducted as part of a qualitative study on the consequences of performance measurements at German universities.

The Development of Academic Community in Portugal-The Relevance of Internal Segmentation

Carvalho, Teresa; Queirós, Anabela; Diogo, Sara

University of Aveiro, CIPES Portugal
teresa.carvalho[at]ua.pt, anabelassq[at]gmail.com,
sara.diogo[at]ua.pt

Academics have been classified as an elite profession. The special status academics had in society, in a great extent resulting from the state protection sustained in the need to preserve autonomy and freedom, allows their classification as organic intellectuals. Nevertheless, in the last years the academic profession has been submitted to similar pressures and challenges as other professional groups. The working conditions are said to be deteriorating with an increase in precarity and casualisation, configuring deprofessionalisation processes. However, the analysis leading to these conclusions do not consider the relevance of internal segmentation. This paper intends to address this gap in the literature by analysing the evolution of the working conditions of Portuguese academics in the last 10 years taking into consideration the relevance of age, gender, participation in the governance roles and the type of Higher Education Institution where they develop their activities. Empirical data is based on a quantitative approach, sustained in 2 online surveys distributed in 2008 and 2018 in Portugal. Both surveys were part of international research projects (CAP - Change in Academic Profession and APIKS - Academic Profession in Knowledge Society). Responses of 1320 academics in the first survey and 2206 in the second sustain the analysis presented. Data analysis allows concluding that the working conditions of Portuguese academics deteriorated in the last ten years but significant differences emerge based on gender, age and the participation in management bodies. These results reveal that internal segmentation is a relevant variable when the professionalisation process and professionalism of academics is under analysis.

RN19_06 | The Current State of Cultural Professionalism

Designer Profession - Relational Contexts In Defining Dimensions Of A Professional Role. The Case Of Polish Designers

Rojek-Adamek, Paulina

Pedagogical University of Cracow, Poland
padamek[at]up.krakow.pl

Contemporary society, and especially the sphere of economy is saturated with design. Scott Lash and John Urry (1994) drew attention to the fact that that the Post-Fordist society is more reflective and is based on the flow of symbols and signs, so the production system in opposition to mass-produced goods increases the need to look for functional and aesthetic distinctions. Therefore, when uniqueness, idea, individuality counts, it is the work of designers that is becoming a good tool in striving to exist among other competitive sets of offers. However, how to describe a designer's work today, whose education can be comprehensive (no longer limited to artistic or technical schools), and which can be realized in the field of design, from designing everyday objects to solutions in the field of services and activities of the nature of social intervention, close to the artistic sphere. The designer's profession can not be limited to simple classifications, so referring to Abbott's (1988) definition, in this description it is worth to use a relational orientation. Proposition, which most justifies the use of this category, is close to examining the professional role as part of the social network, inspired also by the concept of "the world of art" of Becker (1982/2008), "art field " of Bourdieu (1992). With full awareness of the complexity of the issue, this work attempts to systematize the above issues by embedding designers' work in a wider socio-economic context. The case study, which will provide empirical descriptions concern research carried out among Polish designers of industrial design and graphic design in the years 2017-2018.

Invisible Professionals Doing Invisible Work: Professional Identity Construction in the Translation Industry

Seddon, Emma

Newcastle University, United Kingdom
e.l.seddon2[at]newcastle.ac.uk

This paper presents preliminary findings from a PhD project that aims to demonstrate how translators construct professional identities in the face of significant challenges. Translators seem to be at a professional tipping point, faced with multiple and conflicting processes and drives. This cohort enables and relies on a globalised economy while being largely freelance, female, and unregulated. Within the industry, the push towards professionalization runs alongside technological developments in machine translation that change how translation is done. End-users of these services often seem unaware of the value of 'professional' translation. The organisation of translation work – mainly funnelled through agencies –, the desire for translations that 'don't read like a translation', and the lack of awareness on the part of clients make translators and their work 'invisible'. This paper uses assemblage thinking and emergence as a theoretical and methodological underpinning to explore how translators understand their role as 'professionals' in a fierce and unregulated market; and how a largely freelance cohort, without the backing of an organisation, incorporates 'traditional' professional values and ethics into their ongoing professional project. By foregrounding relations and interconnections, assemblage focusses on how professionalism, in this arguably fledgling professional group, is produced and enacted at micro and macro levels through the interactions of heterogeneous actors. Lastly, this paper demonstrates how the seemingly unstoppable rise of machine translation – perceived as both threat and opportunity – emerges in the professional identities of translators and how it interacts with the value of 'traditional' and industry-specific professional skills and traits.

"Coaching for Happiness" An Emerging Professional Field

Condom Bosch, Josep LLuis; Escobedo, Anna; Martin Perez, Alberto; Casanovas Caparros, Pol

Universitat de Barcelona, Spain
jlcbosch[at]ub.edu, anna.escobedo[at]ub.edu,
martinperez[at]ub.edu, polanski10[at]hotmail.com

The contribution discusses the emergence of a specific professional field: coaching for happiness, as a case study which illustrates current dynamics of international professional regulation and deregulation, in an emerging global digital market of happiness industry. The case study is part of a research which uncovers the organizational field of the happiness industry (The Happiness Industry Project, funded by the Spanish Ministry of Science, Innovation and

Universities, 2016-2019, Ref. CSO2016-77248-P). The research uses traditional qualitative methods mixed with digital methods very close to the Big Data approach. We have observed the emergence and consolidation of a new field of expertise within the coaching profession: the happiness coach, differing from the regular life coach, with several agencies providing specific accreditations. This professional field is organized, set and regulated by so-called "international" accreditations, disconnected to the national accreditation systems regulating classical professions. The happiness coacher, as a new profession, emerges from the positive psychology and the business coaching, operating in the space we define as a happiness market. As a relevant fact, the identified accreditation agencies are offshore, and national states don't show intention until now to regulate them. We have found two types of life histories amongst these coachers. One type of coacher comes from universities with a degree in a regulated space, in the boundaries of the national professional organization. Coachers in the second type, do not have a regulated background with University degrees. Both have international accreditations from regulatory agencies offshore.

Internships and Building a Career in Journalism

Pereira, Fábio Henrique

University of Brasilia, Brazil
fabiop[at]gmail.com

In this paper, I will review the role of internships in the career of Brazilian journalists. A career can be defined as a typical sequence of statuses, roles and remunerations by which a profession is chronologically defined (Tréanton, 1960). Careers establish behavioral patterns that develop in an orderly manner over the course of time. The internships represent a phase within the career of journalism. They are learning stages and would provide practical experience for the professional world and one of the mechanisms that would allow the individual to foresee any uncertainties in the labor market and guarantee (or facilitate) their entry into the profession. A survey conducted by Mick and Lima shows that only 23.7% of active journalists in 2012 had not taken an internship. The increase in the number of internships could be an indication of a broader change within the labor market and job instability within journalism itself. In order to discuss these issues, I conducted interviews with 32 journalists across several generations and different outlets. These journalists' reports were confronted with other quantitative and qualitative data. The results show that more than just a learning and preparation experience, these experiences make up a career of socializing in journalism and managing the uncertainty of future journalists in newsrooms. Internships are also telling of the transformations in journalism. The streamlining of the hiring process for interns in some more reputable media companies is evidence of increased competition in journalism. This scenario also refers to changes in newsroom hiring procedures which tend to "formalize" this process - which could be seen as increased power for HR sectors in media companies.

RN19_07 | Architecture as/of a Profession

New Risks, New Distinctions. Architecture in the Age of Digitalization

Schmidt-Lux, Thomas; Wandelt, Alina

University of Leipzig, Germany
schmidt.lux[at]uni-leipzig.de, alina.wandelt[at]uni-leipzig.de

As one of the oldest professions, architecture is largely concerned with the general functions of social economy. Architects do not only provide shelter for people but bear a central responsibility for the set-up and workings of society. Digitalization seems to pose a threat to this: Tasks that used to be performed by architects, are becoming increasingly automated. Technologies like BIM (building information modelling) are changing the process of designing, constructing and operating buildings. And while 'architecture without the architect' may seem improbable today, software makes it conceivable to think of automatically generated or partly transferred designs that ultimately render architects obsolete. Against this backdrop important questions arise: In what ways do architects use, acquire and assimilate digital technologies at their disposal? How do architects perceive processes of digitalization? And how does all of this possibly alter results and working conditions of the domain? On the basis of in-depth interviews with architectural offices in Germany, the paper addresses how digital technologies set new conditions for architects. As our research shows, digitalization is no news for architects, but enforces collaborative arrangements, which potentially blur the lines between human and non-human actors. Simultaneously, digitalization functions as a means of differentiation among the highly competitive field of architectural firms that strive to distinguish themselves from their competitors on the basis of their use and framing of analogue techniques. Methodologically, our research challenges the aptitude of existing theories of the sociology of professions: Defining the impossibility to standardize actions as one of the characteristic features of professional practice, theories may have to be revised to account for digital technologies that heavily rely upon standardization.

The Knowledge Practices Of Mid-Career Architects: Building A Career And Responding To The Internationalisation Of Professional Activities

Dimitrova, Venetsiya

HafenCity University Hamburg, Germany
venetsiya.dimitrova[at]hcu-hamburg.de

In the context of growing globalisation, architecture has come up with new forms of professional practice that have been manifested in the emergence and increasing dominance of global architectural firms. These international offices have become an attractive employer for mid-career architects, as they hold the promise of prestige and invaluable experience, by enabling professionals to work on transnational large-scale and design-ambitious projects. Yet, although these professionals are crucial for the generation and implementation of designs, and thus for the functioning of global architectural offices, they have remained invisible in the public and academic discourses that have been dominated by the figure of the "starchitect". This paper addresses the outlined gap by focusing on the knowledge practices of mid-career professionals, namely on the skills, codified strategies and implicit know-hows these actors develop, in order to respond to the ongoing internationalisation of professional activities. This complex set of practices is strongly interwoven with architects' professional development, which is often shaped by labour-intensive, underpaid and intermittent employment, and uncertain contractual conditions. Hereby, architects inevitably need to negotiate between the desire to build a career, and the precarious and volatile working conditions that impact their personal path. Moving beyond the common perception of professional roles as prestigious and privileged, the paper explores empirically the knowledge practices of these less visible actors, and contributes to the conceptualisation of how these practices impact professionals' identities and career development, and of the role they play for the generation and reinforcement of barriers and inequalities within the profession itself.

Working As An Architect, Surviving Architecture: The Grand And The Mundane

Sahin-Dikmen, Melahat

University of Westminster, United Kingdom
m.sahindikmen[at]westminster.ac.uk

Working as an architect, surviving architecture: the grand and the mundane The sociological literature on architectural practice is predominantly concerned with its external boundaries as a profession, presumed challenges to architects' authority from other occupations and the 'external' constraints on the pursuit of design ambitions. Two dominant themes can be discerned: architecture has failed to establish monopoly over a clearly defined area of expertise (Kaye, 1960; Larson, 1977; Abbott, 1988; Gutman, 1992) and there is a strong dissonance between the image of independent artist and the reality of practice (Cuff, 1991; Caven and Diop, 2012). The focus is very much on strategies of occupational closure and architectural firms (Blau, 1984; Symes et al, 1985) whilst the divisions and relations that structure architectural practice are little examined. Holding a Bourdieusian field lens (Bourdieu, 1993; Stevens, 1998) onto experiences of working as an architect, this paper shows that architects operate in a field divided by conflicts between competing interests, capitals and narratives. The dominant representation of architecture as an independent, client focused and creative endeavour is contested with reference to technical and managerial expertise, inter-dependence between construction occupations and architects' social responsibilities. At the same time, architects are united by shared beliefs and ideals and in meeting the rules and requirements of the field, they contribute to the reproduction of its divisions and illusions. Above all, individual accounts are indicative of the social, economic and political relations that structure the field of production (of the built environment), within which architects are positioned, with implications for the classical theories of the architectural profession.

RN19_08 | Clinic in Change

Professionalism as Social Closure or Self-Techniques: the Sociological Implication of CanMEDS in medical education

Tsai, Po-Fang

Graduate Institute of Humanities in Medicine, TMU, Taiwan
pofang[at]tmu.edu.tw

In the past decade, competency-based or outcome-based education (CBE or OBD), in contrast to content-based or time-based education, has become the mainstream way in medical education around the western world, such as Canada (CanMEDS roles), the United States (ACGME, six core competencies), the United Kingdom (Tomorrow's Doctor), and Scotland (the Scottish Doctor). Among these programs, the CanMEDS not only has its virtue of simplicity, in which the "medical expert" role is surrounded by six additional roles—communicator, collaborator, leader, health advocate, scholar, and professional, but also has been widely-adopted outside Canada. However, researchers in the sociology of professions have not yet noticed this new and contested trend. In this paper, I first examine the changing educational context of medical profession, and then focus on the sociological analysis of CBE, especially the case study of CanMEDS. The substantive analysis of CanMEDS and its CBE background demonstrate the following arguments: (1) for proving positivism in professionalism as competency, the reformers paradoxically introduce the CBE ideas from vocational education and unintendedly formulate closure in medical education; (2) the practice of CanMEDS roles echoes a foucauldian theme in professional ethics, transforming from 'knowing oneself' to 'caring for oneself' in the figure of an ideal doctor; (3) only taking into account the self-cultivated nature of professionalism can sociologist complement the neo-Weberian theory of the profession with its ethical or subjective element. In short, although neither the neo-Weberian approach nor the Foucauldian-governmentality approach scrutinizes the contested nature of CBE, the sociological implication of CanMEDS lies in the ambivalence of competency-based professionalism, which can be viewed as social closure and self-technique.

Barriers To Clinical Academic Careers For Nurses, Midwives and Allied Health Professionals In The UK

Trusson, Diane (1); Rowley, Emma (1); Bramley, Louise (2)

1: University of Nottingham, United Kingdom; 2: Nottingham University Hospitals, United Kingdom
diane.trusson[at]nottingham.ac.uk,
emma.rowley[at]nottingham.ac.uk,
louise.bramley[at]nuh.nhs.uk

NHS healthcare professionals are encouraged to pursue careers combining clinical practice and academic research. However, data from a mixed methods study reveal that research conducted by nurses, midwives and allied health professionals (NMAHPs) is not adequately valued, leading to barriers to clinical academic career progression. This paper reports on experiences of 67 NMAHPs in the East Midlands area of England who were pursuing a clinical academic career. Survey and interview data revealed that NMAHPs struggle to maintain their joint clinical and academic roles through lack of support at line management level and a perceived lack of value placed on their research aspirations. Participants compared their experiences with other medical colleagues (e.g. doctors and surgeons) who are supported to do research because it is typically embedded within their career development structures. In contrast, some NMAHPs reported experiencing barriers to progression such as pay cuts, reduced hours, or having no job to return to post-PhD. Despite their innovative research, potentially improving patients' safety and satisfaction, with substantial potential cost-benefits for the NHS, some participants were considering navigating to a purely academic career path which would result in a loss of clinical expertise for the NHS. We argue that knowledge created by clinical academic NMAHPs can be as valuable as that generated by medics. Furthermore, having research-active NMAHPs benefits the NHS by encouraging recruitment and retention of talented staff. However, management support is crucial in facilitating NMAHPs to progress in their careers and to continue to utilise their experience and expertise post-PhD.

Prudential Professionalism and Social Innovations: Shifting Relationships

Champy, Florent

National Centre for Scientific Research, France
fl.champy[at]yahoo.fr

In prudential activities, professionalism used to be closely related with an original form of innovation. In the singular and complex situations in which prudentiality (or practical wisdom) is needed, practice often requires deliberating not only about the means to implement but also about the prioritization of the ends of the activity itself. When the activity is routinized (which means here that it is practiced without deliberations on its ends), some members of the profession may criticize the dominant practice and propose an alternative one, based on another prioritization of its ends. Classical examples are the criticism of authoritative education on behalf of a more liberal conception (putting emphasis on the autonomy of the person), or the promotion of post-modern architecture, which prioritizes esthetics, vs. the functionalism of modern architecture. This has big theoretical consequences, as this kind of commitments and innovations sheds light on an original type of segmentation (agonistic segmentation), on the propensity for commitments, on the intraprofessional competition in markets, etc. The presentation will argue that such phenomena associated with prudentiality are becoming rare while another kind of commitments of professionals is becoming more frequent: commitments to fight the increasing obstacles to practical wisdom and restore a conception of professionalism more in line with the need of prudentiality in situations of irreducible uncertainties many professionals have to face. I will present examples of this new kind of innovations in medicine and propose a precise way to use the concept of practical wisdom to guide empirical work on them.

RN19_09a | Too cool for School? Changing Professionalism in the Educational Field

Changing Professional Knowledge and Authority of School Teachers

Mansurov, Valery; Yurchenko, Olesya

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation
val.mansurov2014[at]yandex.ru, olesya[at]mail.ru

Globalisation of education led to the understanding that Russian school is not effectively preparing graduates for life in the modern world. The Ministry of Education and Science fostered changes in school education. It proclaimed the need to change the content of the school teachers' job and to build an open and collegial management system in school education. In this article, we consider the school teacher's views of the changing nature of their professional knowledge and authority. We rely on selected results of a focus-group study conducted in six cities of the Moscow region within the framework of the project of the Institute of Education of Higher School of Economics Universal Competences and New Literacy. Focus groups were held in May 2018. The introduction of new school standards resulted in the increased workload of teachers, who were burdened with extra bureaucratic responsibilities. The research showed that the professional community was discontented with the implications of diminished discretion and with the fall of authority. There was no much freedom of choice regarding learning programmes, textbooks and working routine. The All-Russian population survey showed that only 39% of adults were ready to acknowledge the authority of school teachers. Schoolchildren challenged the authority of school teachers too. Even primary school children were aware of the various ways to acquire knowledge. They did not need teachers as a source of knowledge in the same way as pupils did a few years ago. Teachers could not derive their authority just from their position and knowledge. As teachers reported the most desirable type of authority was personal authority, based upon merit and respect.

On the Emergence of a New Expertise: Contextualizing the Educational Turn in the Resilience Discourse in Israeli Schools

Plotkin-Amrami, Galia

Ben-Gurion University, Israel
plotking[at]bgu.ac.il

A new paradigm of "resilience education" has emerged over the past decade through efforts by international organizations, states, and local communities to provide their constituencies with means to cope with disasters and risks. While the topic of resilience has benefited from an explosion in academic and policy interest over the past decade, there has been little scholarly attention directed at examining how resilience education becomes embedded in particular social contexts. Based on interviews with key professional experts who have developed resilience projects within/for the educational system in Israel, I will sketch the main tendencies in the local history of resilience training in Israeli schools from the early 1980s to the present. I will illustrate that this history has been influenced by various mutually related factors: extension of insecurities and risks, the broader theoretical developments, the transformations in cultural understandings of human suffering and coping, and the establishment of educational counseling as a profession within the Ministry of education. I will argue that the development of the resilience training practices in Israeli schools was accompanied by the process of alignment between various potential insecurities and risks in terms of the mechanisms of potential injury and coping resources, and de-centralization of knowledge on resilience capacities, which has challenged the traditional expert/lay hierarchy. These tendencies brought about a gradual process of extension in the scope and format of resilience training. They interwove the normal with the extreme, the expert with the lay, and brought about the "routinization" of war-related insecurity and the emergence of a new professional expertise. The sociology of expertise appears to be a particularly useful approach for investigating the educational turn in resilience discourse.

In Search for the Professional Core: How Secondary Schoolteachers Navigate on the Swedish School- Market

Persson, Magnus (1); Dannefjord, Per (2)

1: Malmö University, Sweden; 2: Linnaeus University, Sweden
magnus.x.persson[at]mau.se, per.dannefjord[at]lnu.se

This presentation focus on how secondary schoolteachers navigate in the Swedish school-system, a system that has developed into a school-market after several market-oriented reforms during the 1990s. This development has intensified the possibilities for every pupil to select and deselect specific schools, something that have increased competition and social differences between schools. Less is known about how teachers navigate on this socially fragmented market. By interviewing secondary schoolteachers working on a wide social range of schools the use of navigating strategies of avoiding and searching has been exposed. Some interviewed teachers seek to avoid low status schools dominated by pupils with weak school performance, low social origin and wide ethnic heterogeneity. Others actively search for these schools and avoid high status schools populated by high performing pupils mainly from the middle-class. In preliminary analysis different forms of capital held by the teachers are used to understand what strategy the individual deploy. No matter what navigating strategy the interviewed teachers search or avoid, the possibilities to work with professional teaching is a common reason for their course of action. The professional core in teaching is differently described though. It is described as caring and social work by teachers navigating towards low status schools and as didactics and subject-matters by teachers searching for schools with higher social status. To the dimension of social fragmentation on the school-market, another dimension concerning differences in how professional work is interpreted and carried out in different types of schools therefore can be added.

Primary School Teachers' Images Of Their Profession In A Context Of Change. A Study Of The French Case

Garcia, Sandrine; Danner, Magali; Farges, Géraldine; Giret, Jean-François

Université de Bourgogne Franche-Comté, France
sandrine.garcia[at]u-bourgogne.fr, mdanner[at]u-
bourgogne.fr, geraldine.farges[at]u-bourgogne.fr, jean-
francois.giret[at]u-bourgogne.fr

In many countries, the teaching profession currently meets with many changes at the workplace, relating to a great extent to the introduction within educational systems of New Public Management methods. Concerning the French case, several surveys have demonstrated that teachers have a poor image of their profession, and are not satisfied with their working conditions. In the same time, the social trajectories leading to the teaching professions have changed over the past years: at the primary level, teachers come from higher social backgrounds and have a higher educational level. Thus, focusing on primary school teachers, our presentation will tackle the relationships between, on the one hand, the images teachers have of their profession and, on the other hand, both characteristics of the workplace and characteristics of social trajectories. Our analysis is based on a research programme granted by the French Ministry for Education, that have enabled the implementation of an empirical design consisting in a first-handed questionnaire-survey and in-depth interviews. We insist that primary school teachers' job satisfaction mainly varies according to the professional autonomy they benefit on their workplace, which largely depends upon the relationships with the local school team and hierarchy. However, we uncover inequalities among primary school teachers regarding professional autonomy: some social and educational backgrounds seem to better prepare to adapt to the contemporary design of the teaching profession.

RN19_09b | Changing Context - Shifting Identities?

Varieties of Professionalism: A Comparative Study of Workplace Cultures and Professional Role Identities in Two Swedish Welfare State Bureaucracies

Jacobsson, Kerstin (1); Wallinder, Ylva (1); Seing, Ida (2)

1: University of Gothenburg, Sweden; 2: University of Linköping, Sweden
kerstin.jacobsson[at]gu.se, ylva.wallinder[at]gu.se, ida.seing[at]liu.se

Professionals in welfare state bureaucracies face the challenge of negotiating their professional identity in the context of changeable policy priorities, organizational pressures and managerial styles. Previous research has contrasted two types of professionalism: occupational vs. organizational (e.g. Evetts 2011, 2013), the latter a type of professionals without a profession. Others talk of hybrid professionalism (e.g. Noordegraaf 2007). Based on ethnographic studies of seven local offices of the Social Insurance Agency (SIA) and the Public Employment Service (PES) in Sweden, this paper identifies a third type of professionalism, provisionally conceptualized as 'task-defined professionalism'. Empirical evidence comes from the comparative analysis of case workers in these two agencies, which represent very different public sector workplace cultures and professional role identities, even though management systems are similar and case workers in both agencies lack a common professional training. The case workers differ in terms of embraced notions of professionalism; view of discretion; relationship to clients, managers and external parties; emotional alliances and reward at work; as well as loyalty to current organizational goals. While SIA caseworkers represent a distinctive form of organizational professionalism, which make them highly adaptable to shifting organizational imperatives, the PES caseworkers, representing 'task-defined professionalism', are highly flexible in their task orientation but more resistant to shifting organizational goals. Keywords: activation policy, caseworkers, profession, professionalism, organizational professionalism, street-level bureaucracy

Professional Cohesion in Classic and New Occupational Groups under the Current Reforms of Welfare State in Russia

Prisiazhniuk, Daria; Iarskaia-Smirnova, Elena

National Research University Higher School of Economics, Russian Federation
dprisiazhnyuk[at]hse.ru, elena.iarskaia[at]gmail.com

In today's Russia the NPM reforms are in progress, the liberalization of welfare state is complemented with statist interventions. Such processes create the dynamics of struggle and control outside and within the professional groups. The paper is based on the analysis of survey (n=200) and qualitative interviews (n=20) with medical doctors and social workers (SW) in a large Russian city. The research shows that cohesion in two professional groups is distinguished by features of mechanical (SW) and organic (doctors) solidarity in Durkheim's terms. Comparing to that of medicine, the 'professional project' of social work in Russia started quite recently, and this occupation is characterized by low level of autonomy and social closure. SW more often talk about the homogeneity of the group, and mutual aid practices. Cooperation between members of professional group and competition with other groups are more characteristic for doctors. They more often than SW say about the heterogeneity of their community, the uniqueness of each member; perceive themselves as members of a professional group and report about positive emotions of belonging to it. The division of labor in a group of doctors employed in the same organization, as well as a higher level of professional autonomy, make this group cohesive, despite the differences in value orientations. Mobility opportunities into a commercial sector undermine the organizational cohesion of doctors. Sources of a stable professional cohesion of SW are to be found in similarity of vocational attitudes and competencies, since this group is weakly specialized; its members lack autonomy and have fewer career opportunities and employment alternatives.

Professional Dynasties as a Social Mechanism for the Reproduction of Professional Identities

Yurchenko, Olesya; Mansurov, Valery

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation
olesya[at]mail.ru, val.mansurov2014[at]yandex.ru

Project Professional Dynasties as a Social Mechanism of the Reproduction of Professional Groups is directed towards the studies of reasons and circumstances of the rise and fall of professional dynasties. By dynasty we understand a social group localised in the industrial and socio-economic sphere characterised by kindred relationships, where several generations do their professional work in the same sphere. We have studied the professional dynasties of doctors, teachers, lawyers and engineers under contemporary conditions of work. We have undertaken in-depth interviews with the members of these professional dynasties engaged in the public and private sector in Moscow, Moscow region, Ekaterinburg, Ufa and Samara in 2018. The phenomenon of 'professional dynasty' was brought to life by the Soviet state in the 1920-s. Dynasties were social constructs done by the state that aimed at producing elite professions and professional layers. Later, professional dynasties were formed in various spheres by professionals themselves through parents' expectations and passing down of professional knowledge. Contemporary dynasties still constitute professional identities and provide the passing down of knowledge from parents to children. Dynasties may become a resource for a family professional mobility. The members of dynasties use various informal methods and practices for the upbringing of next generation in the context of changing economic, technical and social realities. Dynasties may provide conditions for the effective professional adaptation and career realization of young generations. Dynasties no longer guarantee an elite professional standing. However, dynasty professionals have a stronger professional identity and they report to be better adapted to the changes in the labour market.

True Believers And Basket Weavers: Tensions in Role Formations between Higher Education And Irish Military Professional Identity

Gibson, Andrew Gerard

Trinity College Dublin, Ireland
gibsona[at]tcd.ie

The 1960s saw a signal development in role of the Irish Defence Forces, with greater involvement internationally starting with the United Nations Operation in the Congo (ONUC) in 1960, and a deteriorating internal security situation with start of "The Troubles" in Northern Ireland. In this same period, the general staff of the Irish Army started sending officer cadets to civilian University during their training, at a time when ever greater demands were being put on the army to prepare young officers for immediate deployment. Since

then the Defence Forces has maintained – and expanded – its policy of sending officers to civilian higher education institutions. Military training and education as theorised in the literature is a relatively clear-cut example of secondary socialisation whereby the military organisation sets out explicitly to turn civilians into military professionals. By sending officer cadets to University, in Ireland this military socialisation process is interrupted, with potential for role ambiguity in the formation of a professional military identity, and "corrective" processes brought to bear on and by the individual. This paper explores how military identity is formed in light of possibly conflicting demands by examining three points of contact between officer socialisation and University: choice of course, commissioning and graduation, and returning to military life from University. Data was generated as part of a broader study of higher education and the Irish Defence Forces since the 1960s, drawing on 50 semi-structured interviews with both serving and retired officers.

RN19_10a | Law and Legitimization

The Discourse of Professionalism as Instrument of Legitimization: case study Czech civic sector

Stovickova Jantulova, Magdalena

Charles University, Czech Republic
9653[at]mail.fhs.cuni.cz

In last year a different interpretation of the concept of professionalism is developing. This article is framed within the interpretation of the concept as a discourse (Evetts, 2003). In this paper, I will try to answer a question: How and in what ways the discourse of professionalism is being used by actors of Czech civic sector as an instrument of legitimization of sector? This study is framed within the theory and methodology of Critical Discourse Analysis (CDA). It analyze the linguistic ways in which legitimization is constructed in discourse (Fairclough 2003). The study use the set of categories proposed by Van Leeuwen (2007) addressing legitimization in discourse: authorization, moral evaluation, rationalization and mythopoesis. It includes an exploration of empirical studies of text and talk of representative of civic sector organizations to other members of society. This article aims to introduce different paths in which legitimization takes place in discourse of professionalism.

Gender and Age Inequalities in the Professions: Careers and Work-Life Reconciliation in Canadian Engineering and the Legal Profession in Finland

Choroszewicz, Marta (1); Adams, Tracey L. (2)

1: University of Eastern Finland, Finland; 2: The University of Western Ontario, Canada
marta.choroszewicz[at]uef.fi, tladams[at]uwo.ca

The article explores men's and women's experiences of professional careers through an intersectional lens by focusing on the intersection of gender and age. Engineering and the legal profession are male-dominated, which is reflected in divisions of labour, hierarchies, career choices, recognition of skills and returns on career investments that have traditionally favoured men. Nevertheless, there are signs of significant change. Over the last several decades engineering in Canada has taken steps to encourage women's entrance and retention in the profession. Finnish parental leave policies have been undergoing changes to encourage fathers' involvement in caregiving responsibilities for their newly born children. Do these policies contribute to more gender equality and work-life balance among professionals? By combining intersectionality theory with a life course approach, this paper sheds light on the impact of family life on careers, among Canadian men and women engineers, and Finnish men lawyers. Our analyses show that experiences of work-life conflict – and its impact on careers – differ significantly across age and gender in Canadian engineering. Moreover, our analyses demonstrate that Finnish male lawyers of different age cohorts negotiate diverse narratives of fatherhood. In both professions experiences of work-life conflict are individualised by being seen as a private challenge rather than professional or organisational issue. The article contributes to literature on inequalities in the professions by demonstrating the ways in which gender and age converge to confer privilege and produce disadvantage, and the ways in which gender inequality is reproduced, and disrupted, through the activities of professionals on the job.

Ethical and Economical Challenges of Italian lawyers. The Case of Lawyers Defending Mafia Clients.

Ingrascì, Ombretta

University of Milan, Italy
ombretta.ingrasci[at]unimi.it

The paper deals with the ethical and economical challenges faced by Italian lawyers in the last thirty years by exploring the case of lawyers defending mafia clients. Starting from the assumption that lawyers of mafia clients might perform their role in different ways - from the legitimate defence to the direct participation into the activities of mafia associations, given their expertise and social capital- this paper explores the structural and individual mechanisms influencing the lawyers'

shift from a legitimate conduct to a criminal one. Focussing on the case of Sicilian mafia, Cosa nostra, the paper argues that such mechanisms are linked, on the one side, to the changes undertaken by this mafia organization, that have led to increase its demand for professional services and, on the other side, to the challenges faced by lawyers as professional category due to the growth of market competition. The research is based on a mixed-method approach, combining the analysis of secondary literature and quantitative data on the transformations experienced by the legal profession in Italy with the analysis of a set of case studies of lawyers charged with the crime of mafia association through interviews with key observers (including a lawyer, who turned state witness) and judicial files. By framing the analysis within neo-institutional theories, which understand professionals as "institutional agents" that contribute to shape various social spheres (Scott 2008), the paper addresses some pivotal ethical and socio-economic questions related to the impact of lawyers' misconducts on the professional environment and the broader society.

RN19_10b | Adjustments and Ambivalences in professional work

Adjustment Of German Doctoral Candidates In France And The Netherlands

Schäfer, Gregor; El Dali, Yasmin

University of Siegen, Germany
gregor.schaefer[at]uni-siegen.de, yasmin.eldali[at]uni-siegen.de

The research we would like to present has been conducted in the realm of a project funded by the German research foundation (DFG). The project has been conceptualized and developed by Prof. Dr. Karin Schittenhelm and looks at the migration of PhD students (EU-graduates of the Arts, Humanities, and Social Sciences), who have concluded their higher education studies in Germany and moved to France and the Netherlands to continue their scientific career (i.e. PhD). Our research focuses in particular on the adjustment process the academics experience in the host countries. The research discusses factors that exercise positive and negative influence. With regard to theoretical frameworks the paper will discuss the different adjustment areas (Black 1988; Black & Stephens 1989) as well as a number of propositions developed and put forward by Black et al. 1991. It will also include the concept of self-efficacy (Bandura 1977) and theories of Church (1982), who argues that previous international experiences aid adjustment as more accurate expectations can be formed, which in return positively influence anticipatory and actual adjustment. The empirical data was gathered through the conduction of autobiographical narrative interviews (Schütze 1983). Conducting in-depth interviews und utilizing the documentary method (Bohnsack 2014) for analysis allows a comprehensive understanding of the decisive factors in the adjustment processes.

Mètis: A Concept To Capture The Blurred Culture Of A Constrained Occupational Group?

Di Bianco, Soazig (1,2)

1: Ecole Supérieure d'Agricultures d'Angers, France; 2: INRA, UMR CESAER, Dijon, France
s.dibianco[at]groupe-esa.com

This communication explore the complex interplay between several components of professional culture, such as common values, rites and group beliefs, as well as the interplay between individual and group scales, and the coexistence of different sub-cultures. We conducted a meaningful qualitative survey with 33 technical advisors of French agricultural cooperatives (33/161) and a questionnaire (97.5% response rate). We show that “semi-remote” work sites provided to a large extent freedom of interpretation and application to the technical advisors, which develop operational autonomy and strong coping skills. This area of freedom is an offer of space for their sub-cultures to be expressed. We identify three professional subcultures. Each allows the job to be performed, but leads to different work practices and social interactions. These professional subcultures are reflected in the various debates that took place at professional meetings or in informal exchanges between technical advisors. For instance, the professional purpose of their interventions, the appropriate relationship with farmers and the desirable characteristics of a “good” farm advisor are different among our respondents. We explore how the porosity between farmers and technical salesmen professions helps acculturation and explains the similarities between their respective professional cultures. Bound together by this social proximity, farmers and technical salesmen have a significant impact on the cooperative cultural system. Finally, we propose the concept of “mètis” to analyze the professional skills of technical advisors, developed under this very specific cultural transmission that gathers 3 major vectors: (i) organization (professional training, management), (ii) peer group (transmission), (iii) social capital.

Obscured by Ambivalence: Managerialist Institutional Work in Israel's Welfare Ministry

Timor-Shlevin, Shachar (1,2,3)

1: Bar Ilan University, Israel; 2: Ben Gurion University of the Negev, Israel; 3: Ashkelon College, Israel
stimorshlevin[at]gmail.com

The encounter between managerialism and professional discourses is mainly presented as hierarchical where managerialism subjugates previously predominant professional discourses. An alternative stream of literature illustrates this encounter as mutual and hybrid, combining managerialist principles with professional ones. However, these portrayals fail to allow for a more complex analysis of the power relations between managerialism and professional discourses, particularly regarding critical professional discourses. Specifically, insufficient attention has been paid to the possibility that the ambiguity created by a stated willingness to promote critical-professional change, and actual

practice directed at impeding such change, could shape power relations in a specific way. This study uses the framework of institutional work to investigate this possibility by clarifying the power positions of managerialism and critical-professional discourse in a unique moment when the Israeli Welfare Ministry invited scholars who promote the critical-professional discourse to formulate pilot programs for families living in poverty. This created an analytical encounter allowing the examination of the unique institutional work of senior agents under conditions of ambiguity, where the opposing critical and managerial logics have to work together but implicitly challenge one another. I conducted 23 interviews with social workers and 14 interviews with administrators identifying practices, routines and discursive power positions operating four forms of institutional maintenance work: underfunding, conditionality, suspicion, and rejection. My contribution lies in elaborating the institutional work directed at maintaining the institutional superiority of managerialism, under conditions of ambiguity. This ambiguity allows the appearance of hybridity while concealing the hierarchical position of the managerialist stance.

The Difference In The Ways Certified Care Workers Understand Tasks Based On Varying Vocational Education And Training In Japan: Making Reference To The Idea Of 'Dignity And Independence'

Suzuki, Yuma

The University of Tokyo, Japan
yuma.s.0907[at]gmail.com

The purpose of this research is to clarify how Vocational Education and Training (VET) affects the ways in which certified elderly care workers understand tasks differently in Japan. In Japanese VET of elderly care, there are two ways to receive a certification as a professional elderly care worker, and there are many differences in how VET is conducted in each office. Therefore, this research will clarify how the difference in the experience of VET affects workers' understanding about their tasks. To achieve the purpose, semi-structured interviews with certified care workers were conducted; 13 of whom receiving their certificates by graduating from elderly care vocational schools and 10 of whom receiving their certificates by passing the national examination after spending necessary years on the job. In the interviews, we asked what types of VET the workers have experienced and how they understand their tasks. From these interviews, the following results were obtained: (1) The certified care workers can be classified into two categories. The first one is those who received enough VET (group A). The second is those who experienced insufficient VET (group B). (2) The workers of group A considered that user-oriented care is important, but they endured their poor working conditions to keep the quality of care. In contrast, the workers of group B considered time-saving as more important than user-oriented care, but they had critical attitude toward poor working conditions. The present result suggested that elderly care workers acquire self-sacrificing attitude by logic of user-oriented in VET.

Transposition I: Visual Recording and Visual Data

Capturing the Interrupted Boundaries of Public and Private Experience at UK Pedestrian Crossings

Greenwood, Martin

University of Manchester, United Kingdom
martin.greenwood[at]postgrad.manchester.ac.uk

This paper details the development and employment of a method designed to capture participants' experiences of pedestrian crossing use in their routine walking journeys through Manchester. The paper describes how pedestrian crossing practice in the UK can be said to be characterised by a 'normalised incoherence', with a tendency to favour individual judgement, over adherence to what the signals advise, leading to frequent occurrences of awkwardness, confusion, poor-judgement and hazard. It was posited that this might, in part, relate to the crossings representing interruptions of 'publicness' in routine experiences of pedestrianism that have been increasingly framed by privatised and individualised notions of mobility. The paper details how this hypothesis was investigated through a two-part ethnographic process. Initially, a period of participant-observation was undertaken, with a route through Manchester featuring significant interruption by pedestrian crossings being repeatedly walked, with audio field-notes recorded in situ. This was complemented by a visual method, 'Dual Perspective Go-Pro Ethnography', which involved participants recording their pedestrian journeys using a head-mounted camera, whilst the researcher followed them, also wearing a camera, to capture a contextualising view of the trip. The captured footage was edited such that both recorded perspectives could be viewed simultaneously and used as means of elicitation in discussions about the journey between the researcher and participants. The paper goes on to discuss the effectiveness of this method as a means of obtaining reflections on and insights into mobile social experience that might otherwise escape a participant's or researcher's attention, and describes how it facilitates the ability to discuss these journeys as shared experiences, despite participants (mostly) behaving as they would if walking alone.

Visual Diaries of the Border. Methodological Challenges of Researching Everyday Practices with Smartphone Application

Rogowski, Łukasz (1); Sommer, Vivien (2); Frąckowiak, Maciej (1)

1: Adam Mickiewicz University, Poznań, Poland; 2: Leibniz-Institut für Raumbezogene Sozialforschung, Germany
lukasz.rogowski[at]amu.edu.pl, Vivien.Sommer[at]leibniz-irs.de, adv[at]3made.eu

In our presentation we will refer to project "De-Re-Bord. Socio-spatial transformations in German-Polish interstices. Practices of debordering and rebordering", implemented in the framework of the Polish-German NCN-DFG Beethoven 2 program. Its aim is to research Polish-German border and to reconstruct spatial discourses and the knowledge systems they imply, as well as actual practices of residents. Particular attention is paid to material and visual manifestations of the border. We implement in the project multidimensional qualitative research design. Document analysis and expert interviews are used for the reconstruction of discourses. Within participatory observations researchers use photographic shooting scripts. Participants are asked to create spatial-temporal visual diaries. In order to reconstruct the materiality of borders, we use the walking-with-video technique. Following the illustration of the methodological challenges, we will focus primarily on the presentation of an smartphone's application, designed specifically for the needs of the project. The application allows to record the daily activities of research participants, as well as patterns of their daily mobility. It also enables participants to produce visual diaries showing the daily experiences of the border and the debordering and rebordering processes present there. In our presentation we would like to point out such aspects of the application's functioning: • The way of designing the application and its basic functions • Problems encountered by participants while using the application and ways to avoid them • Ways of collecting, storing and distributing materials from the application, taking into account legal and ethical conditions • Possible ways of analysing data collected by the application • Possible ways to use the data collected by the application in subsequent stages of research.

The Use Of 360°-Videos In Qualitative Social Research

Windscheid, Julian

Technische Universität Ilmenau, Germany
julian.windscheid[at]tu-ilmenau.de

The advantages of video recordings for observation are manifold. But despite the advantages of videography, the use of video for observation is repeatedly critically questioned. A frequently discussed problem the related question of whether or to what extent the position and direction of the camera influences the analysis and evaluation of the recorded situation (eg Reichertz, 2014; Bohnsack, 2010; Frankenhauser, 2013; Knoblauch & Schnettler, 2015; Jewitt, 2012; DuFon, 2002, Luff and Heath, 2013). Because framing only reveals what happens in front of the camera, it is also determined what is outside. Framing separates the visible from the non-visible (Godman, 2007). For video-based observation, this circumstance appears to be highly problematic. In practice, the camera holding person has a great influence on the analysis and a massive impact on the results. With an almost clairvoyant ability the videographer has to determine situationally, what should be in the focus of the camera and what not. However, what has been ignored in this discussion so far is the use of 360° video recordings. At first glance, it seems like this technique could be a great advance for scientific observations. Framing is lifted, a "before and behind the camera" doesn't seem to exist anymore. Multi-perspectives become superfluous and the person holding the camera no longer needs clairvoyant abilities. However, this technology also raises many new questions. In the present paper we would like to discuss the impact of 360° video recordings on existing "techniques and rules" of scientific videography. It will be questioned whether current findings on this subject should be rethought or at least revised.

Qualitative Perspectives: Visual Methods (Family map and Life line) in Children of Divorce Research

Robles, Felicia Annamaria

Università Cattolica del Sacro Cuore, Italy
FeliciaAnnamaria.Robles[at]unicatt.it

Many changes are affecting the family today, transforming the foundations of self-identity, which are the core models for everyday personal life. The situation of family disruption, such as separation and divorce, raises either a number of human and social issues, and transitions which deserve to be better understood. Results from a PhD research thesis carried out on a sample of young Italian adults, showed in the form of qualitative data the main features of two visual methods, the Family map and Life line. They defined the structure, the positions of family members, the relationships between them and conceptualized who belongs to a family that has changed, with crucial events related. The interviewee could actively identify and describe graphically (within the four sections and the concentric circles of the map and along the line) which relations and facts were or are more or less relevant. The interviewer could ask questions in order to get some processes of change and the actors' own perception of such change, e.g. with reference to current state or past events. Along a specific visual development of the graphs -while providing a helpful framework- this throws some light on what family relationships, events and representations were/are on the perception of the person involved. The challenge posed for this visual methods is to continue to conceive of individuals in terms of relational approach, through the interdependence with self, others, and the world during the course of life. A great contribution of this tool sui generis is that it opened and opens the door to numerous additional questions that need answers and further research. Keywords: children of divorce, visual methods, qualitative research, network maps, relational approach

Abstract Music Videos, Pop Culture Media and Social Media Comments: Challenges and Perspectives for the (Audio Visual) Grounded Theory Methodology

Dietrich, Marc (2); Mey, Günter (1)

1: Magdeburg-Stendal, Germany; 2: Magdeburg-Stendal, Germany
marc.dietrich[at]hs-magdeburg.de, nter.mey[at]hs-magdeburg.de

Since decades the Grounded Theory Methodology (GTM) is one of the most popular methods among qualitative researchers around the world. One reason for that success might be the “All is data”- credo (Glaser 2007) promising the opportunity to integrate every data type into one methodological approach. On the other hand the GTM has not always taken the chance to develop methods in reaction to new challenges of data. Especially concerning audiovisual data (with their complex interplay between text, tone and moving image) GTM has not offered adequate methods yet. Apart from the fact that methods for the analysis of audiovisual data still tend to be neglected in qualitative methods, the lack of visual methods in GTM has two negative consequences: One is that researchers in areas that are traditionally focused on empirical research (e.g. in youth culture research) might have to switch their method – another is that the integration of methods rooted in other theories tends to produce incompatibilities. Based on our project “Music Videos, Scene Media and Social Media - on the Negotiation of Racism in German hip-hop” (funded by the German Research Foundation), we would like to discuss two questions: First, how can we analyze and reconstruct socially polarizing thematizations (e.g. ‘racism’) in pop cultures (such as hip-hop) on different levels of discourse (e.g. in music videos but also in digital pop culture media and social media comments) and how does their interplay shape the discourse? Second, how does an (Audio)Visual Grounded Theory Methodology (Mey/Dietrich 2017; Dietrich/Mey 2018) deal with pop cultural audiovisual products (such as hip-hop videos) and how do maps help to create a “situational analysis” in a digital area (Clarke 2018)?

Depicting and Visualizing Boundaries and Borders

Pauwels, Luc

University of Antwerp, Belgium
luc.pauwels[at]uantwerpen.be

‘Border studies’ have developed into a varied and promising field of research, involving scholars from many disciplines such as political science, social geography, visual social science, (visual) communication studies, visual culture, multimodal and linguistic landscape studies. After a period of widespread belief in a ‘borderless’ globalizing society (the post-1990 era) geopolitical borders and bordering processes again have become a harsh reality. But the concept of borders has also expanded beyond the geopolitical sphere and today may comprise ethnic, socio-political and economic, linguistic, sociolinguistic, mental, virtual and metaphoric dimensions. Each of those spheres tends to have both visible and invisible traits. My presentation involves a systematic discussion of the scholarly practice of creating a visual essay as part of a broader research project on developing an innovative and integrated visual and mixed-method approach of different concrete political and non-political border situations and conceptualizations. The aim of this larger ‘Borders and Borderlands’ project is to build bridges between several fields in the social sciences, the humanities and beyond, involved with the study of borders and bordering. But the project also seeks to promote and strengthen a more visual (and multimodal) research and communication practice. I will discuss and illustrate my visual preoccupation with different types and conceptualizations of boundaries, borders and borderlands through a series of researcher-produced images which try to embody these different dimensions and takes on borders and bordering in both documentary and more expressive ways. Most images will have a metaphorical layer or employ rhetoric devices to construct an implicit argumentation (supported by an introductory text and caption).

Sounds And Knowledge. Animal Bells As Prototypical Technology

Maeder, Christoph

University of Teacher Education Zürich, Switzerland
christoph.maeder[at]phzh.ch

In my paper i want to investigate on an ancient acoustic technology from a sociology of knowledge point of view: the handling and use of animal bells. At first glance, this technology seems to be irrelevant and completely outdated to modern man. But the implications of the mastery of sounding artefacts that produce acoustic, non-linguistic knowledge are manifold: bells produce prototypical structures of knowledge and power in functional, aesthetic and symbolic regards (Augoyard et. al. 2009). And the sounding artefacts allow the formation of unexpected stocks of special knowledge in relation to the uses of time, space and social relations: I will illustrate the production of audibility by means of bells for animals as an audio-technical structure of power, a kind of "Governmental Soundscape" which shapes the boundaries in the man-animal relation. Put together we are looking at, and hearing an auditory culture (Bull & Back 2003) which is far more reaching and complex than the simplicity of the sounding artefact - the bell - implies. As empirical data I will use photographs and video strips of exemplary situations in which animals and humans are governed by sounds in the Swiss Agriculture. The data used will finally bring me to the question of how to do research on non-linguistic acoustic phenomena: is the non-linguistic character of a phenomenon observed a boundary for qualitative research? Augoyard, Jean-François, Henry Torgue, Andra Shirley Jean McCartney, David Paquette, eds. 2009. *Sonic Experience: A Guide to Everyday Sounds*. Reprinted. Montreal: McGill-Queen's Univ. Press. Bull, Michael / Les Back. 2003, eds. *The Auditory Culture Reader*. Oxford: Berg Publishers. Maeder, Christoph. 2017. «Bells and Social Order: Analysing Sounds in Ethnography». Olfactory Perception – A Neglected Sense In Social Research

Eberle, Thomas Samuel

University of St Gallen, Switzerland
thomas.eberle[at]unisg.ch

Qualitative social research has been preoccupied mainly with verbal statements and descriptions, only a few include auditory and visual data as data in their own right. Other sensory data have remained strikingly absent or downplayed in sociological research. This implies that the actual life-world of social actors is considerably reduced in sociological investigations. My presentation will put an analytical focus on the olfactory sense. This sense has been regarded as "brute" and "animalistic" throughout the history of Occidental philosophy, and it comes as no surprise that this disrespectful attitude persisted in the social sciences. In everyday life, however, human perception is always multimodal, including several senses at the same time. We may often concentrate on visual and auditory information, but olfaction is always included, too. In certain situations olfactory perception stands out, for instance, when tasting wine or fine food or when smelling blooming flowers or perfumes. In other situations bad smells are avoided or managed, for example, by deodorants or other smell neutralizers. But even when we do not perceive it consciously, each space has a certain smell (odor, scent) and co-constitutes a locality's atmosphere. Smells can often be recognized, and memory studies reveal that olfaction and memories are intimately interrelated – a smell can bring on a flood of memories. I will ponder the methodological question, how we can integrate olfactory experiences into sociological research. My thesis is that a phenomenological analysis can clarify the difficulty to transpose pre-predicative experiences into verbal statements, and that it is crucial for qualitative social research to adopt a methodology which covers that realm of pre-lingual experiences and a-semiotic communication.

RN20_04 | Drawing (New) Boundaries In Qualitative Research Methodologies

The Practice, Strategies and Boundaries of method making in qualitative social science Research: A Meta Analysis of Discourse production in English- and German-speaking journals since 1995 to 2018
Eckert, Falk (1); Behrmann, Laura (2)

1: Universität Hamburg, Germany; 2: Deutsches Zentrum für Hochschul- und Wissenschaftsforschung, Hannover, Germany
falkeckert[at]gmx.net, Behrmann[at]dzhw.eu

As well as cultural diversity across and beyond European boundaries is researched and discussed it is to ask how qualitative research as discursive practice is presented in social science journals and how this is bound to different research cultures. Scientific writing is a materialized discursive practice and part of a discourse-formation which (re)produces procedures as well as quality criteria of qualitative research. This paper focuses on the practices of presentation of qualitative inquiry in social science journals as social scientific practices. We propose that the production of discourses justifying qualitative social science research is a scientific practice as such distinct independent from doing research itself. In a meta-analysis of articles in highly ranked sociological journals from 1995 to 2018 we compare the discursive practices and strategies of presenting qualitative inquiries published in journals printed in English or German. How do researchers present their selection of studied object, research design, and their applied methods? How are techniques and procedures presented, reflected, and justified in the written publication? Our comparison reveals specific commonalities and differences between the English- and German-speaking communities regarding the representation of qualitative research and the sociological production of knowledge: Statements and arguments in the articles offer insights into the stabilization and justification of qualitative inquiry of research practices.

Reconfiguring Realities: Addressing Boundaries through New Materialist Analysis

Schadler, Cornelia

University of Vienna, Austria
cornelia.schadler[at]univie.ac.at

A recent nexus of theories subsumed under the notion of new materialisms is increasingly recognized within sociology. Theories, such as the agential realism of Karen Barad (2003, 2007), the posthumanism of Donna Haraway (1992, 2008) or the Deleuzian materialism of Rosi Braidotti (2002, 2006) claim to rewrite definitions of humans, overcome dualisms and representationalism, include material processes into research and redefine the relationship of subject and object in research. Material-discursive boundaries play a major role in this theoretical perspective. Karen Barad theorizes the universe as intra-acting matter. Intra-action then defines boundaries, hence separated entities. These boundaries and entities do not exist by themselves, but they are inseparable from other boundaries, because they are part of the general mattering process. Boundaries are specified as fixed and sometimes extremely durable, but as never ahistorical or universal. Consequently, many boundaries do not erode or diminish easily but sustain constant redefinition. However, since intra-action is always boundary reconfiguration the extent of the redefinition of boundaries matter. The process of research is simultaneously defined as a response to and a reconfiguration of existing boundaries. The process ontologies of new materialisms define "research objects" as well as research processes and methods as bounded entities intra-acting and creating research outcomes (which are bounded entities themselves in the form of articles, talks or books) (Schadler, 2017). Research therefore is not just an innocent intra-action but an intervention that reconfigures realities, while the entities researched leave their marks on research. If we take this concept seriously, how should we rethink the reproduction of boundaries in research? The talk shall address this issue and proposed solutions from the perspective of new materialisms.

Beyond The Human: Pros And Cons Of "Post-Qualitative" Methodology

Kissmann, Ulrike Tikvah

University of Kassel, Germany
ulrike.kissmann[at]uni-kassel.de

Materialisms and posthuman concepts have given rise to what has been termed "post-qualitative" thinking in qualitative methodology. Broadly, new materialism can be understood as critique of the predominance of human mind in western culture. One common feature of materialisms consists in the rejection of taken-for-granted ontological assumptions. In this line of reasoning, entities such as, for example, "subject" and "object" are not conceived anymore as prior to the relations in which they arise (see, e.g., Kissmann & van Loon 2019). In this paper, I will ask what it means for the collection and analysis of qualitative data if subject and object are engendered in the process of investigation. One might opt for "mess" in social science research such as John Law (2004) in order to resist the pitfall of Cartesian and Kantian divide of matter and human experience. As a consequence, human and nonhuman are equated from a methodologically point of view. Or one might take up a stance on materialities such as, for example, Karen Barad (2007) and perceive the investigating human subject entirely as effect of an apparatus. Here, the distinction of human and nonhuman as prior to the process of investigation is negated. Finally, I will show how empirical inquiry is currently conducted in the post-anthropocentric. Barad, Karen (2007). *Meeting the Universe Halfway: Quantum Physics and the Entanglement of Matter and Meaning*. Durham, North Carolina: Duke University Press. Kissmann, Ulrike Tikvah & van Loon, Joost (ed.) (2019). *Discussing New Materialism: Methodological Implications for the Study of Materialities*. Wiesbaden: Springer. Law, John (2004). *After Method. Mess in Social Science Research*. London, New York: Routledge.

Indigenous methods (IM): Qualitative research as "boundaring"?

Ryen, Anne

University of Agder, Norway
Anne.Ryen[at]uia.no

Indigenous researchers claim a need for their own methods different from methods used by their colonisers. Indigenous methods (IM) are communicated as indigenous peoples' tools to seek social justice after centuries at the margin. Indigenous research is part of the strategic decision to centre-stage indigeneity and to talk with one voice by downplaying regional, historical and political variations. The contemporary preference for storytelling as the dominant way of representing experience, facilitates IM as a tool by, for and with indigenous peoples inspired by early feminism to accentuate the indigenous insiders' collective story. Methodologically, criticism ranges from indigenous methods as nothing but variations of existing methods to all methods as indigenous. I explore into the political and emotional of IM by their romantic call for the authentic - in times of populism, and claim IM holds a problematic status between methods and politics.

RN20_05 | Situatedness and Data Collection I: The Power of Situations and Going Along

Towards a Situational Understanding of Qualitative Interviews

Mangset, Marte (1); Vassenden, Anders (2)

1: Oslo Metropolitan University, Norway; 2: University of Stavanger, Norway
marte.mangset[at]oslomet.no, anders.vassenden[at]uis.no

This paper extends on discussions after Jerolmack and Khan's article 'Talk Is Cheap', which proclaims ethnography as superior to interviews, in regards to whether people's accounts and attitudes reflect their actual behavior. Criticisms followed from DiMaggio, Cerulo, Maynard, Vaisey, and the debates have been picked up by e.g. Lamont and Swidler. One central theme in these debates, explicated in most detail by Maynard, is the micro-interactionist notions of the social situation and the interaction order. Fruitful as these debates are, there has been fairly little subsequent elaboration on understanding the interview as a social situation. We contribute by discussing the methodological implications of the perspective that interviews are locally produced realities in themselves. We revisit Goffman's microsociology, and his notions of interaction order and face-work, while also highlighting a neglected issue in an influential branch of cultural sociology – the French pragmatist school's (Boltanski & Thevenot) emphasis on peoples' creative capacities to switch between situations, situations that relate to different macro-cultural resources. Next, we discuss two studies of middle-class cultural distinctions (or lack thereof): Investigating the same topic, Skarpenes and Jarness make contradictory conclusions. Their disagreements, we argue, pertain to their respective interviews being different social situations, which entailed different cultural repertoires. For further illustrations, we use examples from own research (top-bureaucrats; cultural capital). The task ahead for qualitative sociologists, we argue, is to reflect critically upon how researcher and interviewee co-construct the interview as a social situation, and next, which situations outside the interview that any given interview may mirror.

Passivity and Resistance in Focus Groups: Analysing Power Relations and Identity Performances in Interview Settings

Katainen, Anu (1); Heikkilä, Riie (2)

1: University of Helsinki, Finland; 2: University of Tampere, Finland
anu.h.katainen[at]helsinki.fi, riie.heikkila[at]uta.fi

It has often been argued that the focus group method has a potential to democratise social scientific research as it permits participants' own voices to be heard in their own terms. While the objective of the focus group method is usually to enable interaction and to provide a natural setting for joint production of accounts on a given topic, interaction is never neutral but always involves positions of power. Moreover, participation requires both capabilities and reflexive skills that depend on resources and forms of capital that are bound to social position. The paper draws on the experiences of a focus group study that examined adolescents' meaning-making of alcohol in different social class milieus. In the discussions, significant variation was found in the ways the participants reacted to the study setting and interacted in the groups. Thus, rather than concentrating on the outspoken attitudes towards alcohol use, we ask what kinds of roles participants mobilized in order to mark their positions. We further analyse these roles as situated identity performances. We concentrate especially on passive and resistant participant roles that may appear problematic in terms of what kind of data is produced. We argue that resistance or passivity can be viewed as actively taken positions that reveal how participants interpret the setting and what kinds of competences they are able and willing to mobilize in the situation. We conclude that identifying participant roles is especially important in studies that involve minors or other vulnerable groups.

Going Along Strained Creativity

Wästerfors, David (1); Egard, Hanna (2); Hansson, Kristofer (1)

1: Lund University, Sweden; 2: Malmö University, Sweden
david.wasterfors[at]soc.lu.se, hanna.egard[at]mau.se, kristofer.hansson[at]kultur.lu.se

This paper reflects on the potential of 'go alongs' – in Kusenbach's version – within ethnographic disability studies. Despite noble policy declarations about an accessible society, people with disabilities still face numerous obstacles in their everyday life, sometimes emerging here-and-now, and thereby hard to predict, prevent or even name. When we go along persons with disabilities in urban settings in Sweden, they are given a spatial and discursive arena in which to display and explain their daily accessibility troubles. So far, the informants have shown and narrated what seems to be a set of ethno-methods to overcome or manage various barriers, such as (a) using others, (b) making deals, (c) following routines, (d) "piggybacking" the conventional, (e) debunking inaccessibility accounts and (f) doing politics. Disabilities are still, as Fred Davis put it in the 1960s, expressed in "a

pronounced stickiness of interactional flow", but today this is revolving not only around difficulties for others in relating to persons with disabilities but also around a particular tension that is continually situated: a celebrated ideal of universal access in combination with scanty practice. When we as fieldworkers accompany individual informants in their daily routes and errands, there seem to be fruitful opportunities to get a glimpse of what might be called today's strained creativity among persons with disabilities inside this tension. The paper argues that to use go alongs can work as a way to understand both the everyday frustration when handling inaccessibility today, and the everyday basis of political frustration among disability movements regarding a "too slow" struggle against discrimination. Policy-driven evaluations, on the other hand, seem not able to fully grasp these things.

Expanding The Concept Of Situatedness Through The Notion of Temporality

Olofsson, Jennie Kristina

Faculty of Social Sciences, University of Ljubljana, Slovenia
jennie.olofsson[at]fdv.uni-lj.si

This presentation engages in a critical reading of Donna Haraway's concept of situated knowledges (1988) through the notion of temporality. As a methodological tool, the concept of situated knowledges challenges objectivity and universalist understandings of knowledge in that it aims to demonstrate the subjective character of objectivity, and more specifically, the situatedness of scientific knowledge production. Reading Haraway's outline of the concept of situated knowledges, it is noteworthy that she frequently employs spatial metaphors, in particular anywhere, nowhere and somewhere, to illustrate the idea of situatedness. Saying this, while the concept of situated knowledges takes into account the location and embodiment of the researcher subject, less is said about the researcher's constraint to particular temporal frameworks. As such, Haraway's notion of situatedness seems temporarily oriented towards the researcher's present. Inspired by the work of Barbara Adams (1998), Rob Nixon (2011), Kim Fortun (2014) and Erin Fitz-Henry (2017), this presentation engages in potential ways in which Haraway's concept of situated knowledges can be used as a means to acknowledge questions that adheres to temporality, and more specifically the short-time temporalities that characterizes much of contemporary (capitalist) life. Haraway has indeed showed the importance of acknowledging the researcher's own situatedness when it comes to space, and elaborating on the concept, this presentation aims to show that the positioning of the researcher subject is not temporarily indifferent.

RN20_06 | Situatedness and Data Collection II: Transcending the Boundaries of Situations

Transcending the Boundaries of Doing interviews

Flick, Uwe

Freie Universität Berlin, Germany
Uwe.flick[at]FU-berlin.de

Interviewing used to be seen as a well-defined setting of doing qualitative research. In most cases, interviews were conducted in a face-to-face situation between two people (interviewer and interviewee) in a specific room for example. Interviews mostly were limited to one meeting. They are usually based on a common language and a number of implicit assumptions about cultural background knowledge shared by the participants. Many studies relied on one type of interviewing used as a stand-alone method. This well-defined setting has recently been challenged not only by online or Skype based interviewing or by using mobile methods with participants in the fields. Complex issues of research also ask for transcending the interview setting in other ways, which are the focus of this paper. Its background is a study about labour market integration of refugees who came to Germany lately. The interview setting had to be transcended in several directions: Many interviews were conducted in Arabic, either with interpreters or followed by translation into German afterwards. For covering the process of integration over time, repeated interviews in a longitudinal design are necessary. For more comprehensively understanding the process of finding long-term gainful work, episodic interviews with the refugees are triangulated with different methods – expert interviews with other actors such as employers, job centre staff, activists from informal initiatives etc. This paper will discuss these challenges and examples of our experiences with transcending the interview setting for their methodological implications in conceiving relations and communication in interviews.

Discourse Ethnography. On Analysing Structures That Transcend the Boundaries of Situated Action

Elliker, Florian

University of St.Gallen, Switzerland
florian.elliker[at]unisg.ch

Discourse ethnography can be understood as research design that uses ethnographic fieldwork to study how macro-level structures are intertwined with micro- and meso-level contexts in shaping locally situated action. Situated action is also (but not only) constrained by elements external to the situation. Such external constraints do not necessarily need to become manifest in the situation to be relevant for action: Departing from a (radical) situational and interactionist perspective, I suggest to conceptualize such elements as meaning contexts. Such macro-structural meaning contexts do not, however, govern local action in 'unmediated' ways; rather, meso- and micro-level knowledge conglomerates are fundamentally implicated in shaping how macro-level processes produce specific social outcomes. Discourse ethnographies can be used to pursue a range of analytical purposes. Amongst these are the following: (1) With an interest in understanding and analysing local settings in their complexity, discourse ethnographies aim at studying how a more or less diverse range of discourses shapes a given local setting that is additionally structured by local knowledge. (2) If interested in studying a particular discourse, a discourse ethnographic approach entails sampling and comparing a range of different micro contexts to reconstruct the typical ways in which this discourse constructs social reality, inflected and co-produced by the local knowledge in these different contexts. In the paper, I address some of the methodological challenges that such research designs pose, particularly what type of data is needed to plausibly reconstruct how discourses as macro-structures shape situated action. The paper draws on an ethnographic case study of a large-scale transformation process of groups that are embedded in a shared organizational contexts.

Disentangled Drug Trajectories And Recursive Methods: How Young People Use Illegal Drugs During Transitions From Adolescence Into Adulthood

Fynbo, Lars; Østergaard, Jeanette

VIVE - The Danish Centre for Social Science Research, Denmark
lafy[at]vive.dk, jea[at]vive.dk

Contemporary drug research conceives addiction as a mental disorder with harmful individual and social consequences. From this perspective, drug addiction develops through continuous stages comprising a drug trajectory. Each stage outlines different risk characteristics and entails different consequences for the individual's social life, family, etc. This study analyses drug trajectories in a non-clinical sample of 49 people selected from a cohort survey to 6,000 children born in 1995. The 49 interviewees participated in biographical qualitative interviews at age 17, 19 and 22. Focusing on the 29 interviewees with illegal drug consumption experiences, the study plots everyone's drug trajectory from initiation, via experimentation, regular and risky use, towards addiction. The analysis gives special attention to the nine interviewees who reported risky use touching upon drug addiction. Rather than focusing on the boundaries delimiting the different stages of each drug trajectory, the analysis explores the young people's transitions between stages, including changes in the interviewees' risk perceptions and to their social lives. The analysis finds that drug trajectories for this sample are not always linear but more often recursive with several interviewees moving "back" and "forth" within the same trajectory over time. Based on the empirical analysis, the study concludes that to conceive drug trajectories as linear and somewhat logical pathways towards (eventually) addiction may not apply to non-clinical drug users. Instead the study proposes three new types of trajectories: 1) straight-forward trajectories (consistent with current conceptions), 2) recursive trajectories and 3) non-trajectories.

Changing Stories or Stories of Change? The Restructuring of 'the Self' Across Multiple Interviews with the Same Informant

Bengtsson, Tea Torbenfeldt; Berger, Nichlas Permin

VIVE - The Danish Center for Social Science Research, Denmark
ttb[at]vive.dk, NiBe[at]vive.dk

This paper explores how multiple interviews with the same informant carry important knowledge about social change and the use of interview data. Qualitative researchers largely agree that interviews are interactional events that enable interviewees' to manage and accomplish consistent presentations of 'self'. From a social interactionist perspective, the narrative construction of self is always conditioned by the social context in which they are produced. However, when analysing interviews their interactional structure is often set aside in order to conceive data as valid expressions of the interviewee's 'real' self. This paper analyses four interviews with two different interviewees; a young man with experiences of living in out-of-home care and a young mother who had her baby girl placed in out-of-home care. Both of their lives are thus in different ways are structured by interventions from the child protection system. By comparing the different interviews, the analysis focuses on how the interviewee's stories are not fixed over time and across interviews. Rather, the interviewee's stories and presentations of their self change – sometimes dramatically – between interviews. The analysis highlights three dimensions that influence these changes 1) the micro-organisation of the interview situation, 2) the organisation of everyday life, and 3) macro-level structures – such as social welfare interventions. The discussion interprets the dimensions as facilitators of stories of self-change, rather than documentation of how interviewee's deliberately manipulating their stories of self. A focus on analysing changes in stories from one interview to the next can contribute important knowledge to our understanding of the interviewee's sometimes fragile experiences of self and, more generally, the significance of such changes for our interpretations of qualitative data.

RN20_07 | Situatedness and Data Collection III: Comparing and Extending (Ethnographic) Cases

Pushing the boundaries of Ethnography: doing Comparative, Collaborative and Continuing Ethnography

Moerman, Gerben; Bröer, Christian; Veltkamp, Gerlieke; Ramanujam, Archana; Bouw, Carolien; Verplanke, Loes

University of Amsterdam, Netherlands, The
gmoerman[at]uva.nl, c.broer[at]uva.nl, g.veltkamp[at]uva.nl,
A.Ramanujam[at]uva.nl, c.bouw[at]uva.nl,
l.verplanke[at]uva.nl

Since 2016 we have been setting up a large-scale study on eating, drinking, physical activity and sleeping of children between the age of 0 and 4. Our research is intended to shed light on health practices in everyday life. The ethnographic panel study is concerned with practices within the family and socio-environmental resource pathways leading to health inequality and child overweight. The study is part of a cohort research programme initiated by Sarphati Amsterdam. Our design is meant to lead to a large data set which enables ad-hoc and post-hoc questions and can help to make sense of epidemiological and register data. In this paper, we want to share our methodological reflections on setting up and performing this Comparative, Collaborative Ethnographic panel study. We will show how we designed the comparison of practices within the family with different researchers while trying not to sacrifice depth. This is only possible when trying to push the boundaries of what is commonly considered ethnography.

The Elephant In The Room: Reflections On 'Comparison' From An International Study Of Childhood Publics

Varvantakis, Christos; Nolas, Sevasti-Melissa; Aruldoss, Vinnarasan

Goldsmiths, University of London, United Kingdom
c.varvantakis[at]gold.ac.uk, s.nolas[at]gold.ac.uk,
v.aruldoss[at]gold.ac.uk

In idiomatic English to invoke 'an elephant in the room' is to indicate an unspeakable problem. It is a declaration of knowledge held in common by those present in the room and an invitation to address it, in conversation. In the ancient

Indian parable of the blind men and the elephant, the animal is not known and the blind men must come to know it and define it by feeling their way around its body. The figurative elephant prompts us to think about the relationship between Europe and its beyonds, as that relates to practices of knowledge construction. This contribution problematises one particular 'elephant' which we encountered in an international ethnographic study of childhood publics in two European cities (Athens, London) and one Indian city (Hyderabad), namely: the elephant of 'comparison'. Comparative practice is the bedrock of much qualitative research whether acknowledged or not. Yet, to compare also suggests a number of boundaries, divisions and binaries, of similarities and differences, which sit awkwardly in a globalised world and within an ethnographic sensibility. In presenting our study to different audiences we invariably received questions about within city and between city comparisons. These were questions we tended to resist. In this contribution, we explore the narrative arc of the 'comparative' in the study -with all the boundaries, divisions and binaries it invokes - in an attempt to, like blind people in the presence of a proverbial elephant, feel our way, piece together and eventually, articulate ways in which the study practised comparisons and why questions of boundaries, divisions and binaries caused such discomfort.

Qualities of Practising Cross-Jurisdictional Comparison

Pedersen, Inge Kryger

University of Copenhagen, Denmark
ikp[at]soc.ku.dk

Learning from currently non-standard practices of comparative qualitative research demands further methodological reflection and articulation. In this paper, I explore how comparative moves deployed in an ongoing qualitative comparative case study set in Denmark into three emerging professional 'proto-jurisdictions' of water-related climate adaptation, prevention of lifestyle-related diseases, and innovation management may help to push at a field of doing comparison within which linear-causal comparative ambitions might not be suitable. By demonstrating our collaborative research practice on professional boundary work, I show how our comparative strivings have had potentials – or 'qualities' (Pink & Morgan 2013) – to opening methodological boundaries for doing comparative qualitative research. Such potentials will prove important as we try to evaluate: what is relevant to compare; what are implied comparisons; how to get them visible; which 'language' or common terms can we develop; when are the comparisons (needed to be) intensive or extensive; what are the best units of comparison; what are the relationship between units; how to find variation among relational forms, for example when not only stating a hierarchy among professional groups but also degrees of kinds of hierarchies.

Distinguishing the Typical From the Idiosyncratic. On the Adequacy of Using Ethnographic Case Studies as Pars Pro Toto Representations of Society

Reichle, Niklaus

University of St.Gallen, Institut of Sociology, Switzerland
niklaus.reichle[at]gmail.com

The process of becoming a minority after the end of Apartheid has been contradictory and ambivalent for the relatively small white Afrikaans-speaking population segment of South Africa: While for some, social downward mobility has become a reality, the majority remains privileged when compared to the rest of the South African population in terms of wealth and income. However, an increasingly uncertain socioeconomic outlook as well as symbolic and political marginalization have created an overall sense of decline and precarity. This paper gives an insight into an on-going ethnographic project that examines how white Afrikaans-speaking students who live in student residences on two University campuses in South Africa perceive, experience, and cope with precarity and socially downward mobility. Based on data from an initial phase of fieldwork, the paper addresses the question of how in-depth interviews, participant observation, and photo-elicitation interviews can systematically be triangulated in order to generate findings that are relevant beyond each of the examined cases. How and to what extent can the investigated phenomena – the heterotopias of the student residences, the perceptions of the students – be interpreted as pars pro toto being representative for or typical of the wider South African society? How can the findings be regarded as relevant on a larger scale, e.g. for specific wider population segments? Given the specific methods employed, what other data is potentially needed to make such inferences? The paper thus discusses the methodological question of how to distinguish the 'typical' from the 'particular' or 'singular' in qualitative research projects.

RN20_08 | Collaborative Data Collection/Future of Qualitative Research

Supporting Data Collection Techniques in Qualitative Longitudinal Research

Pustulka, Paula; Buler, Marta

SWPS University, Poland
ppustulka[at]swps.edu.pl, mbuler[at]swps.edu.pl

Incorporating a range of qualitative methods into longitudinal research designs has been increasingly popular in recent years as researchers seek to investigate the dynamics of the ever-evolving social reality. A temporal perspective, which – from a practical standpoint -broadly aims at empirically capturing change between the timed waves of data collection, tends to rely primarily on interviewing techniques. While the conceptual contributions that pertain to strategies and challenges of interviewing within qualitative longitudinal research (QLR) are quite well-documented, less is known about the more technical side of this type of research, even though supporting techniques of data collection are often used. Therefore, this paper recounts the characteristics of the QLR and discusses which supporting techniques (ST) might contribute to a better understanding of the temporally-framed research problem. Specifically, we draw on three qualitative longitudinal projects that utilized concentric circles, trajectory drawings, activity cards, tables and genograms. In assessing their usability and efficiency, we focus on how well ST of data collection fit into the QLR designs, as well as discuss the value that different techniques may bring to the fieldwork and data analysis.

Collaborative Online Interpretation

Steinhardt, Isabel

University of Kassel, Germany
steinhardt[at]incher.uni-kassel.de

One main requirement of hermeneutic methods is the joint interpretation of data in groups. The aim of the joint interpretation is to broaden the spectrum of possible readings and understandings of the material, based on the assumption that the interpretation is always related to on one's own experience and perspective. The joint interpretation of data allows for generating research results and explanations based on inputs that are more diverse with people who are involved in the analysis being from different social backgrounds, gender and age. For joint hermeneutic interpretation, it is necessary to find an interpretation group, ideally a heterogeneous interpretation group. Therefore, it was explored whether it is possible to interpret hermeneutically online. A wiki-based tool was developed and tested for this purpose. Narrative interview material from the open science project "Use of digital technologies for the study and habitus of students" was used for the test (see: www.sozmethode.de). The presentation will tackle the following points: 1) Which conditions must be fulfilled in order to be able to interpret collaboratively online? This concerns issues of data protection, access possibilities and technical boundaries. 2) How does the process of interpreting online look like? The tool, the methodical and theoretical background and the possibility to use the tool will be presented. 3) What results can be achieved? Reflecting the participation online, the differences of the interpretations between the online group and a real interpretation (control) group will be presented.

RN20_09a | Measuring, Automation, Diagrams, Podcasts: Extending Qualitative Data Analysis

Automated Text Analysis In The Domain Of Qualitative Research. A Methodological Approach

Philipps, Axel

Leibniz University Hannover, Germany
a.philipps[at]ish.uni-hannover.de

A new development in qualitative research methods challenges the drawn boundary between quantitative and qualitative research. Qualitative researchers are currently confronted with a growing number of software solutions for automatic 'qualitative text analysis' that were engineered by computer linguists, computer scientists and others (see e.g., Ignatow and Mihalcea 2016). As a consequence, researchers with a background in qualitative research are now confronted with text mining tools, which support interpretive social sciences to a limited extent. Moreover, as latecomers, they are in a position to assess the usability of automated text analysis

tools rather than advancing software solutions dedicated to qualitative research. My presentation discusses challenges and opportunities to implement and apply text mining technologies in qualitative research. My main objective is to identify requirements that support qualitative inquiries. It starts from the observation that text mining tools enable researchers to classify, group and rank a large textual corpus. Such an approach might offer new and unfamiliar perspectives on data for qualitative researchers. However, I argue the salience of text mining technologies for qualitative research will increase if we shift away from methods of grouping and clustering whole text corpora to processes that automatically detected documents that do not fit into applied conceptual constructs provided by interpretively oriented social researchers. Especially textual data that deviates from proposed conceptual constructs offers empirical material to interpret contrasting documents and then to specify and adjust existing assumptions, hypotheses and theories. Reference Ignatow G and Mihalcea R (2016) Text mining: A guidebook for the social sciences. London et al: Sage.

What Do Sociologists 'Measure' When Speaking of Happiness (and How)?

Narbut, Nikolai (1); Trotsuk, Irina (1,2); Grebneva, Valeriya (1)

1: RUDN University, Russian Federation; 2: Russian Presidential Academy of National Economy and Public Administration, Russian Federation
narbut.n[at]mail.ru, irina.trotsuk[at]yandex.ru, grebnevavaler[at]rambler.ru

In recent years, the issues of happiness have become phenomenally popular especially for different global rankings. There is a wide range of quantitative studies (mass surveys), whose authors seek to characterize population of different countries by the level of happiness, and, thus, present international ranking of countries according to this level. Even without taking into account a certain absurdity of attempts to compare multi-million communities by their level of happiness, the results of such surveys raise a lot of questions for they are often contradictory, especially when it comes to international comparisons and national surveys (in an international study a country can be presented as quite unhappy while according to national polls its population is much happier). Many scholars admit the necessity to systematize interdisciplinary definitions of happiness, to create typologies of factors influencing everyday interpretations of happiness (dominant media discourses in particular) and lists of empirical indicators to 'measure' it. However, this is not enough for clarifying what people really mean when answering surveys' questions and describing themselves as happy/unhappy. Qualitative methods can be a solution here, for instance a combination of the unfinished sentences technique, narrative interview and Twenty Statements Test. Such a combination can serve as a methodological experiment and a preliminary stage for designing a mass survey questionnaire, because it allows to make necessary changes in the standard questionnaires on happiness, thus, ensuring more valid and reliable results of mass surveys.

Sound as a Landscape for Reflection on Thesis Writing

Høyen, Marianne

Aarhus University, Denmark
hoyen[at]edu.au.dk

This presentation discusses the use of podcasts to inquire how students cope with writing their final master's thesis and shows how this approach offers a qualitatively rich way to support future thesis writers. The last decade has seen the publication of vast numbers of study skills books and an increasing focus on study skills on University webpages so, as podcasts are becoming increasingly popular, I wanted to examine whether this aural medium can provide a useful space for students to reflect for on their own writing processes. Sound offers the listener possibilities to engage with content in other ways than text or videos, so podcasts may provide a fruitful alternative to existing formats. I contacted five students for whom writing their thesis was an ongoing process and arranged to interview them five to seven times from the outset through to submission. I talked with the students about their thoughts, considerations, fears, and hopes in relation to the task ahead. These differed considerably for each student, partly depending on students' life-styles, their prior experiences in school and at University and their aspirations for the future. From the interviews I created podcasts around the students' experiences of thesis writing to make a space for reflection for new thesis writers. The presentation will discuss theories of sound, present the intentions behind the making of the podcasts and how they aim to meet students known and unknown needs as writers, and offer examples from the podcast.

Towards An Ethics Of Rupture: Diagrams As Technique In Social Research

Whiteman, Natasha Ewa (1); Dudley-Smith, Russell (2)

1: University of Leicester, United Kingdom; 2: UCL Institute of Education
new9[at]le.ac.uk, r.dudley-smith.14[at]ucl.ac.uk

This paper focuses attention on one of the most under-discussed yet widely deployed conventions for the analysis of social processes: the creation of diagrams. We argue that these are only fully productive if they take relational form. Often, they do not. One aspect of the productivity of such diagrams is examined: their ability to encourage an estranging move from both scholastic a priori theorisation and sedimented common-sense understandings of the world. They are then a key technique for what we have termed an ethics of rupture. Their implications for the practice of sociological research is considered via reference to the writing of Bachelard on the requirement in science for artificial technique (Bachelard, 2002 [1938], 1968 [1940]) and Bourdieu's imperative that researchers work towards sociological reflexivity (2019; 1991 [1968]; 1992). These themes are illustrated through interview data generated during a study of media filesharing activity: the

necessary diagrammatic principles are applied to this setting. The result is contrasted with a well-known diagram, Howard Becker's (1963) classic typology of deviant behaviour, that, we argue, does not succeed in making the necessary break with non-relational conventions. In presenting our analytical shift, we introduce an alternative mode of diagramming the social, Social Activity Method (Dowling, 2009, 2013). Through this organisational language, the paper questions the taken-for-grantedness of the 'conceptual exercises' (Bailey, 1994) of some sociological research and draws attention to the way that diagrams may become corrupted via traces of the 'known.'

RN20_09b | Relating to Research Participants: The Self and its Boundaries in Qualitative Research

On the Issues of Being a Stranger and a Confident: Researching Biographical Crises

Caetano, Ana

Instituto Universitário de Lisboa (ISCTE-IUL), Centro de Investigação e Estudos de Sociologia (CIES-IUL), Portugal
ana.caetano[at]iscte.pt

Interviewing a person who has experienced a difficult or even traumatic event in her/his life can be considered a privilege, in the sense that we access a private and intimate domain of that individual. But it also raises a number of issues that need to be addressed to ensure the protection of both participant and researcher, as well as the validity and objectivity of the study. There is a difficult balance to be made between the need to collect data to meet the research goals and the need to empathise with the respondent's experiences and perceptions, especially considering the sensitive nature of the inquiry topic and the interviewee's vulnerability. This presentation is focused precisely on the different challenges encountered in a sociological study focused on biographical crises – i.e., stages of life marked by the disruption of habitual frameworks of action and thought, which have a substantial impact in the lives of individuals – and the strategies developed to cope with such issues. It is argued that the problems faced (i) begin before meeting the participants with the procedures of accessing the studied population, (ii) are particularly visible during the interaction between interviewer and respondent, and (iii) also manifest themselves after the interview ends, since the researcher has herself to cope with the crises narrated during the interviews. The role of emotions of both researcher and participant in this three-folded process, as well as the reciprocal character of the interaction situation are key to this discussion.

Self-disclosure as a Means to Transcend the Boundaries Between the Researcher and the Subject

Necef, Ümit

University of Southern Denmark, Denmark
necef[at]sdu.dk

This paper will present autoethnographic reflections on how self-disclosure contributed to breaking down the boundary between myself and an inmate convicted of terrorism during an interview. After I told the inmate that I had myself been involved in leftist extremist organizations in my early youth, I felt that the ice between us was broken and he opened up to me. Simmel (1950) writes that "obviously, all relations which people have to one another are based on their knowing something about one another" (Sociology Inquiries into the Construction of Social Forms). In the beginning I presented myself to the inmate with all the necessary information about my research. However, my position as a detached researcher became untenable when he began elaborating the "void" inside himself, and how he filled it with Islamic State's ideology. I felt the need to tell him about my youth. My identification with some of his initial intentions helped me to question my own over-demonizing and over-exoticizing of him and seeing him as an example of the "ultimate other". The inmate was not merely a "research object" any more, but a human being who had chosen a wrong path to realize his political and religious ideals, a "lost soul" - just like I had been in my late teens. Moreover, my engagement on a personal level and building up a rapport with him led me to see more clearly the similarities between all the extremist and violent ideologies and groups, notwithstanding their various religious and political positions.

The Complexities of Studying 'Up'

Brade, Lovise Haj

Mid-Sweden University, Sweden
lovise.hajbrade[at]miun.se

In 1972 anthropologist Laura Nader urged her colleagues to turn their gaze upwards and start critically engaging with the (re)production of what seems to be given and uncontroversial positions of power rather than focusing on the sociological darling of the underdog. Since then, Nader and many of those who followed her call has presented convincing arguments as to why this shift of focus is important but very few has presented methodological reflections concerning the question of how to do it. In my current research I engage with the challenges of studying the privilege of normality within a range of different areas (such as whiteness, middleclassness, straightness and ablebodiedness) and in this presentation I will discuss the complexities and uneasiness of keeping a steady focus 'upward' (or perhaps: sideways) when recruiting and interacting with research participants. As Bob Pease has noted, people tend to get angry or defensive when confronted with their privileges (2010:9) and navigating these reactions as well as challenging the unmarked status of normality are at the core of what I refer to as 'Studies of firstness' which aims to enhance the awareness of what Alison Bailey calls

"systematically conferred advantages individuals enjoy by virtue of their membership in dominant groups" (1998:109). In this presentation I will discuss the strategies of poking, flirting and being a killjoy which are some of the methods I have tested when trying to sensitize participants to their privileges during interviews.

Situating the Self in the Field: Biographical Echo in Ethnographic Research

Erasga, Dennis Saturno

De La Salle University, Philippines
dennis.erasga[at]dlsu.edu.ph

Ethnography as a research methodology reads context as a form text. In the postmodern sense, ethnographic reading is a mediated process and what goes between the researchers and how they read the research field is their biography. By extension, there will always be biographical remnants in all ethnographic enterprises. The challenge, therefore, for researchers is to be able to discriminate which portions of the ethnographic regimen are most vulnerable to biographical bias. Locating these portions allow researchers to create a modus vivendi to satisfy the demands of a sound sociological research. The present paper explores the implications of these challenges by imagining fieldwork as encounter with multidimensional yet progressive modalities- from the archival to the scopic culminating in the biographic. It maintains that the biographical echo of ethnographic productions reverberates more in the research scribal phase than in the actual fieldwork, where the multiple, fragmented and fragile positions (biographic episode) that the researchers invoke and bring into play ultimately displace the authentic context (scopic episode) of the data co-produced and made meaningful with participants during and while in the field.

RN20_10a | Digital and Analogue Discourses

Work-related Discussions and Online Sociality on a Global Online-forum – Studying (Professional) Knowledge in the Making?

Fersch, Barbara

University of Southern Denmark, Denmark
fersch[at]sam.sdu.dk

In the proposed paper I want to present methodological reflections on forum discussions as qualitative research material. In order to study work practices and (informal) rules on an online platform for freelance work I have analysed 27 discussion threads including 1427 postings from the lively forum of the platform. What does characterise this kind of qualitative data in the context of specific work practices? Two aspects will especially be considered: 1) the role of sociality / "the social world" of the forum and 2.) role of communicative aspects. I will argue that several characteristic – e.g. the asynchrony of communication, the status of in-between oral and written and the "public intimacy" of the online forum make it especially useful for getting insights into the constitution of meaning. It opens up the opportunity to study these processes even earlier than with other qualitative material (oral, synchronous). In the context of the specific case of forum discussions on working on an online platform this might mean to get an insight on the process of the externalisation of practical experience to (professional) knowledge in an early stage. Thus, I will argue that the analysis of online forum communication can contribute with unique insights to processes of meaning making in general and the work-related / professional knowledge making in particular.

Personal Testimonies from the Times of Boundaries Melting and Crystallising

Kusá, Zuzana; Orišková, Dominika

Institute for Sociology Slovak Academy of Sciences, Slovak Republic
zuzana.kusa[at]savba.sk, dominika.oriskova[at]savba.sk

The goal of our contribution is to display the value of processual approach to boundary breaking and making in everyday language for the study of living in unsettled political situation. The base of our study are 200 letters written by readers of national dailies in February 1990 in response to the call of the Slovak Sociological Association to share their personal experiences of the days of "Velvet Revolution" (the breakdown of the Communist regime in former Czechoslovakia) in their workplaces, neighbourhoods and families. The letters are believed to present "authentic imprints" of at that time experienced dilemmas, hopes and

worries associated with erosion of settled classifications and hierarchies and organisational and jurisdictional boundaries as well as descriptions of (especially at workplaces) negotiations and crystallisations of new social and moral boundaries. Our study of the procedures of boundaries/categories/identities' melting and crystallising chiefly focuses on the rhetorical figures by which letter writers brought (moral) order and sense into experienced events and negotiated new taxonomies that would make their moral inclusion possible if their former regime identities were stigmatised. Though we both employ dramaturgical sociology perspective of Erving Goffman and some ethnomethodological inspirations, our age difference is so high that dissimilar sensitivity to language tropes and arguments of the foregone period could be expected. That is why we design our study as quasi experiment. In its first stage we do discursive analysis of letters independently. Its second stage is meant as space for discussion of our coding and interpretation and for negotiating consensual interpretations of processes under study. The separation of stages might help make the effect of differing generational experiences on interpretation process more visible.

"Completely Ordinary Girl": Firsthand Narrative from a Swedish Syrian Traveler who joined Islamic State

Esholdt, Henriette Frees

Lund University, Sweden
henriette.frees_esholdt[at]soc.lu.se

This paper presents a single case study of a young female Swedish so-called Syrian traveler (hereafter called Jasmine), who went to Syria in 2014, after IS's self-proclamation of the Caliphate. The analysis takes its point of departure in data consisting of: 1) Visual materials of Jasmine and two blogs (consisting of uploads of texts, pictures and a short story) created by Jasmine a couple of years before leaving for Syria, and 2) A Facebook profile (consisting of uploads of texts, pictures and videos) created by Jasmine around the time she went to Syria. The analysis describes how Jasmine went from, in her own words, being a "completely ordinary girl" to propagandizing for radical Islam on social media from Syria. The analysis is complemented with data from interviews with persons in Jasmine's close social milieu as well as with professionals in the field (such as police officers, social workers etc.). Drawing on Gubrium and Holstein's methodological concept of 'analytic bracketing' (e.g. 1997, 2009), the analysis seeks to outline the complexity concerning why and how young people from the West, more specifically women (as in the case of Jasmine) become involved in violence-promoting Islamist extremism. With this approach the analysis seeks to capture the interplay between Jasmine's narrative work (how she performs and presents herself) and the "narrative environments" that Jasmine was situated in (what the social context of Jasmine's narrative work is). The paper is a work in progress.

495

The Role Of The Generational Gap In Family Practices Toward Social Media

Bozukova, Katya Danielova

Royal Holloway University of London, United Kingdom
katya.bozukova.2015[at]live.rhul.ac.uk

Children's usage of social media technologies is conceptualised in traditional media and policy as being inherently risky. However, the concept of the generational divide - which sees children as "digital natives" and their parents as "digital migrants" - lacks sufficient empirical backing and overly simplifies the processes that go into family practices around social media technologies. Using data from family group interviews with children between the ages of 4 and 15, this paper argues that there is insufficient evidence to support the idea of a generational gap between parents and children as far as social media is concerned. While there are differences in how family members perceive risk and trust on social media, and differences in social media usage, there is not sufficient evidence to suggest that this is determined by generation alone. Indeed, what this paper will argue is that individual disposition, family environment, and wider social circle, have far bigger influence on children's usage of social media and their families' practices around social media. This has an impact both on scholarship, and on policy, as the generational gap is a widely espoused assumption. This paper will report in part on a wider research project undertaken with the support of the Leverhulme Trust, in collaboration with Royal Holloway University of London.

RN20_10b | Pedagogy and Research Ethics

The Ethics Of Research And Researching Ethics

Kärgel, Katharina

Goethe University Frankfurt, Germany
katharina.kaergel[at]web.de

There are many phenomena that within specific cultural and social context are 'sensitive'. This is especially true for phenomena that deal with potential fears of stigmatization or reputational damage. As researchers, we are generally well versed in outlining the importance of protecting participants, the way we intend to this and the possible consequences of the research process upon the lives of those being studied. Experience clearly indicates that these are not the only participants affected by the research. Especially with regard to investigating sensitive issues within organizational settings, the researchers and non-participating employees may also be placed at risk. The present paper aims at uncovering a gradually developing 'spiral of fear', initiated by organizations' alleged fear of being publicly blamed, resulting in manifold fears felt by almost all organizational actors as well as the researcher(s). The presentation focuses on the associated implications for field access, methodological concerns, data collection, data analysis and explanatory power. Basis for this

is a critical reflection on a research project examining whether social identity is a predictor of employees' destructive authoritarian obedience within public corporations and agencies in Germany. Despite the successful agreement on the research cooperation, the research project was steadily doomed to failure, among other things because of a strict organizational governance of the research process. For example, interview partners have been directed with regard to their response behavior. The outline field experience calls for strategies encouraging the collaboration of research and practice.

A Method Proposed for the Analysis of Lesson Observations: The Exploration of Social Representations about the Student-Teacher Relationship.

Morales Verdejo, Jocelyn Lisette

Institute of Education - UCL, United Kingdom
j.verdejo[at]ucl.ac.uk

In this abstract, a method for analysing lesson observations about social representations that both teachers and students can have of their relationship within the classroom is proposed. Although research on the student-teacher relationship has been studied extensively, research on social representations about the relationship is rather scarce. Indeed, the analysis of lesson observations for exploring social representations about the student-teacher relationship is almost non-existent. Considering that social representations are a complex social construct for analysis, it is necessary to reflect on the best way to do it. Even though there are several ways for analysing lesson observations, these methods and techniques have shown to be insufficient for the comprehension of the social representations. As part of my doctoral thesis, I have proposed a method which is based on the mix of three sources: the theory of social representations of Moscovici, the definition of the verbal, non-verbal and para-verbal languages of Van-der Hofstadt, and the technique of Thematic analysis by Braun and Clarke. Eight observations of classes of different teachers belonging to four high schools were analysed with this method. The experience was very positive and provided significant insights into the understanding of social representations about the relationship of both teachers and students in the classroom. The proposed method of analysis turned out to be quite practical and easy to follow. However, it requires some adjustments which are discussed in this document. The limitations and scope of the method are also discussed.

Empowerment And Social Responsibility In Qualitative Research

Behrensen, Birgit

BTU Cottbus-Senftenberg, Germany
birgit.behrensen[at]b-tu.de

The aim of the paper is to open a discussion on the challenges of digital technology for the progress of qualitative research. The benefits are obvious. Recording and transcription is continuously getting faster, more precise and cheaper. With the help of digital tools the analytical process gains in depth, breadth and complexity. The thesis of the paper is that these developments produce challenges, which need new ethical and methodological reflection. This thesis will be discussed by analyzing problems that occur in qualitative research with refugees in Europe.

The challenges begin with the decision, if a researcher should sound record or even video record interviews or rely on handwritten notes. Because of experiences before and during their flight, many refugees have reasons to refuse recording their voice. Methodological decisions to create a trusting cooperation based on safety and empowerment can conflict with the state of the art. By doing interviews with non-native speakers or interpreters another question is, how differentiated such recorded material can honestly be used. A further issue is how to publish this material. While reading phonetically transcribed material is part of the academic culture, target groups often state discomfort, when reading quotations that ignore the rules of correct language, punctuation and grammar. This is especially true for refugees, who experience exclusion in times of growing nationalism that often refers to national language. In order not to reproduce or even strengthen social hierarchy, methodological decisions need empowering solutions beyond the current practice.

origin for this conceptualisation lies in the possibility of exploring consistently policy, knowledge and interaction as a way of an in-depth exploration of the processes and enactment of the pedagogical practice.

This work is presented as a theoretical piece drawing on results from previous research and aiming to support the methodological framework of forthcoming research. Within this context the paper has a dual focus, firstly on lessons learned regarding theoretical and methodological imbrication in pedagogical practice analysis and secondly, the possibility of overcoming the boundaries and barriers presented by the use of combined theoretical and methodological frameworks.

Analysing Pedagogical Practice: Theoretical and Methodological Boundaries

Kolokitha, Magdalini

University of Thessaly, Greece
mkolokitha[at]uth.gr ; magfocus79[at]gmail.com

The present paper aims to explore theoretical and methodological boundaries for the analysis of the pedagogical practice. In this paper, the analysis of the pedagogical practice concentrates on three particular aspects a) the curriculum – as the policy driver, b) the teachers' understating of the curriculum – as the recontextualisation of knowledge and c) the teacher-students interaction within the classroom – as the realisation of the pedagogical practice.

The theoretical combination utilises the work of Foucault, Bernstein and Goffman and the methodological imbrication concentrates on discursive methodology, ethnomethodology and symbolic interaction. Within this work theory and methodology are understood as notions that formulate particular frameworks and in doing so, they also construct theoretical and methodological boundaries and barriers in attempting to use them simultaneously. However, the point of

Measuring the Permeability of Class-Boundaries: An Information Theoretic Approach

Mueller, Georg P.

Univ. of Fribourg, Switzerland
Georg.Mueller_Unifr[at]bluewin.ch

Mutual information (MI) is a concept from mathematical information theory, which describes the information-gain about a random-variable Y that results from knowledge about a related variable X. The concept is obviously of interest for intergenerational mobility research: in open societies with permeable class-boundaries the MI of the parental class-position X with regard to the status Y of their children is generally small, whereas in feudal societies with strict class-barriers the corresponding MI is generally higher. Thus MI is an indicator of the inequality of chances. One of the advantages of MI is the possibility to decompose it by the class (a) of the parents and (b) of their children. The first case refers to the information of the class of origin about the child's destination: this is an indicator of the conservatism of the related class as a result of social heritage. In the second case we acquire knowledge about the information contained in the class of destination about the child's origin: this indicates the closedness of a class due to the exclusion of social newcomers. In order to show the utility of the mentioned indicators, the author uses the European Values Study (2008) for an analysis of the intergenerational transfer of educational attainments in different countries. The high standardization of the data-source allows to compare countries with regard to conservatism and closedness of primary, secondary, and tertiary education. The analyses show for the three educational strata a considerable variation of closedness and conservatism within and between countries.

A Phantom Menace: Random Data, Model Specification and Causal Inference in Qualitative Comparative Analysis

Thiem, Alrik; Mkrtchyan, Lusine

University of Lucerne, Switzerland
alrik.thiem[at]unilu.ch, lusine.mkrtchyan[at]unilu.ch

To date, the method of Qualitative Comparative Analysis (QCA) has been employed by hundreds of researchers. At the same time, the literature has long been convinced that QCA is prone

to committing causal fallacies when confronted with random data. Specifically, beyond a certain case-to-factor ratio, QCA is believed not to be able to distinguish anymore between random and real data. In consequence, applied researchers relying on QCA for the analysis of their empirical data have worried that the explanatory models presented to them would be nothing but algorithmic artifacts. So as to minimize that risk, benchmark tables of boundary case-to-factor ratios have been proposed by Marx and Dusa (2011). We argue in this article that fears of inferential breakdown in QCA are unfounded as every set of data generated by any proper causal structure can always be reproduced by an isomorphic set of purely stochastic data. In this connection, we furthermore demonstrate that Marx and Dusa's benchmarks do not prevent but force QCA to commit causal fallacies. Ultimately, we argue that random data are a phantom menace which applied researchers need not worry about when designing their analyses with QCA.

Quantitative Grounded Theory – A Neglected Tool?

Kevern, Peter; Tolhurst, Edward

School of Health Studies, Staffordshire University, United Kingdom
p.kevern[at]staffs.ac.uk, e.tolhurst[at]staffs.ac.uk

Grounded theory is a methodology for structuring and interpreting research activity, irrespective of the type of data to be gathered. Despite this, 'Quantitative Grounded Theory' is an almost entirely neglected methodological tool. This neglect suggests two things: first, the effectiveness with which grounded theory has been 'annexed' by qualitative researchers, and secondly the degree to its distinctive contribution as a methodology has been lost because of its reduction to a lexicon and set of methods for constructivist qualitative research. This is reflected in the discrepancy between the abundance of methodological writing on qualitative grounded theory, and the limited number of studies that actually adhere closely to its key tenets. Nevertheless, a strong case can be made for applying grounded theory to quantitative research. The distinctive strength of grounded theory is the way that pays close attention to the inductive phase of research i.e. processes of theory-building and the development and refinement of concepts which are frequently 'bracketed out' of accounts of quantitative research. Furthermore, because it aims only to generate working hypotheses for further testing and stops short of claiming to have arrived at robust findings, it has the potential to bridge the divide between University-led 'clean and slow' research and the needs of commissioners for 'quick and dirty' answers.

Interactive Graphs for Lineal and Logistic Regressions Networks

Escobar, Modesto

University of Salamanca, Spain
modesto[at]usal.es

Graphs have been employed not only to solve topographic problems and to represent social structures, but also to show the correlation between variables according to casual models. Path analysis and structural equations models are indeed well known by sociologists, but both were restricted to quantitative variables at their early stages. In this paper, we propose a new way to display the connections between qualitative variables in a similar way to the correspondence analysis, but using another set of multivariate techniques, such as lineal and logistic regression, mixed with network analysis. The proposed representations are based on solving several equations and selecting only those coefficients with a significant positive relationship. By doing so, graphs are obtained selecting the categories with predicted proportions or means significantly greater than those of the population. Furthermore, to increase their analytic power, they have interactive characteristics, which include either the selection of the elements according to their size or attributes, and the filter of the most central and strongest links. The first part of the paper deals with the statistical basis of these representations; the second proposes programs to make them possible, and the third gives examples of their use in international comparative surveys.

Experimental Evidence On The Effect Of Using Rating Scales With Numeric Instead Of Semantic Labels

Gummer, Tobias; Kunz, Tanja

GESIS Leibniz Institute for the Social Sciences, Germany
tobias.gummer[at]gesis.org, tanja.kunz[at]gesis.org

Web surveys are increasingly being completed by using smartphones. This trend facilitates the need to optimize question design to fit smaller screens and thereby to provide respondents a better survey experience, lessen burden, and increase response quality. In this regard, it has been suggested to replace semantic labels of rating scales (e.g., “strongly like”) with numeric labels (e.g., “+5”). However, research on the applicability of these scales is sparse, especially with respect to interactions with other scale characteristics. To address this research gap, we investigated the effects of using numeric labels on response behavior in comparison to semantic labels. Moreover, we tested how these effects varied across different scale orientations (positive-negative vs. negative-positive) and scale formats (agree-disagree vs. construct-specific). To answer these research questions, we implemented a web survey experiment. The web survey was fielded in November 2018 (N=4,200) and quota-sampled from an access panel.

RN21 | Quantitative Methods

Respondents were randomly allocated in a 2x2x2 between-subjects design in which we varied scale labels (numeric vs. semantic), scale orientation (positive-negative vs. negative-positive), and scale format (agree-disagree vs. construct-specific) of a rating scale comprising 10 items presented item-by-item. The experimental variations were assessed based on several response quality indicators (e.g., agreement, primacy effects, response times, straightlining).

Online, Face-to-Face Or Mixed-Mode? Findings From A Methodological Experiment For The Generations And Gender Survey

Schumann, Almut (1); Lück, Detlev (1); Naderi, Robert (1); Bujard, Martin (1); Cabaço, Susana (2); Emery, Tom (2); Toepoel, Vera (3); Lugtig, Peter (3)

1: Federal Institute of Population Reserach (BiB), Germany; 2: Netherlands Interdisciplinary Demographic Institute (NIDI), Netherlands; 3: Utrecht University, Netherlands
Almut.Schumann[at]bib.bund.de,
Detlev.Lueck[at]bib.bund.de, Robert.Naderi[at]bib.bund.de,
Martin.Bujard[at]bib.bund.de, Cabaco[at]nidi.nl,
Emery[at]nidi.nl, V.Toepoel[at]uu.nl, P.Lugtig[at]uu.nl

In a digitalised world CAWI becomes more and more an option for surveys due to cost savings and the accessibility for young generations. Therefore, the Generations and Gender Survey (GGG) – an international panel study focussing on family-demography and hitherto conducted in CAPI mode – carried out an experimental study which investigates the chances and risks of partly moving online for the next round of data-collection. It tests a sequential mixed-mode (push-to-web) design, combining CAWI and CAPI modes. The particular circumstances to consider are a rather long questionnaire of approximately 60 minutes, a complex routing and a high degree on private and partly sensitive questions due to familial and relational queries. The experiment was conducted in three GGS countries – Germany, Croatia, and Portugal – with more than 1,000 respondents in each country. In all three countries a reference group was interviewed in CAPI mode, while an experimental group was interviewed in a sequential mixed-mode design (CAWI and CAPI). In each country a further specific experiment was carried out: In Germany strategies of incentivitation, in Croatia the timing of reminders, and in Portugal two modes of selecting a contact person within the household were compared. We are comparing response rates, costs, representativity, accuracy of measurement, and further aspects of data-quality for different modes of data collection and the experimental groups. The experiment identifies recommendable design characteristics for a push-to-web design for the GGS and other future surveys and it provides evidence for the importance of the country-context in that respect.

Measurement of Student's Competencies: Effects of Group Testing and Individual Testing

Landrock, Uta; Zinn, Sabine; Gnams, Timo

LifBi - Leibniz Institute for Educational Trajectories, Germany
uta.landrock[at]lifbi.de, sabine.zinn[at]lifbi.de,
timo.gnams[at]lifbi.de

The German National Educational Panel Study NEPS collects, among others, data on the development of competencies throughout the life span. Generally, assessments of competencies can be implemented as group tests or individual tests. Performance tests of groups in institutional contexts are difficult to organize. That also applies for the NEPS study, which is based on voluntary participation. The implementation of tests depends on the support of the institutions, which have to provide rooms and time slots. Furthermore, participating students must be present at given test times, which can be inconvenient for them and negatively affect their motivation to participate. In the NEPS study competences were also individually tested as computer-based web assessments (CBWA). Individual testing is easier to organize and more flexible for the participants. The students can decide for themselves when and where they want to participate. However, it is unclear whether group tests and individual tests have different effects on the results of competence assessments. As part of the NEPS, a "test delivery study" was implemented in the students' subsample. Applying a split-half design, the participants were randomly assigned to group or individual tests. Competences in science, information and communication technology (ICT literacy), and domain general cognitive functions were measured. In order to answer the research question, the performance rates of the two test conditions were compared and assessed for potential intervening factors. Preliminary results indicate that results of the test groups are comparable.

The Quality Of ICT Skills Indicators - Comparing Self- With Direct-Assessment

Rynko, Maja (1); Palczyńska, Marta (2)

1: SGH Warsaw School of Economics, Poland; 2: Institute for Structural Research, Poland
mrynko1[at]sgh.waw.pl, marta.palczynska[at]ibs.org.pl

Basic ICT skills are a prerequisite for social inclusion in the information age. Level of population ICT skills as well as computer and Internet usage are of interest to the European Commission and the national governments. This is reflected in numerous strategic documents (e.g. Digital agenda for Europe, A new skills agenda for Europe, Long-term National Development Strategy for Poland). The EU survey on ICT usage provides a proxy on the level of ICT skills among individuals in Europe. However, it is based on individual's self-assessment which may be prone to misjudgements (e.g. Dunning et al. 2004) and which is shown to differ from the results of ICT skills direct assessment from PIAAC survey. Using data from the Polish follow-up study to the Programme for the International Assessment of Adult Competencies (postPIAAC) we compare self-assessment of basic ICT skills to the direct assessment. The postPIAAC was conducted between Oct. 2014 and Feb. 2015 on over 5000 respondents aged 18-69. The questionnaire included Eurostat questions on computer and Internet usage. Respondents performed also several tasks directly comparable to the Eurostat questions: coping files to a folder, using copy/cut/paste tools for text editing and using basic spreadsheet formulas. Among those who have not completed these tasks in the direct assessment, the majority declared they have carried out these task before (54%, 50% and 59% respectively). The preliminary multivariate analysis suggests that young and higher educated people are more likely to overrate their skills in the self-assessment. The discrepancy between the actual and the declared level of ICT skills poses a question of reliability of ICT indicators based on self-assessment.

RN21_03 | The subjectivities of societal exclusion and belonging

European, National and Regional Identities in the UK: An Examination Using Data from a VAA for the 2017 UK General Election

Manavopoulos, Vasilis; Triga, Vasiliki

Cyprus University of Technology, Cyprus
vmanavopoulos[at]gmail.com, vasiliki.triga[at]cut.ac.cy

More than two years following the referendum that decided the country's departure from the EU, "Brexit" continues to be a major point of contention and as late as February 2019, two months prior to the set exit-date, substantively different preferences for the future UK-EU relationship continue to be debated in the British Parliament. Surveys suggest that this ambivalence is reflected in the attitudes of the population with, e.g., the latest relevant Eurobarometer (EB89, Spring 2018) reporting that 25% of respondents perceived themselves "definitely" as EU citizens, while 31% responded either "definitely not" or "not really". This study examines the relationship between European, national and "regional" (in the sense of constituent countries) identity among the British electorate using data from a Voting Advice Application (VAA), an online platform providing voters with measures of closeness to political parties contesting an election, after users declare their agreement or disagreement on policy-related questions. The "WhoGetsMyVoteUK" VAA, designed for the 2017 UK General Election, included three 10-point scales requesting that users report how well three adjectives describe themselves: European, British, English (Scottish etc.). We employ Cluster Analysis to attempt an examination of the degree to which these different identities can be in accord or are in conflict, analysing the four constituent countries of the UK (England, Scotland, Wales, N. Ireland) separately. Finally, we proceed to examine how different identity types (national-only, cosmopolitan, mixed etc.) are distributed among different groups in the population defined by demographic and political identity variables.

Europe - A Community Of Shared Values? The Empirical Construction Of European Values Spaces Using Multiple Correspondence Analysis

Peters, Yannik

University of Bonn, Germany
peterya[at]web.de

Since the beginning of European integration, the European Union is regarded to be a community of shared values. And the European population is supposed to have a collective identity, being the result of shared culture and history. Instead of being a homogenous group, this empirical analysis makes clear that European citizens and nations are, in terms of their value preferences, rather heterogeneous and divided. European Values Spaces are empirically constructed by using Multiple Correspondence Analysis (MCA) with data from the European Social Survey. Values are operationalized with the Human Values Scale by Shalom H. Schwartz. The centred, recoded ten basic human values of Schwartz are used as active variables constructing the correspondence space. The nationalities of respondents are added as passive variable. The first MCA constructs European community of shared values with data from the latest ESS round (2016). It can be shown, that Western and Eastern European countries differ very much in terms of their value preferences. Religious differences become visible too. The second MCA reveals the development of national value priorities over time, using data from the first (2002), the fourth (2008) and the latest ESS round (2016). Based on these three data sets a shared values space is constructed in order to visualize the spatial movement of nations over time. Results show, that European nations are getting wider and wider apart from each other from 2002 to 2016. In this sense European nations are not on the road becoming a community of shared values. Instead the empirical findings reveal, that the borders between European nations get stronger in the light of European crises.

Carrying The Shackles Beyond The Walls: The Long-Lasting Effects Of Prisons On Recidivism

Morales-Gómez, Ana

The University of Manchester, United Kingdom
ana.morales[at]manchester.ac.uk

The revolving door is nearly unanimously seen as highly undesirable, but who is to blame when someone who has been released from prison relapses into crime and returns to prison? Simplistic solutions are often quoted, such as harsher sentences, stricter policing, etc. On the other side of the road, some advocate for providing ex-offenders with financial support, help in finding jobs, etc. In this research, individuals, as well as their wider social and institutional surroundings, were analysed to debunk the widespread myth that re-offending is the sole responsibility of the persons committing it. Advanced statistical methods were used to obtain prison-specific scores that inform how each prison contributed to their own former inmates' propensity towards re-offending. This is a resisted notion since it is argued that prisons cannot be accountable for something occurring after the institutions have fulfilled their duty. I argue against this and show that prisons have long-standing effects on individuals. This is the result of a combination of factors that are uniquely attributable to prisons, such as staff ratio, overcrowding, health provision, education and psychological support (or lack thereof). Beyond the boundaries of the prisons, this research also comes to the realisation that geographical inequalities play a substantial role, by showing that some territories are more favourable for the social reintegration of ex-offenders than others. This research sought to reinstate the discussion and focus on our responsibility as a society and the need to look at reoffending through a wider, more precise and ultimately fairer lens.

RN21_04 | Current challenges of survey research

Mixing Pretest Methods of Structured Questionnaires

Palmieri, Marco; Martire, Fabrizio; Pitrone, Maria Concetta

Sapienza, University of Rome, Italy
marco.palmieri[at]uniroma1.it,
fabrizio.martire[at]uniroma1.it,
mariaconcetta.pitrone[at]uniroma1.it

"Mixed Methods" is considered a new paradigm for new answers to the never-ending debate between quantitative and qualitative sociology (Morgan 2007; Tashakkori and Teddlie 2010). Nowadays, social researchers use this methodological approach in many research stages: the theoretical framework design, the data collection, the data analysis, etc. (Johnson and Onwuegbuzie 2004; Feilzer 2010; Small 2011), but few scholars

explore the usefulness of Mixed Methods for pretesting questionnaires (Mauceri 2018). In this paper, we present the results of a pretest strategy based on mixed methods approach. • Does the mixed-methods-pretest increase the number and the types of problems usually diagnosed by a mono-method-pretest modus operandi? • How quantitative and qualitative pretest methods can be mixed? In this study, three methods have been employed to pretest a questionnaire designed to investigate the attitudes towards immigrants: expert review, cognitive interview, verbal interaction coding. At the beginning we have used the expert review to locate the main problems afflicting the questionnaire. Then, the cognitive interview has been adopted to inquiry the cognitive processes of respondents involved in closed-ended question answering. Finally, we have used the verbal interaction coding to analyze the verbal interaction between interviewer and respondent in a real interview context. Offering different points of view over the problems concerning the questionnaire, the three pretest methods have allowed us to conceive solutions for the questionnaire biases taking into account different aspects of the interview process.

Offering Versus Omitting An MC And/Or A DK-O: The Consequences Linked To The Respondents' Approach To The Topic

Wetzelhütter, Daniela

University of Applied Sciences Upper Austria, Austria
daniela.wetzelhuetter[at]fh-linz.at

The effect of different numbers of response categories is recurrently examined. Although opinions diverge, offering a five-point scale plus "don't know" option might covers all the respondents' needs. However, it could be that some respondents might tend to choose the "middle category" or the "don't know" option indiscriminately, even if it would be possible to choose a more accurate solution. The paper addresses the consequences of offering versus omitting an MC or DK-O linked to the respondents' approach to the topic. Data was collected by means of an online-survey dealing with student participation at a University in Austria. The analyses are based on 7.3% (n=1,282) of the invited students, who finished the survey. Four types of respondents were classified: "inexperienced", "indifferent", "irresponsible" and "regular". The results show: The proportion of MC of inexperienced respondents decreases significantly, in case a DK-O is available. Vice versa, indifferent respondents choose a DK-O more often when an MC is not provided. Including an MC and DK-O decreases the consistency of the answers of irresponsible respondents, but excluding both does not improve the result essentially. In the end, just the consistency of answers of regular respondents is independent of the provided response scale format.

Potentials and Limits of Administrative Data to Adjust Internet Panel Surveys

Cabrera-Álvarez, Pablo

University of Salamanca, Spain
pablocal[at]usal.es

Over the last years the use of internet panels to collect survey data has been expanding around the world (ESOMAR 2017). However, this new method is affected by two main issues: undercoverage and non-response. Undercoverage occurs when part of the target population does not have access to the internet while non-response error refers to the lack of response from a sample unit. These errors can affect the representativeness of the sample and bias the survey estimates. The administrative data collected from open sources can be used to compute survey adjustments that, if related to the likelihood of response and the survey target variable, can reduce the bias of the survey estimates. This paper examines the potential of aggregate administrative data to adjust the survey data collected from an internet panel in Spain. To address this research question, I use statistical simulations and data from an internet panel. The statistical simulations are useful to assess the potential of the aggregate data compared to individual data to adjust surveys. Then, two surveys from an internet panel based in Spain are used to implement adjustments using the aggregate administrative data. The estimates from these surveys are compared to a major face-to-face study in order to assess the effect of the weights on the survey bias. The administrative aggregate data have been collected from the Spanish government data repositories as long as the data were available at the municipality level or lower.

Doing research on/ and with youth in the era of the General Data Protection Regulation

Mazzucato, Valentina; Haagsman, Karlijn

Maastricht University, Netherlands, The
v.mazzucato[at]maastrichtUniversity.nl,
r.haagsman[at]maastrichtUniversity.nl

'Youth hold the future' is an often-cited phrase. Organizations such as the UN time and again state that it is important to listen to youth and for youth to be involved in decisions affecting their lives. However, youth are not often provided a platform in which they can speak or be listened to. One way to give youth a voice is through research, yet most research on youth continues to be based on adult assessments, be they teachers, caregivers, health professionals or parents. Additionally, in migration research, migrant youth are often seen as a vulnerable group needing protection, a stance that takes away from youth's own agency. Finally, the newly instated General Data Protection Regulation (GDPR) and the way it is being interpreted by governments and institutions, makes it hard to collect data on youth. Using the experience of the Mobility Trajectories of Young Lives (MO-TRAYL) project, this paper

discusses the challenges that formal ethical procedures present for youth centred methodologies in the era of the GDPR: from strict interpretations of the GDPR to protective gatekeepers, from institutional barriers to ethical guidelines and parental consent. Finally, it discusses ways in which we can use a more youth centric and inclusive approach to study youth mobility.

alhumbert[at]gmail.com, contact[at]elisabeth-anna-
guenther.eu

Wearable sensors are providing exciting new research opportunities for social scientists. The scholarly community has invested considerable effort to assess the validity and reliability of gathered data over the recent years (Kayhan et al., 2018; Parker et al., 2018). The grand majority of these initial studies has relied on laboratory experiments or field studies with single groups. At the same time, contributions are spread out across different strands of the social-, behavioral- and computer science literature. Findings, therefore, are scattered, and mostly limited to one specific group or field situation without means to assess the influence of wider contextual conditions on sensor based data and insights based on them. This paper addresses the problem by analyzing and comparing wearable sensor data of ten, relatively small Research and Development (R&D) teams in the context of the H2020 GEDII project (2015-2018). Inter-group variance of sensor measures are explored in the light of complementary data collected, including socio-demographics of team members, gender stereotype, personality traits, and three round-robin ratings regarding advice seeking, friendship and psychological safety. By examining how important sensor measures vary between comparable teams, a more fine-tuned picture regarding the context-sensitive nature of supposedly "objective" sensor measures starts to appear. Our research contributes to the important task of validating sociometric, sensor-based data as new, quantitative measurement tool for social scientists; a methodological proposal for research design, data pre-processing and analysis is included. Kayhan et al. (2018). How honest are the signals? A protocol for validating wearable sensors. *Behavior Research Methods*, 1-27. doi:10.3758/s13428-017-1005-4. Parker, et al (2018). Using Sociometers to Advance Small Group Research. *Sociological Methods & Research*, doi:10.1177/0049124118769091.

The Applicability of Big Data for Studying Human Socio-Spatial Interactions and Integration: A Systematic Literature Review

Müürisepp, Kerli; Järv, Olle

University of Helsinki, Finland
kerli.muurisepp[at]helsinki.fi, olle.jarv[at]helsinki.fi

International migration has reached record highs in recent years. Movement of people from their familiar community to a foreign place and culture creates challenges for both migrants and host communities. The need to alleviate possible tensions and support migrants to realize their potentials puts the operationalization of current integration policies under pressure and urges researchers to strive for a better understanding of ethnic relations. Integration is widely studied from various angles such as civic and political participation, education and labour market outcomes. Scientists concerned with the spatial aspects of integration have mainly focused on residential segregation and neighbourhood effects. Yet, meaningful social encounters and interactions take place in the extent of individuals' entire activity spaces – in places they visit for work, education, shopping, services, socializing and leisure time. However, not much is known about those activities and interactions due to the lack of suitable data and methods. We argue that user-generated digital data derived from mobile phones and social media platforms have the potential to narrow this gap by providing a more nuanced understanding of individuals' complex social interactions in space and time, and therefore, open new avenues for integration research. Our research aims to (1) provide a systematic literature review on the big data approaches and methods applied for studying socio-spatial interactions; (2) assess critically the strengths, weaknesses and ethical aspects of the big data sources and methods reviewed; (3) propose a conceptual framework for implementing big data in integration research.

RN21_09 | New Directions in the cross-national measurement of quality of life

Comparing The Measurement Of Subjective Health Related Quality Of Life Between Migrant And Native Populations

Mayerl, Jochen (1); Holz, Manuel Michael (2)

1: Chemnitz University of Technology, Germany; 2: Chemnitz University of Technology, Germany
jochen.mayerl[at]soziologie.tu-chemnitz.de,
manuel.holz[at]hsw.tu-chemnitz.de

Assuming that mass migration to post-industrial countries inhibits specific selection mechanisms, it could be shown that migration happens overly proportional into the lower social strata. This social structure determines available resources and therefore the probability of typical experiences which in turn translate into varying perceptions of well-being. The subjective experience of well-being and quality of life is either way structured along dimensions of culture, time-varying effects, macroscale changes in attitudes and epistemes concerning indicators about the individual assessment of functioning. Empirical evidence suggests dependant on the region of origin migrants tend to extreme or centred self-evaluation. Therefore, the question arises whether comparability of outcomes can be assumed, especially within instruments regarding subjective feelings, when comparing migrant and native populations. The aim of the study is testing for intercultural and longitudinal equivalence of health related quality of life in form of the Health Short Form 12 - items scale (SF-12), trying to answer the question whether this instrument is useful to compare subjective assessments of health of migrants and native Germans over time. The study contributes to the ongoing discussion on measurement equivalence of the SF-12 by including variables concerning integration and assimilation, employment, family status and varying types of migration and years since migration to the analysis. Using a Multiple Group Structural Equation Modelling approach analyzing longitudinal data of the German Socioeconomic Panel (SOEP), we test the validity and measurement equivalence (configural, metric and scalar invariance) of the latent construct 'health' over time and between (non-)migration groups. The study concludes in recommending a reduced version of the SF-12 to improve the avoidance of measurement artefacts when comparing the health of migrants and native Germans.

Operationalization of Sen's Capability Approach to Quality of Life Assessment within Eurostat Recent Recommendations: Case of Poland

Zwierzchowski, Jan; Panek, Tomasz

Warsaw School of Economics, Poland
jzwier[at]sgh.waw.pl, tompa[at]sgh.waw.pl

Improving quality of life (QoL) is the overriding goal of social and economic policies. In the last two decades the increase in quality of life has become one of the main objectives of social policy within the EU. Within the European Statistical System, a general concept of measuring the QoL has been presented in an expert report. The report defines the dimensions and partial indices measuring various aspects of the QoL. The study provides operationalization of the QoL measurement based on the Eurostat recommendations. It utilises the Sen's capabilities approach, which enables taking into account the different ways of achieving high QoL among differing individuals (different ways of functioning) caused by their individual characteristics and differences in the local conditions in which they live. This way, it is possible to compare the QoL of individuals living in different regions, countries, etc. The operationalization of the QoL measurement was conducted using a special case of the structural equation model (SEM), namely the multi indicators and multiple causes model (MIMIC). In this model the Eurostat dimensions of QoL were treated as latent variables, the partial indicators of QoL as symptoms and the individuals' demographic characteristics as causes. The basis for the empirical part of the study was data from EU-SILC Survey conducted in 2015 for Poland. We have estimated the quality of life values for all individuals in the database. This has enabled us to compare quality of life across regions and social strata. Keywords: quality of life, capability approach, SEM, MIMIC.

Well-Being Global Index: Assays of multivariate statistical approaches

Botelho, Maria do Carmo (1); Mauritti, Rosário (1); Nunes, Nuno (1); Craveiro, Daniela (2,3)

1: CIES-IUL, ISCTE-IUL, Portugal; 2: CIS-IUL, ISCTE-IUL, Portugal; 3: SOCIUS-UL, Universidade de Lisboa, Portugal
maria.botelho[at]iscte-iul.pt, rosario.mauritti[at]iscte-iul.pt, nuno.nunes[at]iscte-iul.pt, daniela.craveiro[at]iscte-iul.pt

All over the world, populations with fewer resources have worse life chances, health and well-being. The unequal distribution of resources and their consequences in well-being is a current discussion, with growing importance (UN, 2015, OECD, 2015, Stiglitz et al, 2018a and 2018b), as well as the search for informative and analytical elements for greater reflexivity and social intervention capacity (Mauritti et al., 2016, Botelho et al., 2018, Wilkinson and Pickett, 2018). In Europe and particularly in Portugal, where there are great disparities, the construction and improvement of tools for analysing the relationship between social inequalities and well-being is essential. This presentation is part of an ongoing research project on the relationship between welfare and

social inequalities in Europe that have two main objectives: (i) to present dimensions and indicators of well-being perceptions; (ii) and discuss different quantitative methodologies for the construction of a global and integrated well-being index. The well-being approach is based on the multidimensional concept developed by the OECD through the Better Life Initiative (OECD 2013, 2015, 2017). This model is starting to have an impact on how states and reference entities assess the progress of societies. This guidance also includes the work of EUROSTAT (Eurostat, 2017) or other more recent approaches, focusing on the perspective of justice and social progress (Stiglitz et al, 2018a and 2018b). Our quantitative methods support an innovative research line because it analyses the microdata of the European Social Survey (year 2016), aiming to portray the global perceptions of well-being of the Europeans.

RN21_10 | Measuring social inequality in Europe

Does Automation Technology Increase Social Inequality? – Robot Installations and the Individual Unemployment Risk in Germany

Otto, Michael; Damelang, Andreas

Friedrich-Alexander University Erlangen-Nürnberg, Germany
michael.otto[at]fau.de, andreas.damelang[at]fau.de

Several scholars argue that the current technological development will change future work. Nevertheless, it is highly controversial how and to which extent employment is about to change. A crucial question in a sociological context is whether employment outcomes vary between different social groups at the labour market. In our study, we focus on the individual risk of unemployment and present two alternative explanations how industrial robot installations may affect social inequality. We argue that automation technology can either create new social inequality due to occupational differences in the vulnerability to automation or reproduce existing inequality to the disadvantage of social groups that already have had a higher degree of insecurity on the labour market before. We use the task-biased approach by Autor et al. (2003) to explain why not only low qualified workers but particularly workers with a high share of routine-task in their occupation have an increased risk of being replaced by industrial robots. Further, in our empirical analysis for the years 2011 - 2013, we introduce an innovative measure for the risk of automation on the individual level by considering two important types of measurements. We include an interaction term between actual investments in robot technology at the industry level and the estimated automation potential of an occupation on the individual level to ensure that an employee indeed experiences automation. Therefore, we merge data from the World Robot Survey to administrative data (SIAB) provided by German Institute of Labour Market Research (IAB). Our findings suggest that we indeed can observe social inequality in the unemployment risk between different occupational groups that we cannot explain by skills and education but only by occupational task.

The Effects Of Occupational Mismatches On The Employment Biographies And Income

Ruf, Kevin Alan Franz (1,2); Damelang, Andreas (1)

1: Friedrich-Alexander Universität Erlangen-Nürnberg, Germany; 2: Institute for Employment Research, Germany
kevin.ruf[at]fau.de, andreas.damelang[at]fau.de

The negative outcomes of overeducation are well studied in the literature. Nevertheless, long-term effects of occupational mismatches on the employment biography are less clear. If mismatches are more than a temporary part of the allocation process on the labour market, they become a major driver of social inequality and economic outcomes. In the case of Germany, the results of the literature regarding mobility and mismatches are contradictive. Several studies confirm the negative impact of scarring effects, while others found supporting evidence for the career mobility theory. In this study, we will focus on the long-term effects of the different types of mismatch regarding wage development over the employment biography and the persistence of precarious employment conditions. Adding to the existing literature, we will not only observe formal mismatches, but a broad set of occupational mismatch states. Furthermore, we argue that due to the varying degree of standardisation of academic and vocational education training, the impact of occupational mobility on long-term wages vary between the training groups, depending on the mismatch type. We expect the negative effects of field-of-study mismatches to be higher for occupations with a higher standardisation, while the wage effects of a formal mismatch will be more severe for those with a lower standardisation. To answer our research question, we are using the NEPS-ADIAB. This unique data set links the National Education Panel Survey biographies to the administrative data of the federal Institute for Employment Research (IAB).

Child Deprivation In Europe. Study On Family And Context Factors

Ciceri, Paola; Lucchini, Mario

University of Milano Bicocca Department of Sociology and Social Research Italy
p.ciceri[at]campus.unimib.it, mario.lucchini[at]unimib.it

The study of child deprivation in contemporary Europe is a relevant topic for social policies. The paper focuses on material deprivation conditions of children, using data from EUSILC. The analysis has been carried out across 32 European countries and two waves (2009 and 2014). A particular attention has been given to the age of children, splitting up the sample in two groups - pre-school age children (1 to 5 years) and school age children (6 to 15 years) – thus measuring the specific deprivation for each group. The aim of this paper is to evaluate the degree of consistency of different methodologies that allow to capture the multidimensionality involved in the concept of child deprivation. Both synthetic indices (e.g. Alkire Foster index) and clustering procedures (e.g. Self Organizing Map) have been implemented. Our analysis highlights the importance of some heterogeneity factors, such as number of children, family structure, tenure status, living with adults affected of chronic illness, parent's education level and low work intensity, in accounting for patterns of multiple deprivation in both the samples.

RN22_01 | Current Research in Risk Perception and Representation

Social Trust And Representations About Risks Of The Introduction Of Artificial Intelligence Into Everyday Life

Nestik, Timofei

Institute of psychology, Russian academy of sciences, Russian Federation
nestik[at]gmail.com

The results of a series of empirical studies (N = 526, N = 129, N = 293) are presented, that were devoted to the socio-psychological predictors of Russian adults' attitudes toward the introduction of AI systems into everyday life. Different psychological types of AI technologies ("cyborgization technologies" and "smart city technologies") are identified, which are influenced by different psychological factors. Different types of fears about the possible consequences of AI adoption in society are revealed. It is shown that the perceived threats of AI are associated not so much with the reliability and predictability of the technology as with its use by the state and other people. At the same time, fears that artificial intelligence will get out of control and subjugate people are more typical for those who are ready to use AI technologies, believes in its rapid development and benefit to society. It is shown that the estimation of the technologies of specialized AI and their possible influence on society directly depends on the person's level of social trust. It was found that the willingness to interact with the general AI as a partner that has consciousness and emotions requires a combination of techno-optimism with social optimism, with confidence in social institutions and other people. Support for the using of AI to improve the effectiveness of social institutions was not associated with prosocial and collectivist attitudes, but with an emphasis on personal success and a low value of safety. Perspectives of further research are proposed.

Beyond Information Control – The Enabling Qualities of Fatalism

Englert, Kathrin; Ludwig-Mayerhofer, Wolfgang; Waldecker, David

University of Siegen, Germany
englert[at]soziologie.uni-siegen.de, ludwig-mayerhofer[at]soziologie.uni-siegen.de, Waldecker[at]soziologie.uni-siegen.de

Web-based communication opens up possibilities of unlimited observation, surveillance and data collection by a wide range of institutions and individuals: by platform-based companies like Google or Facebook who monetize data, by seemingly ever-increasing governmental surveillance, but also by other users such as employers, (former) friends, loose acquaintances or hackers. While users are alerted by media, teachers, parents etc. about the dangers of intelligence operations, "surveillance capitalisms" and excessive posting, they can never be fully knowledgeable about what is done to and with their data. In other words, using web-based services entails risks and uncertainty. How do users perceive the risks and uncertainties inherent to their social media usage? The paper addresses this question drawing on qualitative data on young people (aged 16 to 22) collected within the research project B06 of the Collaborative Research Centre 1187 at Siegen University. This age group is engaged extensively in online activities and thus especially challenged to consider questions of information control. Our findings show that the perception of risk and uncertainty in social media relates to their individual understandings of undesired observation. When interpersonal surveillance plays a crucial role the privacy settings of social media platforms count as technical solution offering effective risk management. When institutional surveillance is seen as relevant undesired observation young people perceive themselves without information control and adopt a fatalistic attitude. Fatalism in this case represents a positive coping strategy because it enables users of web-based services to stay capable to act under the condition of constant uncertainty.

European Parents' Risk Perception Of Online Hazards: Identifying Cognitive Styles

Veltri, Giuseppe Alessandro

University of Trento, Italy
giuseppe.veltri[at]unitn.it

In this study we have carried out a study about European parents' risk perception of online hazards concerning their children using a survey aimed at exploring different dimensions and determinants of risks. In this research, the target population was citizens aged 25–65, with children aged 6–14 living in their household and under their responsibility or care. The survey was conducted by computer-assisted web interviews (CAWI) using online panels in France, Germany, the Netherlands, Spain, Poland, Italy, Sweden, and the United Kingdom, with 800 interviews per country (total N = 6,400). We carried out a two stages analysis, in the first part, we have explored the mapping and grouping of hazards based on participants' assessment. In the second part, we carried a cognitive style segmentation of subjects based on the way how the risk perception judgements are made. This approach draws upon a cognitive sociology approach, which proposed the idea of "thought collectives" or "thought communities" identifiable by means of shared cultural schemas. The analysis was carried out using novel techniques like Correlational Class Analysis (Boutyline, 2017) and Relational Class Analysis (Goldber, 2011). Results indicated the presence of three different cultural schemas defined groups that cut across countries and socio-demographic characteristics. Implications for the study of risk perception will be discussed. Ref. • Boutyline, A. (2017). Improving the Measurement of Shared Cultural Schemas with Correlational Class Analysis: Theory and Method. *Sociological Science*, 4, 353–393. • Goldberg, A. (2011). Mapping shared understandings using relational class analysis: The case of the cultural omnivore reexamined. *American Journal of Sociology*, 116(5), 1397–1436.

Threat Response Over Time: Political Compartmentalization Of Terrorism Risk Perception

Räsänen, Pekka (1); Koivula, Aki (1); Keipi, Teo (1); Oksanen, Atte (2)

1: University of Turku, Finland; 2: University of Tampere, Finland
pekka.rasanen[at]utu.fi, akjeko[at]utu.fi, teo.a.keipi[at]utu.fi, atte.oksanen[at]uta.fi

Societal threats are a growing concern in European democracies in light of risks of terrorism. There is a need to understand how risk perceptions have changed over time ideologically and demographically. This article provides a novel look into threat response over time while considering potential ideological links to the phenomenon. The model of threat response over time (TROT) is developed in order to understand how fear of specific threats may evolve societally and ideologically over time given competing risk phenomena. The

analysis is based on four comparable population surveys collected between 2004 and 2017 (N=7,775) in Finland. Findings showed that terrorism risk perception was highest in 2004 and declined during the 2010s despite multiple terrorist attacks in Western Europe. Terrorism risk perception became ideologically based in 2014 and 2017, and the decrease in terrorism was explained by the deepening of political polarization. Overall, the findings reflect the evolution of risk perception over time depending on values, attitudes and goals, here linked to political ideology. The TROT model proved useful for understanding the phenomenon and could be applied to other countries as well. These findings help us to deepen our understanding of the significance of contemporary populists affecting not only political systems but also the realignment of traditional parties.

RN22_02 | Theoretical Advancements in Risk and Uncertainty Studies

On The Relationality Of Risk: Insights From Cross-Field Interactions

Between Finance and Politics
von Scheve, Christian; Lange, Markus

Freie Universität Berlin, Germany
c.vs[at]fu-berlin.de, markus.lange[at]fu-berlin.de

Recent relational accounts of risk explain variation in risk perception across groups not through individual psychological factors, but situated cognitions defining risk as a relationship between "risk objects" and "objects at risk" (Boholm). The present paper extends this relational approach to include not only the relational constitution of risk, but also of the different actors perceiving and assessing risk. Risk in this perspective is relational because it establishes a link between two different objects, i.e. risk objects and objects at risk, and because it establishes linkages between two (or more) actors or strategic action fields. We argue that this is the case when one actor or field becomes the risk object of another field and vice versa, whereby each field retains its distinct objects at risk. This leads to constellations of what we call "risk entanglement" across fields and actors. Typically, these constellations occur when there are substantial and prolonged cross-field interactions and dependencies, for example between investors and businesses or insurances and companies. To illustrate our theoretical arguments, we use data stemming from 53 qualitative interviews and extensive ethnographic fieldwork in the German financial sector, the federal parliament, and federal financial supervisory authorities. Our analyses show how risk entanglement affects and transforms the fundamental logics according to which both of these fields operate.

Analytical Perspectives in Risk Theory: Actor, Structure and Ambivalence

Olofsson, Anna; Giritli Nygren, Anna
Katarina; Öhman, Susanna

Mid Sweden University, Sweden
anna.olofsson[at]miun.se, katarina.giritli-nygren[at]miun.se,
susanna.ohman[at]miun.se

Intersectional risk theory opens up for a critical discussion of whether risk itself is one of today's colonial concepts, which obscure our understanding of the present rather than make it more comprehensible. To make this critical analysis, we must strive to demonstrate the ambivalence of dichotomies such as structure and agency, as well as of the use of risk, to make new understandings of the world possible. In this presentation, our aim is to explore how the interplay between risk and inequality can be understood from different angles: How the subject becomes possible through structure, for example through interpellation and normalization and how the subject as an actor negotiates and navigates among and between different discourses of risk. In this way, we want to highlight the importance of both the external constraints on human beings often conceived of as 'social structures', for example collective habits formalized as legal rules, policy, norms, moral obligations etc., and on the other hand the often contrasting/opposite concept of 'action' or 'agency', for the understanding of risk and inequality. Social theorists have battled structure and agency to and for generations, and as such it is a known picture. However, by mixing pieces from different perspectives and making use of an intersectional approach of inequality and risk, we can find ways to understand and put our own time in perspectives.

Responding To Violent Radicalization: Risk-Focused And/Or Context- Sensitive Prevention In Europe

Baillergeau, Evelyne (1); Mythen, Gabe (2)

1: University of Amsterdam, Netherlands, The; 2: University of Liverpool, United Kingdom
e.baillergeau[at]uva.nl, G.Mythen[at]liverpool.ac.uk

Recent terrorist attacks in France, the UK, Belgium, Spain, Germany and Sweden have led to renewed attention being directed towards risk-focused responses to terrorism, such as those exemplified by the Prevent strategy in the UK. There are many equivalents to Prevent across mainland Europe which seek to reduce the threat of future attacks by deploying policies of pre-emption and intervention. Aside from well-documented problems with ascribing risk factors to specific ethnic and religious groups, risk-focused prevention measures have tended to lack appreciation of social, political and economic context. Are policies directed towards preventing violent extremism doomed to approach communities and individuals considered to be susceptible to radicalization in a non context-sensitive way? Addressing the issues raised above, this paper examines policies geared toward responding to violent radicalization by enhancing dialogue through community mediation and improving social cohesion and

discusses the ways in which and the extent to which they contrast with the Prevent strategy. In so doing, we confront critical questions that are crucial in developing appropriate policy responses to the threat of terrorism. In particular, drawing on empirical evidence developed during explorative area-based research in a few European cities recently affected by terrorist attacks (chiefly in Belgium), we question the underlying interpretations of life trajectories bending towards political violence that are at stake in prevention work as day-to-day practice. Along the way, we critically engage with the popular view that 'radicalisation' existed as a process.

Theorizing Inequalities and Emotion in the Sociology of Risk and Uncertainty: a Bourdieuan and Mannheimian Perspective

Eckert, Judith

TU Darmstadt, Germany
eckert[at]ifs.tu-darmstadt.de

The simple-sounding question "Who Fears What and Why?" (Wildavsky/Dake 1990) raises two issues: First, how can we move towards an integration of risk theory and social inequalities beyond Douglas's group-grip scheme which has been criticized for being functionalist, lacking empirical support and neglecting multiple inequalities and their dynamics? Second, how can we conceptualize emotion in risk theory? Scholars have begun to address these issues from different angles. I want to make the ideas of classics fruitful for these new questions by proposing a theoretical framework based on Pierre Bourdieu's and Karl Mannheim's sociologies. To show its empirical value, I provide illustrations from my own qualitative study. Both authors reconcile the objective (social position and resources), collective (styles of thought) and seemingly subjective or individual (perception, thought, action). Thus, particular groups select specific "risk portfolios" they consider relevant out of the universe of risks. Following Mannheim, the individual is part of different groups, and it is to be determined empirically which social differences and inequalities are relevant and how they interact instead of reproducing theoretical assumptions. Within these risk portfolios, I differentiate between the more abstract risk perception and the experience-bound fear. Even though both authors have barely addressed emotions, their distinction between theoretical knowledge and the often implicit practical knowledge is helpful for theorizing emotions. While risk perception is linked to theoretical knowledge, fear is related to practical knowledge, since emotions are "a kind of practice" (Scheer 2012).

RN22_03 | Risk and Uncertainty in Everyday Life

The Fabrication Of Certainty: How Impostors Manipulate Everyday Risk-taking

Thiel, Christian Alexander

University Augsburg, Germany
christian.thiel[at]phil.uni-augsburg.de

Recent research mentions several rational, non-rational and in-between strategies for managing risk and uncertainty in everyday life (Zinn 2016). The presentation addresses the 'weak points' of these strategies by looking how professional fraudsters deceive people to trustfully grant access to their individual assets. Often using typical 'scams and schemes' they successfully manipulate people's perception of (un)certainty and their modes of risk-taking. Based on data of a qualitative study of several actors involved in fraudulent activities (n = 37 in-depth interviews with offenders, victims, police investigators; n = 13 extensive criminal files), carried out as a three-year DFG project at the University Augsburg, we tried to explore how risk-taking in everyday life can be exploited. We therefore analyzed typical scams tackling basal aspects of everyday life: "romance scam" (love), "rip-deal" (business), "grandparent scam" (family) and "investment fraud" (finance). We could identify several techniques to manipulate risk-managing strategies like calculation, trust, intuition, emotion, belief, hope and faith as well as people's motives of risk-taking, their locus of control, their assessment of risk and their (situational) identity. By embedding this in a methodological approach of interpretative sociology we could reconstruct the complex interactive processes of acting and sense-making in fraudulent interactions. These findings will be discussed regarding the necessity and the dangers of risk-taking in late modern society. All in all this sheds some light on the question how people perceive, construct, manage and communicate risk and uncertainty in their daily life. References Jens O. Zinn (2016) 'In-between' and other reasonable ways to deal with risk and uncertainty: A review article, *Health, Risk & Society*, 18:7-8, 348-366

Couples' Construction of Boundaries of Risk and Responsibility during Pregnancy

Radu, Irina (1); Gouilhers, Solène (2); Hammer, Raphaël (2); Meyer, Yvonne (2); Pehlke-Milde, Jessica (1)

1: Zurich University of Applied Sciences, Switzerland; 2: University of Applied Sciences and the Arts, Western Switzerland
irina.radu[at]zhaw.ch, solene.gouilhershertig[at]hesav.ch, raphael.hammer[at]hesav.ch, yvonne.meyer[at]hesav.ch, pehl[at]zhaw.ch

From a public health perspective, alcohol has been constructed as an important risk factor for fetal health during the pregnancy period. This is reflected in public health guidelines, which in many European countries advise abstinence during pregnancy. Women's own perceptions of alcohol as risk during pregnancy however, are varied and practices range from abstinence to occasional or regular alcohol consumption. In our study, which focuses on expecting couples living in Switzerland, we aim to understand the way that pregnant women and their male partners perceive this risk and how they construct the boundaries between "harmful", "risky" and "safe" daily habits. To this end, we used a rare methodological set-up among studies on risk and pregnancy: we conducted separate interviews with both partners of 46 couples, in the Lausanne and Zurich areas. Based on a thematic analysis, our findings indicate that pregnancy is a transition period during which boundaries around health risk-assessment emerge within the couple, with women tending to take on the responsibility for the fetus's health, seeking information on everything from prenatal screenings to diet and alcohol consumption. We identified three ideal-types concerning women's risk perception and alcohol consumption during pregnancy, with the women's information-seeking behavior playing an important part in shaping risk perception. Furthermore, we found that male partners take on a supportive role during this stage, enforcing the women's strategies of risk diminution – a dynamic, which can lead to an early solidification of gender roles in child rearing.

Risk Perceptions In Relation To Threats, Violence And Attacks On Higher Education Institutions In

Denmark

Baron, Nina

University College Copenhagen, Denmark
niba[at]kp.dk

Globally the awareness on safety on schools and higher education institutions is growing, especially in relation to threats, violence and attacks. At the same time, this sector has historically not had a large focus on emergency management. In this study, we explore what this means for the risk perception and knowledge of emergency management on campuses of higher education in Denmark. The study consists of qualitative case studies of ten different campuses spread out over Denmark. On each campus, a number of qualitative case studies have been carried out with students, faculty members and the management. Also, observations of student behaviour and the physical location has been made. The study shows an overall feeling of safety in a Danish context. However, also some important divisions. The students and faculty members express that they see the risk of violence or attack on the institutions as very limited or non-existent. On the other hand the managers and to some extent the facility people, see the risk as real and one that demands attention. For the managers smaller cases of threats and violence are an ongoing part of their everyday tasks. Also, the managers in general express an expectation of high level of knowledge among the staffs and students' of the institutions emergency management plans, which often do not match the knowledge level expressed by the students and staff members in our interviews. In the presentation will be discussed the consequences of those findings. Are they an example of how everyday practices unavoidable influence risk perceptions or should it be seen as a call for action?

From the Problematization of Uncertainty in Iranian Films to the Uncertainty of a Traumatic Everyday Life

Moghim, Habib Allah

University of Sydney
hmoghim86[at]gmail.com

One of the main features of contemporary Iranian cinema is uncertainty. This uncertainty is most recognizable in two forms. The first appears as moral uncertainties in the content of the films, and the second in the neorealistic form of the Iranian films where, often, the viewer is uncertain of the boundaries between the reality of the storyline and the fictional recreations within the film. By problematizing this vital feature of Iranian films this paper answers the following related questions. How is "uncertainty" shaped as an artistic form in Iranian cinema? How is uncertainty understandable as a social concept in Iranian everyday life? Answering these

questions will enable us to understand the relationship between cinema and everyday life and also will help us to portray Iranian everyday life. Keywords: Visual studies, Visual uncertainty, Iranian cinema, Everyday life, Urban Trauma

RN22_04 | Risks in Health and Social Care

Severe Asthma Patients' Risk Work and the Use of Biologicals: Navigating the Risks and Uncertainties of State-of-the-art Medication in Everyday Life

de Graaff, Bert; van de Bovenkamp, Hester; Bal, Roland

Erasmus School of Health Policy & Management, Erasmus University Rotterdam
degraaff[at]eshpm.eur.nl, vandebovenkamp[at]eshpm.eur.nl, r.bal[at]eshpm.eur.nl

Severe asthma is by definition difficult to control with standard asthma medication. Patients are always at-risk of new exacerbations occurring. Preventative self-care, medication use and regular hospital visits mean that not only the illness but also its treatment burdens patients' everyday lives. This burden may have changed due to the recent introduction of biologic agents ('biologicals') to the asthma treatment arsenal. Biologicals appear relatively successful in patients (re)gaining control of the severe asthma, however long-term effects are uncertain and because of their high costs this medication is reserved for a select group of patients. In this paper we explore the experiences of risk and uncertainty in the everyday life of patients with severe asthma in the Netherlands in relation to the use of biologicals. We contribute to research on risk work as we emphasize how patients work to negotiate shifts in the 'burden of treatment' and illness in their everyday lives, and how such work is framed by risk and uncertainty. We do so by interviewing 10 patients using life-history techniques and by the use of existing patient stories from an established collection of ego-documents. In our analysis of these patient narratives we focus on how patients work to make sense of the use of biologicals and their effect(s) on patients' everyday lives. We focus in particular on whether and how patients navigate and translate between the risks and uncertainties of state-of-the-art medical technology, self-care and the experienced physical impact of illness itself.

The Formation and Perceptions of Food- Related Risks: Aspects of Food-related Risks in Turkey

Delibas, Kayhan

Aydin Adnan Menderes Universitesi, Turkey
kdelibas[at]adu.edu.tr

In recent years, food related risks and fears increasingly becoming one of the most heated public discourse. These debates ranging from very often pesticides in produce, hormones in milk, antibiotics in meat to cancerous food dyes, which are said to have been added to brown bread, and may even be related to a wide variety of foods. Even government declared a war against 'the three White Poisons'(namely salt, flour and sugar). Research shows that more than half of the population (% 55) did not find food safe at all. There are some recent media reports about big chicken-farm producers declaring bankruptcy partly caused by this widespread chicken-meet fear's in the media. It is already known that this industry lost its % 40 market shares as a result of bird-flu epidemic occurred ten years ago. Several food-related scandals like detection of anthrax disease in beef meat, GM corn and rice, high level of pesticide residue in agricultural products have promoted public concerns about food risks. The aim of this paper is to find out how food-related risks are perceived, what kinds of foods are often related as risky foods, and what are sociocultural, economic and regional variables. The paper will draw on quantitative questionnaire (N 750) compiled in two different regions in Turkey. Keywords: risk formation; risk perceptions, food safety; food-related risks; health concerns.

RN22_05 | Public Discourses and Media Representations of Risk

Narrating Risk or Debating International Relations? Critical Analysis of Media Discourses on Climate Change

Telešienė, Audronė; Zolubienė, Eimantė

Kaunas University of Technology, Lithuania
audrone.telesiene[at]ktu.lt, eimante.zolubiene[at]ktu.lt

The aim is to critically analyse the ways that climate change (CC) related risks are being narrated in online news discourses. We draw upon 323 texts sampled through multistage criteria sampling from most popular news portals in Lithuania – delfi.lt and 15min.lt (av. of 1 mln unique monthly visitors) during Nov 2017 – Nov 2018. Fairclough's three dimensional model of critical discourse analysis (Fairclough 1992, 2013) is employed. Analysis is conducted using MAXQDA. The initial linguistic analysis allows insights into the dominant narratives. The

presentation will discuss what risk-objects and objects-at-risk are communicated (following the relational theory of risk; Boholm, Corvellec 2011); what discourse actors are presented as active subjects. The preliminary results show that CC is most often related to health issues (31% of texts), temperature changes (17%), food issues (33% of texts). Yet the intrigue is in the frequent appearance of political figures as active subjects. E.g. words related to leadership are used 201 times, in 58% of texts; Russia is mentioned 378 times (68% of texts). The political figures speak of topics that compete with risk narratives (be it warning, mobilizing or other). Is the CC discourse becoming yet another arena for political power consolidation? This debate question will also be addressed during the conference. The research project 'Public Perceptions of Climate Change: Lithuanian case in a European Comparative Perspective' is funded by a grant (No. MIP-17-126/SV3-0511) from the Research Council of Lithuania.

Framing Safety in Nuclear Waste Disposal: Comparing Finland and France

Kojo, Matti (1); Lehtonen, Markku (2); Litmanen, Tapio (3); Kari, Mika (1,3); Jartti, Tuija (1,3)

1: Tampere University, Finland; 2: University Pompeu Fabra in Barcelona, Spain; 3: University of Jyväskylä, Finland
matti.kojo[at]tuni.fi, markku.lehtonen[at]upf.edu,
tapio.a.litmanen[at]jyu.fi, mika.kari[at]jyu.fi,
tuija.jartti[at]jyu.fi

Among forerunners in developing final disposal of high-level nuclear waste, Finland and France differ strikingly in terms of two crucial features for radioactive waste management (RWM) policy: requirements for reversibility and monitoring of the repository, and the degree of public trust in RWM institutions. In the Finnish 'high-trust society', the disposal concept is based on the idea of passive safety, i.e. no monitoring is required in the future after the closure of the repository. By contrast, in France – called sometimes a 'society of mistrust' – legislation stipulates that the project must be reversible, and the repository and its environment remain under constant monitoring for a period of several centuries. These countries have therefore adopted different means of building trust in the waste disposal solution and trust in the organisations responsible for RWM. This paper critically examines the dynamic interplay between waste disposal concept, its monitoring, trust, and mistrust in these two countries' RWM policies. By applying frame analysis, we examine the minutes of parliamentary sessions and news articles from the countries' leading daily newspapers – Helsingin Sanomat and Le Monde, especially the ways in which these news media and the various societal actors represented in the debate have defined problems and solutions relating to safety, trust, and repository monitoring. Our analysis illustrates the context-dependence of the roles of trust and monitoring in RWM policy, the interdependence between trust and monitoring solutions, and suggests that the potential virtues of mistrust have been underestimated, notably in literature on companies' "social licence to operate".

Threats, Violence, Anger and Attacks in Institutions of Education – Public Discourses on Probability, Reasons and Solutions

Andersen, Nina Blom

University College Copenhagen, Denmark
nban[at]kp.dk

The findings in this presentation relate to a larger two-year Danish research project that studies threats, violence, anger and attacks in institutions of higher education in which the concern of unexpected incidents caused by premeditation has occurred lately. In Denmark, educational institutions are only sparsely required to plan, prevent and act in certain ways concerning cases of e.g. deliberative attacks - the field is still characterized by lack of regulation and official requirements. There is nonetheless a growing awareness among institutions, experts and in media if violent and fatal attacks will occur. The study presented investigates the emergence of a public discourses on the potential threat of a violent attack on institutions of education in Denmark. The distinct character of this analysis is that it covers the preliminary occurrence of a discourse on risk that is well known and acknowledged internationally, though not experienced in Denmark since 1994. The method applied is a combination of framing analysis (Entman 1993), media text analysis (Gamson & Modigliani 1989) and analyses of official plans of emergency from the entire population of Danish University colleges (Jørgensen & Phillips 1999), which serves as a case. The research questions that guide these analyses are: How is probability of, reasons for and potential solutions to violent attacks in educational institutions framed and presented in Danish public discourses? The investigation is an example of the early enactment (Law 2004; Mol 2002) of a potential risk still not stabilized in the national context investigated.

"Risk Communication In The Social Space: The Reconstruction Of The Risk Communication In The Local Community"

Fidrya, Efim; Fidrya, Olga

Immanuel Kant Baltic Federal University, Russian Federation
EFidrya[at]kantiana.ru, OFidrya[at]kantiana.ru

The aim of our project is to reveal the structure, stages and the sequence of the risk communication in the local community in relation to the structural, social and cultural features of the communication agents (on the example of the risks related to the potassium salt mine development in the settlement of Nivenskoye of the Kaliningrad region). Namely: to reveal the risk images existent in the public imagination, the opinions about the nature, causes and consequences of these risks, to determine the structure of the participants of the risk communication and their position within the social space, along with the order and content of risk communication, and to determine the key factors (social, political, economic,

spatial, demographic) shaping the perception of risks and the extent and the nature of their effect. The structural model of the social space of the local community to be presented constructed with regard to its attitude towards risks, comprising of: - subgroups characterized by various social, political and cultural attitudes; - the features and characteristics of the communication in the local community; - their attitudes towards mass media sources; - people's attitudes towards risks, perception of their nature, causes and those who's in charge for them, according to the social, political and cultural attitudes and demographic characteristics.

RN22_06 | Social Responses to Climate Change and Environmental Risks

Constructing and Borrowing Dutch Expertise in Miami: Traveling Ideas in Climate Change Risk Governance

Kiefer, Mitchell Timothy

Maastricht University, University of Pittsburgh, United States of America
mtk36[at]pitt.edu

Rotterdam and the Dutch have become models on preparedness for climate change, particularly sea-level rise and flooding. Their knowledge and technical skills are exported via engineering firms contracted out across the globe. I investigate how power brokers and experts in Miami use Dutch practices as a model for managing risks such as sea-level rise and increased flooding from climate change. Through ethnographic studies of climate change risk governance in Miami and Rotterdam, I trace the transfer of Dutch expertise from Rotterdam to its implementation in Miami. In doing so, I uncover the ways Miamians operationalize why the Dutch are succeeding in climate change preparedness and what it means to model themselves after the Dutch. I argue that experts in Miami appeal to borrowed Dutch expertise to provide assurance and certainty to the public with accounts of Dutch successes offering optimism in the face of popular pessimistic narratives. Further, while counter-narratives can be found, appeals to Dutch expertise in practice and discourse remain focused on technological achievements, largely ignoring historical and political contexts. Finally, Rotterdam is used as a model of turning climate change risks into opportunity, with Miamian power brokers envisioning a future in exporting technical solutions to Central and South America. These findings contribute to how we understand the relationship between traveling ideas and socially constructed expertise, specifically regarding climate change risk governance. In this case, we see how a place-based expertise is borrowed and instrumentally situated to achieve a veil of certainty and economic growth.

Exploring the Role of Value Orientations in Climate Change Risk Perception across Europe

Balžekienė, Aistė (1); Echavarren, José M. (2)

1: Kaunas University of technology, Kaunas, Lithuania; 2: University Pablo Olavide, Seville, Spain
aiste.balzekiene[at]ktu.lt, jmechavarren[at]upo.es

Values and worldviews have been extensively explored in environmental and risk sociology as determinants of environmental concerns or environmental and technological risk perceptions. Corner et al. (2014) identified that value orientations are related to the public engagement with climate change. Little research has been done on the influence of value orientations on risk perception of climate change, especially based on international comparative survey data. One of the extensively used measurements of human value orientations is developed and grounded by Schwartz, who conceptualizes values into the self-transcendence, conservation, self-enhancement and openness to change. Largest international survey project in Europe, European Social Survey, uses the scales of value orientations in their questionnaires. This presentation is exploring how the main types of human values shape public risk perception of climate change and compare the effects of value orientations across European countries based on Round 8 (2016) data from European Social Survey (ESS) on climate change. This presentation is based on a research project “Public Perceptions of Climate Change: Lithuanian case in a European Comparative Perspective” Grant (No. S-MIP-17-126) from Research Council of Lithuania.

Water, Water Everywhere, Nor Any Drop To Drink: Risk And Uncertainty in UK Water Risks

McGuinness, Martina (1); Morris, J.C. (2)

1: University of Sheffield, United Kingdom; 2: Technische Universitaet Dresden, Germany
m.mcguinness[at]sheffield.ac.uk, jonathan_clive.morris[at]tu-dresden.de

In the Anthropocene age a combination of shifting weather patterns and social changes has led to an increase in climate change related water risks. The United Kingdom has seen a growth in the frequency and severity of flood risk whilst simultaneously incubating a risk of water scarcity. So, for example, in 2017 the north-west of England and Cornwall experienced severe flooding as a result of extreme weather. At the same time, an unusually dry winter and spring 2017 resulted in depleted ground water reserves and reservoir levels leaving the south-east of Britain at risk of drought in summer 2018. Both flood and water scarcity are socially constructed risks reflecting a complex combination of ‘natural’ events with underlying conditions and vulnerability. Consequently, human activities across different levels (individual, household, business and government) are central to any discussion on water. More particularly multi-level

perceptions of risk and uncertainty, as well as scale, have important implications when addressing this ‘wicked challenge’ (Rittel and Weber, 1973). Without clear insights into these, attempts to mitigate and adapt through changed water behaviours are unlikely to succeed. Utilising data gathered from an interdisciplinary project Drought Risk and You (DRY) funded by the Natural Environment Research Council, this paper draws upon theories of risk and uncertainty (Beck, 1992; 1999; Giddens, 2011) and crisis management (Pauchant & Mitroff 1990; Beck & Holzer, 2007) to examine water risk perceptions and behaviours of businesses drawn from seven river catchments in the UK and their significance for future water sustainability.

RN22_07 | Risk, Uncertainty and Inequality

“It Was a Struggle, And I Didn’t Even Know To What End.” Uncertainty In The Conduct Of Life Of Young Middle-class Members In Germany

Holubek, Stefan

University of Bremen, Germany
stefan.holubek[at]uni-bremen.de

The ongoing debate about the ‘crisis of the middle’ strengthened the sociological interest, in gaining a more elaborated picture of diverging practices of ‘leading a middle class life’. This contribution focusses on the class-generational unit of young German middle-class members in transition to adulthood and emphasizes the role of cultural and economic uncertainties in the process of shaping their status-orientations and their biographical decisions. Within our research project “Investing in Status as a Mode of Living. Practices, Conditions, Disturbances“, we conducted biographical-narrative interviews to arrive at an understanding of the variety of conducts of middle-class life (“Lebensführung”, in the sense of Max Weber) in Germany. In my dissertation project and my presentation I will focus on middle-class members in the transition to adulthood, who find themselves confronted with several irritations, facing the biographical task to find a position that enables them to lead a ‘middle-class life’. I will provide empirical findings and analytical thoughts on processes of “doing orientation” that can encompass a broad range of habitualized status-orientations – from seemingly unlimited pursuit of economic success to rather moderate status-orientations that seek recognition within local communities. I found that uncertainty is substantially shaping processes of orientation of young middle-class members during the unsettling phase of professional establishment. After elaborating the analytical and methodical framework, I will present sceneries of biographical uncertainty and how the research participants perceived them.

Managing Precarity And Mastering Contingency In Academic Careers

Keil, Maria

TU Darmstadt, Germany
keil[at]ifs.tu-darmstadt.de

Uncertainty is an inherent moment of careers in the German academic field. In the course of neoliberal dynamics and a restructuring of the academic labour market as consequence of short-term funding models, labour conditions for researcher are becoming even more precarious. Based on a Grounded Theory study using semi-structured and narrative interviews with Postdocs and Professors in the social sciences, the phenomenon of uncertainty within academic careers and the management of precarity shall be discussed against the backdrop of social inequalities. Following an analytical field theory (Bourdieu) perspective, current developments of the German academic labour market and their impact on academic careers and biographies are outlined first. Secondly, different practical strategies of managing uncertainty and risk are presented from the data. Overall, it can be seen that an all-in strategy with a comprehensive focus on academia is necessary in order to stay in the field longterm and achieve academic success. However, the actual management of uncertainty does not only vary with the employment situation, but also with the resources that arise from the actual living and partnership situation as well as from the social background. It can be shown that managing precarity and herewith mastering contingency is a specific skill within German academia that builds on cultural and economic capital and presents itself in a certain conduct of life and academic habitus that obscures the existential seriousness of the 'academic game'. In the interplay of the outlined field structures and the agents' practical strategies that are bound to their resources, social closure is produced and the boundaries of the field are maintained. Consequently, German academia nowadays stays and becomes even more socially exclusive.

Risk Concepts and Inequalities: From Risk Class to Dangerous Class?

Galantino, Maria Grazia

Sapienza University of Rome, Italy
mariagrazia.galantino[at]uniroma1.it

Moving from and beyond the critical debate about the flaws of the 'risk society' approach in grasping the underlying structures of power which define risks and their objects, this contribution aims to discuss the relation between risk concepts and new/old patterns of vulnerability. The paper starts with some conceptual distinctions among cases often subsumed under the same 'risk' label, showing how different definitions correspond to and/or create different 'risk positioning' or 'risk-class' (who/what is at risk). Then proceeds with a discussion on how mainstream approaches for the identification of vulnerable groups (i.e. resilience) treat all instances like external, negative events striking individuals and social systems from outside. By doing so, they do not only miss the endogenous character of most contemporary risks but also divert attention from the (root)causes of contemporary risk

solely to their effects. Moreover, asserting from whom the potential harm might come, the process of risk construction/definition can also create new risky or 'dangerous classes'. Such a process also breeds second-order consequences: it may elude responsibility within the social systems and construct an external enemy posing a security threat. By looking at examples in different risk domains (i.e. crime, migration, ...), we claim that this is not only a conceptual but also a performative shift that may have relevant implications in terms of doing, studying and addressing contemporary inequalities.

Investigating Precariat: Labour Market Uncertainty and Class Based Voting

Ivanková, Paula

Comenius University in Bratislava/Institute for Sociology of SAS, Slovak Republic
paula.ivankova[at]gmail.com

Research on class-based political preferences used to belong to frequently examined topics within sociology. The ongoing global social change impacting class and class-based structures in many societies all around the world, however, seems to gradually weaken the well-established connections between class and political preferences. One of the reasons for this decoupling could be the growth of a particular group of people experiencing uncertainty at the labour market – their precarious position is seen as a key determinant of a newly forming social class – the Precariat. The paper asks if particular features in the voting behaviour of the precariat can be identified. Does the newly emerging social class, defined by uncertainty, behave in a particular way with regard to electoral participation and political preferences? Based on Standing's definition focused on uncertainty, before engaging with this central question, we try to tackle the problem of empirical identification of the precariat. Our analysis is based on ISSP data from the Work Orientations module, conducted in 2016. The core of our empirical analysis is the verification of the concept of precariat, and the identification of particular voting patterns among its members. We ask if members of the precariat can be characterised by a lower or a higher electoral participation and if they turn more frequently towards newly established political subjects than other classes. With respect to traditional class membership our analysis shows that middle-class members are particularly threatened by uncertainty. With regard to electoral participation and party preferences, there seems to be no clear pattern among people who experience uncertainty at the labour market.

RN22_08 | Risk Governance and Emergency Preparedness

Simulations and All-Hazard Preparedness Against the Threat of Global Pandemics

Pieri, Elisa

University of Manchester, United Kingdom
elisa.pieri[at]manchester.ac.uk

Pandemic preparedness is characterised by high uncertainty, with policy-makers and practitioners mitigating against threats that are novel and high-consequence. The risk of new global pandemics is a pressing concern in the West, mobilising substantial budgets and resources. In the UK, the national Risk Register ranks pandemic flu, for example, as a Tier 1 risk, the highest category contemplated. Despite the anticipated devastating effects that a pandemic could unleash, pandemic risk remains largely under-specified and un-specifiable. A number of pathogens (including novel ones) could trigger the outbreak – due to a naturally occurring DNA or RNA modification or re-assortment, zoonotic diseases jumping species or intentional release of a biological agent. The outbreak inducing pathogen cannot be identified in advance, and the high-consequence pathogens with pandemic potential already known to us have widely different aetiologies, vectors and communicability pathways. They would also be producing different outcomes in terms of symptoms, risk groups initially targeted and mortality rates. This means that measures to mitigate the emergency would also need to be very fluid, fast to deploy and easy to re-calibrate to the appropriate scale. In this paper I discuss the findings of a three-year project on pandemic preparedness and reveal how the plans to mitigate pandemic risk are heavily relying on simulations. Drawing on sociological knowledge, alongside medical and other knowledges already dominant in pandemic planning, is key in unpacking the far-reaching consequences of assigning such a pivotal role to simulations, and analysing the implications of recent developments in all-hazard preparedness.

Governing (through) Anticipation, Vigilance, Affect

Linnell, Mikael

Mid Sweden University, Sweden
mikael.linnell[at]miun.se

The perceived increase in and transformation of societal insecurities necessitates novel approaches for governing societal responses to future disruption (e.g. O'Malley, 2008). One such novel approach is the establishing of public disaster simulation centres to ensure a vigilant and prepared population. Societal insecurities do not necessarily mean trans-boundary or de-localized modern risks (in Beck's, 2009, sense), but may just as well imply threats to geographically delimited communities, societies, and regions, for example nature-induced (yet social) disasters like earthquakes and

tsunamis, and insecurities originating from extreme weather conditions due to climate change (e.g. hurricanes, heatwaves, landslides, flooding). This paper presents a case of public simulation centres understood as a manifestation of the Foucauldian notion of self-technology, emphasizing, as it does, the modification of individual conduct: Not only skills but also attitudes must be aligned towards the overarching goal of preparedness (Foucault, 1988:18). Based on a diverse assemblage of empirical sources (e.g. individual's accounts of their simulation experiences, notes from sensuous ethnographic field work, and governmental rationalizing of the need for public simulation centres), the paper puts forward an analysis of the mechanisms and technologies by which individuals become "resilient". One overall tentative conclusion is that the sensuous-affective experiences conveyed by the simulation (like excitement, thrill, discomfort, stress) are intended to have an empowering effect on the participants.

Turning a Blind Eye to Risk and Resilience: Images of Crisis, Transformation and Emergency Preparedness

Seifert, Fabienne; Schorch, Marén

University of Siegen, Germany
fabienne.seifert[at]uni-siegen.de, maren.schorch[at]uni-siegen.de

In our contribution, we present findings from our research project about continuity and change in the context of crisis and uncertainty. We zoom in a rural area in Germany (population 100.000 inhabitants) with a particular focus on its small and medium enterprises (SMEs) that are high in number and are described as "hidden champions" in reference to their global economic success (Simon 2009). The paper is based on results from two of our empirical studies: First, data from a representative local survey with over 2.200 replies where we asked people about their prior experiences with crisis in the area, the impacts on their life, but also generally about their living situation, emergency preparedness and networks. Second, we reflect on insights from a qualitative study in small and medium enterprises in the same area that is also focused on experiences with crisis, their dealing with economic, digital and social change and the involved risks and uncertainty that go along with these processes (methods: participant observation, qualitative interviews with different stakeholders). Although the companies are located in a rural area, they are highly intertwined with the European and global markets, rely on the supply of material, but also have a large international sales market and so on. This blurring of boundaries and the international networks are often described as further challenges and "necessary risks" by many of the managers. One interesting result from our analysis is the low level of emergency preparedness both in the SMEs as well as in the civil society, despite their prior experience with multiple extreme events in the area and their awareness of particular risks (like landslides, large fires, blackouts etc.).

The Critical Potential Of Ignorance: (Re)Writing Expertise Reports On The Brétigny Derailment (France)

Castagnino, Florent

Telecom ParisTech, France
florent.castagnino[at]telecom-paristech.fr

This paper tackles mechanisms of knowledge production after accidents comparing four expert reports on the last major derailment in France (at Brétigny in 2013, causing seven deaths). The purpose is not to provide a socio-technical explanation of the accident. It is to highlight how mechanisms of knowledge and ignorance production strongly depend on experts' "social position". More precisely, it shows that the extent to which certain groups of experts consider the knowledge of other groups of experts depends on their institutional and administrative base. Four types of report are chronologically examined. They differ in their framing of expertise work. Whereas the railway company experts try to impose a purely technical definition of the accident, other experts (working for the employees, the Transport Department, and the examining magistrate) highlight the conditions of maintenance work and the dilapidation of the railway network. The paper analyses the explanatory processes at work in the reports, focusing on how some causal elements evolve, become more complex or disappear. Depending on the data used, the definition of the accident and of the responsibilities change. Building upon works on the production of ignorance, the paper identifies two mechanisms of ignorance production: ignorance by omission and ignorance by submersion. The comparison of the 4 types of reports shows that what is silenced by one group of experts becomes a resource for another one to criticize and contest previous analyses of the accident.

RN22_10 | Risk, Healthcare and Professional Work

Personalising Risk: Social Workers' Perspectives On The 'Making Safeguarding Personal' Approach To Adult Protection

Dixon, Jeremy

University of Bath, United Kingdom
j.dixon2[at]bath.ac.uk

Safeguarding adults forms a core part of adult social work and involves workers making efforts to assess risk and protect adults from abuse. In England and Wales, social workers have been encouraged to adopt a 'Making Safeguarding Personal' approach. This involves prioritising the needs and wishes of the person at risk when considering how such risks should be managed. Drawing on ethnographic research data in three local authorities in England, this paper considers safeguarding

practice using governmentality theory. The findings draw on observations of and interviews with social workers involved in safeguarding assessments. Social workers were positive about the idea of involving people in their own assessments of risk. However, several dilemmas were raised. First, initial assessments were conducted by telephone. This made it hard for workers to assess whether individuals had the mental capacity to make informed decisions or whether the person assessed was subject to coercion. Second, social workers identified that some individuals were unwilling to engage in risk discussions, making personalised practice challenging. Third, several social workers were reluctant to be explicit about safeguarding procedures when meeting with individuals, due to concerns about the person becoming alarmed or upset. Several benefits were identified by social workers in adopting 'Making Safeguarding Personal'. The approach was presented as 'empowering' to the person being assessed, through discouraging paternalism. It was also seen to reduce unreasonable demands for risk reduction amongst other agencies such as the police or ambulance service. In addition, adopting the approach enabled social workers to engage with individuals over a prolonged period, in the context of managerial pressure to close cases quickly.

Political Representation as Social Work: Unearthing the Risk Work of Constituency Members of Parliament in the UK

Warner, Jo

University of Kent, United Kingdom
j.warner[at]kent.ac.uk

The relationship between politicians and social workers in the UK is complex and has been prone to continuous cycles of crisis and reform that can be traced back to the 1970s. Each crisis is precipitated by media, public and political reaction to a significant event or scandal. Hostile media coverage of social workers, combined with unrealistic expectations about their capacity to assess and manage risk, have had a deeply negative impact on frontline practice; made worse by increased demands and reduced resources under austerity. In analysing the role of the politician in relation to social work, attention to-date has largely focused on their position as outsiders - either as policy-makers and legislators who react to adverse events and create the problematic conditions for the risk work that is undertaken in practice, or as commentators on a media story as it unfolds. This role can be conceptualised in terms of the politics 'of' social work. In contrast, this paper explores a conceptualisation of politics 'as' social work. The paper draws on semi-structured interviews with British Members of Parliament, where the focus is their experience of formal state social work through activities of political representation in their constituencies. The MP accounts show how they are faced with a complex and often contradictory set of demands in relation to risk, trust and uncertainty. When risk work is understood as emotional, moral and value-laden rather than simply rational-technical in character, the boundaries between politicians and social workers as actors in state-society relations are disrupted.

Foreign-trained Professionals' Integration: Are Institutional Disjunctions Endemic?

Bédard, Jean-Luc; Zaidman, Anna Maria; Massana, Marta

Université TÉLUQ, Canada
jbedard[at]teluq.ca, annamariaz[at]yahoo.com,
marta.massana[at]gmail.com

As numerous authors analysing professions from a social science perspective have shown (Freidson, 2001; Champy, 2012; Ruhs, 2013; Saks, 2015), every society regulates some professions to frame an equilibrium between the State, the market and the economy. In that respect, every jurisdiction has its own history and ultimately, culture that structures and defines regulation of these professions. Furthermore, entry of foreign-trained professionals into professional practice involves a complex process through immigration, recognition and complementary training. Neo-institutionalist framework (Riza, 2008) helps to analyze how institutions and actors cooperate (or not) towards this integration. Building on analysis of Quebec's evolving professional system, institutions and actors, this presentation looks at how actors are shedding criticisms, mainly pointing at corporate self-interest, by invoking protection of the public and complications due to institutional disjunctions, to which they sometimes contribute. Based on data from a literature review, open-ended interviews and grey documentary analysis, I describe how actors and institutions are putting in place adaptations and measures opening to a smoother integration of regulated professionals, despite their deep history of conservatism. This is further complicated by a complex set of rules and by-laws, in addition to Charters of Rights, which acts sometimes as institutional obstacles justifying delays, and as moral devices to which everyone agrees and abides. Finally, our analysis leads to propositions as to how "institutions think" (Douglas, 1985) in a web of interactions between multiples levels of institutions and actors.

Developing A Post-Formal Approach To Analysing Risk Work: A Case Study Of Tensions Experienced Amid A Public Health Intervention In A Dutch City

Brown, Patrick (1); Slagboom, Nienke (2); Gale, Nicola (3)

1: University of Amsterdam, Netherlands, The; 2: University of Leiden, Netherlands, The; 3: University of Birmingham, United Kingdom
p.r.brown[at]uva.nl, nienkeslagboom[at]gmail.com,
n.gale[at]bham.ac.uk

Decision-making amid uncertainty is inherent to healthcare work and it is common to recognise risk as a defining mode through which uncertainty is handled in late-modern organisations. Risk, as abstract knowledge, seems straightforward to apply across populations but results in various paradoxes and tensions when applied to individuals by client-facing (para)professionals. Recent research into 'risk work', especially in public health interventions, has noted such tensions but has not focused on them as a central feature of analysis. Drawing on a quasi-ethnographic study of a parent-focused public health intervention in a large Dutch city, we develop a post-formal analysis which emphasises tensions and incoherencies as important to grasping (para)professional practices and identities. These tensions – for example around risk categories, as abstract knowledge is reinserted into concrete social contexts – also illuminate wider paradoxes and developments in knowledge frameworks, organisational dynamics and (para)professional authority. Using Bechky's work on workplace artefacts as a starting point, we analyse risk as one such organisational technology. Yet while these artefacts are usually politicised and contested, we understand the lack of explicit contestation of this technology in terms of the sacred nature of the central risk object (children), and related ritual processes which impede critical discussion.

Homonationalist values? A comparison between European countries over time

Freude, Leon; Domínguez Amorós, Màrius; Vergés Bosch, Núria

Universitat de Barcelona, Spain
leon.freude[at]web.de, mariusdominguez[at]ub.edu,
nu.verges[at]gmail.com

Since the concept homonationalism was introduced in 2007, it has been discussed enthusiastically in the academic context. Homonationalism is still a controversial concept that has already influenced public policies and social movements. Much of previous research proved the emergence of homonationalism in 2001 in the United States, Canada, Israel and Europe. However, previous works mostly focused on the analysis of discourses and through qualitative methodologies. We propose to move this forward towards the analysis of homonationalist values of the Europeans, quantitatively and over time. Working with data between 1990 and 2017 of the European Values Study we propose to compare the populations of European States regarding prevalence, magnitude and growth of homonationalist values over time. We conceptualized Homonationalism as a confluence of LGBTQ tolerance, racism and nationalism. Therefore we measure the general association of LGBTQ tolerance, racism and nationalism as well as the strength of the group of those who are highly tolerant with LGBTQ, highly racist and highly nationalist. Our results indicate that homonationalist values do exist in Europe but they are far from being hegemonic; since 2000 they are growing steadily, though they are not completely new. These results are important in order to contribute to the theory on homonationalism, but also to public policies on LGBTQ tolerance, racism and nation building. Our results have also potential for the redefinition of strategies of emancipatorian social movements.

Universality of "The Summer of Sangaile": Cinematographic Causes and Transnational Effects

Linkeviciute, Jorune

Sciences Po, France
jorune.linkeviciute[at]sciencespo.fr

The 2015 Sundance Film Festival, one of the largest and most prestigious independent film festivals in the United States, marked a tipping point in Lithuania's cinematic history as a film by Paris-based Lithuanian director Alante Kavaite, "The

Summer of Sangaile", won the best directing prize in the World Cinema Dramatic category. Given that one of the main themes in "The Summer of Sangaile" was the depiction of a homoerotic relationship between two teenage girls and knowing Lithuania's status as one of the most homophobic countries in Europe, according to the European Commission report on the "Discrimination in the EU in 2015" (European Commission, 2015), one would expect the reception of the film in Lithuania to be less laudatory and more controversial. And yet, both the mainstream public as well as the national film experts expressed similar levels of praise as their international counterparts. This paper will show how "The Summer of Sangaile" embodies the Lithuanian state's political agenda pertaining to LGBT+ issues as the film turns away from sexual identity based politics and, instead, engages in elusive portrayals of homoerotic desire. It will become apparent how the state's national agenda is being advanced through evoking LGBT+ visibility in Lithuania as a crucial part of the wider national discourse on modernity. Given the elusive and ambivalent nature of the homoerotic relations depicted in "The Summer of Sangaile", the film functions as an ideal lens through which the construction of a politically neutral and heavily fabricated LGBT+ visibility takes place.

Decolonizing the Boomerang Effect in Global Queer Politics: A New Critical Framework for Sociological Analysis of Human Rights Contestation

Waites, Matthew

University of Glasgow, United Kingdom
Matthew.Waites[at]glasgow.ac.uk

This paper proposes a new critical framework for analysing transnational human rights claiming and contestation: a 'critical model of the boomerang effect', that can embody sociological understanding and insights from decolonizing analyses. The paper first develops a critique of Keck and Sikkink's well-known original model of the 'boomerang effect', from politics and international relations. The new critical model is needed for analysis of global queer politics, particularly to analyse where and how actors in formerly colonized states in the Global South can draw on the United Nations human rights system. The new model requires analysis of specific themes that can be applied in methodology for data-analysis, including: articulation of human rights; social structures and resources; decolonizing contexts, and subjectivation. These themes are applied to illuminate two pivotal cases of claims for decriminalisation of same-sex acts: by LGBTQ activists Caleb Orozco in Belize, and Jason Jones in relation to Trinidad and Tobago, with reference to published autobiographical accounts and commentaries from these individuals, and related sources such as associated with their legal cases, plus public social media sources. The new critical framework points to a new research agenda for international political sociology.

Does Marriage Really Improve Sexual Satisfaction? Evidence from the Pairfam Dataset

Kislev, Elyakim

Hebrew University, Israel
elyakim.kislev[at]mail.huji.ac.il

In light of the growing unmarried demographic, this study analyzes the extent and determinants of sexual satisfaction among seven relationship-status groups: married, never-married, and divorced/separated where the latter two groups are further divided into single, living apart together (LAT), and cohabitating. Additionally, the levels of sexual self-esteem, sexual communication, and sex frequency are measured for the different relationship-status groups as aspects of sexual satisfaction. Finally, this study also analyzes sexual satisfaction while accounting for overall life satisfaction. Using the ninth wave of the Pairfam dataset and analyzing responses of 3,207 respondents in total, this study suggests that marriage is not a determinant for sexual satisfaction. In fact, it can even be a negative correlator when married respondents are compared to certain unmarried groups. The only exception is that of unmarried individuals that currently have no partner. Even this situation is shown to be dependent only on less frequent intercourse, not on a lack of sexual self-esteem and sexual communication. These conclusions challenge previous research as well as earlier scholars' explanations.

Sexuality as a Private and a Social Space. The Margins of Research Regarding Old Age and Gender in Poland

Bieńko Greczyn, Mariola Marta

University of Warsaw, Institute of Applied Social Sciences, Poland
mariola.bienko[at]gmail.com

The issue of senior citizens' sexuality, especially regarding sexual activity undertaken by people considered to be "old" is usually met with silence or even condemned in Poland. In social discourse, senior citizens are perceived as asexual beings. In addition, any sexual behaviour not connected with procreation is classified as pathological (e.g. masturbation, homosexual acts, oral and anal sex). Only in the last decades of the 20th century did this "taboo" become the subject of scientific interest and research. The purpose of the presentation is to reflect upon the sexual desires, practices, and attitudes of senior citizens understood individually and socially, based on subjective factors and social and cultural ideas (stereotypes, social convictions). An important part of this presentation focuses on empirical data, to wit, an analysis

of 403 in-depth, individual interviews conducted between 2012-2014 with men and women who were 60 or older from Polish cities and rural communes. The outcomes are also based on an analysis of the content of Polish guidebooks addressed to senior citizens. The research shows that the sexual activity of respondents are gradually being treated less like something sinful and shameful, but a "double standard in aging", different for women and men is still a characteristic of femininity in Poland. Society depreciates older women, who are seen as less attractive and sexy. Within the study group, women speak of their erotic capital in the past tense. They are often prepared to make many sacrifices in order to enter old age without radically losing sexual attractiveness.

Women and Sexual Abstinence

Cuthbert, Karen

University of Leeds, United Kingdom
k.cuthbert[at]leeds.ac.uk

The phenomenon of 'involuntary celibacy' (Incel) has received a lot of media attention over the past couple of years. It is an intensely gendered phenomenon, associated with particular online spaces, and with links to 'Men's Rights Activism' and 'Pick-Up Artist' communities. However, women's experiences of sexual abstinence and celibacy have been given very little media or scholarly attention. Drawing on findings from research on 'non-sexualities', in this paper I discuss some of the experiences of women who were not having sex. I discuss how their accounts problematize the distinction that is often made between 'involuntary' and 'voluntary' abstinence. Many of the participants spoke about how their abstinence has arisen as a way of surviving an aggressively hetero-patriarchal milieu, but also about the gendered sexual aggressions that they were subject to in negotiating their abstinence with others. I argue that paying attention to abstinent women starkly reminds us of the operations of hetero-patriarchy, rape culture, and misogynistic ideas around sexual agency and desire, which much remain of urgent sociological interest.

Embodied Sensations and Heterosexual Sex Practices

Bosman, Myra

University of Amsterdam, Netherlands, The
m.bosman[at]uva.nl

This article examines the importance of embodied sensations in shaping heterosexual sex interactions, and the creation of social understandings of sex. Research on (hetero)sex often focusses on how discourses may inform sexual encounters, in particular people's normative understandings of what sex is and should feel like. Previous studies show how these understandings come to structure sexual encounters, for instance as aiming at a buildup of intensifying pleasure culminating in orgasm. Aside from discourses, much of what happens during sexual encounters is informed by feeling or wanting to feel certain embodied sensations. This study therefore takes embodied sensations as starting point to trace how sexual patterns and normative expectations emerge through sexual practices. The body is not only an instrument through which sexuality is expressed, it also is a mediator of practical cultural knowledge. Based on an interview study with 34 women and men (i.e. 17 male-female couples), it is shown how interviewees make sense of their embodied sensations, and in particular, how these sensations (and the understanding thereof) come to inform sexual practices. A combination of interactionism and practice theory is applied to investigate sexual interactions as embodied practices through which social meanings are produced. Ultimately, this article aims to shed light on the relation between embodied sensations and practices, and social understandings.

RN23_02a | Negotiating sexual identities

Non-Cis* Citizens and Border Crossings: The Effects of the Heteronormative Gender Regimes on Practices of Border Controls and Border Crossing by Non-Cis Individuals

Molitor, Verena

Bielefeld University, Germany
verena.molitor[at]uni-bielefeld.de

Non-cis individuals, non-binary as well as trans* bodies challenge gender regimes and border security control regulations, the police practice and policing as such in the sense of hierarchical control. The expectation of gender binary within the policing practices applies to the citizens, who are expected to have documents with registered (mostly binary) gender, so body checks are clearly regulated, as well as having genitalia, corresponding to the documents. The police officers

trapped in the binary-normativity of gender regimes and gender registrations face specific challenges while controlling non-cis individuals. Being binary and cis-gender is also expected from police officers, having e.g. sex-specific uniforms, clear rules of e.g. performing body check on same-sex citizens, and, until at least 2019 in German case, even having certain types of genitalia. Complex ambiguities faced by trans* police officers are rather silenced within the executive power and barely researched. Hence, bodies, not complying in their visual appearance or genitalia to the id-documents challenge police practices and police as institution. This paper demonstrates, using data from biographical interviews with trans* police officers in Germany and materials for diversity trainings concerning trans* and non-binary bodies within German police, how the normality expectations, articulated in heteronormative gender regimes are being articulated, internalised, negotiated and complied to by the trans* police officers in their professional life. The paper shows the embodiment of non-complying non-cis bodies and their clashing with heteronormative gender regimes, gender identity registrations as well as self-positioning of the trans* police officers within the executive power.

Iranian Gayness and Its Origins: A Survey on The Process of Gayness Production in The Iranian Context

Naeimi, Mohammad

Verona University, Italy
mohammad.naeimi[at]univr.it

By reworking Foucault's concept of the sexuality apparatus, Massad coined the term 'Gay International' in order to assert that the identification of homosexuality and gayness are modern and Western products which have been exported to the Middle East by Western Human Rights organizations since the 1980s. In Massad's writings, therefore; non-heterosexuals' agency in the relationship between Middle East and modernity has been denied. In my paper, on the contrary, I will argue that homosexuality in the Iranian context is constituted during two different historical periods: during the modernization process and in post-revolutionary Iran. I will discuss how the process of modernization in the Iranian socio-political atmosphere at the end of the Nineteenth and during the Twentieth century has contributed to the heteronormalization of society and the erasure of traditional same-sex practices. I will also claim that the Islamic Revolution, as a form of fundamentalism, is a by-product of modernization that brought the pathologization and criminalization of homosexuality. And I will also assert that the achievement of new freedom of expression in the 1990s has contributed to the process of gayness production. Based on Rao's thesis, and in contrast to Massad's writings, I will argue that Iranian gays actively took part in the process of gayness production and were not simply the passive receivers of a Western form of life. Ultimately, I will conclude that gayness in the Iranian context is mutually constituted in accordance, and in contrast to modernization and westernization and propose that gayness can escape its Western origins.

Strategic usage of sexual identity labels in mainland China and Hong Kong

Suen, Yiu-tung

Chinese University of Hong Kong, Hong Kong S.A.R. (China)
suenyiutung[at]gmail.com

International organizations such as Amnesty International, Human Rights Watch, and the International Lesbian and Gay Association increasingly speak about sexual orientation-based rights in global terms. Speaking about gay people in such global terms seems to suggest that being gay in different parts of the world share much similarity and commonality with their counterparts in North America and Europe, at least to the extent that they can be referred to using the same sexual identity labels. Some scholars would argue that it is in line of the proliferation that being gay is an increasingly global phenomenon. However, anthropologists and sociologists have challenged the discourse on a homogeneous global 'gayness' and criticized such a notion for being universalizing and ahistorical. Building on ongoing works to challenge and examine the applicability of sexual identity labels in the Chinese cultural context, this research funded by the General Research Fund assesses how same-sex sexual identity labels such as 'men who have sex with men', 'homosexual', 'tongzhi', 'tongxinglian', 'tongxingai', 'gay' and 'queer', and more local terms such as 'membra', 'pure' and 'no label' are applicable or not in contemporary mainland China and Hong Kong in an era of global gay politics. It draws on: an online survey of self-reported usage of different sexual identity labels among same-sex attracted non-activists in mainland China and Hong Kong; interviews and focus groups with same-sex attracted activists and non-activists in mainland China and Hong Kong; ethnographic participation of organizations that work with same-sex attracted individuals in mainland China. This paper contributes to understanding of the local development and adaptation of sexual identity labels at a historical juncture of growing interconnected global gay politics.

Male and Female Ways to Understand and Articulate One's Own Sexuality (on Biographical Stories of Russian Non-heterosexual People)

Kislitsyna, Polina

European University at St.Petersburg, Russian Federation
pkislitsyna[at]eu.spb.ru

The paper focuses on ways to narrativize homosexual experience and gender differences in biographical stories of non-heterosexual people in Russia. Based on biographical interviews and written autobiographies collected from people with homosexual experiences, I consider strategies for telling about one's own sexuality, causal relationships and ideas about the nature of one's own sexuality. I single out a general scheme of narratives about the formation of one's own sexuality which would be relevant for both men and women: the first erotic and aesthetic impressions, the first affections, the first love and sexual relations. However, there are quite a few gender differences in the ways narrators describe this process. There are themes and plots that are more typical for women; others appear only in male stories. For example, only women told about falling in love with a teacher, whereas experiences of collective masturbation are featured exclusively in male biographies. Women tend to talk more about the emotional aspect of sexual and romantic relationships. Men are more free to articulate the bodily aspect of sexuality, especially when it comes to written narratives. These differences in the ways of narrativizing sexuality demonstrate the difference in cultural notions about what male and female sexuality should be in general and how each of them can be told.

RN23_02b | Mapping and understanding sexual attitudes

Democracy Deficit and Homophobic Divergence in 21st Century Europe

Takacs, Judit (1); Szalma, Ivett (1,2)

1: Centre for Social Sciences, Hungarian Academy of Sciences, Hungary; 2: Corvinus University of Budapest, Hungary
takacs.judit[at]tk.mta.hu, Szalma.Ivett[at]tk.mta.hu

In our presentation we will focus on the relationship between democracy deficit and homophobic divergence within 21st century European societies. Our main research question is about how social attitudes towards lesbians and gays changed in the time period between 2002 and 2016, and whether there are any signs of convergence regarding these issues in different parts of Europe, characterized by different welfare regimes. The empirical base of the study is a dataset including all eight rounds of the European Social Survey, focusing especially on a key variable measuring the agreement level with the statement that gay men and lesbians should be free to live their own life as they wish. For data analyses descriptive statistics and explanatory models were constructed by applying multilevel mixed effect linear regression models. Our results show that there are still significant differences between different parts of Europe regarding social attitudes towards gays and lesbians. However, based on our results we would recommend a more refined division than the East–West dichotomy within Europe.

The Dimensions of Sexual Permissiveness

Kinnunen, Anu (1); Verdu, Amalia (2); Kontula, Osmo (3)

1: University of Tampere; 2: University of Turku; 3: Family Federation Finland
anu.kinnunen[at]tuni.fi, alvesa[at]utu.fi, osmo.kontula[at]vaestoliitto.fi

We are identifying dimensions of sexual permissiveness and further investigating how these dimensions differ in relation to gender, age, education, income, religiosity, work life status, relationship status and residential area. This study is based on a unique data of generous representative sample of 6550 citizens from the general population of Finland in years 1992-2015. Factor analysis was used to identify dimensions of sexual permissiveness and linear regression analysis to analyze how these dimensions are interfering with time and cultural elements. We grouped the data in 4 factors 1) permissiveness of sexual orientation, 2) permissiveness of marital fidelity 3) permissiveness of casual sex and 4) permissiveness of selling sex. Gender appears as an important variable although not with the same strength in all the factors. In general men were more permissive than women except for the attitude towards

sexual orientation in which women showed more permissiveness. Religiosity restricts sexual permissiveness, education enforces permissiveness towards sexual orientation and casual sex but predicts less permissiveness towards selling sex. Time is another factor showing disparate results as permissiveness of casual sex and sexual orientation have grown in the past 20 years, but attitudes towards infidelity and selling sex have tightened.

“It Changed, But Not Too Much”: Views And Perspectives Of Young People On LGBTI Diversity In Portugal

Santos, Hugo; Silva, Sofia Marques da; Menezes, Isabel

Faculty of Psychology and Educational Sciences of University of Porto, Portugal
hugosantos[at]fpce.up.pt, sofiamsilvauporto[at]gmail.com, imenezes[at]fpce.up.pt

In recent years, homophobia studies at school have been under an identity crisis whose epicenter has located on the tension between the denunciation of homophobia and the essentialist danger of a single focus on victimization. This tension is not out of step with the paradoxical contexts in which we live in, since, on the one hand, there is an increasing social tolerance and global awareness of LGBTI diversity – consequence of greater media visibility and legal changes in Western societies –, on the other hand, it seems evident the perpetuation of stereotypes, discrimination and violence, subtle or direct, against LGBTI people – or judged as such – still continues to be reproduced. This paper explores the perspectives of young people aged 16-19 about each initials of LGBTI diversity, drawing upon school-based qualitative data from a study conducted in Portugal in 2015–2017 with methodological resource to observant participation, interviews and focus group discussion. Findings reveal a multiplicity of discourses that shows a paradoxical attitude on LGBTI rights. On the one hand, many young people shows what we can call a “liberal discourse”: non-heterosexualities are seen as a legitimate possibility of human sexuality, young people emphasizes individual freedoms and critically reflect upon their own attitudes. On the other hand, a cynical discourse of tolerance still exists, symbolically represented by “nothing against, but” cliché, together with particular comments in which homossexuality is still seen as something unnatural. Our conclusion is that we must take into consideration both kind of discourses, in order to refuse a imminent panorama of total victimization and to reject a false psychological sensation that we are living in societies where homophobic discrimination was solved.

Does Prostitution Legislation Affect the Population's Social Norms? A Natural Experiment on European Prostitution Policies

Adriaenssens, Stef; Heegemann, Patrick; Hendrickx, Jef

KU Leuven, Belgium
stef.adriaenssens[at]kuleuven.be,
patrick.j.heegemann[at]gmail.com,
jef.hendrickx[at]kuleuven.be

Most European countries introducing a law criminalizing the purchase of physical sexual services explicitly aim to raise awareness. One of the explicit aims of the abolitionist programme regarding prostitution, indeed is to change the public's normative evaluation of prostitution. This implies, to a certain extent, that they also expect that a legalization or regulation of prostitution could make people more permissive toward prostitution. Most evaluations of the effects of prostitution policy focus on externalities such as safety at work, occupational health, or risks of human trafficking. Concurrently, the effect of a legislative change on the public's social norms regarding prostitution is still largely unknown. We test these conjectures empirically, with the help of a multi-case study. We design a research where the effect of five European historical cases of national legislative changes in Europe is modelled. We include cases of decriminalization (the Netherlands, Slovenia, and Spain), and cases of criminalization (Sweden and Croatia). The evolution of the normative acceptance of prostitution is measured with the help of the European Values Study, with data collected in the 1990's until 2008. The effect of the legislative change on the prevailing acceptance of prostitution, is modelled through a difference-in-differences approach. The results seem to indicate that criminalization (or 'abolition') significantly decreases the public's acceptance of the phenomenon of prostitution. Concurrently, the decriminalization of prostitution seems to have no marked effect on the public's normative evaluation of the phenomenon.

RN23_03a | LGBTQI+ intersectional experiences

Discussing and Theorising the Conceptual Gap between LGBTTIQ-Identities and Community-Belonging on the Example of LGBTTIQ Police Officers

Zimenkova, Tatiana (1); Molitor, Verena (2)

1: Rhein-Waal-University of Applied Sciences, Germany; 2: Bielefeld University, Germany
Tatiana.zimenkova[at]hochschule-rhein-waal.de,
verena.molitor[at]uni-bielefeld.de

Sociological conceptualisations of identities and belongings are partly intersecting or understood as complimentary or even conflicting conceptions (Pfaff-Czarnecka, 2012). Are gender and sexual identities stable entities, and how do they intersect with community belongings of the LGBTTIQ? The paper strives for conceptualising distinction criterias between the theoretical concepts of identities and belongings with respect to self-articulation of LGBTTIQ. We ask, which theoretical instruments are needed to explain the identity/belonging tensions and clashes between the queer-community and professional belonging of LGBTTIQ? Should LGBTTIQ-identities and belonging to a profession be discussed within the intersectionality perspective? Given the empirical evidence from biographical interviews with LGBTTIQ police officers in Germany we seek to demonstrate tensions and intersections of belonging to the police as organisation and LGBTTIQ identities and queer communities. Being part of the police is framed in the interviews as family-like belonging and the LGBTTIQ identities are addressed by our interview partners as unchangeable and discriminated within the executive forces. The presentation seeks to develop theoretical approaches, capable to embrace conflicts, faced by the LGBTTIQ police officers, who are negotiating between being an activist of LGBTTIQ rights and belonging to executive power. We seek to demonstrate approaches, suitable for explaining the mechanisms of the prioritising of different aspects of belonging/identities within the biographical narrations on the example of LGBTTIQ police officers. To do this, we focus on clashes or negotiations of professional belonging with LGBTTIQ identities, which produce specific forms of power relations and hierarchies (Anthias 1998).

Queering the Glass Ceiling: lgbtqi+ discrimination in the workplace in Portugal

Santos, Ana-Cristina; Alcaire, Rita

Centre for Social Studies - UC, Portugal
cristina[at]ces.uc.pt, ritaalcaire[at]ces.uc.pt

Notwithstanding significant changes regarding formal recognition of LGBTQI+ rights in Portugal since 2001, hetero and cisnormativity remain pervasive cultural scripts. The workplace is one of the spheres in which discrimination is more visible. From feeling ignored or being dismissed, having experienced negative evaluations and/or refusals of promotion, to ostracization and bullying, LGBTQI+ people are overwhelmingly faced with having to remain in the closet in the spaces in which they spend most of their daily lives. Such unspoken expectation is part of what we suggest to call a heterocisnormative glass ceiling in operation, according to which information regarding sexual orientation or gender identity is to remain separate from the workplace. This separation is often disguised as respect for privacy, when it actually consists in replicating a new dichotomy private/public and imposing the closet as the new normativity. Drawing on work done within the CILIA LGBTQI+ study in Portugal, in this paper we offer an exploratory analysis based on relevant surveys conducted by Portuguese NGOs and a literature review of scholarly work on LGBTQI+ embodied experiences in the workplace in Portugal. Through this analysis we identify patterns of (in)equalities that affect the professional lives of people with non-normative sexual orientations and gender identities in specific life course transitioning moments, in particular the transition into adulthood and the so-called rush-hour of life (mid-term career). In the last section of the paper, we suggest ways for reframing research and policy around inequality at the workplace by addressing LGBTQI+ specificities and also the impact of austerity measures and precariousness in Southern Europe.

Language, social networks and belonging among East European LGBT migrants in Scotland

Stella, Francesca; Anna, Gawlewicz

University of Glasgow, United Kingdom
francesca.stella[at]glasgow.ac.uk,
anna.gawlewicz[at]glasgow.ac.uk

Migration studies have long recognised the significance of social networks in the process of migration and settlement. Research on migrants' social networks has often explored issues of language use, acquisition and proficiency, and examined how language shapes migrants' relations with diasporic migrant communities as well as their 'integration' in the 'host' society (Boyd 1989; Haug 2008; Ryan 2011). However, language and social networks remain relatively unexplored within work on transnational queer migration: existing work mainly focuses on language as a means to (re)negotiate sexual and gender identities (Manalansan 2003; Kuntsman 2003), or focus on 'sexual racism' within the gay scene (Callander et al 2016), but rarely explicitly addresses how language may affect queer migrants' social networks, including relations with diasporic communities (Cantu' 2009). This paper examines how language shapes queer migrants' social networks and sense of belonging at the intersection of ethnicity and sexuality, drawing on the findings of a project on LGBT migrants from Central Eastern Europe and the Former Soviet Union in Scotland. The project explored aspects of queer migrants' social networks through a focus on their 'personal communities', a concept that encompasses meaningful personal ties in which people are embedded, and through which they 'give and receive companionship, intimacy and support – whether this is with family members, or friends, or other significant ties' (Pahl and Spencer 2010). Language emerged as an important factor facilitating or hindering social contact, and the paper explores the role of language in socialising and finding companionship, romance and sex. The paper examines language use (multilingualism, proficiency in English, language switching) as well as language as a marker of ethnic identity and racialized otherness.

Gender, Ethnic and Religious Identity Experience among LGBTQ Muslim Youth in the Philippine

Regadio. Jr., Crisanto Quinos (1,7); Cristobal, Jethro Orejana (2); Abuan, Mariane Amor Romina Torralba (3); Hayudini, Shareen Usman (4); Rovera, Jessreel A (5); Tan, Carl Julius Dee (4); Javier, Julia Maria Teresa Bautista (6)

1: De La Salle University-Manila, Philippines; 2: De La Salle University-Manila, Philippines; 3: De La Salle University-Manila, Philippines; 4: Ateneo de Zamboanga University; 5: 51 Talk Philippines; 6: De La Salle University-Manila, Philippines; 7: De La Salle-University, Manila, Philippines
crisanto.regadio[at]dlsu.edu.ph,
jethro_cristobal[at]dlsu.edu.ph, abuanina[at]gmail.com,
shareenhayudini[at]gmail.com, jechi_jarovera[at]yahoo.com,
tancarljulius[at]gmail.com, julia_javier[at]dlsu.edu.ph

This study investigated the gender, ethnic, and religious self-understanding among LGBTQ Muslim youth in the Philippines. Key informant interviews with selected lesbian and gay Muslim Tausug from Zamboanga City and Muslim Maranao from Marawi City were conducted to determine their affiliation with and experience of their religious, ethnic and gender identities. Their sexual orientation and type of relationship established with their family, peers, community and the “ummah” were also investigated. The investigation reveals the incompatibility between gender identities and ethnic and religious affiliation. The incompatibility resulted in the renunciation of their gender identity and their willingness to conform to heteronormative expectations as a “man” or a “woman.” Thus, they are forced towards “compulsory heterosexuality and heteronormativity” in which they live a life in conformity to Muslim codes and ethnic customs and traditions. These participants affirm the need to enter into heteronormative marriage, and to raise their children as pious Muslim who will be observant of their ethnic customs and traditions. On the other hand, the incompatibility reflected through rejection from the family and their Ummah, and their experience of ridicule, shaming, and physical abuse promote the desire to escape “compulsory heterosexuality and heteronormativity,” such they decide to break free from their ethnic and religious ties. These participants seek and live in a more “LGBTQ tolerant” social environment, pursue professional and career aspirations, and follow a more secular life. The findings of the study aim to contribute to the understanding of the intersection between gender, religious and ethnic identities, and to examine its implications to human rights, social justice, and social inclusivity.

RN23_03b | Sex, money and work(s)

Third Parties in Full-Service Sex Work in England

Brouwers, Lilith

University of Leeds, United Kingdom
bnlheb[at]leeds.ac.uk

Although full-service sex work is not criminalised in England, third parties such as managers, maids, landlords, and cleaning and security staff are. Additionally, sex worker-led organisations report that legislation criminalising third parties is also used to criminalise sex workers themselves (SWOU, 2013). This second year PhD research aims to map the work relationships between sex workers and their colleagues, managers and other third parties through a mixed methods approach of 150-200 self-completion questionnaires and 20 in-depth semi structured interviews with a wide variety of current sex worker respondents. The research centres the experiences of workers as experts in their own field by developing the research design in cooperation with sex worker-led organisations and sex worker key informants, by foregrounding the analysis of sex workers themselves, and by remaining in constant dialogue with participants throughout the research process. This presentation will focus on the emerging findings on the effect third parties have on the work and wellbeing of sex workers. While third parties are assumed, both in legislation and in the public imagination (May et al., 2000, Hickle and Roe-Sepowitz, 2016), to be exploiting or controlling sex workers in all cases, sex workers themselves report a variety of experiences with third parties. Additionally, sex workers critically evaluate the ways legislation criminalising third parties affects their safety and wellbeing while simultaneously being highly critical of their work relations within capitalism.

Will Any Body Really Do? Investigating Skills in Commercial Sex

Diatlova, Anastasia

University of Helsinki, Finland
anastasia.diatlova[at]helsinki.fi

This paper explores skills in commercial sex, examining the different skill-sets and the process of skill acquisition among Russian-speaking women engaged in commercial sex in Finland. The paper aims to problematize the perception of commercial sex as unskilled or low-skilled labour and to interrogate the hierarchies of skilled and unskilled work more broadly, suggesting that it is the demands of the labour market and the employers that structure the conceptualization of skilled and unskilled labour. The study is based on interviews conducted with Russian-speaking women engaged in different forms of erotic and sexual labour including escorts, erotic dancers, adult film actresses and models, etc. The study also draws on data derived from ethnographic research in private shows, erotic dance clubs and sex restaurants in two large cities in Finland.

Social Background Indicators Amongst Sex Sellers: An Analysis Using Register Based Data

Dyrvig, Theresa

Copenhagen, Denmark
tfd[at]vive.dk

Using register-based data on more than 1000 women involved in indoor prostitution this article analyzes the social background of sex sellers and identifies possible childhood risk factors. The study offers social profiles on female sex sellers focusing on demographics, family background and individual vulnerabilities such as socio-economic status, physical and mental health and substance use. Knowledge on social background are important on several accounts. Most importantly, existing knowledge on social background of sex sellers is patchy and lack variety in both methodology and target group. Hence, prostitution is often investigated from a street level perspective and more research on other populations (such as indoor sex sellers) is required in order to avoid a “distorted picture of the world of prostitution” (Weitzer, 2005 p. 229). Further previous research is almost exclusively based on self-reported questionnaires and/or interviews due to barriers in obtaining other types of meaningful data. This means that despite a wealth of empirical findings and commentary on sex work, many quantitative questions whose answers could complement the qualitative approach remain unanswered. By integrating register-based data this study uses a new source of data providing the opportunity to examine social background with a new level of detail including sociodemographic indicators making it possible to investigate a possible correlation between family background/social background and prostitution experience.

RN23_04a | Spaces of sexuality

LGBTQ+ Social Housing Residents – extending the locations of sexual citizenship

King, Andrew Douglas

University of Surrey, United Kingdom
andrew.king[at]surrey.ac.uk

This presentation draws on studies conducted over the past two years regarding the experiences and concerns of LGBTQ+ people living in social housing; that is, housing provided by a local government authority or housing association. Themes emanating from this research indicate that LGBTQ+ social housing residents lack sexual citizenship in relation to their housing. The presentation illustrates why this is through the discussion of number of key themes from the research, including: concerns about belonging, erasure of identities and a lack of equality and inclusivity. The presentation outlines what can be done to rectify this situation, including a brief overview of the UK’s first LGBTQ+ social housing resident ‘pledge scheme’. The presentation also considers what this means for the concept of sexual citizenship itself.

‘We’re Not Asking For A Palace, Just A Safe Space’: The Intersections Of Sexuality, Space And ‘Refugeeness’ In The Lives Of LGBTQI* Refugees

Held, Nina

University of Sussex, United Kingdom
n.held[at]sussex.ac.uk

Whilst Europe is proud of its record on LGBTQI* rights and presents itself as a haven for LGBTQI* people, the situation of individuals who seek international protection on grounds of sexual orientation and/or gender identity looks rather bleak. Not only has the ‘welcome culture’ (in Germany, for instance) been replaced with right-wing rhetoric and the closure of European borders, but LGBTQI* refugees also face additional issues such as the impossibility of proving their ‘gayness’ and social isolation, especially when their claim is refused. Whilst the subjectivities of LGBTQI* refugees are constituted by ‘space’ in particular ways, sexual geographies research has not drawn much attention to that relationship. Drawing on the European project SOGICA – Sexual Orientation and Gender Identity Claims of Asylum (www.sogica.org), this paper explores how space and sexuality constitute each other in the lives of LGBTQI* refugees. It challenges the concept of ‘safe space’ and argues that it is the intersections of being ‘marked’ as a refugee and being LGBTQI* that fundamentally shape the intersectional spatial experience of LGBTQI* refugees.

Supporting Young LGBT+ People's Sense Of Belonging And Wellbeing: Contrasting Experiences From England And Sweden

Formby, Eleanor (1); Woodiwiss, Jo (2)

1: Sheffield Hallam University, United Kingdom; 2: University of Huddersfield, United Kingdom
e.formby[at]shu.ac.uk, j.woodiwiss[at]hud.ac.uk

This paper draws on findings from British Academy/Leverhulme funded research in England and Sweden to examine the notion of 'supporting' LGBT+ young people's wellbeing, including in relation to friendships and peer relationships that might facilitate a sense of belonging. Increasing numbers of young people in the UK are being diagnosed with mental health issues, but access to formal support or information about sex(uality) and relationships is limited, particularly in relation to lesbian, gay, bisexual and trans (LGBT+) identities. This contrasts with what are often perceived to be more liberal attitudes towards sex(uality) in Sweden. Our research, using interviews, discussion groups and vignettes with practitioners and young people, indicates that in England LGBT+ identities are perceived by 'others' as problematic, vulnerable and/or conflated with mental ill-health. However, this was resisted by many LGBT+ young people who called instead for more inclusive approaches to schooling and/or youth work that do not necessarily see them as having mental health issues, but which recognise that they might sometimes require additional support within their everyday lives. In Sweden, the level of support available to young people was impressive, but young LGBT+ people did still face challenges. In a context where 'punishment' was frowned upon, a less authoritative approach to schooling led to some problematic language/practices going 'unchecked'. Here we discuss some lessons from both English and Swedish practices, particularly regarding understandings of 'safeguarding'/child protection and 'youth support', which could benefit all young people growing up in a 'sexual world'.

"I'm Not Who They Expect": Hearing Trans People Navigate The Obstacles And Challenges Of Homelessness

England, Edith Amy

Cardiff University, United Kingdom
EnglandEA[at]cardiff.ac.uk

Homelessness is particularly prevalent among trans people. In the UK, homelessness assistance is mediated by local government officials. These "street level bureaucrats" allocate resources based upon systems and practices reliant upon beliefs about deservedness/need, rooted in a heteronormative understanding of home and homelessness (Cramer, 2005), leading to concern over the ability of the service to meet the needs of homeless LGBTQ applicants. Two key gaps exist: first, little work so far has included trans people as a distinct group. Second, the majority of prior scholarship locates LGBTQ homeless people as disempowered and marginalised, and so

does not consider how this group may deploy agency and power. Drawing upon interviews with 25 homeless/ ex-homeless trans people, this paper finds that mundane practices by street level bureaucrats, and overarching organisational oversight, position homeless trans people as unanticipated, passive "strangers" (Ahmed, 2000), whose specific needs are unaccommodated and frequently problematised. Consequently trans people often perceived homelessness service bureaucracies as hostile, dismissive and indifferent to their needs. Yet homeless trans people are also highly creative, working co-operatively to create safe, if often physically and temporally precarious, "homes". Such practices operate dialectically with a deconstruction of heteronormative understandings of home and family. The paper thus makes two key contributions. First, it advances understanding of ways in which bureaucratic/institutional practices contribute to "overlooking" of non-heteronormative applicants. Second, it highlights applicants as resistive, ingenious and reflexive, with a complex and nuanced understanding of their homelessness as a transformative life event.

Social Spaces of Gay Men in Switzerland

Kaeser, Nadine; Fabian, Carlo; Neff, Riccarda

Fachhochschule Nordwestschweiz, Switzerland
nadine.kaeser[at]fhnw.ch, carlo.fabian[at]fhnw.ch,
riccarda.neff[at]fhnw.ch

Research in the area of social network support shows that social spaces and social networks are important areas to promote quality of life. However, there is hardly any empirical evidence in considering positive aspects of social spaces including social networks and social support for homosexual men in Switzerland. With our research project, the lack of evidence-based knowledge concerning the situation of gay men in Switzerland shall be reduced. The aim of the research project is to discover, describe and understand the subjective functions and meaning of social spaces for quality of life of gay men in Switzerland. The project examines its topic with an exploratory mixed method design. The first step consisted of a qualitative exploration of the research field, based on semi-structured interviews including egocentric network analysis. Building on these findings, the second step consists of the quantitative exploration, by means of a broadly supported online survey. The insights gained are intended to better understand the resources within social spaces and networks of gay men in a largely heteronormative society and thus to enrich and broaden the debate as well in practice, politics and science. The conference presentation will provide an overview of the first outcomes of the qualitative exploration. The contribution is intended to demonstrate our interest in the practice and dynamics of positioning as a minority in a heteronormative society. The first results show that the active positioning of gay men brings with it different uses of social spaces and corresponding geographical spaces. This is also reflected in the importance and significance of safe spaces for gay men in Switzerland.

RN23_04b | Sexuality, Abuse and Violence

'Paying with the Bedroom' - Sex as Remuneration in Marriages of Convenience with the Purpose of a Residence Permit

Bzzi, Julia Christine

Johannes Gutenberg University Mainz, Germany
julia.bzzi[at]yahoo.com

A marriage of convenience, as any other marriage, is similar to a contract between two human beings. The contract might contain (negotiated) conditions regarding the payment, for example a fixed sum or a favorable distribution of tax classifications. But in addition, indirect ways of payment can develop. One of those can be sexual intercourse. Therefore, I am speaking of 'paying with the bedroom'. Following the sense of some of my male interview partners, the men profiting by the marriage in terms of residence, pay partly for their permit with sex. The compulsion to regularly engage in intercourse develops due to a very present fear of divorce, justified or not, therefore losing their residence permit because of their wife's dissatisfaction. So the mere possibility of the partner's discontent might lead to agreeing to every – even indirect or assumed – claim the partner supposedly expresses. Ergo, sexual intercourse as a semi-voluntary social interaction can offer access to a residence permit. What is the interpretation of this agreement? It might be an expression of what is at stake for migrants from so called negative third-country nationals such as Moroccans. A strong hint where European migration policy has developed so that migrants engage in – describing this phenomenon in drastic words – sex work. Therefore, we should ask: Is this a version of prostitution which developed out of Europe's migration policy? Do these male migrants empower themselves by using sexual spaces of action in order to acquire the European migration policy? Is this even an act of emancipation? In my presentation I intend to partly answer those questions by suggesting links between migration, residence permit, power and sexuality.

Party, Public Space and Rape Culture. A Study of "La Manada" Case

Camps Calvet, Clara (1); Morero, Anna (2)

1: Universidad de Barcelona; 2: Universidad de Barcelona
campscalvetclara8[at]gmail.com, anna.morero[at]ub.edu

This paper will focus on understanding which elements related to the festive context in the public space are used to explain that sexual violence against women can be understood as a part of the festivity itself. To do so, we will analyze the case of "La manada", a gang rape case that happened in July of 2016 during the San Fermín, a traditional and centenary festivity held in Pamplona (Spain). The verdict dictated by the judges caused huge demonstrations of women all over Spain. The

mobilizations were to show the disagreement of women with the argumentation of the judicial sentence, which didn't consider the aggression a rape because, according to them, the victim didn't resist to the rape. Thus through a specific and paradigmatic case, nowadays internationally known, we will show how a festive context in a public space can be used to justify sexual violence against women. To do so, we conducted a qualitative field work that included journalistic case tracking, in-depth analysis of the instruction and the accusation writings, as well as the court rulings of the case. In depth interviews with the local feminist movement in Pamplona and experts on sexual violence involved in the case were also conducted.

Beyond the 'Socialist Way of Life': Expert Discourse on Sexual Murder and Politics of Respectability in Czechoslovakia after 1968

Moravanská, Lucia

Masaryk University, Faculty of Social Studies, Czech Republic
moravanskalucia[at]gmail.com

Sexually motivated murder represented an extremely dangerous act to Normalization-era Czechoslovakia (1969-1989). At the time, 'normalcy' and 'deviance' represented new ways of categorizing citizens, the regime was based on social homogeneity, and the negotiation of citizenship belonged within the private sphere of the family (Bren, 2011). Paradoxically, sexual murderer was diagnosed as 'abnormal', not a 'real' sexual deviant and usually subjected to death penalty. By using critical discourse analysis, this paper shows how experts from the field of criminology, sexology and psychiatry articulated a perpetrator's high degree of social danger. Indeed, expert knowledge on sexual murder and its punishment were informed by the politics of respectability (Skeggs, 2004). I critically point out that Czechoslovak expertise as well as regime's ideology operated not only within white (Sokolová, 2008; Čajkovičová, 2017) and conservative gender order (Havelková, 2017; Lišková, 2016, 2018; Vodochoďský and Klvačová, 2015), but also class-based framework, although not always explicitly, but by the notion of 'degraded way of life'. As such politics of respectability were constructed at the time when family became a source of the individual's normalcy, I show that murderer not only transgressed sexual norms but also class expectations, the root of which experts placed in the offender's deprived upbringing. By attributing lower-class characteristics to the perpetrator, he was thus symbolically excluded from the 'socialist way of life'. Furthermore, eliminating sexual murderers via the death penalty served to reinforce normalized notions of sexual behaviour, parenting, and class.

Blurred Lines: Reflections On The Normative Specification Of Sexualized Violence In The Era Of Digital Media

Vobbe, Frederic; Kaergel, Katharina

SRH University of Applied Sciences, Germany
frederic.vobbe[at]srh.de, katharina.kaergel[at]srh.de

Intimacy is above all a matter of emotional communication, with others and with the self, in a context of interpersonal equality (Giddens, 1994). Thus, creating intimacy starts with mutual self-disclosure. Exploring some of the qualitative aspects of our 'journeys to intimacy', the spread of digital media has profoundly reshaped intimate lives, transforming the ways in which we are involved in intimate relationships and experience love, sexuality and emotions in everyday lives. Digital media contexts trigger (sexual) self-disclosure unbounded from offline-life creating an illusion of intimacy at a distance. So far, very little is known of the ways in which digital media mediate the ways in which intimacy is experienced and lived. We argue that digital media communication results in a transgression of the idea of intimacy and (sexual) norms that operates in the offline-world. This is significant because digital media have become critical spaces in which we re-negotiate ideas and practices of intimacy within a context of supposed anonymity and distance, disguising the divide between consensual and non-consensual actions. The present paper will reflect on different ways in which digital media, intimacy and sexualized violence intersect. In the hope that the idea of intimacy itself will be opened out in the process, we shed light on digital media intermeshing the idea of intimacy with multiple levels of normativity - equally forcing social work, research, justice and society to think about the implications of blurring lines between intimacy, transgression and sexualized violence, especially with regard to the professional help system.

RN23_05a | Sexual citizenship: Current challenges

What's Queer Got to Do with it? Queernormativity & Heterobrasilidade in Brazil's QueerMuseu

Butterman, Steven Fred

University of Miami, United States of America
butterman[at]miami.edu

The August 2018 inauguration of the "Queer Museum" in Rio de Janeiro brings to the forefront controversial issues that dramatize and even metaphorize Brazil's sociopolitical divisions: state involvement, support, and censorship of cultural initiatives designed to destigmatize creative production of and about gender/sexual minorities. The brief but volatile history of the museum's opening, its subsequent censorship in Porto Alegre, the use of social media to rehabilitate itself in Rio with "crowdfunding" campaigns reveals larger debates on freedom of speech, citizenship as activism, art as a site of cultural resistance, and the limits of reception and spectatorship. For example, a judge ordered on the eve of its opening that children 14 and under not be permitted to visit the exhibit. While the order was suspended days later by another judge, these (re)actions stage current debates in Brazil on "ideology of gender" arguments that continue to suppress gender studies and LGBT/queer studies at all levels of the curriculum, from the "kit de anti-homofobia" at the secondary level to the repression and commission of aggression against Judith Butler's (physical and scholarly) body of knowledge. This paper interrogates simultaneously conflictual and consensual relationships between aesthetics (artwork), the ethical imperative of the museum as a cultural institution invested in representing cultural artifacts of marginalized citizens, the rules of censorship and the roles of freedom of speech in a "democracy" positioning itself in an ambivalent "queer space and time" (Halberstam) consistently questioning the utopian foundations upon which it is employed and revoked in today's Brazil.

Entitlement to Marriage, Entitlement to Fully-Recognised Family Membership and Citizenship: Discussion on Taiwan's Case of Same-Sex Union Legislation

Chung, Wei-Yun

National University of Singapore, Singapore
aricw[at]nus.edu.sg

There is growing literature on same-sex union. However, most existing studies are done in the Western context and therefore cannot fully represent the experience of LGBT people in different cultural contexts. This presentation aims to expand the cultural scope of relative literature by investigating the institutional barriers to and policy implication of same-sex union legislation in Taiwan. Taiwan is the first Asian country which allows same-sex union. In 2017 Taiwan's Constitutional Court ruled that same-sex union should be legalised; consequent referendums in 2018 concluded that same-sex union would be legalised, though not in the name of marriage. Like other East Asian countries, Taiwan is heavily influenced by Confucianism. Confucianism does not explicitly reject homosexuality; nonetheless, its emphasis on the family obligation to have children and continue family line makes homosexuality invisible. Besides, the closely-connected kinship networks and the clear public/private-sphere divide makes the family (particularly immediate family members) rather than the state the main welfare provider. Thus, same-sex union legislation is both an issue of equality and a matter of welfare and personal long-term well-being. This presentation begins with the cultural, social, and legal context of Taiwan's LGBT equality movements. It then analyses the culturally-constructed function of family and marriage and the welfare regime designed around it. In the conclusion, it discusses the influence of same-sex union legislation on Taiwan's future family and social policies, and shows possible paths to same-sex union legislation and LGBT right improvement in other East Asian countries.

Rethinking Sexual Citizenship: Embodying A Model That Includes People With Learning Disabilities

Garbutt, Ruth

University of Leeds, United Kingdom
splrg[at]leeds.ac.uk

Historically, T.H. Marshall (1950) described citizenship in terms of legal, political and social rights. Sexual citizenship, as an element of citizenship, refers to sexual entitlements, such as the entitlement to free expression, the right to choose, and the right to participate in private/ intimate territories. It also refers to sexual responsibilities and the right to non-exploitation by others. Theorising around sexual citizenship has mainly been driven by academics and activists from the lesbian, gay, bisexual, transgender movement. The experiences of people with learning disabilities in relation to sexual citizenship, has

largely been invisible in these debates. This paper seeks to explore the extent to which people with learning disabilities have status as sexual citizens. The paper focuses, in particular, on issues of recognition/ visibility of people with learning disabilities in relation to sexuality, the influence of the state and 'moral rights'. Using sexual citizenship as an analytical lens through which to view the experiences of people with a learning disability I will offer a critique and exploration of the relevance of the present literature to people with learning disabilities.

A common European identity through LGBTI rights?

Eigenmann, Laura

Universität Basel, Switzerland
laura.eigenmann[at]unibas.ch

Over the past three decades, the European Union has introduced some major legal and policy changes in the field of LGBTI rights and more recently has started to portray itself as a promoter of LGBTI rights. However, while LGBTI rights are, in certain areas, used to demonstrate modernity, exceptionalism and superiority of the EU in relation to its "others", the internal debate shows a less consistent picture. In the European Parliament, anti-LGBTI and anti-gender rhetorics are on the rise again. This contribution argues that in this context, especially statements by individuals or institutions and symbolic action (e.g. flying the rainbow flag from the Commission building) often serve as a call for action or a critique of internal resistances by activist actors inside European institutions, rather than a demonstration of achievements. The almost ritualized reference to the human rights identity of the EU or to the idea of "leading by example" in discourses on LGBTI rights could be understood as a search for a common identity of the EU and the struggle to agree on basic values. This contribution investigates how LGBTI rights are currently constructed as norm and problem that needs to be addressed by EU institutions by different actors. It focuses on discourses used to justify action in this field, reaching from references to the "human rights myth" of the EU, the desire to "lead by example" to the neoliberal re-validation of diversity. Special attention will be given to the phenomenon that the practice of international solidarity in LGBTI activism and the construction of a shared identity and culture of LGBTI people surpassing national border turns them into models for the "ideal European citizen".

RN23_05b | Media representations and online sexual subjectivities

Cybjectivities: The Experimentation, Formation, and Regulation of Online Subjectivities in India LGBTQI+

Cyberspaces

Martin-Lockhart, Zoey Njaia

University of Illinois at Chicago, United States of America
zmarti6[at]uic.edu

lgbtqi+ social media spaces can be peculiar zones of self-exploration and cross-fertilization. Cyberspace can forever conceal, question, and transform the “actual” histories and subjectivities of participants. This paper examines how the structures and cultures of Indian lgbtqi+ social media groups and platforms governs the formation of, possibilities for, and mobilities of online (lgbtqi+) subjectivities and communities entangled in the online-physical-world kaleidoscope. Focusing on urban lgbtqi+ communities and social media spaces in India, this paper draws on research conducted from 2014-2015 and continued since via online engagement. Class, language, and location inevitably impact encounters online, but gender-swapped profiles, (cyber)sexual experimentation, and other forms of self-modification and exploration demonstrate subject position gymnastics disallowed by physical-world restraints. Simultaneously, subjecthoods and presentations available on lgbtqi+ social media platforms are constrained: from moderated secret Facebook groups to the dating/hookup apps Planet Romeo and Grinder, where bodies are presented, parsed, and—inevitably—ranked by height, muscularity, race, and penis length, and where a delimited number of (western-tinged) gender and sexuality labels are available. This paper explores online forms of control, limitations, and governmentality that shape subjectivities: applications’ interface structures; the appointment of moderators to monitor Facebook groups (and their subsequent behavior); and social hierarchies determining desirability of bodies and identities on- and off-line. In Indian lgbtqi+ cyberspaces, how do online customs and the norms and ethics of physical-world community cultures mutually shape each other? How similar are the phobias and hierarchies that circulate in online and physical-world communities? Where do they diverge, why, and what are the consequences for lgbtqi+ subjectivities?

It’s Not About the Sex, Stupid: The Importance of Sexuality in Polyamorous Relationships by Self-perception and Media Representation.

Ossmann, Stefan F.

University of Vienna, Austria
stefan.ossmann[at]univie.ac.at

Polyamory - consensual relationship(s) between more than two people based on emotional love and sexual action - has become an uprising topic within the last 20 years. Yet we still know little, and what we empirically-based understand is mainly based on American data. Financed by the Austrian Science Funds FWF, the project “Polyamory in media, social and identity perspective” explored two aspects that have been falling short in academic discussion so far: The media representation of polyamory, and the German speaking area as source of empiric investigation. 368 newspaper and magazine articles published in Austria, Germany and Switzerland over one decade (2007-2017) have been examined by a qualitative content analysis; furthermore 33 narrative biographical interviews of individuals from 14 polycoles based in/around Vienna have been conducted. The presentation in Manchester aims at two specific aspects of the findings: The intimate love (and life) history, and the importance of sexuality in consensual non-monogamous relationships. Following questions (by media portrayal held against self-perception) shall be answered: # What happened in one’s sexual history to dismiss monogamy? # Which value has sexuality in a concept furthermore rooted in consent, comperson, and love? # Can implications be drawn on the impact of media on the societal discourse on polyamory? # Are there implications on how wider society will understand sexuality in the future? Embedded in the Social Sciences theory of Framing, the findings will not only indicate how media influence public opinion in a seemingly new topic, but furthermore compare those with experiences from within the polyamorous community.

Dating and Rating on Grindr: Trade and Exchange Practices in a Virtual Sexual Market

Cserni, Robert T.

SUNY at Stony Brook, United States of America
robert.cserni[at]gmail.com

The general theoretical issue of this paper centers on how technologically-mediated processes of globalization of gay culture influence the (re)constructions of sexualities and sexual identities of men who have sex with men (MSM)/gay men as well as the nature of their interpersonal interactions. More specifically, I argue that location-based mobile dating apps such as Grindr are a sexual market, in which users can be considered self-objectified sexual commodities. Thus, I am interested in exploring the characteristics of actors (users) in this sexual market. In addition, I am interested in examining which characteristics and in what way they are associated with actors' perceived sexual capital. In order to do so, I used data from a sample of Grindr profiles in Vienna, Austria. The data were collected during four time points – weekday afternoons, weekday evenings, weekend afternoons and weekend evenings. All the information users provided in their profiles was coded. Special attention was given to the way the users described themselves and what they were looking for. Furthermore, in order to gain a more holistic understanding of the interactions in this sexual market I also conducted 20 interviews with MSM/gay men in Vienna. I believe this study will contribute to and complement existing literature on technology, sexualities, and, in particular, literature on sexual capital.

Shamed Citizens: Lived Experiences of Mongolian Queers in Media

Tsedendemberel, Otgonbaatar

Corvinus University, Hungary
otgonbaatartsedendemberel[at]hotmail.com

Discrimination based on sexual orientation, gender identity and expression, and sex characteristics (SOGIESC) is pervasive in Mongolian legal, institutional, as well as cultural and social environments. The Being LGBTI in Asia Report states that discrimination in the workplace was identified as one of the most serious and frequent human rights violations. Other areas are education, health, family affairs and media. This also explain why public opinions and attitudes lead to widespread discrimination against lesbian, gay, bisexual, transgender, intersex and queer (LGBTIQ) Mongolians, evidenced by ongoing hate remarks, ridicule and shaming on traditional and social media, and on the streets. Drawing on Glenn's "rhetoric silence" (2004) and Gould's affect and "ambivalence about self and society" (2010), I would argue that the state, media, and public shaming and silencing of the queers through dominant discourses regard them invisible and reveal their subordination at a cognitive level, but domination, marginalization and mis-/non-recognition could be experienced at the affective level through intensive roles of shame. Only by confronting and embracing shame honestly, not avoiding it, queer community

can liberate themselves and claim their agency for and within self and society. Foucault's discourse analysis will be used to investigate and explore media representation and portrayal on how shame plays roles in affecting the queer community by analyzing traditional and social media coverage related to SOGIESC issues. This method will include reviewing major newspapers, news articles, online and offline posts, comments, and other expressions made by the general public in the past 10 years or so.

RN23_06 | Theorizing materialism and the human in sexuality

Mapping Affective Capacities: Gender and Sexuality in Relationship and Sex Counselling Practices

Kolehmainen, Marjo

Tampere University, Finland
marjo.kolehmainen[at]tuni.fi

Drawing on fieldwork on relationship enhancement seminars in Finland, this presentation examines how gendered and sexualized power relations are (re)produced in therapeutic practices. It applies the Deleuzian idea of affective capacities to the analysis of gender and sexuality, understanding gender and sexuality as about 'becoming' rather than 'being'. This kind of framework builds upon the new materialist ontology, where the focus is on what bodies and things do – rather than what they are. The analysis of different event-assemblages shows how gendering and sexualizing happen through diminishing and augmenting bodies' capacities to affect and be affected. In this way, the focus of analysis becomes not only what bodies can do, but what they are made to do. The presentation concludes that the very relations that diminish some capacities may increase other capacities, which is central to the dynamics through which gender and sexuality work in and on bodies.

New Materialist Feminist Perspectives on Sex Robots

Kubes, Tanja

TU Munich, Germany
tanja.kubes[at]tum.de

The construction of sex robots offers a great potential for reducing stereotypes and promoting diversity. For people to sexually interact with robots, traditional dualisms have to be dissolved. Thus, the strict separation of man and machine needs to give way to a view accepting the latter at least to some degree as an equal vis-à-vis. Current trends in sex-robotics, however, do not explore these rich possibilities. Instead, hetero-normative ideas of male hegemony are mirrored in the design of both hardware and software. While the robots' anatomy exaggerates pornographic fantasies of hyper-femininity, the built-in AI is programmed to let the robot act as an ever-ready, obedient servant. Sex with such a robot runs danger of becoming a solitary, unilateral act. A strong strand of feminist critique starts right here and argues from an ontological perspective that, due to the lack of intentionality of the machine, sex with robots is not possible at all. Sex-robots for them only translate a centuries long history of exploitation and oppression into a new medium. I will show that this line of argument is short-sighted and neglects the (also feminist) potential that lies in the development of 'intelligent' machines. In the long run, we might even come to redefining our entanglements with the non-human in the sense of an all-encompassing, ethical "epistem-ontological" approach that overcomes the inherent (and outdated!) anthropocentrism of modernity to open up new spheres of post-humanist encounters, relationships and sexualities.

Queer Materialism: Approaches from New and Historical Materialisms

Klitgård, Mathias

University of Stavanger, Norway
mathias.klitgard[at]uis.no

The contributions made from the new materialist or posthuman turn in the cultural and social sciences have led to a reinvigorated debate on the position and construction of the human as the privileged site of knowledge creation, ethics and politics. When paired with the denormalising promise of queer theory and its insistence on the importance of sexuality, body and desire, a number of significant insights have been introduced to critical theory and activism more broadly. A common (and often appropriate) critique of queer theory and new materialisms alike is their historical inability to account for the way capitalist exploitation and domination shape the possibility of a critical politics of sexuality, body and desire. As such, they become complicit with imperial capitalism in the era of homonormativity and queer niche consumption and production. In this light, how can a revisiting of new and historical materialist theory revitalize queer theory? What are the preliminary steps we must take to understand the relations between these three overlapping sets of literature? In this paper, I aim to understand the 'claim to matter' inherent in both new and historical materialisms and to use it to inform a

revitalised queer (materialist) theory. A diffractive reading with historical materialism, it is my claim, works as an antidote to the (potential) liberal infatuations in the field. Through a close examination of key theoretical texts, I explore the conditions for a meaningful cross-pollination between queer theory, new materialisms and historical materialism as fundamental to the critical project of 'queer materialism'.

Artificial Intimacy: Making the Human / Making the Robotic

Bibbert, Mark Benjamin

University of Kassel, Germany
mark.bibbert[at]uni-kassel.de

The desire to create the perfect sexual partner has preoccupied western culture for quite some time, as seen in the myth of Pygmalion. Nowadays we develop sexbots: mechanical skeletons embedded in 'flesh' made of thermoplastic elastomer (TPE). Smart sensors register touch, microphones hear voices, speakers emit audio. The lips move when audio plays and the eyes blink. The development of these sexbots is based on the engineering of modern sex dolls. In the design, use and coverage of these artifacts, knowledge of what is human, of gender, of intimacy, and of consent is negotiated. In my paper, I present findings from sexbot-human encounters drawn from demonstrations of this technology. Drawing on Wally Smith (2009) and Lucy Suchman (2011) these demonstrations can be understood as theatres of use, situations in which multiple frames overlap. The analysis of sexbot demonstrations shows which interpretative frames of sexuality are projected onto the sexbots. Smith, Wally (2009): Theatre of Use: A Frame Analysis of Information Technology Demonstrations. In: Social Studies of Science 39/3 Page: 449–480 Suchman, Lucy (2011): Subject objects. In: Feminist Theory 12/2 Page: 119–145

RN23_07 | Interrogating monogamy

Alternative Family Life in Canada: Case Studies of Five Polyamorous Families

Smith, Charity

Alice Salomon Hochschule, Berlin Germany
Charity.smith135[at]gmail.com

Alternative Family Life in Canada: The Lived Experiences of Polyamorous Families in the Fringes of Legality is the first qualitative study of polyamorous life in Canada, focusing on the narratives of five polyamorous families. The study explores the link between the polyamorous lifestyle and how family structures are formed. The families in this study include a long-term, stable triad in which two children were raised, a co-parenting family with numerous adults raising three children, and three additional families without children who maintain their own unique structures. Sexuality and the right to sexual expression were frequently cited when participants were asked about their decision to challenge the norm of monogamy, with participants primarily identifying as bisexual, pansexual, and asexual. Participants see polyamory as a way to live their sexuality and maintain connection, kinship, health, and happiness. Each family rejects traditional norms around monogamy, although some still use marriage as a means of attaining legal protections. This research indicates that these families are well-equipped to support the development of their children by offering multiple adults who can provide care. Multiple potential caregivers also led to positive outcomes for participants suffering from mental health issues as well. By showcasing the diversity within polyamorous family structures it becomes possible to investigate the critical role sexuality plays in redefining kinship networks.

Many Loves, New Challenges? Exploring Affective Consensual Non-Monogamies in Italy

Braida, Nicole (1,2)

1: Università degli studi di Torino, Italy; 2: Università degli studi di Milano, Italy
nicole.braida[at]unimi.it

The paper will present the theoretical premises and some results of my PhD project, that focuses on the qualitative exploration of affective consensual non-monogamies in Italy. In particular, the question that will guide the presentation will be: to what extent can the theories and practices of my interviewees challenge the conservative and essentialist definitions of family that are taking root again in Italy? And to what extent these theories and practices can contribute to redefine the subjects who are legitimate or obliged to lend and receive care, also in material terms? To (partially) answer to this question, I will focus on the different degrees of political

commitment of my respondents and of their communities of reference, making a (blurred and not dichotomous) distinction between radical critical non-monogamy and apolitical non-monogamy, as well as between individualistic approach and network approach. I will also present an overview of the gaps and contradictions between theories and practices, concluding with a reflection on the need to overcome the dichotomy between emotions and rationality, daughter of a blind modernist trust.

Bisexual Feminism, Anti-Monogamy and the Politics of Erotic Autonomy

Klesse, Christian

Manchester Metropolitan University, United Kingdom
c.klesse[at]mmu.ac.uk

Feminist anti-monogamy arguments signify a longer-standing endorsement of the value of erotic autonomy within feminist politics. Different currents within North American and European feminist movements presented vocal critiques of monogamy as an integral part of hetero-patriarchal gender relationships. This paper focuses on bifeminist rejections of monogamy from the 1970s onwards. Drawing own and other people's research, I highlight the prevalence of distinctively feminist voices in debates on non/monogamy in bisexual activist circles. An analysis of core texts within the bisexual non/monogamy debates shows bifeminist anti-monogamy critiques share some of the core assumptions prevalent within other identity-related feminist currents (such as lesbian feminism and heterosexual feminism). Arguments have been oscillating between radical, liberal and queer-feminist positions (without being limited to them) but there is a convergence with regard to a shared focus on the value of erotic autonomy. Bifeminist critiques tend to articulate this endorsement from a particular perspective or standpoint.

Compulsory Monogamy in the Law and in the Courthouse

Rothschild, Leehee

Manchester Metropolitan University, Israel
leeheerothschild[at]gmail.com

The law plays a vital role in the construction of social conceptions of intimacy and kinship. It dictates what types of relationships receive social legitimacy and acknowledgement. My presentation will examine the role that the legal system plays in the construction of monogamy as a social institution. I will do so through a critical socio-legal textual analysis of Israeli law and court decisions, using feminist and queer theories. I will start by showing how the monogamous couple is the only familial unit (not based on blood-ties) to receive legal acknowledgment and how even with the expansion of the legal system towards same-sex couple monogamy remained mandatory. I shall note how this limits the other types of intimacies and familialities. Following that I will look at the Israeli family law and show how it also constructs a gendered double standard around monogamy for man and women, and how this double standard is rooted in traditional conceptions of ownership over women's bodies and sexualities. Then I will move to examine the criminal law and see how these same ownership-based conceptions that view woman as man's property within a romantic relationship on the one hand and the woman who is sexually active outside the monogamous dyad as an open pray, are also manifested in court decisions on rape cases. To conclude, I will note the uniqueness of the Israeli legal systems in terms of the blending of civil and religious law and how my conclusions relate to the legal situation in Western countries.

RN23_08 | Relationship practices and the everyday

Researching LGBTQ Parenthood: Conceptual and Methodological Tensions

Gabb, Jacqui (1); Allen, Katherine (2)

1: The Open University, United Kingdom; 2: Virginia Tech,
United States of America
Jacqui.Gabb[at]open.ac.uk, kallen[at]vt.edu

There have been great advances in socio-legal queer partnership and parenthood rights in recent years and LGBTQ-parent families are more visible now than ever before. As a consequence of these political gains and public recognition, LGBTQ-parent family research has arguably come of age. While a great deal of exciting research is now appearing around the globe, we will show that this area also faces numerous challenges in the context of sexuality and inclusivity. Empirical studies typically instantiate hetero-gender and sexuality through insufficient attention to everyday experience and the ways in which this queers kinship. Geo-political and socio-

cultural contexts are used as scene-setting rather than being operationalized to prise apart the intersections of public-private intimacies. Biological imperatives are defining and confining families, with practices of conception invoked to separate one family from the next. We will address the conceptual, theoretical, intersectional, and methodological tensions that remain or have emerged around qualitative LGBTQ-parent family research, focusing on: (a) era, age, and generation; (b) class, sociocultural capital, and the economies of reproductive labor; (c) sexual-maternal identities. We contend that it is timely for research on queer parenthood to take stock; to refocus attention onto the everyday and more sufficiently contextualize experience. So, our provocation is, in these permissive and precarious times, whose lives matter in research on LGBTQ-parenthood? How is 'queer parenthood' materialised? How can our research better reflect ordinary LGBTQ experiences of kinship?

Paradoxical Family Practices: LGBTQ+ Youth, Mental Health and Wellbeing

McDermott, Elizabeth (1); Gabb, Jacqui (2);
Eastham, Rachael (3); Hanbury, Ali (4)

1: Lancaster University, United Kingdom; 2: Open University;
3: Lancaster University; 4: The Proud Trust
e.mcdermott[at]lancaster.ac.uk, jacqui.gabb[at]open.ac.uk,
r.eastham1[at]lancaster.ac.uk,
ali.hanbury[at]theproudtrust.org

This paper will explore how queer young people sustain and in some cases survive family relationships. Open channels of communication between family members are crucial to wellbeing and when ruptured can adversely impact on the mental health of young people. Families' investment in quality time can facilitate communication and a sense of family belonging conversely family tensions could also erupt during these 'precious' times. Parental practices of care can convey meaningful sentiments such as being there for the young person but these interactions also have the capacity to instantiate intergenerational power relations. Here, the meanings, practices and management of food and eating a particularly salient example. In this article, therefore, we develop the concept of 'paradoxical family practices' and use this to demonstrate the ways in which queer youth manage family life through everyday emotion work. This highlights 1. the value of emotion-centred multiple qualitative methods to explore the lives of queer youth and mental health; 2. the ways in which cultural and household contexts reproduce heteronormativity which in turn generates paradoxical family practices; 3. the need to develop 'paradoxical family practices' as a conceptual tool. Findings presented derive from a small scale UK study funded by the Wellcome Trust (UNS39780) and were generated through a two-stage methodology comprising of digital/paper emotion maps and qualitative interviews with queer youth aged 16-25 (n=12) and family members/mentors (n=7), followed by diary methods and recursive interviews (n=9).

Heteronormativity and Openness about Same-Sex Coupledness

Jandric, Dora

University of Edinburgh, United Kingdom
dora.jandric[at]jed.ac.uk

This paper explores how heteronormativity impacts the lives of older same-sex couples. The main focus of the paper is to examine how the social structures built around heteronormativity, such as heterosexism, homophobia and gendered power relations, influenced the lives of non-heterosexual individuals in the past, and how they impact their present intimate relationships and their imagination of possible futures. The data, in the form of semi-structured interviews and written diaries, is drawn from a doctoral research on older same-sex couples in Scotland. The social, historical, and cultural norms present in the participants' lives are explored in the context of the United Kingdom, focusing on Scotland in the present and the future, as the place where the participants live now and imagine they will live in the future. The paper explores the participants' coming out narratives, relationships with their family and community, and the perception of their past and present intimate relationships. Even though Scotland is currently one of the best countries in Europe for LGBTI equality, older non-heterosexual people still remember times when their lives were predominantly regulated by heteronormativity, and its effects are visible in their narratives about the present and the future. The contributions of the paper relate to the exploration of the intersection of the past, present and future, and the importance of studying the three temporalities together when constructing life narratives. Furthermore, the paper contributes by furthering the understanding of how older same-sex couples' lives and intimate relationships are shaped by their past experiences.

LGBTIQ break-ups in Finland

Lahti, Annukka (1); Kolehmainen, Marjo (2)

1: University of Jyväskylä, Finland; 2: University of Tampere, Finland
annukka.p.lahti[at]jyu.fi, marjo.kolehmainen[at]tuni.fi

In this presentation, we explore relationship break-ups of lesbian, gay, bisexual, trans, intersex and queer people in Finland. Demographic research indicates that separation and divorce rates are even higher among same-sex couples than among other-sex couples in Western countries. The long battle for equal rights has placed LGBTIQ people's relationships under a lot of pressure to succeed. Many partners in LGBTIQ relationships try to pass as ordinary and happy as possible and choose to remain silent of the challenges they face in their intimate relationships. Consequently, they may miss the opportunities to receive institutional and familial support. There is also a paucity of research on the separation experiences of LGBTIQ people. In this presentation we seek to fill this gap and explore the break-up experiences of Finnish LGBTIQ people. Our data consists of ethnographic observations of relationship seminars, including events targeted at the recently separated; survey data; and interviews of LGBTIQ people, who have experienced a recent relationship-

break up. In our analysis, we further combine queer theoretical, psychosocial and affect theoretical perspectives in our analysis. In particular, we seek to grasp the affective, lively and often messy realities of relationship break-ups in a way that does not straightforwardly renew dichotomic understandings of sexuality or gender or draw upon pre-defined identities.

RN23_09 | Pedagogies of sexuality

Talking About Contemporary Art And Sexuality In Prison: Which Pedagogies For An Emancipatory And Inclusive Conversation?

Assolent, Mikaela

Loughborough University, United Kingdom
m.assolent[at]lboro.ac.uk

Among many workshops held in French prisons about healthcare or job search, art mediation can be perceived by prisoners as another "civilizing" step in a rehabilitation program. When the chosen artworks revolve around feminism and sexuality, male detainees are even more prone to suspect that they are going to be told how to behave. The control of sexuality is an important coercive aspect of carceral power. Talking about sex can be a powerful emancipatory tool for prisoners to open-up about their emotional states and to be considered as whole beings in charge of their sexual needs. How can educators step out of the educational and make possible a space of equality when talking about sexuality? How can rules around notions of consent, role-play or offence be negotiated collectively to avoid any form of depreciation? This paper will reflect on workshops that I conducted in 2017-2018 with prisoners around the series *Ma collection de proverbes* [My collection of proverbs] (1974) by artist Annette Messager from the 49 Nord 6 Est – Frac Lorraine collection. Composed of thirty proverbs about women, this artwork not only questions sexism, but also French identity and whiteness. To acknowledge such a spectrum, I used intersectional positionality. This methodology views gender, race and class as markers of relational positions rather than essential qualities. Power relations are analysed as changing depending on the situation and can be confronted along the way rather than ignored. Only then can sex talks be envisioned as radical spaces to dismantle sexism from an inclusive perspective.

Teachers' Experiences of Delivering RSE Programme in Irish Second Level Schools

Duffy, Mel; Feeney, Maria; Lodge, Anne

Dublin City University, Ireland
mel.duffy[at]dcu.ie, maria.feeney[at]dcu.ie,
anne.lodge[at]dcu.ie

This paper reviews the meanings and understandings teachers give to delivering Relationships & Sexuality Education (RSE) programme in Irish second level schools which was part of a larger study incorporating all stakeholders. 96 people participate of which there were 22 teachers. The methodology for the study was hermeneutic phenomenology, which concerns itself with the meanings and understandings that participants give to a particular phenomenon as lived. The findings revealed that all teachers are comfortable with their curricula subject for example, Mathematics, French, English and/or Religion. Most participants in this research spoke of the diversity of knowledge amongst first year students. Teachers could not have expectations of prior knowledge amongst the student cohort rather they thread a fine line between those who were knowledgeable and those who were not. They had to be mindful of the needs of all students present and also bring those with less knowledge to a place of understanding. A key factor that emerged from the teachers was their expressed need to develop trust with the students, which enabled them to deliver a student, centred the RSE programme irrespective of the patronage or ethos of the school. The gender mix of the student body did not have a significant impact on how the teachers reflected upon their experiences. Teachers get on with the task in hand to the cohort of students in front of them. Many teachers spoke of the need for either initial training to undertake the RSE programme which renders them unsure of the content and their ability to teach it.

Can Porn Literacy Mitigate Undesired Effects Of Mainstream Pornography?

Thomas, Marina F.

Radboud University, Netherlands, The
marina.thomas[at]student.ru.nl

Many adolescents see porn before making own experiences or having valid information about sex (Sun, Bridges, Johnson, & Ezzell, 2016). The media is theorized as socializing agent, which cultivates people's perception of reality (Gerbner et. al. 2002). Understanding the gap between media representation and reality is conceptualized as media literacy (Potter, 2013) and media effects research has called for "porn literacy" education. This study tests if a porn literacy intervention mitigates undesired effects of porn (body dissatisfaction, sexist attitudes and negative attitudes towards condoms). After exposure to mainstream porn, the control group is expected to score higher on the undesired effects than the experimental group which receives a porn literacy intervention, delivered in the form of a short video about pornography production. The control group receives a matched video. Stronger effects are expected for people with few or no sexual experience and high

physiological arousal during exposure, in line with dual process theories. METHOD A 2 (Intervention) x 2 (Gender) between factorial experiment is designed. Body dissatisfaction is assessed through the non-verbal contour drawing rating scale (Thompson & Gray, 1995). Sexist attitudes are measured explicitly (Glick & Fiske, 1996) and implicitly using an Implicit Association Test (Greenwald, McGhee, & Schwartz, 1998). Attitudes towards condoms are assessed with an IAT (specifically developed for this purpose) and explicitly (Sakaluk & Gillath, 2016): Participants indicate on a 7-point scale how they would feel about using a condom every time they intercourse. Sexual experience is assessed with a self-report scale (Peter & Valkenburg, 2010). Arousal is measured via pupil dilation (Rieger et al., 2015) allowing for gender-universal comparisons. Participants are 120 students (18-25).

Trans* 'Escrevivências' as power

Dias, Alfrancio Ferreira

Federal University of Sergipe, Brazil
diasalfrancio[at]gmail.com

In this text, I discuss a gender analysis stemmed from the movement of trans* *Escrevivências*. I reflect on the development of a trans* epistemology, developed from its existences, experiences, knowledge and writing. In the first part of this work, I discuss how trans* writing is a boost for trans* self-knowledge, thus legitimizing new ways of producing knowledge about such subjects from themselves, stimulating me to describe them instead of theorizing about their lives. In the second part, I discuss the emergence of a trans* pedagogy that develops teaching, broadening the representativeness of this knowledge, based on a pedagogical approach based on the principles of teaching as trans* (feminist self-revelation that strengthens/widens spaces of trans* experiments), teaching about trans* (providing exposure to the trans* universe in teaching), and teaching with trans* epistemologies (to say that trans teaching is not only embedded in other practices of knowledge production, it is, epistemological, itself, that is to say, producer of knowledge). 'Escrevivências' is a Neologism coined from the Portuguese words 'escrever' (to write) and 'vivência' (personal experience acquired during one's life), implying to write according to one's personal life, that is, from one's social, racial and gender perspective.

RN23_10 | Sexual Health: Negotiating therapeutic imperatives

‘Prep Is A Chemical Condom’: Narratives Of Pre-Exposure Prophylaxis For HIV Among Barebackers And Bugchasers

Garcia Iglesias, Jaime

University of Manchester, United Kingdom
jaime.garciaiglesias[at]manchester.ac.uk

PrEP, a daily drug regime which helps prevent HIV infection even if exposed to the virus, has caused a cultural groundswell in the gay community with its potential to prevent HIV and its problematic medicalization of the HIV-negative body (Dean 2015, Felicianantonio 2017). This paper looks at the impact of PrEP among barebackers, who fetishize unprotected sex, and bugchasers, who fetishize HIV infection. While PrEP has been conceptualized as an effective HIV-prevention tool by mainstream media and the ‘gay community’, little to no empirical work is available on how barebackers and bugchasers use PrEP and interact with the medical authorities providing it. Over the past year, I have conducted over fifteen in-depth interviews with barebackers bugchasers and analysed hundreds of online messages to explore how these men access, consume or reject PrEP. This paper sustains that barebackers’ and bugchasers’ perceptions of PrEP are fluid and varied: whereas some see it as a last-barrier against HIV infection, others consider it to be an obstacle for intimacy. Even more so, whereas current research focuses on the process of starting PrEP, participants in my research found abandoning PrEP to be a much more symbolic act, whereby they would be truly experiencing freedom from medicalized sex. Overall, this paper theorises these narratives and contextualises them within larger dynamics of sexual and public health, presenting alternative significations and challenging stable narratives of PrEP. In so doing, I open new avenues for research regarding PrEP and proposes points of action for future public health interventions.

Sex and Sexuality in Later Life: the More the Healthier?

Stoncikaite, Ieva

University of Lleida, Spain
iewukaz[at]yahoo.com

New biomedicalized forms of longevity, anti-ageing ideals, and the focus on successful ageing have permeated the current sociocultural and political climate. These changes have also influenced the perceptions of sexual practices, sexuality, and sexual health of older people. The idea of having an active sexual life in older age, previously negatively associated with the narrative of decline that portrays older individuals as sexually inactive, impotent, and frail, is now changing. This paper draws attention to the perception of sexuality in later life and the model of successful ageing that emphasises the optimisation of sexual activity and equates it to the overall health of an ageing individual. It opens the discussion about shifting attitudes towards sexual practices and sexuality beyond biomedical understandings of late-life sex, and provides examples that challenge the model of successful ageing and the consumption of medication to enhance the idea of sexual activity. Finally, this paper reveals alternative ways of exploring sexual practices in older age and calls for a consideration of more realistic perspectives towards sexual experiences of older individuals that can have significant implications for healthcare policy and the future of sexuality in later stages of life.

Realizing Sexuality by Preventing Sexuality – The Case of Non-Offending Pedophiles

Brodersen, Folke

TU Berlin, Germany
brodersen[at]campus.tu-berlin.de

The social response to pedophilia in Germany is currently changing. Instead of a total exclusion, incarceration and death wishes, a long list of therapeutic institutions, self-help communities and books try to include pedophilic persons into society by offering guidance towards a non-offending life. The doctoral work aims to reconstruct this societal change by aligning data from media coverage, therapeutic programs and narrative interviews with participants of therapeutic/self-help institutions. In this talk, I want to highlight the entangled configuration of 'prevention' of sexuality within this dispositif. Whereas inside the media coverage 'prevention' is exclusively associated with child sexual abuse and is thereby the legitimization of the therapeutic programs, the programs themselves focusing on the pedophilic subject produce an authenticated representation, which is inevitably drawn towards sexual contact with children, if not preventively strengthened, stabilized and taught control. The non-offending pedophiles claim on the contrary, that there is no need for control. Their sexual impulses were to exist but would be subordinated by the need for emotional preservation of children and the epistemic preservation of the self, which would be destroyed by harming children. Their sexuality was on the one hand almost unrealizable, on the other hand, they would realize an emotional and ethical part by not acting upon it. Interconnections of these aspects and their significant transformation of society by an inclusion through ethical relations to self will be analyzed in the talk.

The Sexual Politics of Healthy Families. Healthist Framings in the Struggles over Parenting outside Heterosexuality in Italy

Bertone, Chiara

University of Eastern Piedmont, Italy
chiara.bertone[at]uniupo.it

The growing prominence of health in framing social struggles has deeply changed public discourse and claims-making around sexual issues, with a turn that Epstein and Mamo (2017) have called "sexual healthism". This process has been discussed for its individualizing, depoliticizing, essentializing and victimizing implications, but the proliferation of the meanings and uses of sexual health can hardly be reduced to unambiguous tendencies. By focusing on parenting outside heterosexuality, the paper explores the connections between these reframing tendencies in sexual politics, and those regarding the therapeutic surveillance of parenting. A focus on parent-child relations allows to address the familization of social regulation in neoliberal politics, which is often overshadowed by a focus on individual responsibility in critical literature on sexual health. Looking both at parents dealing with LGBTQ children and at LGBTQ adults as parents, the paper investigates healthist framings in parents' collective claims, self-help activities and individual sense-making, and their use among relevant allies in the helping and health professions. Focusing on Italy, it builds upon analyses of advocacy and self-help material, focus groups and interviews with professionals and LGBTQ activists, and interviews with parents of LGBTQ children. It explores both the political spaces opened by their strategic use, and concerns about power relations between collective actors and professional experts, which models of good parenting are sustained and how they may uphold class and other social hierarchies. It also shows how healthist frames are resisted or hybridized in understanding experiences of oppression and in outlining strategies of change.

The Social and Ethical Challenges Of The Intellectual Property Rights In Human Genome Editing Technologies

Mali, Franc

University of Ljubljana, Faculty of Social Sciences, Slovenia
franc.mali[at]fdv.uni-lj.si

In the last time, the tremendous progress of human genome editing technologies has big influence on biomedicine. It is predicted that newest genome editing tools (e.g. CRISPR-Cas 9) will revolutionize field of biomedicine. They will revolutionise the treatment of human disease, correcting defective genes within diseased bodies, and banishing genetic errors from the germ-line. Taking in regard the anticipated (presented) revolutionary impact of human genome editing technologies on human life, there are arising a lot of new social, ethical and legal dilemmas. In the contribution, there will be presented the issues who should have the property rights on this revolutionary technology. In the last five years, these tensions have been nowhere more evident than in the patent battle between Jennifer Doudna's research group (The University of California) and Feng Zhang' research group (The MIT/ Broad Institute). This most disreputable case of patent battle between two academic institutions did show extreme mutual exclusivity of both involved parties which are leading to negative social (and ethical) consequences for the further progress of this revolutionary technology and its application in biomedicine. The contribution will try to explain the social reasons and (negative) consequences of increased battles among academic institutions (research groups) around ownership of basic discoveries in the new revolutionary technologies. The attention will be given to socio-economic (ownership versus open innovation models) as well as socio-ethical (the use of patentable subject matter doctrine in different periods of development of genetic engineering) reasons. The comparison between different world regions concerning this precarious issue will be also taken in regard. The paper will base on author's theoretical and empirical analysis in the last two years.

Innovation Practices in Social Collaborative Frames: Hackathons Are Not For Hackers?

Faludi, Julianna

Corvinus University Budapest, Hungary
faludisociology[at]gmail.com

Social innovation is about "reinventing innovation itself" where participation, deliberation and community are focal points of the process (Smith 2017). Hackathons are many times framed as social, or include a public goal in their activity (Gregg 2015), which stems from them being applied based on civic, organizational, governmental, or corporate backing. The framing of hackathons plays a role in defining the voluntary effort of the participants. This implies that the instrumental usage of hackathons may serve various purposes, and invite participants as contemporary lifestyle "problem-solvers" or those pursuing "self-actualization" (Davis 2017), far from hackers and hacker ethics of the computer world, rooted in subcultures of computer-hackers (Coleman). Hackathons, app jams, and coding camps are being criticized for their precarious nature, however they may seem to be an interface for a broader study of the contemporary precarious society (Gregg 2015, Söderberg 2012 Zukin and Papadantonakis 2017). This paper takes under scrutiny the potential for social innovation focusing on how the 'social' is being tucked into 'innovation', where innovation is a social action itself (Hellström 2004). Particularly it focuses on education-driven and citizen-science framed social hackathons as practices of collective social action to innovate for social change (Cajaiba-Santana 2014).

DNA Recombination/Archeology of Artificial Life

Slesingerova, Eva

Goethe University, Germany; Masaryk University, Czech Republic
eslesi[at]fss.muni.cz

Taking analytical inspiration from the contemporary sociological and anthropological views on knowledge, technology and science studies, the paper shows the outcomes and initial results of ethnographical research conducted in biochemical laboratories in the Czech Republic in comparison with a German context. The fieldwork relates to the context in which the various technologies of DNA recombinant and genome editing are used. DNA recombinant is understood here as the exchange of DNA strands to produce and design new nucleotide sequence arrangements. Specifically, the paper focuses on technologies that deal with “lifelike entities”, “bio-informatic life models”, “immortal cell lines”, “genetic tools/genes as tools”, “edited DNA sequences”, and “living beings”. The views, perspectives, and attitudes of scientists and laboratory technicians are analysed and presented with special regard for the naming and dealing with emotions and body or life borders. It primarily addresses the following questions: How do scientists approach issues of life and embodiment? How they relate themselves to the various interfaces of bodies, biological tissues, machines, digital simulations and other networks? How do they deal with their expectations, hopes, fears and emotions in general?

The Technopolitics of an Augmented and Virtual Reality: Gamifications in the Womb of Neoliberalism

Muriel, Daniel; Cuenca, Jaime

University of Deusto (Spain)
daniel.muriel[at]deusto.es, jaime.cuenca[at]deusto.es

In recent years, there has been a proliferation of devices with augmented and virtual reality capabilities such as virtual reality glasses and smartphones, which have widely fostered a process of hybridization between digital and physical objects, connecting bodies, technologies, and spaces in complex sociotechnical assemblages. These devices and the social practices that entail are developed within particular social and political apparatuses, which determine what and how can be seen and done. In this paper, we would like to explore some of the most relevant technopolitical implications of both augmented and virtual reality. While these technologies are increasingly applied to the fields of labour, education, healthcare, it is in their use as leisure devices where their potential to transform our daily social interactions in a decisive way becomes most apparent. In this sense, this paper aims to explore the – often unnoticed – political implications of virtual and augmented reality technologies as they are being used in different contexts to gamify all sorts of practices, social interactions, and activities. Building upon theoretical debates around the hegemonic dispositifs, scopic regimes, and political rationalities of our time, we will discuss some of the different

ways in which these technologically mediated and gamified contexts can shape power relations by offering new forms of disciplining bodies, opening up wider territories for sur- (and sous-)veillance, enabling identity reconstruction, and affecting spatial representations, among others. Not only do virtual and augmented reality reproduce some of the main political implications of dominant neoliberal narrative, but they also carry the promise of new modes of power relations and agency that help transform our daily interactions in unexpected ways.

RN24_01b | Sociological concepts for comparative science and technology studies

Which Concepts Support The Comparison Of Researchers' Autonomy In Different Research Systems And Fields?

Laudel, Grit

Technical University Berlin, Germany
grit.laudel[at]tu-berlin.de

In this study I investigate how researchers move from early career to mid-career in four countries (Germany, UK, France, USA) and in two science fields (experimental physics, theoretical chemistry). I conducted interviews with researchers on their first position that formally guarantees independent research (lecturer, assistant professor, junior professor, maître de conference). The project will answer the question as to if and how researchers in these positions achieve sufficient autonomy for realising the individual research programmes they developed during their postdoctoral phase. This requires a concept of autonomy that supports the comparison of researchers' situations, control over which researchers share with other actors such as the University, senior group leaders, funding agencies and members of their scientific community. These actors exercise authority through the control of resources, reputation and career opportunities (Whitley et al. 2018). Autonomy is the degree of control over goal achievement that remains with an actor who is influenced by others (Gläser and Schimank 2014). This conceptualisation enables comparisons of researchers' actual autonomy that go beyond properties of formal positions. I compare the authority relations, i.e. the authority over research goals exercised by each actor, and the specific sets of conditions of action produced by these authority relations. This leads to an empirical typology of 'autonomy profiles' and of mechanisms that create them.

Changing Conditions for Innovation in Different Arts and Sciences

Whitley, Richard Drummond (1); Glaeser, Jochen (2)

1: University of Manchester, United Kingdom; 2: Technical University, Berlin, Germany
richard.whitley[at]manchester.ac.uk, jochen.glaeser[at]ztg.tu-berlin.de

The modern arts and sciences have become novelty-driven systems of cultural production generating three kinds of innovations that make other producers change their priorities and practices. Incremental innovations are minor shifts in how work is organised and conducted, while complementary innovations establish new priorities, epistemic and aesthetic standards and technical procedures for new areas of novelty production. Displacement innovations replace established priorities, standards and practices. The processes by which novelties become accepted as innovations reflect the strength of different forms of mutual dependence between producers in scientific communities and art worlds, which include audiences for works of art and the intermediaries shaping their assessment and distribution. These forms can be functional in which producers depend directly on each other's contributions, concerned with production standards or focused on significance standards. While strong levels of interdependence can inhibit the adoption of radically unorthodox innovations, lower levels limit the speed and generality of adoption of novelties throughout fields. Interdependence is affected by the conditions governing the allocation of symbolic rewards and of the means necessary for continued novelty production, especially the extent of producer authority over epistemic and aesthetic standards and goals and the diversity of sources of support. These conditions are changing in many fields and societies in ways that may concentrate innovation opportunities on scientific elites and intermediary gatekeepers in the arts.

A Role Theoretical Approach For Analysing Socio-technical Innovations

Schulz-Schaeffer, Ingo

Technical University of Berlin, Germany
schulz-schaeffer[at]tu-berlin.de

Each successful innovation requires many heterogeneous components to become mutually adapted to each other, resulting in a sufficiently consistent and coherent behaviour of the constellation as a whole. A conceptual framework for analysing innovations as heterogeneous associations, thus, has to deal with a conceptual problem. It should be able to explain what makes all the heterogeneous entities similar in their capacity as mutually adaptable components, but it should do so without ignoring their heterogeneity. As a solution for this conceptual problem, I suggest a role-theoretical approach to socio-technical networks. At the core of sociological role theory, there is the distinction between person, position, and role. As I will argue, this distinction paves the way to an approach that allows to conceptualize innovations as networks of mutually adapted components and to take account of these

components heterogeneity. The key to the solution is that it is the positions of the components of a socio-technical network that are subject to processes of mutual adaption and not (or only derivatively) the humans or the objects occupying them. Two other notions from sociological role theory prove to be most helpful for understanding socio-technical networks: The first is that positions exist only in relation to other positions thus constituting position fields, sets of related positions. The second is that positions usually allow their occupants to hold other positions as well. This leads to an understanding of socio-technical networks as structures that consist of different position fields with heterogeneous entities occupying the positions.

Technological Interdependencies And Its Epistemic Consequences In The Humanities

Franssen, Thomas

CWTS, Leiden University, The Netherlands
t.p.franssen[at]cwts.leidenuniv.nl

Technological developments influence research practices by offering new analytical possibilities. Such technological developments often also come with particular constraints, such as the need for new types of expertise and a more complex experimental setup (e.g. see Laudel et al., 2014 on Bose-Einstein condensation). The technologization of research, in general, increases interdependencies and creates a need for collaboration (Shrum, Genuth & Chompalov, 2007). The particle colliders in the field of high energy physics is an extreme example of a technological development that increased interdependencies and resulted in a very extensive collaboration (Knorr-Cetina, 1999). In the humanities research is typically conducted without extensive technologization and thus is not influenced by technological interdependencies that would influence the analytical possibilities of individual researchers (It does typically depend on other research infrastructure such as libraries and archives). The rise of digital humanities across humanities disciplines changes this, as recent ethnographic research has shown (Kaltenbrunner, 2015; Antonijevic, 2015) This paper draws on the work of Gläser and Laudel (Laudel & Gläser, 2014; Gläser & Laudel, 2015) and analyzes the epistemic consequences of digital technologies developed in the humanities in a comparative perspective. Drawing on an analysis of Dutch research projects in literary studies, linguistics and history in the period 2000-2018 this paper develops a typology of digital technologies and their epistemic consequences for research practices in the humanities.

RN24_02a | Science, technology, innovation & society II

Social Aspects of Technological Approaches to Increase Personal Mobility for Visually Impaired Persons in Urban Spaces

Winkelmann, Markus; Weinberger, Nora

KIT, Germany

markus.winkelmann[at]kit.edu, nora.weinberger[at]kit.edu

Background: Due to the partial or complete loss of vision people have to meet two challenges: first, the free movement through space (navigation), and second, the knowledge of the spatial issues and their walkable ways. This can lead to a decreased range of motion and restricted mobility and might result in social isolation. A technical solution can be audio-tactile navigation systems. By using acoustic and haptic signals, the system provides the user with an easier and more independent daily mobility and supports the autonomy of the person. Hypothesis: Applying a socio-technical perspective and assuming a co-evolution between technical and social factors is regarded as essential to develop innovative technologies in a way that it is acceptable for all parties, in particular users and those affected by technology. Method: To deal with the complex co-evolutionary dynamics in the assessment and the social embeddedness of the technology users as well as scientific experts, stakeholders and citizens are involved in the project 'TERRAIN – independent mobility of visually impaired persons in urban surroundings through audio-tactile navigation'. Results: Technology developers are regarding the TERRAIN technology as innovative for enabling visually impaired people to access their individual social spaces in the neighborhood and allowing a "secured participation" in social life. The accompanying research examines potential ethical, legal, social implications (ELSI) of a real world implementation and proposes measures to promote acceptance by users and potentially affected persons in public.

CRISPR In Context: Lessons for Genome Editing from the History of Controversial Biotechnologies

de Saille, Stevienna (1); Morrison, Michael (2)

1: iHuman, University of Sheffield, United Kingdom; 2: HeLEX, University of Oxford, United Kingdom
s.desaille[at]sheffield.ac.uk, michael.morrison[at]dph.ox.ac.uk

Widespread use of CRISPR-Cas-9 has prompted calls for greater public engagement with genome editing, long before the birth of genetically edited twins in China, with the assumption that this will help pre-empt or avoid public

opposition to such technologies. This concern is understandable, given the history of controversial biotechnologies. But why are so many biotechnologies controversial, and what does this mean for the way we manage the concerns they generate? The 'hybrid' mixing of natural and human-directed processes in the objects produced by biotechnology can make them appear unsettling, even monstrous. Recognising this, future oversight of technologies like genome editing needs to acknowledge that physical harm to people or property is not the only concern that needs to be managed. Instead, we require a greater understanding of how intrinsic dichotomies are enabled by the technologies themselves, leading to inseparable qualities of fascination and fear. In this paper, we use Mary Douglas' work on 'matter out of place' and Martijnte Smits' monster theory to consider how the long-entwined history of recombinant DNA and in-vitro fertilization could be used to better inform discussions of the responsible development of CRISPR-related technologies in human beings.

Co-created Strategic Planning in Academia: Case Study of an Action Research Group

Senabre Hidalgo, Enric (1); Fuster Morell, Mayo (2)

1: Austrian Academy of Sciences, Austria; 2: Universitat Oberta de Catalunya, Spain
esenabre[at]uoc.edu, mfuster[at]uoc.edu

Exploratory case study of how co-creation methodologies can be applied to strategic planning in academic research. We describe the co-designed strategic planning of an action-research group, outlining its integration in the group's novel day-to-day Agile project management (APM). The strategic objectives of the group were formulated in a participative process, in which visualization and other co-design techniques were adopted from an ecosystemic perspective, to ensure diversity and maximize agreement among team members and research collaborators from different disciplines. Results of the strategic planning were also benchmarked with the ones from the research center where the group is integrated, and in connection with the United Nations Sustainable Development Goals (SDG) and the Responsible Research and Innovation (RRI) principles, adopted as landmark at final stages of the process. Our paper explains the rationale of the different stages in connection with literature about strategic planning, collaboration in research management and co-creation derived from design thinking and APM. The analysis of this case study is based on methods of participant observation, surveys to participants and content analysis of the online tools used by the research group. On the one hand, results coincide with existing literature about the need to understand strategic planning as a dialogic and emergent process, where our novel contribution in the field of research management analyses the benefits of co-creation approaches for team members engagement with strategic vision, as well as for dealing with complexity in the day-to-day of academic activity. On the other hand, this study offers a systematized methodological description for the co-creation of participative planning and in research groups, which could be of practical interest for scientific institutions in different areas.

A Complicated Union. Epistemological Challenges In The Collaboration Between Architects And Sociologists

Marguin, Séverine

Technische Universität Berlin, Germany
severine.marguin[at]tu-berlin.de

This contribution examines interdisciplinarity between design and social science in the academic field and its impact on the refiguration of scientific understandings. In the course of the so-called "Design Turn" (Schäffner 2010), that promotes the integration of design disciplines (such as architecture, design and art) within the humanities, we can observe for the field of spatial research new collaborations emerging between architects, urban designers and sociologists, on which a strong innovative potential is attributed. But to what extent do such collaborations work? Which problems do they face? And how do they affect respective disciplinary epistemic cultures (Knorr-Cetina 2002)? Based on an ethnographic investigation on a research project involving the three disciplines, we would like to show central epistemological and methodical challenges, that shape everyday collaborative research practices. The relationship to empiricism forms an interesting focus, so far it founds their understanding of scientific validity. A main point of empirical contention concerns the definition of what an empirical data is and its relation to the constructed reality. A second fundamental difference is their handling with visual research methods, which, while embodied as a tacit knowledge by the architects, is still in the process of being legitimised for the sociologists - despite recent developments in visual sociology towards photography or videography. Finally, we will address the asymmetry of the relationships between the disciplines. We can observe a scientification of architecture and urban design research, understood as an imperativ for their alignment with sociological criteria of scientific validity. What does such a levelling mean for the development of architectural research? And what does it reveal on interdisciplinarity?

RN24_02b | Science and Technology (Open Session) I

‘Not A Place Of Honor’: Risk, Technology And The Aesthetics Of Prohibition

Vurdubakis, Theodore

Lancaster University, United Kingdom
t.vurdubakis[at]lancaster.ac.uk

Drawing on post-ANT material semiotics, the paper examines the proposed designs for a nuclear Waste Isolation Pilot Plant (WIPP) located near Carlsbad, New Mexico. The purpose of WIPP is to provide a burial chamber where military nuclear

waste can be safely entombed for the next 10,000 years –that being the time during which transuranic elements remain particularly dangerous contaminants. WIPP design(s) are not created solely by scientists and engineers, but also by archaeologists, artists, linguists, sociologists and sf writers. Indeed, a key objective is to forestall not only leakages of radioactivity, but also (witting or unwitting) human intrusions. Given that 10,000 years far exceed the timeline of recorded history, it was taken for granted that none of the institutions that currently administer the site would survive. The task of therefore, was to devise forms of communication able to transcend time and convey to unknown (and unknowable) Future Others the risks haunting the site: “This place is not a place of honor... nothing valued is here....This place is best shunned” (Trauth et al, 1993). At the same time, the panels had to conjure a range of scenarios under which the taboo might be violated even if understood. Taken together these artistic-scientific endeavours, the paper argues, have a significance that goes far beyond the technoscientific problem(s) at hand. Rather, they articulate particular (occidental) cultural understandings of technological risks, the nature of the forbidden and the aesthetics of prohibition.

The Double Life of Scripts in Science and Technology Studies

Glaser, Jochen

TU Berlin, Germany
Jochen.Glaser[at]ztg.tu-berlin.de

The concept ‘script’ has been successfully employed in two unrelated comparative approaches. In studies of academic careers, it has been introduced by Steve Barley to describe sequences of actions leading to successful careers. Scripts can be understood as collective frames that mediate between institutions and individual actions by informing researchers about decision outcomes that are likely to advance their careers. These frames are descriptive in that they do not prescribe actions to be taken. Their mediating role, which is field specific, helps explain why different sequences of organisational positions occur in different fields (Laudel et al. 2018). In studies of technology, the concept ‘script’ has been introduced by Madeleine Akrich to describe sequences of actions a user must carry out to successfully use a technology. These sequences are inscribed into material artefacts. Although users always can deviate from the script and use an artefact for their own purposes in ways that are not inscribed, scripts reflect the way in which designers intend the artefact to be used, which is followed by most users. Thus, scripts materialised in artefacts mediate an influence of designers (and their clients) on users. They are prescriptive. They are also a very good conceptual tool for comparing influences mediated by technology (The Berlin Script Collective 2017, 2018). This leaves sociologists with a dilemma: A very useful concept that has productive applications in different areas of comparative science studies carries two incompatible definitions. The aim of my presentation is to discuss possible solutions to this problem.

Technology and Interpretive Flexibility: A Structural Hermeneutic of Resistance to Robots in Schools

Johannessen, Lars E. F.

OsloMet – Oslo Metropolitan University, Norway
larsem[at]oslomet.no

Science and Technology Studies (STS) has provided rich demonstrations of actors' "interpretive flexibility" vis-a-vis technology, thus showing that technologies do not have fixed meanings and functions, but are open to various interpretations and uses. However, while an important critique of technological determinism, I would argue that research on interpretive flexibility could benefit from engagement with more cultural perspectives, as current research pays insufficient attention to the meaning structures that underlie actors' interpretations. This article therefore seeks to engage STS with cultural sociology, and it does so by exploring the resistance in Norwegian schools towards the introduction of a telepresence robot for children with long-term illness, meant to act as the child's eyes, ears and voice in the classroom. The fact that schools meet this technology with skepticism is dumbfounding to both the producers and users of the robot, who ask how anyone can resist a technology that is meant to give sick children access to teaching and their friends. Drawing on 'the strong program' in cultural sociology, this article utilizes a structural hermeneutic approach to tease out the binary codes and narratives that underlie teachers' and principals' objections to the robot. It shows that their resistance is motivated by a multitude of concerns, including privacy, an unease with the robot's monitoring 'gaze', and broader discourses about the loss of professional autonomy in schools. In detailing these cultural structures, the article seeks to build a bridge between STS and cultural sociology, thus opening avenues for further collaboration.

RN24_03a | Science and the public I

Research Communication in Magnetic Fields: Pitfalls and Strategies

Andersson, Mette

University of Oslo, Norway
mette.andersson[at]sosgeo.uio.no

This paper analyses the challenges of research communication in thematic fields of political contention and polarization. Migration and diversity here serves as an example of a more general category of such thematic fields, 'magnetic fields'. I use the term 'magnetic field', a central concept in the natural sciences, as a sensitizing concept and as a metaphor that may aid the analysis of research communication in social science thematic fields such as migration and diversity. Magnetic fields are recognized by that public opinion is strong and polarized,

themes are high on the political agenda and central for voters in elections. Thematic fields can become more and less magnetic over time, depending on political circumstances, media trends, developments in the Academy, and local and national cultures of public communication. The paper builds on empirical data from depth interviews with 31 Norwegian migration and diversity researchers of different ages, gender, and social science disciplinary background. The analysis focuses on the complexity of researchers' own reactions to reception of their research communication, and on their strategies to overcome or avoid reactions they understand as variously hate, ridicule and politicization. In the concluding discussion, I scrutinize the references to the concept of magnetic field by comparing research communication about migration and diversity with research communication about other similarly controversial themes

Travelling Beyond the Barriers of Germline Genome Editing To Belong

Kaur, Amarpreet

University of Cambridge, United Kingdom
ak997[at]cam.ac.uk

Within a frame of globalisation and nationalism, this paper draws upon findings from a representative, online, mixed-methods survey to share public attitudes towards travelling outside a country of residence to access germline genome editing. The paper questions the acceptance and feasibility of travelling beyond borders in the hope of achieving reproductive desires, and the repercussions that could ensue. The findings reveal how the wider public understand, relate to, and prophesise the scope of science and technology through the context of germline genome editing via human embryos in the United Kingdom (UK). Collectively, the questions and discussions raised in the paper highlight senses of belonging and how identities are (re)imagined through the pragmatic scope of germline genome editing, both within the UK and beyond.

Experience Narratives as Acts of ‘Public Engagement with Science’

Andell, Kia Kaarina

University of Turku, Finland
kia.andell[at]utu.fi

The paper discusses the relationship between experiential and scientific forms of knowledge, which has been widely problematized in contemporary ‘post-truth’ western societies. In particular the empirical focus is on certain kinds of bodily, sensuous experiences that contradict the scientific-technical worldview and biomedical conceptions of human body/mind. Drawing on autobiographical narratives of extraordinary sensory experiences like voices, visions, precognition, and telepathy, I interrogate the formation of experiential knowledge and its effects on people’s perceptions of scientific knowledge and expertise. The research material consists of an archive of letters that were spontaneously sent by Finnish people to an interdisciplinary research project Mind and the Other after the project gained visibility in the Finnish mainstream media. The narratives are thus analyzed as acts of ‘public engagement with science’ through which the writers seek to make their experiences understandable and justify them in the eyes of a scientific audience. Particularly I focus on narratives from writers who, along their experiences have come to practice alternative treatments like channeling or energy healing. The narratives question simplifying accounts of alternative health practices as building on ‘false beliefs’ by making visible the complex experiential basis of individuals’ conceptions of mind/body. They also problematize the prevailing hierarchical relationship between scientific-rational and experiential, affective, and intuitive ways of knowing as they discuss the social consequences of such hierarchy. I analyze how the relationship between experiential and scientific forms of knowledge becomes politicized through the practice of narrating one’s personal experiences to researchers, and what kind of public engagement does it call forth?

Defamiliarization And Refamiliarization: Literary Techniques In The Service Of Scientism In Contemporary Popular Science

Helsing, Daniel Lars

Lund University, Sweden; University College London, United Kingdom
daniel.helsing[at]litt.lu.se

The construction of science in publicly accessible texts—from Mary Somerville’s *On the Connexion of the Physical Sciences* to Carl Sagan’s *Cosmos*—is an integral part of the construction of science itself. While all scientific texts can be said to deploy literary techniques to some degree, many of the most successful and influential public texts rely heavily on techniques like narrative and metaphor to convey/construct science. Since the late 1970s, it has been common for popularizers to convey/construct science in such a way that it

aligns with scientism—i.e., the view that science is inherently superior to all other forms of knowledge and should therefore permeate culture and provide the intellectual foundations for all research. In this paper, I analyze literary techniques that some of the most influential contemporary popularizers use to convey/construct science. I show that the expansionism of scientism is incorporated already in the ways in which certain literary techniques are used, i.e. already in the narrative structure of the texts. In particular, I show that popularizers like Brian Greene and Neil deGrasse Tyson use an interplay between defamiliarization (presenting familiar objects as unfamiliar) and refamiliarization (placing the objects-made-unfamiliar in new narratives) to convey/construct science. I go on to show that the resultant construction of science is fraught with ambiguities. I argue that an analysis of the use of literary techniques in popular science contributes to critical perspectives on present-day scientism and constructions of science in society.

RN24_03b | Artificial Intelligence and machine learning

The Politics of Machine Learning

Tupasela, Aaro

University of Helsinki, Finland
aaro.tupasela[at]helsinki.fi

Machine learning platforms have emerged as a new promissory technology that some argue will revolutionize work practices across a broad range of professions, including medical care. In 2017, a group of Oncologist at Copenhagen’s Rigshospitalet piloted the IBM Watson for Oncology platform only to realize that they were in full concordance with only 30% of its recommendations. Other studies, supported by IBM, claim concordance rates as high as 96%. In this presentation, I will look at machine-learning platforms, which support medical decision-making in cancer oncology and contemplate the significance of concordance rates as manifestations of evidence. If there is a high level of concordance between the platform and the oncologists, then there is no need for the platform. If there is a low level of concordance with the platform then the platforms decision become suspect. I suggest that there is a way out of this dilemma by better understanding how concordance and discordance are generated and what it says about the decision-making processes themselves. Furthermore, I suggest that concordance levels relate more to knowledge production regimes, rather than absolute truth claims regarding treatment options

Artificial Intelligence: A Macro-Sociological Approach

Ruzzeddu, Massimiliano

University Niccolò Cusano, Italy
mruzzed[at]hotmail.com

Artificial Intelligence includes two main fields of research: Big Data and Automation (i.e. Industry 4.0 and Internet of things). Now, sociological scholarship about Big Data is quite large and well established in international academia. On the contrary, so far sociology has not focused on Automation, even if there is general agreement on the fact that, in the next years, Automation-related innovations will heavily affect many aspects of social life. Within this framework, a (macro) sociological approach to Automation studies is necessary, in order to find how to cope with the social consequences of the coming productive innovations. Namely, massively spread Automation-related innovations will be likely to reduce the amount of socially necessary work - both manual and intellectual- and, at the same time, impose a much stronger mastery of automation technologies to all active citizens. In other words, Automation could be a historic occasion for social progress, while, in the case of bad management, Automation might cause troubles of unemployment, income distribution, and social discontent. My paper will propose a theoretical model for dealing with this issue, especially: - an analysis of the main sources for sociologists to achieve reliable information about the actual state-of-the-art of Automation technologies. - a general pattern for scenario analyses on the Automation impact; this pattern, will include the technical, economic, political and cultural points of view. - a general pattern for Automation related policies.

Artificial Intelligence as a Disruptive Innovation from an Organizational Perspective

Blasutig, Gabriele

University of Trieste, Italy
gabriele.blasutig[at]dispes.units.it

The increasingly pervasive introduction of A.I. systems is one of the distinctive features of the so-called Capitalism 4.0. Analyses of this phenomenon are rapidly flourishing. One branch of studies is dedicated to the possible developments of these technologies in relation to the multiple fields and ways of application, considering the new skills needed as well as the implications for the nature and quality of work. A second large area of study addresses the large-scale effects of new technologies, considering their employment, work and social impact: for example, the possible effects of substitution, creation, displacement and transformation of work, or the effects on the distribution of employment and wealth, on welfare state systems and labour regulation. This contribution addresses an intermediate analytical area between the two mentioned above, reflecting on the possible effects of A.I. on organizational structure and processes, using some analytical tools provided by the sociology of the organization. The hypothesis that we want to examine is that the introduction of

management and operational devices based on the A.I. can constitute a disruptive innovation also from the organizational point of view. This is possible because A.I. interacts widely with the dynamics of learning, communication, decision and action that operate at various levels in organizations. It can therefore be important to reflect, taking a sociotechnical perspective, on how A.I. interacts with different organizational aspects, such as the system of roles and relationships, coordination mechanisms, decision-making processes, authority structures, organizational cultures, etc.

Artificial Intelligence: Where Were We?

Borgna, Paola

University of Turin (Italy), Italy
paola.borgna[at]unito.it

In the '80s the interest in Artificial Intelligence and its promises spread within the social sciences and the sociology in particular. The most ambitious ones explored the possibility of simulating the social behavior with a degree of strong equivalence, that means that it allows to understand the simulated object; from this point of view AI is a cognitive tool. Today a significant portion of the discourse on AI seems to have abandoned that aspiration. In return, AI penetrated in the reality of our daily lives in different forms and applications; in its name, revolutions of different kind are described or foreseen, some of which also in the practice of sociological research. "Artificial Intelligence" is nowadays a recurrent expression in different fields, to refer to the most varied applications – that's why it is often included in buzzwords lists. We try to reconstruct its recent fortune also in sociology, to find the uses of it that refer specifically to simulation – that is to say that aim to reproduce some aspects of the social life through computational models; and to understand if and to what extent the simulation aims to be an explanation.

RN24_04a | Science and the public II

S&T Meet Diplomacy: Dialogue between Scientists and Politicians

Urze, Paula; Diogo, Maria Paula

FCT/UNL, CIUHCT, Portugal
pcu[at]fct.unl.pt, mpd[at]fct.unl.pt

This paper aims at discussing the entanglements between science, technology and diplomacy. In recent years, there has been a stream of a growing interest in science and diplomacy by STS scholars particularly in the context of the Cold War and its aftermath. This renewed attention in science diplomacy, together with the well-known perception that science and technology are strategic assets for diplomacy opens new scientific and political avenues to build a fruitful and both formal and informal dialogue between scientists and politicians outside their respective boundaries. The role played by a multi-layered set of actors and by international institutions in this dialogue is of outstanding importance. The agency of scientists in corporate decision-making and knowledge sharing within S&T communities raises particularly relevant issues to enlarge our perspectives on how scientists and politicians meet and discuss S&T. This paper is based on research developed within the on-going H2020 project – InSciDE - Inventing a shared Science Diplomacy for Europe which aims at exploring the concept of SD by bringing to the forefront both institutional actors, such as academies, and individual actors such as ambassadors, scientific attachés, and ST consultants. InSciDE covers 6 broad themes which work on a case-study basis. These case studies are used both per se, to illustrate forms of collaboration between scientists and diplomats and as an analytical tool for understanding European SD. We present a first version of the two Portuguese case studies we are exploring: the Ciência meetings (2016-2018) and the diplomatic response during the Fukushima crisis.

The Relationship Of Science To Its (Threatening) Outside In The Age Of Digital Media

Wenninger, Andreas

Technische Universität München, Germany
andreas.wenninger[at]tum.de

Due to the increasing establishment and use of social media, there are currently intensified disputes regarding the boundaries of science. Supposed followers of anti-scientific worldviews (esoterics, vaccination opponents, conspiracy theorists, pseudo-scientists, believers, etc.) meet scientists and science advocates in blogs and other internet portals. This leads to sometimes fierce controversies. Using the example of science blogs, I trace different patterns of boundary work between science and non-science. In addition, I show that these discussions cannot be brought to an end, but rather makes visible insoluble paradoxes. The social situatedness of

science leads to the problem that the boundaries of science cannot simply be determined within the science system (e.g. by self-descriptions of scientists or by philosophy of science), but have to be formed again and again within a society and in dealing with often contrary views. Thus, this situatedness of science leads to the development of communicative strategies within the scientific community and their proponents, which aim to fight against the imagined opponents of science. Theoretically, my contribution assumes that science - like all parts of society - imagines and fights a respective 'diffuse' outside in order to stabilise its (imagined) identity. In recent years, the increasing digitalisation of science communication at the interface with society has created and intensified new challenges. This contribution is an attempt to reflect on this sociologically.

Citizens Engagement through the Social Impact of Science in Social Media

Redondo-Sama, Gisela (1); Ramis, Mimar (2)

1: University of Zaragoza; 2: University of Barcelona, Spain
grsama[at]unizar.es, mimarramis[at]ub.edu

One of the main pillars of IMPACT-EV: Evaluating the impact and outcomes of European SSH research (2014-2017), has been the evaluation of the social impact of science. This research project has developed indicators and criteria to evaluate not only the scientific impact of research in the Social Sciences and the Humanities but also their policy and social impact. One of the core results of the project has been the creation of SIOR (the Social Impact Repository) which is the first open-access repository in the world that showcases and cites the social impact that the results of scientific research achieves. These results are also shared by researchers in the social networks, where scholarly content is becoming increasingly common. Therefore, Almetrics is a tool more and more used to evaluate the dissemination of scientific research. Less is known as to how to adequately identify the evidence of social impact among all the interactions of participants in the social media: what they are sharing, or what their opinion about of our results as scientists are. This paper presents the most recent advances in the evaluation of social impact in social media, especially on Twitter and Facebook. In so doing, emerging forms through which citizens engagement contributes to the very evaluation of the social impact of science arise. These progresses are in the line of what the EC-through its publication "Monitoring the impact of EU Framework Programmes"-, is defining as indicators of societal and policy impact for all sciences in the next research programme FP9.

The Cultural Meanings of Science: Understanding Science Identification Using the Sociology of (Non)religion

Jones, Stephen H.

University of Birmingham, United Kingdom
s.h.jones[at]bham.ac.uk

Due to its underlying normative concerns, the public understanding of science has predominantly focused on people's knowledge of, or trust in, science. Less attention has been paid to the meanings publics attach to science and to the ways science forms part of a comprehensive philosophy and moral outlook. While this is understandable given the discipline's interest in bridging gaps between publics and producers of scientific knowledge, this leaves unanswered questions about how science is envisaged in different contexts, how it forms part of a national or cultural identity, and how it fits into cultural politics and conflict. Based on 123 interviews and 16 focus groups conducted with mixed religious and non-religious publics and life scientists in the UK and Canada, this paper utilizes approaches common in the sociology of religion and nonreligion (where personal meaning and worldview are the primary point of concern). Using this data, I delineate varieties of science identification and how these forms of identification intersect with class, gender and cultural and political orientation. I focus in particular on how science is envisaged by nonreligious individuals who have been neglected in science studies. I tentatively map out 'practical', 'moral', 'civilisational' and 'existential' forms of identification and highlight how these forms of identification are grounded in people's moral/cultural formation rather than knowledge.

RN24_04b | Science policy & national research systems

Current and Potential Use of complexity measures for Decision- Making: The Case of Transnational Research Programs in Europe

Zinilli, Antonio; Reale, Emanuela

National Research Council, Italy
antonio.zinilli[at]ircres.cnr.it, emanuela.reale[at]ircres.cnr.it

The increasingly widespread availability of data on characteristics and funding related to joint R&D programmes between European countries represents a key element to shed light on the process of Europeanization of research activities. While there is a growing literature on the national funding schemes devoted to transnational research (Reale et al, 2013), there are few contributions in this field using approaches focusing on interactions and relationships between agents, such as social network analysis (SNA) and spatial analysis. These approaches are likely to provide important insights into communication and knowledge flows, in addition to the effects

of proximity and similarity between the units of analysis (Reale et al., 2017). However, the contribution based on the reciprocal interaction in the process of Europeanization of research activities at the level of political decision-making process (policy design and implementation) remains little debated. In fact, most of the studies have been focused at performer level related to research programmes/projects, (Barber et al, 2011; Hoekman et al. 2013; Scherngell and Barber 2009; Zinilli, 2016). By changing the level of analysis from the performer to the policy level, we expect to achieve an understanding of the decision-making network and its evolution over time. The aim of this paper is to discuss the contribution and the benefits of using this different application of methodological approaches to the transnational research programmes.

Converting Scientific Knowledge And Technology Into Social And Economic Value: Arguing For Dual-Way Transfer Policies

Santos, Helena (1); Sistelo, Marta (2); São Simão, Fátima (2)

1: University of Porto, Portugal, Portugal; 2: UPTEC (Park of Science and Technology of the University of Porto), Portugal
hsantos[at]fep.up.pt, msistelo[at]uptec.up.pt,
fatimass[at]uptec.up.pt

The various socio-cultural and economic changes brought by globalization and the development of information and communication technologies, as well as the transition from industrial to 'knowledge based-society', are challenging the relationships between the production of knowledge and society. Public policies, especially in Europe, are explicitly committed to boosting the "3rd mission" of the universities, i.e., their role in national and regional development through the conversion of scientific and technological knowledge into social and economic value. Universities' Science and Technological Parks (STPs) have been, and still are, a core part of these policies, with the aim of promoting the emergence and sustainability of a new business culture (new ideas, business innovation, entrepreneurship). In this sense, the fostering of the 3rd missions of universities has been oriented mainly by one-way direction, meaning predominantly market-driven policies that intend to (more or less directly) transform knowledge into 'market value'. Our research has been questioning these mainstream policies and practices, by inquiring about the need of a dual relationship between universities and societies, in a broader and in-depth sense. We will present the results of a case study (the STP of the University of Porto, Portugal) where this dual-way is being implemented through several strategies and practices. Some of these cover the presence of a dynamic Creative Industries' centre inside the STP, its synergies towards technology and science, and some experiences in bringing non-technological knowledge inside the STP, as well as different ways of 'delivering' science and technological knowledge to society.

Mapping the Social Sciences in EU funding schemes

Kropp, Kristoffer; Larsen, Anton Grau

Roskilde University, Denmark
kkropp[at]ruc.dk, agraul[at]ruc.dk

In the last three decades science policies and science funding has become ever more important in the EU. Hence, more money and political attentions has been devoted to the area. In this paper we analyse the social science project funded through the EU framework programs from the 1990s and onwards. Using data from the CORDIS database and geometric data analysis we seek to shed light on how social science knowledge production has entangled with EU politics through research projects. We construct a social space of social science research project in order to understand the internal differences between projects. More specific we analyse the relations between topics, funding schemes, involved institutions – both academic and others, grant size and researchers in order to further our understanding of the internal principles of differentiation in EU research funding. Hence, the paper aims at understanding the role of Europeanisation processes in relations to the intuitional and cognitive structure (or epistemic culture) of European social science knowledge production.

Patient Knowledge, Complexity, and Health Technology Assessment

Gunn, Callum; Regeer, Barbara

Vrije Universiteit Amsterdam, Netherlands, The
c.j.gunn[at]vu.nl, b.j.regeer[at]vu.nl

Health Technology Assessment (HTA) sits at the border of research and policy by first evaluating the potential societal impact of health technologies, then drafting recommendations to facilitate evidence-based policymaking. HTA's goals of objective and rationalist science have been challenged through the political drive towards the inclusion of patient perspectives within its process. Integrating non-scientific and scientific knowledge in research tends to highlight the complexities of the research object. However, such complexities, and their management within assessments, have not yet formed an analytical focus of evaluative research within HTA. This research thus aimed to explore the manifest complexities in HTA utilising patient knowledge, and how these complexities were managed. Interviews with HTA agency and patient organisation representatives were triangulated with observations of HTA research and documentary analysis from 6 European HTA contexts, with the data then analysed thematically. Patient knowledge introduced a layered presence of complexity into HTA research: The complexities of technology, the social system in which technology is implemented, and the assessment project all arose in HTA projects studied. The methods to manage these complexities were conflicting: some attempted to navigate the complexity through reducing or encoding patient knowledge into formats which were more congruent with normal HTA practice. Meanwhile, other methods relied heavily on social processes such as translation of knowledge, reflexivity, cooperation and

trust between scientists and non-scientists. These competing means of managing complexity form an intriguing gap in practice: further work would be useful to analyse the different approaches of European agencies and the influence these may have on the outcomes of assessment projects.

RN24_05a | Scientific careers and practices

“Science Is Still Important...” A Qualitative Study On (Age-Related) Retirement Of University Professors In Germany

Berli, Oliver; Reuter, Julia

University of Cologne, Germany
oberli[at]uni-koeln.de, j.reuter[at]uni-koeln.de

In recent years differentiating phases and types of careers has been at the center of sociological research on University careers. The majority of studies focuses on the so-called “young researchers”, which results in discussing primarily questions of access to and success in the field of science. In comparison, research on later career developments of University professors is relatively rare. Inspired by this observation the research project “The end of the academic career?”, funded by the German Research Foundation (DFG), investigates the (age-related) retirement of University professors in Germany. Besides anecdotal evidence little is known about (age-related) retirement of University professors, which is curious, because retirement is an important aspect of the reproduction of the academic field. In particular, we are interested in the entanglements of practices and regulations related to retirement of University professors, the individual handling of and coming to terms with this status passage. Our paper deals with the research problem in three steps: Firstly, our paper provides insights into general aspects of the end of University careers in Germany. Secondly, we will present our methodical approach developed on the basis of a preliminary study conducted in 2017. In order to grasp the complex nature of our research problem, we combine the analysis of documents, expert interviews and problem-centered interviews. Finally, we will discuss preliminary findings and directions for further research.

Presenting and Valuating the Academic Self with the CV – Tracing historical contexts

Tumeltshammer, Markus

University of Klagenfurt, Austria
markus.tumeltshammer[at]aau.at

Academic curricula vitae (CVs) are often carefully designed and maintained documents of auto/-biographical practices (Miller & Morgan 1993) by scientists and other researchers. These practices are linked to expectations and self-perceptions that are specific to the fields (Bourdieu 2006) in which researchers are embedded. In my PhD-research, I address the question how researchers are being constructed as epistemic subjects (Knorr-Cetina 1999) in practices of presenting and valuating themselves and others based on academic CVs. They play an important role in performing the “scientific self” (Daston & Galison 2007) and signalling “epistemic styles” (Lamont 2009). Whether and how a person is being recognized as a credible researcher depends on social processes of successfully ascribing such credibility. In this respect, CVs are part of diverse practices of valuation embedded in institutionalized processes of inclusion and exclusion. Reaching or keeping an academic position in contemporary audit culture normally involves CVs as “tools of assessment” (Ruth 2008). Researchers' CVs circulate in various formats, ranging from ‘classical’ CVs, included in grant and other applications, over personal entries on departmental websites, to academic social networks. In my talk I will focus on a part of my work that adds a historical perspective, tracing contexts (Asdal 2012) in which CVs emerged as part of academic institutions and everyday life. To do so, I will draw on findings from literature on CVs, and on the history of autobiography. I will also present examples from my own archival research on historical academic practices with CVs in Austria and Germany.

New Techno-Scientific Governance: Time Regimes and Scientific Trajectories

Picardi, Ilenia; Agodi, Maria Carmela

University of Naples Federico II, Italy
ilenia.picardi[at]unina.it, agodi[at]unina.it

In the last years, the relation between productivity regimes and time regimes in academia have become a new object of analysis in science studies (Gibbs et al. 2015, Felt 2009, 2016, 2017, Ylijoki and Mäntyla 2003). This paper debates the impact of new forms of global and local governance of research and academia on situated scientific practices and academic careers. Recent perspectives from STS studies, where matters of concern and matters of care interact (Latour, 2017; Haraway, 2016; Martin, Myers, Viseu, 2015; Harding, 1991; Puig de la Bellacasa, 2017; Stengers, 2009), define the positioning for the analysis. Combining quantitative and qualitative research methods, we reconstruct the details of scientific trajectories of Italian academic researchers through different cohorts. Two Italian scientific institutions are examined as cases studies. The goal is to investigate the impact of new recruitment and career progression rules on scientific trajectories and researchers' timescapes, after the 2010 reform of Italian academia. New forms of (intersectional) inequalities stemming from new forms of regulations are furtherly coming to the floor. While gender equity policies are working for the overcoming of the Glass Ceiling, a more detailed analysis of data reveals the closing of an overlooked and till now invisible Glass Door (Picardi, 2019) facing women researchers when approaching tenure track. The research reveals that the emphasis on competitive meritocracy proposed as a neutral universalistic framework has not removed ‘traditional’ co-optative mechanisms (predominantly based on informal networking practices). It is reinforcing the productive paradigm versus the generative one in technoscientific practice, making it hard for researchers to gain the reflexivity to pay attention to and respond to shifting topologies of power in our rapidly changing worlds.

Big Databases and the Uncertainties of Financialising Technoscientific Knowledge in Healthcare

Vezyridis, Paraskevas; Timmons, Stephen

University of Nottingham, United Kingdom
Paraskevas.Vezyridis[at]nottingham.ac.uk,
ntzst1[at]exmail.nottingham.ac.uk

The English NHS is seen as key site for the use of big data to revolutionise biomedical research. It is a universal healthcare system, with strong penetration of electronic health records in primary care, giving the possibility of harvesting large amounts of de-identified patient data for big data analytics. We report on a qualitative study of GPs, staff from primary care research database services, and interested citizens. We examine some of the challenges (primary care) databases face in England, drawing on 'sociology of expectations' and STS literature on the financialisation of technoscientific knowledge. By bringing into focus the performativity of expectations as well as the various competing, contrasting and complementary valuation practices these data infrastructures have to navigate through, we show that collecting and curating these datasets is a complex and laborious practice within a highly competitive and regulated environment. There are variable access costs and time lags in data availability and demanding technological and human capital requirements for data analysis for these databases. At same time, maintaining public acceptability creates tensions between data being open and available to researchers and the necessity for these research databases to find a sustainable model of operation. We conclude by discussing the role of these databases in the internalisation of the uncertainty involved with NHS research and development externalisation to universities and industry, while these actors externalise other risks and costs involved (e.g. feasibility, data collection, information governance, data validation), and, what this means for the future of data-based research in public healthcare.

Controversy Over Animal Experimentation : A Waltz In Five Steps

Crettaz von Roten, Fabienne

University of Lausanne, Switzerland
Fabienne.CrettazvonRoten[at]unil.ch

According to Dorothy Nelkin (1995), animal experimentation (AE) controversy concerns "the social, moral and religious implication of a scientific theory or research practice" (p. 447). While the conditions for the resolution or closure of a controversy have been described (E. McMullin, 1987), none were met in Switzerland until today. To understand why this controversy is still vivid in Switzerland, a socio-historical analysis was realized from 1950 onwards. Six elements of the controversy have been identified (validity of AE, status of animal, alternative methods, economical aspect, relocation of tests). The results delineate five periods, where each element of the controversy was more or less prominent. In this time interval, four popular initiatives related to the issue were proposed to vote to Swiss citizen. They were extensively discussed in the public sphere along various frames, that overlap the elements of the controversy (for framing of science-related issue see Nisbet and Scheufeule, 2009). We will conclude by showing how the future initiative on the issue (2020) relates to the previous periods and how it differentiates. References Nelkin, D. (1995). Science controversies: the dynamics of public disputes in the United States. In Jasanoff, et al (eds), Handbook of science and technology studies, Thousand Oak: Sage (444-456). McMullin, E. (1987). Scientific controversy and its termination. In Engelhardt, et al. (eds). EFFORTI: Comparative Findings of 19 Case Study Interventions for a Greater Gender Equality in R&I across 6 European Countries

Palmén, Rachel (1); Bühner, Susanne (2); Kalpazidou Schmidt, Evanthia (3); Reidl, Sybille (4); Groo, Dora (5); Striebing, Clemens (6); Holzinger, Florian (4)

1: Open University of Catalonia, Spain; 2: Fraunhofer ISI, Germany; 3: Aarhus University, Denmark; 4: Joanneum Research, Austria; 5: NaTE: The Association of Hungarian Women in Science, Hungary; 6: Fraunhofer CeRRI, Germany
rpalmen[at]uoc.edu, Susanne.Buehrer-Topcu[at]isi.fraunhofer.de, eks[at]ps.au.dk, sybille.reidl[at]joanneum.at, dora.groo[at]nokatud.hu, clemens.striebling[at]iao.fraunhofer.de, Florian.Holzinger[at]joanneum.at

This paper presents the findings of the comparative analysis of 19 gender equality interventions in R&I case studies carried out across Europe (Austria, Denmark, Germany Hungary, Spain and Sweden) in the framework of EFFORTI (Evaluation Framework for Promoting Gender Equality in R&I) H2020 research project. For each case study a theory of change was developed which was based on three main axes: concept/design analysis, implementation analysis, and an impact assessment. This paper synthesises the findings across all case studies focusing on the strengths and weaknesses of the design of interventions by sub-fields of action and the common facilitating and hindering factors that have shaped the implementation and subsequent impact of the interventions. Case study evaluations are then discussed followed by a summary of the ethical and methodological reflections of the case study authors. Case study work to validate the EFFORTI evaluation framework is then presented regarding the theory of change approach, the validation of the EFFORTI indicators and the EFFORTI impact stories.

When Grand Vision Meets Peer Review: Untangling “Research Impact” in a National Funding Agency

Shankar, Kalpana; Luo, Junwen

University College Dublin, Ireland
kalpana.shankar[at]ucd.ie, junwen.luo[at]ucd.ie

National funding agencies establish and fund research programmes based on many factors: organizational mission and remit, national and international research strategy and policies, workforce needs, to name a few. In particular, the agency must demonstrate “impact” of research: that their resources are being directed towards projects that are relevant and enhance society, economy, environment and culture in particular ways that are deemed important by the agency. However, how the grand vision of research impact is translated into “on the ground” funding programmes (and how and who gets funded through them) is often an unexpected journey that

is mediated by peer review processes involving various stakeholder groups: grant applicants, expert reviewers and funding agency managers and committees. This translation complicates both the role of impact in all dimensions of the research enterprise. This paper investigates the process of how “research impact” becomes translated from the grand vision of a national funding agency to the design and implementation of a specific funding programme, then to the prospective peer reviews and eventual funding decisions of the applications. Drawing on policy and vision documents, peer review criteria, anonymised peer reviews of applications, and interviews with stakeholders, we explore this process through the lens of John Law’s (1992) work on actor networks to understand how the different actors address, mobilise, and translate “research impact” and to what extent a national funding agency’s criteria and methods for assessing the potential impact of research pick the “winners”.

The Global Nature of STEM Education Increases Minority Students’ Readiness to Work with the Outgroup

Diamond, Aurel; Kislev, Elyakim

Hebrew University of Jerusalem, Israel
aurel.diamond[at]mail.huji.ac.il, elyakim.kislev[at]mail.huji.ac.il

What is it about STEM that brings people together? On the one hand, it could be that STEM education presents a multicultural and cooperative environment where diverse groups work together on shared problems and projects. On the other hand, it is arguable that the nature of science and STEM education creates a more ‘universal’ or global social context that is availing to equitable and positive interactions between groups. This paper investigates how minority groups’ willingness to integrate into a mixed work or study environment relates to whether they hold multicultural or universalist perceptions of STEM education. Multiple regression analyses are conducted on questionnaire data (N=246) collected from Arab-Palestinian high school students in Israel. Factor analysis is used to create latent variables that represent multicultural-cooperative and universalist-global perceptions of STEM. The analyses indicate no significant relationship, and in some cases, a negative relationship between multicultural and cooperative perceptions of STEM and willingness to integrate into a mixed environment. However, students’ perceptions of STEM as universal or global is strongly associated with willingness to integrate into a mixed environment. It is argued that in a context of high intergroup animosity, such as in Israel, a multicultural or cooperative space can in fact increase intergroup threat. Conversely, a global or universal space can reduce intergroup threats created by the national context. Therefore, and despite the broad support for multicultural approaches to STEM education, this paper presents a potential caveat for multicultural STEM education in contexts of conflict.

Mind the Gap. Barriers in Computational Social Sciences Education and How to Deal with Them.

Baczko-Dombi, Anna (1); Abramczuk, Katarzyna (1,4); Komendant-Brodowska, Agata (1); Jager, Wander (2); Fecher, Benedikt (3); Sokolovska, Natalia (3); Spits, Tom (2)

1: University of Warsaw, Poland; 2: University of Groningen, University College, Groningen Center for Social Complexity Studies, The Netherlands; 3: The Alexander von Humboldt Institute of Internet and Society (HIIG), Germany; 4: National Information Processing Institute, Poland
anna.baczko[at]gmail.com, k.abramczuk[at]gmail.com, agatakom[at]gmail.com, w.jager[at]rug.nl, fecher[at]hiig.de, natalia.sokolovska[at]hiig.de, t.spits[at]rug.nl

In the current digital era, with an increasingly complex and turbulent society, demand is rising for social scientists capable of analysing behavioural dynamics. Studying behavioral dynamics is a valuable lens, both in public policy making and community planning, as in scientific projects on how human behaviour affects ecosystems. Computational Social Science (CSS) answers this need for skills by offering a framework that connects a complex networked systems perspective with a suite of computational tools and methodologies. Despite its potential and fast growth, CSS is still hardly found in programs at bachelor and master levels in Europe. It seems that teaching social sciences students computational thinking seems to be lagging a bit behind. In the presentation we would like to look at this discrepancy from the perspective of sociology of education and higher education researches. At the beginning, we will discuss why there is a need to develop computational education in the social sciences and why we have not been so successful in developing this kind of education. Our aim is to address the perception of CSS, students' barriers in this field (e.g. mathematical and statistical anxiety, transition of gender inequalities in STEM education into differences in social sciences) and the perspective of academic teachers. Afterwards, we would like to present some ideas for tackling these challenges in frames of our Erasmus+ project "Action for Computational Thinking in Social Sciences" (ACTISS).

Opening a Space between Fields. How Actors in Politics, Industry, and Higher Education Shape an Emerging Field of Knowledge

Saner, Philippe

University of Lucerne, Switzerland
philippe.saner[at]unilu.ch

This paper investigates the transformation of higher education regarding socio-technical processes of digitization and political demands for innovation, competitiveness, and economic growth. Specifically, I ask how actors in politics, industry, and higher education envision data science, an emerging field of knowledge at the intersection of various existing disciplines. Which categories and concepts are used to frame this space and to coordinate cooperation between the different actors involved? To address these questions, I examine the introduction of data science at Swiss universities as a case study, using study programme descriptions, interviews with data science educators, policy documents, and economic reports to serve as empirical material. I show that the proclamation of "skills gaps" by business actors was readily taken up and transformed into research and higher education policy. The cultural framing of the "sexiness" of data science by industry further contributed to these efforts enabling students to envision themselves as future societal leaders. Political actors imagine data science mainly in reference to economic concepts and sociotechnical visions such as the "4th industrial revolution" or the "competitiveness" of the economy, thus outlining promising economic scenarios of the future that become possible through data science. I argue that data science opens up an underdetermined "space between fields" (Eyal 2013) that allows participating actors to position themselves therein, but still remain attached to their primary field. Furthermore, it enables them to take multiple roles (as researchers, entrepreneurs, innovators etc.), but also to participate in the distribution of material and symbolic resources in this space. The reconfiguration of the relations between industry, universities, and the state may indicate a new governance of the higher education sector overall.

School Bus: A sociotechnical Analysis

Araújo, Emília Rodrigues; Ribeiro, Rita;
Silva, Marcia

University of Minho, Portugal
emiliararaujo[at]gmail.com, rmgr[at]ics.uminho.pt,
era[at]ics.uminho.pt

This communication seeks to present the results of a research made in Portugal, at the city of Braga, concerning the implementation of the school bus project. Climate change, health, security and quality of life are increasingly assumed as main challenges with which society must deal with. For societies that have invested in the massive use of cars, like it happens in Portugal, these challenges put singular queries and difficulties. The aims of reducing the use of fossil energies or adopt other forms of mobility must tackle with several barriers concerning both social and political constrains as well as the understandings about means of transportation. In Portugal, local municipalities are being involved in projects whose main aim is reducing the use of cars and other carbon-based means of transportation. One of the measures in implementation refers to the school bus project which consists in organizing a collective transportation of children to their schools, thus alleviating the traffic in city centres and reducing the times inside cars. On the basis of different theoretical approaches, this communication debates the results obtained in the study done in Braga city. This study involved participant observation and two surveys to parents and head of schools. Showing the still low use of the school bus, results demonstrate the need to comprehend school bus as a sociotechnical phenomena, thus allowing to reiterate the importance of the citizen participation in science and technology projects, notably transportation.

RN24_06b | Science and Technology (Open Session) II

Traditional and New Information and Communication Technologies and social values in European Countries

Fernández-Prados, Juan Sebastián;
Rodríguez Martínez, Pilar; Ainz-Galende,
Alexandra

Universidad de Almería, Spain
jsprados[at]ual.es, pilarr[at]ual.es, aag486[at]ual.es

Information and Communication Technologies (hereinafter, ICTs) seem to have a great influence on value systems. The main objective of this contribution is to learn how the new ICTs influence on value systems in Europe between different social groups within each country. In methodological terms, the relationships between ICTs (both traditional, press, radio and television, and new ones, ie mobile phone, internet and social media) and the social values (Materialism and Post-Materialism) will be analyzed by comparing different societies (Inglehart, 2018) The relationships in the different social

groups within each society will also be the subject of research. In this sense, the social center will be compared with the social periphery according to Galtung's Center-Periphery Theory (Galtung, 2009) The main databases that will be used are (though other databases that can add value to the research will also be used): World Values Survey, 2010-14 and 2017-18 waves (www.worldvaluessurvey.com). In summary, the aims are to obtain a social profile according to the type of information and communication technologies used, besides to establish relationships with social values according to the country and social group.

Risks of Disruptive Technological Advancements and their Potential Social Solutions

Šottník, Ľubomír

Comenius University in Bratislava, Slovak academy of sciences,
Slovak Republic
sottnik5[at]uniba.sk

Recent advancements in the field of artificial intelligence and machine learning led a significant number of academics, journalists and public figures to the belief that they may become a threat to the labour market, social cohesion and the overall resilience of societies in the near future. The paper deals with the origins of the current technological advancements and changes, reviews its potential societal risks and offers possible solutions. The paper is based on the notion that technological advancements and changes are a natural part of innovation-based market economy. Technological innovations are a necessary precondition for economic development and their eventual limitation would slow down future economic progress. Typically, mass unemployment is identified as the principal risk of current technological advancements. Within this notion, technological unemployment could lead to the erosion of the middle class as artificial intelligence has the potential to eliminate jobs that are currently occupied by the middle classes. The paper recognizes that new technologies will affect the job market, but argues that these changes tend to be largely exaggerated. Historically, every technological change, including the current, lead to new job opportunities for a wide range of employees. Lastly, the paper deals with the typically proposed social, political and economic solutions to the expected negative effects of new technologies. It is argued that universal basic income or robot tax are unachievable within the current political landscape. Instead, arguments are provided why rather a reform of the education system would be a better long-term solution.

New Identities and Quality of Life in the Context of Biotechnology Development in Russia

Bogomiagkova, Elena; Orekh, Ekaterina

St.-Petersburg State University, Russian Federation
elfrolova[at]yandex.ru, e.orekh[at]spbu.ru

The paper deals with social consequences of biotechnology development in modern Russia. Progress in biology and medicine, changing understanding of being healthy, has an impact not only on social practices of caring for the body, but also contributes to the formation of new kinds of social cohesion and the processes of social identification. Using such conceptions as bioeconomics, biopolitics, biosociality, etc. and such empirical methods as analysis of Russian statistics, discourse analysis of mass media, in-depth interviews, we studied the transformation of the concept of quality of life as well as new kinds of social identity. On the one hand, genetization and biomedicalization of society, and on the other hand, the identity crisis in the context of modernity, lead to the emergence of new ways of an individual's self-identification. Biological and/or genetic similarity becomes a new basis for social identity. Thanks to the latest discoveries in the field of biomedicine and the corresponding specific scientific logic, these characteristics are beginning to be perceived as the ultimate and most reliable foundation of identity and social solidarity. The concept of quality of life starts to be closely connected with the access to genetic and medical technologies, and biological tissues and materials. Moreover, biological aspects have got social and cultural importance that leads to symbolic exclusion and discrimination against people with «susceptibility genes», and the formation of communities and social activism based on genetic and biological identities. Thus, biologization and genetization of social processes can be regarded as a marker of social change.

Theorizing Commensuration of Social Phenomena

Kaidesoja, Tuukka

University of Helsinki, Finland
tuukka.kaidesoja[at]helsinki.fi

My aim is to develop a theoretical framework for studying commensuration of social phenomena. Commensuration is a social process through which qualitatively different phenomena are made numerically comparable by using a common metric (Espeland and Stevens 1998). Commensuration is ubiquitous process in modern science, technology, economy and politics. Examples of commensuration include cost-benefit ratios, standardized tests, statistical indicators, rankings, performance measures, transparency measures and the measures of quality control that are all used in both private and public sectors. I begin by discussing Wendy N. Espeland, Mitchell Stevens and Micheal Sauder's theoretical and empirical research on commensuration. Then I make three proposals to further develop their theoretical framework. First, I suggest that commensuration processes can be fruitfully decomposed into

three temporal stages: the construction of a new measure, the implementation of the measure and the reactive outcomes triggered by the measure. Second, I argue that the embodied and distributed cognition approaches provide conceptual tools for deepening our understanding commensuration. Third, I show how the mechanism-based approach to explanation can be used to theorize causal mechanisms that drive commensuration processes in different contexts. References Espeland, Wendy N., and Mitchell L. Stevens. 1998. "Commensuration as Social Process". *Annual Review of Sociology*, 24: 313-343.

Containing Superintelligence: Transhumanists And The Global Future Of Democracy

Taillandier, Apolline

Sciences Po, France
apolline.taillandier[at]sciencespo.fr

Current narratives of AI governance enact different sociotechnical and political projects, involving various regulatory actors (benevolent intellectuals, tech companies, or government agencies), temporalities of regulation (algorithmic fairness in the present or preparedness for potential catastrophe in the future), and political values (global justice or national performance). This paper focuses on predictions and scenarios of future artificial intelligence (AI), the possibility that "superintelligent" machines could overtake the limits of human cognition in the long term. Combining political theory and the study of sociotechnical imaginaries in various anglo-american settings, this paper shows how "superintelligence" gets constituted into a technoscientific object, at the margins of current machine learning practices. As part of a growing field of "AI ethics", including academic and public debates about algorithmic fairness and governance, superintelligence also takes part in struggles between different visions of the legitimate democratic order. Until recently a topic for scifi enthusiasts and transhumanists who predicted the coming "technological singularity", superintelligence is at the horizon of recent research in "AI safety". AI safety lies at an imaginative angle, at the intersection of industry and academia, early AI ambitions and current deep learning practices, moral philosophy and amateur science. It articulates technological and economic expectations in unexpected ways, in a transnational space of expertise where both endorsements of Silicon Valley self-governance and strong state-led regulation can be found. This transnational space further reveals how European early web-users got into conversations that had previously occurred among digital elites on the U.S. American West-Coast, how these new practices shaped different local communities, and how actors appropriated concepts and practices of future-making and integrated them to European, and specifically British disciplinary habits and civic epistemologies.

The Everyday Practices of Neoliberalism in Taiwan Higher Education

Peng, Ming-Te

Goldsmiths, University of London, United Kingdom
mpeng042[at]gold.ac.uk

Research outputs and knowledge production have been recognised as an indispensable role in social progress, economic growth and state development. Emerging notions of knowledge economy, responsible research and innovation (RRI), and University social responsibility (USR) show an attempt to further govern the knowledge production. Whereas scientists and scholars live and work in the mundane world, their everyday life consists of not only research but also administrative affairs, such as promotion assessments, evaluations and applications for funds. Hence, this study aims to explore how academic practices are influenced via the institutional practice. Method: Semi-structured interviews were adopted to carry out this study. Questions in interviews consisted of two themes: institutional practices and impacts on individual activities. The interviews were conducted in Taiwan in 2017. In sum, 41 scholars were recruited from four disciplines of biomedicine, material science, history and sociology. Conclusion: The existence of meritocracy with KPI measure systems makes scholar docile and inclined to follow external guides rather than own wills. Political intentions might not directly influence individual scholars, but though the duplication of criteria in academic management. When conducting a study, researchers might interpret their own values through a virtual observer in their mind. All these trends infer the model of governmentality in Foucauldian senses. This phenomenon varies in different disciplines and reflects financial dependence on the state.

Dating Apps and Platforms as Communities of Knowledge

Stoicescu, Maria Valentina; Hosszu, Ramona Alexandra

University of Bucharest, Romania
maria.stoicescu[at]sas.unibuc.ro,
alexandra.hosszu[at]sas.unibuc.ro

Online dating platforms and apps have become increasingly popular. Besides matchmaking, online dating is also an experimentation practice, contributing to self-shaping and self-knowledge, and redefining the meanings and practices of intimacy. Though multiple interactions, users of dating apps learn about other people and become more aware of their own preferences and dislikes, changing or maintaining their sexual and emotional targets. Finding a romantic or a sexual partner relies heavily on learning about other people, as potential matches, and learning about oneself in this process. We discuss this process in relation to the concept of self-tracking (Lupton 2014) that envisions a learning process resulted from experimentation and interaction in digitally created environments. Beyond self-knowledge and knowledge of other people, individuals that search for romantic or sexual partners

also pursue information about dating per se – including strategies, tools and platforms. Learning about how best to find a partner is also often digitally mediated, through multiple forms of distributed knowledge making and sharing. We rely on the concept of lively data (Lupton 2017) to analyze such knowledge communities. This paper relies on a literature review on dating apps, the app culture and the transformation of lay knowledge in online settings. We discuss how lay and specialist knowledge circulate in online settings concerning the dating process, as well as users' learning about themselves and their potential partners, through experimentation with dating apps and through information seeking in various digital arenas.

RN24_07 | Energy, climate change & sustainability

Towards a Smart Grid for All?

Processes of Social Exclusion in the Transformation of Electricity Grids

Tarasova, Ekaterina (1); Wallsten, Anna (2); Rohracher, Harald (1)

1: Linköping University, Sweden; 2: The Swedish National Road and Transport Research Institute (VTI)
vareshkakatya[at]gmail.com, anna.wallsten[at]vti.se,
harald.rohracher[at]liu.se

Smart electricity grids are perceived to be an essential element of future sustainable energy systems. Various policy initiatives and nearly 1000 ongoing smart grid pilot projects all over Europe give evidence of the huge efforts put into this development. The strengthening of consumer power in the electricity system and a more active role of households and electricity users is one of the key claims by proponents of smart grid development. However, empirical studies (e.g. Wallsten 2017) show that the actual implementation of smart grids is much more messy and may well lead to developments which rather strengthen the power of established actors and more wealthy households than cater to the needs of a diversity of social groups. There are a few examples of studies that mention that smart energy technologies can increase vulnerability among certain groups of electricity users, such as the elderly, sole parenting women, renting households, the ill, those who are less educated, households with low income and those living in rural areas. Little is known on how to prevent these groups to become neglected or left out in future smart grid roll outs. In this presentation we will ask, to which extent the politics of smart grid development, the negotiations, communicative strategies and the positioning of different actors, may lead to the exclusion or disempowerment of different groups of users. How about those who do not have sufficient access to or competence with smart technologies? Those who resist? Based on an ongoing study of smart grid implementation in Sweden we will work out different mechanisms of social exclusion in socio-technical change.

Seeing is Believing: Citizen's Engagement with the Science of Climate Change

Delicado, Ana (1); Pellegrini, Giuseppe (2); Falanga, Roberto (1); Rowland, Jussara (1)

1: Instituto de Ciências Sociais ULisboa; 2: Observa, Portugal
ana.delicado[at]ics.ulisboa.pt, pellegrini[at]observanet.it,
roberto.falanga[at]ics.ulisboa.pt,
jussara.rowland[at]ics.ulisboa.pt

For a number of decades, (dis)belief in climate change has been a prime example of the difficulty in persuading public opinion of what scientists consider a fact. Despite generalised scientific consensus, political discord and media's "balance as bias" perpetuated the idea of a controversy that clearly reflected on citizen's opinion. However, the tide seems to be turning. More recent public opinion surveys show that even in the US the share of climate change deniers is growing ever smaller, even if political polarisation shows no sign of diminishing. Direct experience of climate-related disasters (draught, forest fires, hurricanes) may be responsible for this change. However, will this change of perception have an impact on the willingness to support difficult political decisions or rethink everyday practices? This presentation will explore how citizens form opinions about the science of climate change, which sources of information they use and trust, and the impact it has on actions. It relies mainly on literature review and data analysis of international surveys. The orientation of public opinion will be presented considering the recent Eurobarometer survey on climate change (EBS459, 2017). Europeans are increasingly considering the problem of climate change and have adopted behaviours to reduce energy consumption. Alongside this personal commitment, the awareness that institutions, the business world and scientists must define new goals of commitment to mitigate the effects of Global Warming. This presentation is based on work carried out for the European funded (H2020) research project CONCISE Communication role on perception and beliefs of EU Citizens about Science, coordinated by the University of Valencia, and with the participation of partners from Spain, Italy, Portugal, Slovakia and Poland.

Exnovation, Innovation, and Surprises in the German Energy Transition: What role for Real-world Experiments?

David, Martin (1); Gross, Matthias (1,2)

1: Helmholtz Centre for Environmental Research - UFZ, Germany; 2: University of Jena, Germany
martin.david[at]ufz.de, matthias.gross[at]ufz.de

The German energy transition towards more sustainable forms of energy production has been characterized as a large-scale or real-world experiment. Experiments are open-ended processes set up explicitly to allow (or even generate) surprises. By contrast sustainability implies the pursuit of

clearly defined, normative ends. Whereas much of the literature on system transformation builds on the concept of innovation, the hypothesis of this paper is that focusing on the "natural" flipside of innovation – called here "exnovation," i.e. departing from unsustainable pathways – should also be seen as a valuable conceptual strategy for coping with the tension between the unavoidable indeterminacy resulting from unknown risks and the necessary amendment and redefinition of goals and rules. In this paper elements of the process of the German energy transition are used to illustrate the recursive processes of experimentation that make it possible to accommodate surprise, and, thus, to conceptualize the unavoidable tension between innovation, and the maintenance of older, unsustainable structures. The argument of our paper entails two aspects in particular. First, the recognition of the importance of scenarios like exnovation might be a vital step in order to overcome the innovation bias in sustainability transformation thinking. Second, when envisioning exnovation, policymakers should seek to create co-produced knowledge and, in so doing, be more open to public sentiments and opinions; the German example is telling in this regard. Constructively addressing controversies that develop either by not exnovating or by exnovating might be a vital asset in the futurization of politics for sustainability.

Climate Change and Cosmovisions in Environmental Assessment Processes in Chile and South America

Parker, Cristian

Universidad de Santiago de Chile, Chile
cristian.parker[at]usach.cl

The measures for adaptation and mitigation to climate change in developing countries will be effective as citizens and institutions evaluate the environmental impacts coherently. The historical experience of environmental assessment in Chile, and in Latin America, leads us to believe that environmental assessment processes face difficulties that are technical and political, as well as regulatory and managerial. But they are also because of the "encounters" of types of knowledge. It has been studied how the expert accounts of physical reality have come into conflict with local knowledge. It is proposed that we are dealing with the dilemma expert knowledge / non-expert knowledge as if socio-technical knowledge was the only challenge to manage the environment. The analysis of the variety of types of knowledge found in environmental assessment processes has been scarce and is the subject of this paper. The "socio-climatic" semantic differences of the discourses of the social actors that intervene in environmental evaluation is also explained by the social actor's cosmovision (as a key background). The perspectives on climate change and energy issues are fundamental and help the construction of referential knowledge frameworks. The thesis about the relevance of these "knowledge encounters" and the controversies in which knowledge of climate change is decisive, is methodologically based in an empirical research in three communes of Chile (FONDECYT 1181065), on data obtained from two previous sociological researches in four South America countries and in comparative terms with the literature (secondary sources) existing in Latin America on this subject.

RN24_08 | Health, bio-medicine & social context

“The Window of Opportunity is Closing” - Chronic Urgency in the Promotion of Biomedicine

Tarkkala, Heta; Snell, Karoliina

University of Helsinki, Finland
heta.tarkkala[at]helsinki.fi, karoliina.snell[at]helsinki.fi

Metaphors are an inseparable part of science communication informing lay people of significance of scientific research or findings. They are also utilized in promotion of science, for example in promotion of biomedical research and biobanking. In our presentation, we pay attention to the metaphor of “window of opportunity” that is closing fast, which is used in constructing expectations around biomedicine. Various stakeholders such as biobank managers and pharma companies participate in defining science and innovation policy, and promote their cause by using such expressions. Our analysis builds on sociology of expectations and sociology of metaphors. We highlight the alerting nature of the metaphor that is tied to both negative and positive expectations, and address the fast pace and urgency that follows from the closing of the window, suggesting that certain actions need to be instantly taken. Based on publicly available materials such as strategies, public presentations and pr-materials from Finland, we discuss the pressing need for the allocation of funding, changes in organizational structure and legislation that come with the urgency. The metaphor of closing window of opportunity for Finnish genomics has been used since early 2000s, which seems to turn the urgency into a chronic condition. We put this constant urgency in context through analysing the case of Finnish genomics and biomedical R&D, and highlighting the role of science advocates in the creation of policy.

The Perfectibility of the Self: on the Promises of Digital Health Technologies

Wieser, Bernhard

TU Graz, Austria
bernhard.wieser[at]tugraz.at

The quantified self has received scholarly attention for quite some time. From an STS point of view the various ways in which digital technologies translate the human body into numbers is of particular interest. Technologies are used to relate to one’s own body, to perceive it, objectify it and ultimately to act upon it in order to transform it. Sensors and tracking technologies have become omnipresent companions of modern life, whether they come in special devices or as integrated functions of smartphones. We produce data everywhere we go, practically at all times. These data are valued as a resource and many are keen to capitalize on them.

It is a central part of the quantification promise that these data hold the key to self-optimization. I discuss these technologies of the self against the backdrop of much older ideas of self-perfection. This allows me to draw out the unique type of contemporary self-optimization practices in a larger context of historical discourses on what it means to live a good life. In my paper, I will draw on Foucault and complement my analysis with references to Passmore’s work on self-perfection. This contribution is inspired by the author’s research on ethical, legal and social aspects of digital health technologies (funded by Zukunftsfond Steiermark, PN 8008).

The Impact Of Implantable Smart Heart Devices On The Daily Life Of Their Carriers: Regaining A Sense Of Control Through The Formation Of A Technoscientific Illness Identity

Erisman, Jetske Charlotte; De Sabbata, Kevin

Vrije Universiteit Amsterdam, Netherlands, The
jetskeerisman[at]gmail.com, k.desabbata[at]vu.nl

Implantable smart heart devices (ISHDs) such as pacemakers, Implantable Cardioverter Defibrillators and Cardiac Resynchronization Therapies are technologies used to support or correct the heart rhythm. Although information materials present them as having a low impact on the lives of their carriers and enabling an improved quality of life, studies and practice show that the intimate relationship between these technologies and those who carry them is much more complex. The agency and unpredictability of the devices are resulting in a sense of loss of control, which can lead to anxiety and depression. Yet, there is a lack of knowledge on how the relationship between the person and the device concretely plays out. The present study aims to fill this gap by studying how ISHDs influence the daily life, social relationships and identities of the people who carry them. The research consists of ten in-depth interviews exploring the experience of Dutch ISHD carriers with their devices. Starting from cyborg theory and biomedicalization, it conceptualises such experiences in terms of interactions between bodies, machines and surroundings. From this perspective, ISHDs appear devices which, far from being neutral, impact the life of carriers at multiple levels, changing their relationship with their family, environment, society and themselves. It shows how carrying an ISHD prompts these individuals to construct a technoscientific illness identity, through which they make sense of their experience and regain a sense of control.

Towards a Sociology of Transfusion: European Politics of Blood Beyond Procurement

Wittock, Nathan; Bracke, Piet; Hustinx, Lesley

Department of Sociology, Ghent University, Belgium
nathan.wittock[at]ugent.be, piet.bracke[at]ugent.be,
lesley.hustinx[at]ugent.be

Human blood for transfusion constitutes a vital resource in European medical practice, with many Europeans needing a transfusion over the course of their lives. Previous scholarship in Political Sociology, Science and Technology Studies, and the Sociology of Health and Illness has shown that institutional politics of blood inform multiple, sometimes competing, logics of action that structure the interrelation of donors, recipients, blood establishments and actors from proximate fields (e.g. state, EU, WHO, the media). These logics shape actors' behavior with and toward blood. However, there is a dearth of scholarship beyond the interrelation of donors and procurement agencies. Largely ignoring blood distribution and transfusion processes in the health care setting, transfusion-recipients are characterized as a unitary, passive actor, which limits sociological understanding of diverse patient-pathways and transfusion needs. Part of a project developing a sociology of transfusion, this paper maps the institutional logics and logics of action structuring blood distribution and transfusion practices in Belgium. Through abductive analysis of transfusion guidelines and policy of the national ministry of health, the high council for health, the government institute for healthcare benefits, the federal agency for drugs and health products, and the European Blood Directives, we study how politics of blood relevant to the health care setting inform dominant logics of action. The latter technocratic, European standards on blood storage, transport, quality control, traceability and notification of serious adverse reactions are used as a starting point to scrutinize guidelines on how to engage with patients, how to negotiate transfusion and communicate risks, and expected recipient-behavior.

Exploring the Relationship Between Gendered Team Dynamics and academic performance.

Guenther, Elisabeth Anna (1); Humbert, Anne Laure (2); Meneses, Julio (3); Müller, Jörg (3)

1: Universität Klagenfurt, Austria; 2: Oxford Brookes, UK; 3: Universitat Oberta de Catalunya, Spain
contact[at]elisabeth-anna-guenther.eu,
alhumbert[at]gmail.com, jmeneses[at]uoc.edu,
jmuller[at]uoc.edu

This paper opens up the black-box of the often discussed gender gap in research performance. Empirical studies are largely inconclusive, with some finding evidence of a gender gap (Abramo, Cicero, & D'Angelo, 2015) while others do not (Nielsen, 2017). Meta-analyses have shown that this may be because there is no simple or linear relationship between gender diversity and performance indicators (Haas, 2010; Webber, 2001). In addition, this relationship may vary within different subject areas, or in relation to the overall working environment (especially the team). This paper thus explores this further and examines the relationship between gendered team dynamics and performance using multilevel modelling. It builds on a cross-country survey of R&D teams in Europe (H2020 GEDII project 2015-2018). The dataset provides information on 1,357 individuals, working within 159 teams. In our models, we rely on socio-demographic data (e.g. care responsibilities, experience, etc), information about the team (e.g. team climate, gender stereotypes, power disparity, etc). We also include a Gender Diversity Index, a composite indicator that considers the representation and attrition of women and men within teams along seven grounds of diversity. Performance is measured through self-reported publication output but also through outreach activities and academic governance roles. Our contribution provides a compelling snapshot of the contemporary gendered aspects in R&D teams while contributing to critical discussions on gender diversity and research performance.

Gender Diversity Leads to Better Science

Buslón Valdez, Nataly

Barcelona Supercomputing Center
nataly.buslon[at]bsc.es

Gender diversity leads to better science, innovation and benefits for scientific progress. Nevertheless, the under-representation of girls and women in science is a global phenomenon. Recently, Nature (2018) has published a study that points out the gender bias in the workplace, more specifically in science. Women face biases and barriers at all turns within the scientific community, from publishing, funding and hiring, to promotion to more seniors positions, recognition and visibility. According to United Nations (2017) only 28% of all researchers in the world are women. Scientific evidence shows structural barriers for girls and women, such deep inequality that do not happen by chance, many women and girls are held back by discrimination, biases, social norms and expectations that influence the quality of education they receive and the subjects they study. This presentation aims to discuss the gender inequality in science but also addressing the gender issue in the medical studies. Even today, in medical field, practice is less evidence-based for women than for men due to a bias towards the study of males in scientific research. The usual approach in scientific research is to ignore sex or to analyse only one sex and assume the results apply to the other sex. Gender equality in the medical and health sciences and elsewhere is therefore a priority. It is important to work all together crafting solutions to improve lives and generate inclusive growth that benefits us all. In this sense, we want to present this social aspect in science and explain the Bioinfo4women Programme to build a better knowledge in bioinformatics making visible the women work, in order to multiply their scientific and social impact.

Gender-specific Discourses on the Legitimacy of Informal and Formal Promotion Practices in Scientific Careers

Wolffram, Andrea; Dahmen-Adkins, Jennifer; Dorgeist, Matthias; Göttgens, Anne; Schulz, Astrid

RWTH Aachen University, Germany
awolffram[at]soziologie.rwth-aachen.de,
jdahmen[at]soziologie.rwth-aachen.de,
mdorgeist[at]soziologie.rwth-aachen.de,
agoettgens[at]soziologie.rwth-aachen.de,
aschulz[at]soziologie.rwth-aachen.de

Fostering equal opportunities in technological careers is on top of the political agendas in most European countries and beyond. Research institutions put effort in developing and implementing career supporting measures. However, from an organizational sociological perspective, it is known that organizations do not rely solely on their formal structures, but rather compete or correspond with existing personal networks

in an organization. Accordingly, we examine academia for their invisible control mechanisms. How can informal processes unfold in science and who shapes these processes? Influencing finally takes place against the background of formal structures and standards that are regulated by University laws for example such as selecting new staff members and appointing professors. If networks can be understood as a link between structures and individuals, the question arises, under which individual and structural conditions can actors (and which ones) influence the invisible control? Which orders of justification are referred to with regard to informal promotion and staffing practices if, in return, with regard to formally legitimised gender equality measures, there are fears that performance equity will be jeopardised? Our presentation based on qualitative Interviews with postdocs and professors carried out in a research project funded by the German Federal Ministry for Education and Research, called GenderNetz. It focusses on examining informal networks and their influence on research career in technological disciplines in science and industry. Experiences from the EU-funded gender equality projects FESTA, GenderTime and CHANGE on organisational structural change in science and research institutions build an additional source of information for this paper.

Barriers To Implementing Gender Equality Measures In Physics – Lessons Learned From GENERA Project

Sekuła, Paulina

Jagiellonian University in Krakow, Poland
paulina.sekula[at]uj.edu.pl

Gender equality in research and academia is nowadays high on the political agenda of the European Union and some of the European countries. They provide legal and financial incentives to research organizations and higher education institutions for implementing gender equality measures. Despite these efforts and some improvements, many organisations still face under-representation of women among scientific staff and in decision-making bodies. This raises questions about the barriers of effective implementation and sustainability of gender equality measures in research and academia. The former Horizon 2020 project GENERA (2015-2018) focused on effective structural change through designing and implementation of Gender Equality Plans customized to circumstances and needs of 11 research organizations active in physics and related fields. The challenges and barriers to their implementation were investigated thoroughly with the use of various research methods, including desk research, semi-structured and expert interviews as well as ex-ante and ex-post evaluation interviews. Drawing upon both these results and the experience of the member of a team implementing gender equality plan in one of the research organisations the various categories of barriers will be analysed. Among them lack of awareness and denial of existence of the gendered processes as well as individual and institutional resistance to implementing gender equality measures will be investigated.

Reputation Technologies and Social Innovation: A New Approach

De Paoli, Stefano

Abertay University, United Kingdom
s.depaoli[at]abertay.ac.uk

This paper contributes to the problem of studying the intersections of digital technologies design and society. The paper shows how STS theory driven qualitative research can play an important role in shaping novel digital technologies. The paper is outcome of a European (H2020) Social Innovation project, whereby digital technologies are used to tackle social issues. The Pie-Project offers innovative digital tools to people who have experienced poverty due to the financial crisis, facilitating their emancipation from some of their conditions. The project sees sociologists and computer scientists working together in a transdisciplinary fashion. One of the tools created by the project is an innovative reputation system, whose design was inspired by field research conducted in 3 countries (Italy, Croatia, Netherlands) and by social theory. Using qualitative interviews (34 conducted with e.g. precarious workers, NEETs, unemployed), digital observations of reputation systems (in e.g. self-help contexts) and workshops, we gathered the participants' perspectives on their offline and online trust building processes (e.g. with other people or administrative bodies). From the data analysis, we concluded that mainstream approaches for building online reputation/trust, largely based on individualistic models, would not align with our respondents' needs and particularly with their needs for emancipation from isolation, mistrust, despair, lack of connections. It emerged that our respondents would rather favour an approach, where reputation/trust is a common belonging to the community. Based on our findings, we have conceptualised a novel approach to online reputation called the Commonsahre, inspired by the notions of the Assemblage (DeLanda, 2006) and of the Density of social relations in a group. DeLanda, M. (2006). A new philosophy of society: Assemblage theory and social complexity. A&CBlack.

Blockchain Technology: Constructing a Progressive Framework for Development

Redshaw, Tom

University of Salford, United Kingdom
T.Redshaw1[at]salford.ac.uk

Cryptocurrencies are a colossal waste of energy. In the ten years since the first transactions were made with Bitcoin, neither Bitcoin nor one of the thousands of subsequent cryptocurrencies have been proven to be more efficient, reliable or secure than alternative means of making electronic transactions. Nor has the blockchain technology underlying cryptocurrencies been found to offer anything more than

established means of recording and storing data. Nevertheless, the use of cryptocurrencies has steadily grown over the past decade, University programmes for studying blockchain are increasing in number, and venture capital continues to pour into blockchain-related projects. What is motivating this sustained interest? The STS tradition teaches us that technology development necessarily involves the simultaneous construction of visions for technology, visions which define the functionality, meaning and purpose of new technical devices for social groups. It is these visions which drive paths of developments, more so than any intrinsic technical features. But what are the visions, or 'technological frames' that have emerged around blockchain and continue to drive its development in various directions? In this paper, I will draw on the findings of my primary research into blockchain technology to argue that its potential has been ceded to various strands of neoliberal imagining, and that what is necessary is a progressive framework for defining its purpose and guiding its future development.

Young University Students And News. Uses And Gratifications

Martinez-Gras, Rodolfo; Espinar-Ruiz, Eva; Gonzalez-Diaz, Cristina

University of Alicante, Spain
rodolfo.martinez[at]ua.es, eva.espinar[at]ua.es,
cristina.gdiaz[at]ua.es

Nowadays, Information and Communication Technologies continue generating changes in most social aspects and, of course, in the way young people in particular manage different sources of information. This is no less true for University students. The ways in which we communicate have all changed; and of course, Internet and Social Network Sites have also made accessing knowledge and information easier. However, there are still important lacks of knowledge around these media changes, fundamentally due to the relative ignorance about young people's consumption and use of information and information sources. For this reason, the main aim of this study is to know how young University students access, use and consume news. Our interest focuses on: preferences, motivations and gratifications that lead young people choose among different news and sources; utilization of devices, platforms and distribution channels (traditional mass media, websites, social networks, etc.); what kind of information they consume, how they consume it, and how they interact with this information (comments, participation in social networks, etc.); In order to analyze these aspects, a strategy of data production based on quantitative methodology has been designed, using a survey as the research technique in its self-applied modality. The total population is made up of all the students in Sociology and Advertising degrees at the University of Alicante (Spain), in the 2017-2018 academic year. The final selection of the sample has been made by means of multistage sampling, using simple random to select groups and then a quota sampling to select the final units

Whose Right to the City? The Class Dimension of Urban Struggles in Zagreb and Belgrade

Dolenec, Danijela (1); Kralj, Karlo (2); Balković, Ana (3)

1: University of Zagreb, Croatia; 2: Scuola Normale Superiore, Italy; 3: Universitat Autònoma de Barcelona, Spain
danijela.dolenec[at]gmail.com, karlo.kralj[at]sns.it, ana.balkovic[at]uab.cat

The city is the primary site of conflict in capitalism, exposing its logic of commodification, while at the same time generating space for mobilizing towards its alternatives (Harvey, 2008; Brenner, Marcuse and Mayer 2012). Since many post-2008 mobilizations revolved around housing struggles, this paper explores how they are related to class dynamics. We reject Kerbo's (1982) distinction between movements of crisis versus movements of affluence, arguing that urban struggles often embody anti-capitalist demands as well as post-materialist demands for increased citizen participation and democratisation of city governance. To understand this complexity, we explore class bases of protest events in Zagreb and Belgrade, capital cities within post-socialist political economies. Compared to their Western counterparts, in post-socialist cities the demolition of the social in favour of the market has resulted in far-reaching transformations of how the city is used and experienced (Dolenec, Doolan and Tomašević 2017). Relying on PEA data for 2000 - 2017 enables us to capture periods before and after the onset of the economic crisis. We distinguish protest demands focusing on the housing crisis on the one hand, versus those focusing on urban planning and quality of urban space on the other. Starting from this distinction, we explore identities of protesters, the framing of demands, and other aspects of protest events to establish possible class patterns of mobilization. Furthermore, we spatially analyse the distribution of these types of protest in Zagreb and Belgrade, aiming to determine class dynamics across city neighbourhoods.

New Seasons Of A Claim Among The Right To The City And The Right To Inhabit: The Case Of Naples

De Falco, Ciro Clemente (2); Punziano, Gabriella (1)

1: University of Naples Federico II, Italy; 2: University of Naples Federico II, Italy
ciroclemente.defalco[at]unina.it, gabriella.punziano[at]unina.it

Naples is interesting to analyze from a political point of view: in recent years the city has seen a proliferation of movements' actions aimed mainly at the re-appropriation and renewal of neglected spaces or buildings. From the point of view of social movements, it should be emphasized that the city, in the past, has expressed high levels of conflict. What characterizes the current initiatives is the driving force of a strictly endogenous nature that feeds the propulsive drives from below and is deeply rooted at the territorial level. Of this type are the squatting experiences – related to the housing crisis and to the “right to inhabit” – or those of occupations with a socio-political aim – actions undertaken in the general strand of the “right to the city”. The perspective that leads the development of social movements to the structure of political opportunities seem to work well to interpret the reason for this atypical political vivacity with respect to the national context. Therefore, the aim of this work is twofold: to map the experiences of movement that have recently arisen, describing them from the point of view of the practices and the actors involved; to analyze whether these actions characterize or not a new political phase of the Neapolitan movement. This aim will be pursued through an ethnographic analysis that will also make use of interviews with leaders of local movements and proponents of actions directly attributable to the claim of the right to the city and the right to inhabit.

"Lulu's Movements in multilevel Struggles in Italy"

Sorci, Giuliana (1); della Porta, Donatella (2); Piazza, Gianni (1); Bertuzzi, Niccolò (2)

1: University of Catania; Italy 2: Scuola Normale Superiore, Italy
giuliana.sorci81[at]gmail.com, donatella.dellaporta[at]sns.it,
giannipiazza[at]tiscali.it, niccolo.bertuzzi[at]sns.it

Territorial or LULU movements are regaining media centrality in public discourse in Italy. While addressing local issues, they develop a complex multi-level strategy, addressing local, but also national and European targets. A comparative analysis of LULUs struggles allows in particular to assess processes of scale shifts, both upwards and downwards in a context characterized by an economic crisis. Developing upon the political process approach in social movement studies, but bridging it with approaches in policy analysis, we aim at explaining the ways in which opportunities are framed at various levels along the different steps of the policy process. Specific questions refers to the assessment of Europe as a potentially, target and space of struggle in a situation of declining processes of Europeanization within social movements, given the perceived closing of opportunities at EU level; the potential for appropriation of opportunities as the Five Star Movement took power at national level. The research is based on a cross-case analysis of four movements: 1) the No TAV, against the construction of the high-speed railway line in Val di Susa (Piedmont); 2) the No MUOS, contrary to the US Navy geo-satellite communication system (Sicily); 3) the No TAP, against the construction of the Trans-Adriatic Gas pipeline in Apulia; 4) the No Large Ships adverse to the transit of cruise ships in Venice. The paper is based on previous research, on interviews with key-informants and analysis of documents and press.

Understanding Cycling Activism

Cox, Peter

University of Chester, United Kingdom
peter.cox[at]chester.ac.uk

Advocacy and activism mobilising around issues of bicycling has both a long history and a vibrant and growing present. However, the global scale of activities linked by cycling as a trope makes it hard to think conceive as a coherent movement, and the diversity of analyses and approaches employed by activists makes theorising it as a single movement problematic. This paper revisits Lofland's 1990s work on the American Peace Movement to consider the ways in which diverse activisms with a single uniting feature can be understood as articulations of a range of interlocked and bundled models of change. The study considers the actions and self-expression of activists through their actions, writings and through the networks and organizations they form to understand these as reflections of underlying assumptions that participant hold about the nature of change. Based on extensive empirical study and more 10 years of work with these activist networks in Europe, South Asia, and North and South America, the study outlines a modification of Lofland's original six-fold model to demonstrate the tensions and contradictions within a broader

set of alliances. It shows that it can be meaningful to understand cycling activism in social movement terms. It further reports on how this academic analysis his being taken up by activists as a tool for self-understanding and conflict resolution.

Waste Pickers, Resistance and The Urban Commons. Stories from The Resilient Community La Chureca

Zapata, Patrik (1); Zapata Campos, María José (1); Pérez, Jessica (2)

1: University of Gothenburg, Sweden; 2: University of Central America, UCA, Nicaragua
patrik.zapata[at]spa.gu.se, mj.handels[at]gu.se,
jessicap[at]uca.edu.ni

Millions of waste pickers in cities all over the world make their living collecting, recycling and selling materials that someone else has thrown away. Accordingly, waste pickers are increasingly being recognized for their significant contributions to reducing the carbon footprint of cities, recovering resources, improving environmental conditions and the health of low-income residents, and creating jobs among the poor. Despite their contributions, waste pickers are one of the most widely excluded, impoverished and disempowered groups of society. Waste pickers are exposed to toxic materials; suffer from widespread prejudice and stigmatization; are persecuted by police and others; are susceptible to global price market oscillations and are subject to exploitative relations with intermediaries. Notwithstanding they overcome these colossal barriers with their everyday work and their everyday resistance. Both individually and collectively they strive to improve their working situation, gain their rights as citizens, and secure access to waste as a source of livelihood. They form new social movements of urban poor that, intentionally or not, challenge the nature of the state, local governments and civil society. Informed by the history of resistance of the community of waste pickers that since 1972 work at La Chureca (the municipal dump in Managua, Nicaragua) this paper aims to examine the everyday/individual, collective and material strategies of resistance in the process of maintaining access to waste as an urban common. Theoretically, the paper builds upon theories on resistance, insurgent citizenship and urban commons. Methodologically, it combines more than hundred in-depth interviews with waste pickers and other actors, conducted along ten-years research, documents, mass media analysis and observations.

RN25_02 | Youth political activism

These Days Are Ours: Exploring Young Disabled People's Experiences and Views of the UK Disabled People's Movement

Griffiths, Miro

University of Leeds, United Kingdom
m.griffiths1[at]leeds.ac.uk

This paper explores challenges encountered by young disabled people participating and engaging within the UK Disabled People's Movement (DPM). Challenges they face were identified following a qualitative investigation. Seventeen semi-structured interviews were conducted with both young disabled people and established members of the Movement. The paper argues that, for the Movement to be inclusive, remain committed to the social model of disability (UPIAS 1975) and accessible to young disabled people, the DPM must provide young members and newcomers with the resources and support to offer a vision for a new and inclusive society for all - disabled and non-disabled people. To achieve this, the social model should be repositioned: from a tool/strategy to an "oppositional device" (Beckett and Campbell 2015) that provides counter-rationalities and disrupts the normative practices inherent in the political, economic, and cultural realms. The paper opens by exploring prominent debates pertinent to the situation of disabled people in contemporary society. It focuses on the politicisation of disability and the intrinsic aspects affecting young disabled people's participation within activism and campaigning. The original account of key challenges are positioned around three central themes: membership, organisation of the Movement, and future considerations that will affect the DPM's sustainability. Through existing literature, the research delineates a way forward; its emphasis lies on oppositional devices. The thesis addresses directly the concerns raised by respondents. It will prompt discussion - within and outside of academia - on the standing of young disabled people within the DPM. The paper contributes towards an understanding of youth and disability activism.

Young Radicals in Europe

Uba, Katrin (1); Bosi, Lorenzo (2)

1: Uppsala, Sweden; 2: SNS, Italy
katrin.uba[at]statsvet.uu.se, lorenzo.bosi[at]sns.it

Studies about radicalized young people often focus on specific cases of joining the radical movements, participating in radical events or examining youth radicalism in one or a few countries at time. We aim to investigate whether young people with both left-and right-wing radical views or those with the most radical libertarian or authoritarian views are significantly different from each other across different countries, and if they opt for the similar or different political behaviour. We also

examine if young radicals differ from other young people in terms of socio-economic background and political activism in the same country. In general, it is expected that people with radical political views are more likely to participate in politics, but also that they have some specific (more educated) socio-economic background. Considering the scholarship of "authoritarian personality" which suggests that all radicals are alike, and the one on Europeanization, we expect that radical youth is similar across European countries and that there will not be many significant cross-country differences in terms of their political activism nor background. The analysis will be based on the representative survey data from nine European countries.

Youth on the Margins: Experiences of Young People's Participation in Political Parties and Social Movement Organisations in the UK

Smith, Katherine Alice

University of Sheffield, United Kingdom
katherine.smith[at]sheffield.ac.uk

In recent years, the rate of participation of younger generations in social movement organisations (SMOs) and political parties in the UK, has been characterised simultaneously as part of an increasing surge in youth participation and as ongoing concern due to decline. This paper seeks to understand the experiences of young people who join SMOs and parties, in particular their experiences of joining and becoming established members within these spaces. Based upon the initial findings of 28 in depth interviews with young activists in a city in northern England, the analysis focusses on the experiences of young activists in navigating participation within parties and SMOs. It explores the experiences and processes which influence their initial and ongoing participation in these groups, as well as cases of disengagement. In particular, it presents preliminary findings which draw upon experiences of marginalisation of young people in these organisations, compounded by inequalities in multiple dimensions. Specifically, the intersection of youth with multiple inequalities including class, gender, sexuality, disability and ethnicity impact upon activists' participation opportunities, as well as their voice in these spaces and sense of belonging. This paper develops a greater understanding of the processes by which societal inequalities are replicated within party and social movement organisations, with significant implications for youth political participation.

Young Female City Councillors In the Electoral Scenario Of Brazilian Cities In 2016: Paths, Identities And Political Engagement

Silva, Ana Beatriz Pinheiro e

Universidade Federal Do Estado Do Rio De Janeiro, Brasil
abeatrizpinheiro[at]gmail.com

The option for a trajectory on political militancy involves several factors that permeate the paths of young people. Many of these factors are related to school, family, friends, the University environment, work, among others. In recent years gender and identity issues have been highlighted in the development of this decision-making process for political engagement. Many young people begin to participate in political groups after having had experiences related to these themes in their personal lives. In the 2016 county elections in Brazil, four candidates for councillors from Socialist and Freedom Party (PSOL) were elected with agendas related to gender and identity issues: Marielle Franco (Rio de Janeiro), Auréa Carolina (Belo Horizonte), Samia Bomfim (São Paulo) and Talíria Petrone (Niterói). They were voted for significantly after a major feminist movement called "Women Spring," which manifested against the setbacks in women's rights and in defense of their rights to their bodies regarding abortion legalization. These young women councillors, whose trajectories will be analyzed in this article, came from a militancy consolidated in social movements and seemed to aim, with the entrance in institutional politics, at putting their agendas, with their own voices. Thus, the main objective of the article is to analyze their paths, political engagement and the Brazilian electoral scenario in 2016, based on the political conjuncture of that period and on a research conducted in social networks, relating it to the recent bibliography on youth and political participation in Brazil.

Conflict and Collaboration in Contentious Events: The Case of the 1-O in Catalonia

Giménez, Ferran; Gunzelmann, Hans Jonas

Barcelona University, Spain
ferran21_2001[at]yahoo.com, hans.gunzelmann[at]sns.it

Internal conflict frequently divides social movements into several groups and factions. However, their ability to promote social change depends, among other things, on whether they are capable of sharing and synchronizing goals and means of collective action. This paper represents an empirical analysis of the Referendum on Catalan Independence held on October 1, 2017 (1-O) as an exceptional case of collaboration. In this moment of aperture towards unforeseen forms of contention,

various social actors beyond the independentist sector aligned to organize and guarantee the vote on Catalan self-determination. This includes numerous grassroots groups, large organizations such as ANC and Òmnium Cultural, but also the independentist political parties and the Catalan government. Our hypothesis is that this exceptional case of collaboration is an outcome of a discursive and cognitive transition from the master frame of the "right to decide" towards an adversarial framing of the Spanish state as the enemy. This discursive construction is intrinsically linked to chain of repressive events in the weeks prior to the 1-O as well as on the same day of the referendum. Moreover, through the intervention of Spanish police in Catalan autonomous institutions, the role of institutional politics diminishes, while the contentious sphere gains weight in this period. Thus, we identify two central elements: the "right to decide" as a normative foundation, determined by the referendum, and the repression of the Spanish state as an external antagonism. Once the referendum is held, conflict among movement actors reappears as interpretations of the right to decide and state repression become ambiguous. Field work was conducted between september and december 2017, a period of intense contention under a qualitative-ethnographic approach.

The Politics of Alliance in Farmers Movement in India

Fadaee, Simin

University of Manchester, United Kingdom
simin.fadaee[at]manchester.ac.uk

On the 30th November 2018 tens of thousands of Indian farmers marched to the parliament and demanded a special session to discuss the deepening agrarian crisis which began over twenty years ago. While climate change and its effects on Indian agriculture has played a role, activists and opponents of the government's agricultural policies see the Green Revolution and the transformation of Indian agriculture into large scale corporate industrial agriculture as the main reason behind India's agricultural crisis. The protest march to the parliament was only the latest in a series of protest marches which have been organised by an umbrella group of over two hundred farmers organisations from all over India within the past year. Moreover, for the first time an alliance of different activist groups, oppositional political parties and students has cohered to support the farmers and their cause. Despite its political, empirical and theoretical significance, research on processes and mechanisms of the formation of alliances across classes, movements, organisations and political parties has gained scant attention in social movement studies. Based on original research this paper reflects on dynamics and implications of alliance building in contemporary farmers movement in India.

The Movement-Elite Alliance After the Great Recession: The Case of The Icelandic Constitutional Reform Movement

Shiota, Jun

Kobe University, Japan
ujun28211[at]gmail.com

In Iceland, the financial crisis of 2008 led to the simultaneous rise of a progressive left-wing government and a social movement for constitutional reform. While the left-wing political elites and the movement were initially collaborating among each other, the failure of the left-wing government to implement constitutional reforms turned them into adversaries for the social movement activists. This paper considers the above process as an example of the formation and dissolution of movement-elite alliances. Although previous research has considered elite allies as crucial for social movement success, the paper argues that the movement's mistrust for political elites produced strategic dilemmas that ultimately influenced the decision to break with the institutional partner. This argument is tested by interviews with both activists and politicians. The paper thereby adds to the study of movement-elite alliances more broadly, and to the general study of social movements in the wake of the financial crisis.

Extra-Territorial Activism by Syrian Refugees in Europe: Exploring Intersections Between Contentious Acts and Electoral Politics

Sharkawi, Tasneem

Lancaster University, United Kingdom
tass.sharkawi[at]gmail.com

With the violent developments of the situation in Syria during the past eight years and the ensuing forced migration, Syrian activism has a visible presence in several European capitals. Many young Syrian refugees in Europe are actively involved in organizing and mobilizing against the Syrian regime. This paper is based on an ethnographic account of the collective action of two groups of young Syrian refugees, one in Britain and another in Germany, tracing their networked activities with young Syrian activists based in Turkey. The paper investigates the subjects, objects, and sites of contention for these young activists through analyzing the rights claims they make and tactics they employ in constituting themselves as political players in their European host communities. I combine mobile and digital ethnography to examine research materials from 1) thick descriptions from field notes 2) long intensive interviews, and 3) social media artifacts. I adopt a contentious politics perspective to social movements to discuss the spatial dynamics of collective and direct action organized extraterritorially by these Syrian activists who pressure the public opinion and voters in host countries to demand a different foreign policy towards the Syrian regime. I explain

how these activists use contentious acts to trigger a change in electoral politics in their host countries highlighting intersections between extraterritorial activism contentious politics, and electoral politics. This paper contributes to a deeper understanding of the less explored aspects of the refugee resettlement experience which can shed light on possibilities of political participation of young refugees in Europe.

RN25_04 | Political violence and social movements

Securitized Volunteerism and Neo Nationalism in Israel's Rural Periphery Gazit, Nir (1); Grassiani, Erella (2)

1: Ruppin Academic Center; 2: University of Amsterdam, Netherlands, The
nirgazit2[at]gmail.com, E.Grassiani[at]uva.nl

Hashomer Hachadash (The New Guardian) movement claims to fill a gap of security, and moral education in the Israeli landscape that in the words of the organization 'has forgotten its Zionist roots'. It frames itself as a bottom up organization that brings together people (mostly Jews) who feel connected to the land of Israel and want to protect it against an often-unnamed enemy. The movement, which was founded by a farmer's son and a small group of friends, has expanded into a conglomerate that provides free security services and labor assistance to farmers and settlers in the Israeli frontier. It also organizes countless educational and cultural activities with schools, youth movements, and the private sector, which combine civilian and military themes and promote a neo-national (neo-Zionist) agenda. Today, ten years after its establishment, the organization includes tens of thousands of activists and volunteers. Although rooted in a particular socio-political context, we believe that this case demonstrates how militarism may re-emanate in civil society, in the margins of the state, with almost no influence from military actors. Ethos and practices of voluntarism play an important role in this process as they enable the organization to nurture a civilianized and populist form of militarism and neo-nationalism, outside the monopoly of formal governmental institutions. It further helps it to attract various audiences. As such it serves as a platform for new social new alignments between social sectors and groups in Israeli society.

The Heterogeneous Impact of Threatening Events on Violence during the German Refugee Crisis

Frey, Arun Lorenz

University of Oxford, United Kingdom
arun.frey[at]stcatz.ox.ac.uk

While social movement literature on intergroup conflict has frequently examined the role of structural determinants to establish which local conditions lead to ethnic violence, less attention has been placed on the temporal dimension of such violence. A narrow focus on where, not when, violence occurs neglects substantial fluctuations in hostility over time and depicts conflict as overly static. This paper investigates anti-immigrant violence in Germany between 2014 and 2016, a period of heightened immigration to the country, and focuses on the role of events in inciting violence. The study reports three findings: Firstly, there is considerable heterogeneity in events' effects on violence: after controlling for structural determinants, contagion dynamics, seasonal fluctuations and media salience, the 2015 New Year's Eve sexual assaults (NYE) stands out among all threatening events in Germany, dramatically increasing subsequent attacks. Comparing this increase to the more moderate impact of domestic terrorist attacks indicates that discrepancies in events' effects seem not to be related to straightforward measures of severity, but to more complex mobilisation dynamics. Secondly, events are able to not only influence the amount, but also the very distribution of violence. Following the NYE event, attacks increased disproportionately in previously less hostile regions, suggesting that nationwide hostility temporarily trumped the importance of pre-existing local conditions in predicting anti-immigrant violence. Finally, the increase in attacks consisted largely of minor crimes, while more extreme forms of violence were less affected. Extreme crimes and their offenders may be less susceptible to situational influences than minor delinquencies.

Local Conditions and Online Media Context for Anti-Immigrant Violence in the 2010s: An Analysis of Arson Attacks against Asylum Housing Facilities in Sweden

Wahlström, Mattias; Ekbrand, Hans; Törnberg, Anton

University of Gothenburg, Sweden
mattias.wahlstrom[at]gu.se, hans.ekbrand[at]socav.gu.se,
anton.tornberg[at]gu.se

Similar to several other countries, Sweden has faced an upsurge in radical right mobilization in the 2010s, both visible in terms of parliamentary successes of the Sweden Democrat party as well as extraparliamentary activities, including political violence. One expression of the latter is arson attacks against asylum housing facilities, the number of which rose in

late 2015 and 2016, in connection with the contemporary wave of immigrants to Europe. Among influential explanations for this dispersed and sometimes disorganized type of political violence one finds social movement theories including assertions about the impact of political and discursive opportunities for the incidence of arson attacks. However, there is still a lack of scientific consensus about the relative (and combined) importance of various local and national level explanatory factors. The present study aims to clarify the role of some of these factors by investigating prominent pathways of causal conditions that together appear to lead to attacks. We conduct a qualitative comparative analysis of Swedish municipalities where asylum housing arson attacks have or have not occurred during the time period between 2011-2018. Particular attention is paid to the role played by social media in instigating and/or facilitating political violence.

Opportunity/threat Spirals, Anti-Immigration Protest, and Violence: Observations from Four Swedish towns

Lundstedt, Måns Robert

Scuola Normale Superiore, Firenze, Italy
robert.lundstedt[at]sns.it

The European 'refugee crisis' of 2015 and 2016 was a composite process consisting of increasing migration flows, contention and reform of domestic and European border policies, and popular mobilization. One particularly striking component of the crisis was the diffusion of arson and bomb attacks against asylum shelters. In the Swedish case, roughly 20 facilities, in as many towns, were attacked during the peak of violence between October and December 2015. While the perpetrators remain unknown, attacks were most often precipitated by local collective action against the accommodation of refugees. Importantly, however, mobilization also happened in places where no violence occurred. Comparing violent and nonviolent trajectories, this paper asks what locally specific factors contributed to escalation of mobilization into violence. This paper argues that the occurrence of violence should not be explained by the emergence of collective action per se, but by the gradual development and deployment of frames that combine rising levels of threat with the closure of opportunities for nonviolent action, i.e. opportunity/threat spirals. In order to test this argument, the paper uses frame analysis of statements made in local print media and on radical right-wing web sites by opponents to the accommodation of refugees in four Swedish towns, combined with retrospective interviews with opponents and proponents of reception.

RN25_05 | The impact of collective action

How the Social Movement Actors Assess Social Change: An Exploration of the Consequences of Ukraine's Local Maidan Protests

Zelinska, Olha

Graduate School for Social Research, Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland
ozelinsk[at]sns.edu.pl

Social movements aim to change specific aspects of society and researchers have long considered the question of how to assess contention's immediate outcomes and broader social consequences. In this paper, I contribute to arguments that, to assess the potential change created by social movements, we need qualitative studies of the social movement actors who attempted to change their society. I explore the outcomes of the Maidan social movement in Ukraine, 2013-2014. The movement in Kyiv grew into a nation-wide contention, led to the resignation of the president and new parliamentary elections, and was followed by a military conflict in the east of the country. Relatively understudied are the dozens of local Maidans in Ukraine's cities, towns and villages that issued own demands to local and national authorities. I present the results of a pilot study that aimed to understand, from the participants' point of view, what the outcomes of local Maidans were. I analyzed (a) the primary documents – local Maidan resolutions – issued by protest assemblies in four Ukrainian localities during November 2013-February 2014, and (b) 24 face-to-face interviews with 33 Maidan activists, representatives of local authorities and observers, held in these four communities during September-November 2018. I compare four case studies on local Maidan's impact, including both immediate outcomes and long-term social changes, as seen by activists and observers. In this exploration, I pay specific attention to the role of local-level political opportunity structures (POS) and social movements organizations' (SMO) strength in shaping protest dynamics and outcomes.

Social Impact Solidarity Components in European Current Social Movements

Campdepadros, Roger (1); Soler-Gallart, Marta (2); León-Jiménez, Susana (2)

1: University of Girona, Spain; 2: University of Barcelona, Spain
rogerceaceu[at]gmail.com, marta.soler[at]ub.edu, susana.leon[at]ub.edu

During the last crisis, public administrations' cuts let a lot of actions and attentions in fields as health, social protection or education disregarded. Social movements and active citizenship in several grades of formal and/or informal organization have been providing aid and attention to

vulnerable people or collectives. Even if there are a lot of NGO and organized civil society in Europe today, not all their activities and actions improve people's lives, and achieve social impact. Some of them mislead their goals and focus on looking for funding, fall into clientelist relations with the administration, or professionalize themselves losing contact with the public and disregarding the reality. In this communication we present results from the Horizon 2020 project SOLIDUS. Solidarity in European societies: Empowerment, social justice and citizenship (2015-2018), that has been investigating solidarity actions and gathering evidences of their social impact. This project systematized the common components of organizations' actions that lead to a social impact solidarity. Among them we highlight internal democracy, plurality, transparency, achieving recognition, scalability, level of awareness and preparedness for solidarity, and creation of a sense meaning. Implementing these evidences, neighborhood-based or proximity organizations, NGO, as well as civil society in general, can improve their actions and activities achieving higher social impact on peoples' lives.

The Dynamics of Redistributive Social Policy in Latin America. Protest, Electoral Politics and Institutions

Guzman-Concha, Cesar (1); Ciccica, Rossella (2)

1: University of Geneva, Switzerland; 2: Queen's University Belfast, United Kingdom, Scuola Normale Superiore, Italy
cesarguz[at]gmail.com, rossella.ciccica[at]sns.it

To what extent and under which conditions collective mobilizations influence government's propensity to adopt measures targeting outsiders in Latin America? This region remains one of the most unequal regions in the world despite a long history of welfare state development. The first social protection schemes in the 1920-40s were circumscribed to a small number of politically influential groups (e.g. military, civil servants), but a progressive turn toward more inclusive social policies in the 2000s has extended coverage to low-income households, informal and rural workers. Comparative analyses of social policy expansion in Latin America highlight the importance of political factors such as democratic legacies and left party involvement (Huber and Stephens 2012), but several case studies have also observed an effect of extra-institutional forms of political participation routinely used by citizens to express their discontent and influence governments. The aim of this paper is to explore the determinants of universalistic social policies in 18 Latin American countries starting from the 2000s taking into account social mobilization, politics and socio-economic institutions. The analysis focuses on two sectors – social assistance (programas de transferencias condicionadas, pensiones sociales) and healthcare– which in contrast to social security programmes target outsiders, i.e. individuals out of formal employment and not covered by contributory social insurance. We observe that in countries where protests have been more intense, reforms have been more universalistic and social assistance has been extended to cover larger segments of the population. However, the relative power of left-wing parties in parliament seems to be a decisive factor to explain the generosity of such programs.

Three Rivers Three Struggles: Contemporary Water Conflicts and Resistance Movements in Turkey

Nal Akcay, Ayse

University of Washington, Seattle, United States of America
aysenal[at]uw.edu

This paper analyses the social and political effects of numerous hydroelectric power plant (HEPP) constructions in Turkey with a focus on the Black Sea Region. Based on a field study in villages in three river basins in Duzce, Kastamonu and Rize and with their diaspora associations in Istanbul conducted mainly with the opponents of the power plant constructions, it studies how the peasants respond to the changing involvement of the state and private capital investments in the region. It questions why the resistance movements take different shapes in different regions in the Black Sea Region and under what circumstances they achieve their goals and continue to protect their valleys and under what circumstances they dissolve. One of these cases is Loc Valley in Kastamonu which is a landmark social environmental movement with significant achievements, the second one is Ikizdere Valley in Rize which speaks for a significant social movement that could at least protect some regions of the valley and the third one is Aksu Valley in Duzce which represents a weak local movement that was not able to achieve its goals. I will argue that the differences in outcomes between these three movements are at least partly due to choices in mobilization strategies, willingness to confront the government forces like police and gendarmerie and the presence or absence of clientelistic relationship with the government.

RN25_06 | Micro- foundations of protest

Micromobilization and Mass Protest: The Case of the “Panama Papers Protests” in Iceland

Bernburg, Jon Gunnar

University of Iceland, Iceland
bernburg[at]hi.is

Micromobilization research, that is, research on processes underlying differential participation of individuals in collective action, constitutes a vital part of social movement research. But, while a large volume of research exists on the structural, cognitive, and emotional conditions shaping micromobilization, the research comprises important gaps. First, studies of specific occurrences of activism rarely obtain population-representative data. Population-representative work instead tends to use non-event-specific data, which therefore decontextualizes the work. Second, since research rarely obtains representative data on non-participants, it usually fails to model movement support and participation as separate stages in micromobilization. Finally, research is rarely

able to address “feedback dynamics”, referring to the ways in which movement participation may impact later participation. Feedback dynamics may often constitute a major process underlying historical continuity in mass mobilization. Addressing these limitations, I obtain two population-representative surveys that both focus on a protest campaign occurring in Iceland in April 2016. Spurred by the global “Panama Papers leak”, these “spontaneous” protests attracted about a quarter of the country’s urban population. The data allow me to estimate effects of a wide range of theoretically meaningful predictors on both protest support and protest participation, at different stages of the April campaign. The results support a multi-theory approach to micromobilization. I find effects of biographical availability (age, gender, class), frame alignment (political attitudes), collective efficacy (expectation), social ties (significant others’ participation), and moral shock (seeing a special Panama Papers leak broadcast). Furthermore, results support both short-term (i.e. within-campaign) and long-term (historical) feedback effects.

Does Activists’ Mind Change? Differential Socialization of Political Commitment

Monsch, Gian-Andrea; Passy, Florence

University of Lausanne, Switzerland
gianandrea.monsch[at]unil.ch, florence.passy[at]unil.ch

Social movement scholars usually believe to know who protests and how one gets mobilized. We have shown with empirical evidence that people belonging to the respective movement potential are recruited via highly organized social network channels. However, recent protest events challenge this established knowledge. In France, for example, the “gilets jaunes” currently fight hard to improve their living conditions. Who are they? To what potential do they belong? What happened that transformed these usually silent citizens to active ones, blocking roundabouts and toll plazas every weekend? In this paper, we advance that mind synchronization during participation helps people to sustain their commitment. With the help of longitudinal data from the Swiss Household Panel, we focus on two research questions. Does commitment impact activists’ mind or has the mind to be synchronized with the worldviews of the respective commitment community before activism starts? Answering this first question by comparing environmentalists, unionists and individuals committed to charity organizations allows re-assessing the socializing effect of participation itself. The second question asks whether commitment effects on activists’ mind are durable over time for those who remain committed as well as for those who stop their commitment. With the help of these questions, we work on an important gap in the literature, which is often mentioned but rarely scrutinized: The inquiry of a possible socialization effect of commitment. Further on, these questions touch a major question of sociological theory. Do we need specific meanings to act or does action fashion mental dispositions? Do we need to inverse the causality stated by Weber?

Consequences of Groups Style for Differential Participation

Carlsen, Hjalmar Bang; Toubøl, Jonas; Ralund, Snorre

University of Copenhagen, Denmark
hjalmarzukile[at]gmail.com, jt[at]soc.ku.dk,
snorreralund[at]gmail.com

This article proposes a theory of how interaction in groups influences differential participation in political activism and interrogates this theory through an empirical analysis of online Facebook group interaction within the refugee solidarity movement using online ethnography, survey and “big” social media data. Instead of conceptualizing the group as a social network or social movement organization (SMO), we argue that the group and its culture emerge as patterns of interaction that has implications for what kind of movement activities the group’s members participate in. Based in observations from our online ethnography we suggest that group interaction influence differential individual participation through the processes of 1) encoding different habits and 2) attuning the activist to different aspects of situations. We support our theoretical propositions with six statistical tests of the relationship between the group level variable of contentious group style and the individual level variable of participation in political protest. The dependent variable, political protest, and a comprehensive set of controls stem from an original survey dataset of the Danish refugee solidarity movement with 2,283 respondents. We link the survey data with “big” social media data used to estimate the focal explanatory variable, contentious group style, generated from content analysis of online interaction in 119 Facebook groups quantified with supervised machine learning. The results show that group style has a consistent positive relationship with the individual’s degree of participation independent of networks, SMO framing and individual attributes.

Between A Sense of Injustice and Lacking Self-efficacy. Biographical Conditions of Social Mobilization Among Young People in Precarious Working And Living Conditions

Seehaus, Alexandra (1); Trappmann, Vera (2); Neumann, Denis (1)

1: Freie Universität Berlin, Germany; 2: Leeds University Business School, United Kingdom
seehaus[at]zedat.fu-berlin.de, V.Trappmann[at]leeds.ac.uk,
denis.nmnn[at]gmail.com

New cleavages and the polarized political discourse also reflect among young people. How they form their views and come to engage in political actions, while being in the middle of their transition from youth to adulthood, is not necessarily guided by rational reflections on political arguments but depends on other factors. Our contribution inquires when, why and how young people politicize. What drives them to express discontent and represent their interests – be it in traditional or

unconventional ways? We find a lack of politicization and mobilization among our respondents, who believe in a meritocratic society and its legitimacy, or are preoccupied by everyday life struggles. For some, thought, politics and public sphere become relevant matching their wish for self-realization. In other cases, resistance evolves in the face of negative experiences with welfare state institutions or feelings of helplessness when encountering social barriers – leading some towards authoritarian resentment. Applying Hirschman’s theory to structure the results of our research, we can show that a majority of young people goes for loyalty or exit options. For those who voice discontent, we describe biographical conditions that across the sample enable mobilization: high level of cultural capital, occupational identity, self-efficacy, sense of injustice, conflictual relation to parents and an ideological supply side. Our contribution is based on 60 biographical interviews as well as a representative CATI survey with young people in precarious work and employment between 18 and 30 in Germany. The data have been conducted within the PREWORK project funded by DFG.

RN25_07 | Theory of contentious politics

Rethinking Demobilisation: Concepts, causal logic, and the case of Russia's For Fair Elections movement

Zeller, Michael C

Central European University, Hungary
zeller_michael[at]phd.ceu.edu

The study of social movement organisations (SMOs) has tended to fixate on the initial, upward trajectory and most intense activity of SMOs, that is, mobilisation and campaigning. Comparatively little attention has focused on the downward slope: how do movements falter and fail; how do movements demobilise? Recent work has sought to fill this lacuna. Davenport’s (2015, *How Social Movements Die*) theorisation is the latest, most useful addition to the topic. Yet existing theories still omit some facets of demobilisation and bear the mark of over-reliance on case inference. This article addresses these persistent conceptual problems. First, it argues for a reformulation of Davenport’s theorisation of social movement demobilisation, re-aggregating demobilising factors internal to SMOs and broadening the scope of external factors to include the repressive activities of non-state agents. Next, the article asserts that the causal logic of demobilising factors is essentially set-relational: the concurrence of factors is what produces demobilisation (this is ‘conjunctural causation’) and multiple combinations of factors can cause demobilisation (this is ‘equifinality’). Finally, the article demonstrates the analytical utility of the proposed conceptual framework and concomitant causal logic by briefly analysing the case of the For Fair Elections movement in Russia in 2011-2012. This case exhibits the multiplicity of internal strains and external pressures that converge to induce demobilisation. Taken together, the article’s conceptual framework and empirical example provide a guide for identifying, analysing, and characterising demobilisation.

The Catalan Revolt and the Populist Moment: Exploring the Convergence

Murillo, David

Ramon Llull University, Spain
david.murillo[at]esade.edu

There have been many attempts to explain the Catalan move for independence that culminated in the symbolic declaration of independence on 27 October 2017. Some academic works seek to explain the Catalan bid for independence as a form of top-down indoctrination or as part of a politically-led strategy to mask the cost of austerity policies. Other explanations highlight identity-based or nativist factors behind the pro-independence surge. We consider these interpretations of limited analytical value but, more importantly, failing to understand the broader global socio-political picture. This is a landscape of moving forces where elites try to maintain or recover sovereignty while challenging those who seek to alter the status quo. For academic purposes, we depart from the widespread interpretation that includes this move for independence within a more global backlash against global or nation-state elites (Mouffe 2018). This interpretation frames the events that took place in Catalonia and Spain in recent years, and specifically in the final months of 2017, as a form of what has more generally been called the populist revolt (Geiselberger 2017, Streek 2017). By examining the Catalan uprising under this light, we seek to achieve two goals. Firstly, to help make sense of the theoretical discussion on populism, when analyzed from the generation of the demand side: the understanding of populism as a form of bottom-up mobilization exogenous of electoral contestation (Aslanidis 2017). Secondly, to understand the mechanisms used by the establishment to confront acts of popular resistance to the status quo and its socio-political consequences.

Postindustrial Revolution: Yellow Vests as "the People" and the Transformation of European Democracies

Lianos, Michalis

University of Rouen, France
m.lianos[at]free.fr

The core issue of this SP will be the transformation of political consciousness among the lower and lower-middle classes in Europe. There are few occasions where progressive, revolutionary action can be mistaken for conservative narrow-mindedness. The yellow vest protests in France met with the entire range of possible accusations against the participants: fascists or anarchists, secret instruments of political parties or apolitical masses, clueless rednecks or sophisticated haters. Nothing sticks, however, since they openly and unreservedly admit their plurality. So, what keeps them together? Very simply, experience. This is in many cases a new level of political reflexivity that most of us mistook for an obtuse reactionary attitude. In the last decade, the European lower classes seem to increasingly realise that "elites" are less needed in the

political process. And, if one looks at the overwhelming passive support to the yellow vests from the other classes in France, it seems that the will to change the political organisation of European societies spreads. This development is to be welcomed in many aspects, most particularly as a claim for the renewal of current representative regimes that become increasingly irrelevant and do not qualify as legitimate democracies in the conscience of their citizens. This is not to say that citizens in general, and the yellow vests in particular, do not acknowledge the necessity of "governance". Quite to the contrary, they sense that a new form of democracy is both possible and necessary in order to make governance efficient for those who are side-lined by the 'system' and wish at the same time to count as individuals.

The Political Economy of Revolution: Karl Polanyi in Tahrir Square

Zayed, Hany Khaled

University of Illinois at Urbana-Champaign, United States of America
hanykz2[at]illinois.edu

The causes and consequences of revolutionary change have long been the subject of scholarly analysis. This research extends extant theory of revolution through a systematic integration of Polanyian international political economy into an analysis of contemporary transformations in Egypt. The primary research question of this paper is thus: to what extent can Karl Polanyi's Double Movement theorization explain the Egyptian Revolution of 2011? This research contributes to the current body of knowledge in two ways. First, it extends Karl Polanyi's double movement model by applying it to the Egyptian case study. Through extracted key pillars, this research demonstrates the broad congruence between the dynamics of social change in Egypt and the central elements of Polanyi's work. Second, by demonstrating the effectiveness of the Polanyian framework in understanding Egypt's revolutionary change, the research highlights the value of introducing political economic elements to existing literatures on revolution, expands the depth and variety of the theory of revolution, and extends existing analyses between neoliberalism and revolution in political economy literatures.

Feminist Strikes in Barcelona: An Ongoing Dispute of Contentious Discursive Practices

Dias, Tayrine

Universitat Oberta de Catalunya, Spain
tayrinesdias[at]gmail.com

On March 8, 2018, massive mobilizations took place in more than a hundred cities across Spain, in which hundreds of thousands went to the streets of Madrid and Barcelona. The country was one of the epicenters of a transnational campaign calling for feminist/women's strikes and protests in at least 170 countries. For March 8, 2019, activists have called for a strike in Spain, Germany, Peru, Argentina among others. Over the last years women's and feminists groups have often struck to denounce multiple oppressions and violence against women, but also to challenge the political and economic status quo: 'without us there is no production or reproduction'. The strike in Spain was divided into four fronts: labor strike, student strike, care strike and consumption strike. Women's and feminist groups and activists combined their presence in multiple arenas, online and offline, as they engaged in contentious discursive practices to dispute and (re)define what their strike is, why they stop and what for. This paper will, then, analyze how the 2018 and 2019 feminist strikes unfolded in Barcelona, one of the most relevant mobilization sites in Spain. What contentious discursive practices did activists enact as they struck? How do activists perceive opportunities and challenges to advance their political views through the strikes? Which contradictions, dilemmas or conflicts emerge from these disputes? To answer these questions, I will perform textual and network analysis on a sample of more than a million tweets containing hashtags related to the strikes - collected from Twitter's API over the months preceding both strikes - in addition to conducting qualitative analysis of participant observation notes and semi-structured interviews with activists involved in Barcelona's strikes and protests.

Racist Riots and Antifascist Activism – A Biographical Approach to the Production of Meaning in Social Movements

Kostimpas, Dimitra Barbara

LMU Munich, Germany
dimitra.kostimpas[at]soziologie.uni-muenchen.de

At the beginning of the 1990s, Germany experienced anti-refugee rhetorics and a series of racist violence. The infamous xenophobic riot in Rostock-Lichtenhagen (Germany) in August 1992, which targeted a refugee shelter and a home for Vietnamese contract workers, can be understood as a

significant "discursive event" (Jäger). What meaning did this incident have for 'antifascist' activists? What frames (Goffman; Snow) can be identified as central to this sort of activism? Biographical interviews with persons born 1968-1976 from West Germany were conducted and analyzed. The biographical approach allows the reconstruction of individual and collective histories of framing processes. The auto-biographers describe their activism as devotional commitment integrated to an ethical lifestyle – a form of 'first person politics' and subjectivation of the political. The conflict field of anti-fascist movement is constituted by the genuine opposition to widespread right-wing ideologies, as well as organized neo-fascism. In addition, the police is perceived as a second antagonist. But this enmity is rather learnt than ideological, i.e. a sedimentated experience with the police over years of activist careers in different movement contexts (from anti-nuclear, anti-militarist, autonomist to anti-fascist activism).

Emergence of Anti-gender Campaigns in Czechia and Poland Svatonova, Eva

Aarhus University, Denmark
sva.eva[at]cas.au.dk

While there is a burgeoning literature describing the diverse forms, in which the discourses produced and reproduced by the so-called anti-gender campaigners (Kuhar&Paternotte 2017) emerged in different national contexts, there are only few scholars who approached (Lavizzari&Prearo 2018) or suggested to approach (Roggeband 2018) this quite recent phenomenon from a social movement theory perspective. The notion of "gender ideology" - used as an umbrella term by diverse network of actors to intentionally misinterpret feminist, queer and gender theory in order to justify discrimination against women and LGBT+ minorities (Kane 2018) - that these campaigns claim to oppose, has been introduced by Vatican in the mid-1990s and has gained popularity in Europe over last 15 years. However, the campaigns occurred in different national contexts in different forms and emerged at different period of times. While in Czechia, the discourse opposing "gender ideology" has emerged during last two years, in its neighboring country Poland the pioneers of the campaigns occurred already in 2009 (Graff&Kolorczuk 2017). To provide a better understanding why and when these campaigns emerged in these two post-Soviet, East-Central European countries and how they differ, I combine methods of social network analysis and qualitative content analysis of public speeches, manifestos and official documents published on the websites of grassroots organizations, blogs and newspaper articles that help to disentangle the relational dynamics of the campaigns and the diffusion of their frames.

History Retweeting. Renegotiating The "Fascism-Antifascism" Dichotomy In The Italian Twittersphere

Pavan, Elena (1); Rapini, Andrea (2)

1: University of Trento, Italy; 2: University of Modena and Reggio Emilia, Italy
elena.pavan[at]unitn.it, andrea.rapini[at]unimore.it

In this paper, we investigate how the recent wave of antifascist mobilization in Italy affected the development of a public discourse in which the dichotomy "fascism-antifascism" has once more become the object of a symbolic struggle. We look particularly at the public discourse that developed within the Italian Twittersphere in February 2018 soon after the random shooting of six non-white people by Luca Traini, a neofascist claiming to act to avenge the murder of a young girl for which three Nigerians were charged. Through the combined use of semantic network analysis and qualitative content analysis of original tweets, we examine continuities and changes in the structural position and the symbolic role played by the "fascism-antifascism" dichotomy in the broader online discussion. Our results suggest that the shooting puts the "fascism-antifascism" dichotomy at the core of the discussion and triggers its renegotiation in light of the specificities of the current Italian political situation. Conversely, the mobilization process makes of "antifascism" the true epicenter of the discussion but at the intersection between two opposite trends. On the one hand, the attempt to delegitimize antifascist resistance, either by stressing violent degenerations of ongoing demonstrations or by making a strategic use of the past recalling memories of the foibe massacres. On the other hand, the collective endeavor to reaffirm the legitimacy and the necessity of antifascism as an antidote to the persistence of a fascist and colonial archive rooted in the history of the country but resurging to a new prominence within its current political landscape.

How Strikes And Street Protests Relate: Combining Research on Industrial Conflict And Protest Analysis In The Study Of Contentious Politics In Spain

Pohl, Nicholas George

University of Lausanne, Switzerland
nicholas.pohl[at]unil.ch

Workers go on strikes and paralyze production. They also call for protests and take the streets. While there appears to be an

obvious link between the two forms of contentious collective actions, they are examined largely separate in academia: researchers of industrial conflict analyze strikes, while protest analysts deal with street protests. In this paper, I aim at establishing a broader perspective on contentious collective actions by combining research on industrial conflict with protest analysis. First, I compare the theoretical concepts used in both research areas to explain the emergence of strikes or street protests, respectively. I discuss to what extent the respective concepts overlap, where they diverge or whether they simply address different issues. In a second step, I examine the relationship between strikes and street protests empirically. Based on aggregate data provided by Spanish ministries, I analyze strike and protest patterns between 2002 and 2016 in Spain. Two issues are examined in detail: (1) the role of organized labor in the production of social contention in the streets and (2) the actual links between strike activity and street protests. The theoretical discussion reveals that concepts emanating from the study of street protests often address issues neglected in the study of strikes and vice versa. On an empirical level, the findings show that organized labor is still the main producer of social contention in Spanish streets. Furthermore, increased strike activity is paralleled by higher protest activity. All this suggests that both research areas would benefit from a greater interdisciplinary dialogue.

Czech Trade Union Organisations in Time and Space

Navratil, Jiri

Masaryk University, Czech Republic
jiri.navratil[at]econ.muni.cz

The transformation of trade unions in post-socialist realm still has not been explored in a sufficient detail. Massive transformation of economic and politics after 1989 necessarily led to the fast transformation of trade union organizations in terms of the intensity and diversity of their protest patterns but also of to their diversification through the rise of different types of spatial inequalities and even competition among them (in terms of interest representation, resources, ideology etc.). The transformation of economic and political context did not have the same pace nor consequences and gave rise to various types of spaces for trade union organizing and strategies. The paper aims at conceptualizing and empirical analysis of how emergence of trade unions in post-socialism is related to the economic and political character of localities, how it interacts with the frequency of protest, and how it is related to the character of protest coalitions. Particularly, the paper asks: - what is the difference in dynamics of emergence and protest of trade unions in different localities? - what is the role of different political and economic context in the share of intra-sectoral and cross-sectoral ties of trade union coalitions? - how context affects the selection of non-trade union protest partners, and how is it related to the leadership in protest organizing? The paper builds on survey of local trade union organizations (N=42) in order to generate insights in terms of their relational strategies and context perception, register of trade union organizations, and protest event analysis of trade union protest in the Czech Republic (1989-2017).

Economic and Political Grievance and Participation in Protest in Central and Eastern Europe

Muliavka, Viktoriia

Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland
victory896[at]gmail.com

In theory, grievance is supposed to enhance the likelihood of protest behaviour. Recent social movement research has found that grievance theory has not explained non-violent protest behaviour as well as political opportunity structure and resource mobilisation theories (Andrews and Biggs 2006, Dalton et al. 2010; Welzel and Deutsch 2011). I argue that because most recent grievance studies focus on macro-aspects of economic grievance, they have not sufficiently explored Gurr's (1968) original concept of relative deprivation and subsequent literature that suggests a wider view of macro and micro forms of grievance. Building on Gurr and colleagues, I develop a typology of grievance that includes interacting economic and political forms at the macro and micro level. I theorize how the macro-level economic and political grievance interacts with these grievance forms at the micro level to influence protest. Structural conditions also matter for protest behaviour, and studies of protest in US and Western Europe predict that young people and individuals with higher education are more likely to do non-institutionalized protest (Marsh & Kaase 1979; Melo & Stockemer 2014). As an empirical illustration, I test this hypothesis on Central and Eastern Europe, predicting that negative socio-economic and political impacts of post-socialist transformations magnify micro-level grievance and push the young and the higher educated to protest. I also test how different forms of grievance (or their combinations) influence various types of protest, predicting that strength of connection could vary for different indicators. I construct macro-level indicators of economic and political grievance from World Bank, Standardized World Income Inequality Database (SWIID) and cross-national indexes of democracy; on the micro level, I use the European Social Survey (2002-2016).

How European Patterns of Participation Are Changing in Times of Crisis

Ejrnæs, Anders; Harrebye, Silas

Roskilde University, Denmark
ejrnaes[at]ruc.dk, silas[at]ruc.dk

This paper focuses on explaining the development and variation in extra-parliamentary activities, such as signing petitions, displaying political support, boycotting products, and demonstrating, in 15 European countries. In a period where several integrated crises are shaping the political landscape it is crucial for our democracy to understand the link between dissatisfaction and political activism. Through a multilevel regression analysis based on data from the

Facing Collapses and Expressing Emotions through ARTIVISM in Genova, Marseille and Yaoundé

Salzbrunn, Monika; von Weichs, Raphaela; Moretti, Federica

University of Lausanne, Switzerland
monika.salzbrunn[at]unil.ch, raphaela.vonweichs[at]unil.ch, federica.moretti[at]unil.ch

The effects of neoliberal globalisation can be observed on a material (architecture), economic (decrease and exodus of population) and psychological level. Within our ERC funded project "ARTIVISM. Art and Activism. Creativity and Performance as Subversive Forms of Political Expression in Super-Diverse Cities" (www.erc-activism.ch) we have come across several "events of crisis" that provoked strong emotions and artistic-activist reactions: the collapse of the Morandi bridge in Genova/Italy, the disintegration of the residential buildings in the rue d'Aubagne in Marseille/France, and the so-called "Anglophone crises" in Cameroon. In the three countries, various forms of artistic expression were used to express solidarity with the victims, to sensitise for the causes of crisis, or to exclaim anger against the representatives of political and economic power: cartooning, poetry, performances, concerts, comics, performances. The events of crisis also accentuated the politics of belonging (Yuval-Davis/Viethen/Kannabiran) in which activists and political representatives from different political backgrounds justified their solidarity or critique with their emotional ties to an urban quarter, a super-diverse-city, or a whole rural and urban region in crisis. Through the ethnographic exploration of the mobilisations organized in Genova, Marseille and Yaoundé, in which poetry, cartoons and carnivalesque elements have been adopted by the participants to "mobilise for dignity" or to create "art for peace", the paper investigates how people react artistically to deal with uncertainties, civil war and emotional choc.

Protesting and Having Fun: Humour in the 2017 Romanian Anti-Corruption Grassroots Mobilization

Dumitrica, Delia

Erasmus University Rotterdam, Netherlands, The
dumitrica[at]eshcc.eur.nl

On the night of January 31, 2017, as news of the government's plans to decriminalize corruption transpired, citizens across Romania spontaneously took to the streets. Throughout February, protesters gathered on a nightly basis in front of government buildings and in public squares. The scale of mobilization took the government by surprise, eventually halting its plans. One of the striking features of these protests was the widespread use of humor in the posters citizens brought to the squares. Seldom tackled in the literature on collective action, humor contributes to the development of collective identity and action frames. Furthermore, humor plays into traditional and new media logics, not only attracting media coverage but also adding a 'shareable' dimension to protests, extending mobilization into the digital realm. Contributing to an emerging yet limited interest in humor in collective action, this paper asks what roles different types of humor played during the spring 2017 anti-corruption protests. Informed by discourse analysis principles, a sample of approx. 200 posters is analyzed in terms of content (signification, source of humor) and performativity (what the posters 'do' vis-a-vis protesters, opponents, and the imagined larger audiences). Preliminary findings suggest different types of humor performed different inter-related roles: expressing and channeling emotions (e.g. anger, frustration), demonizing the opponent and constructing the collective 'we', crystallizing the moral framing of the issue, and celebrating the individual as a source of resistance to power.

Impact of Protest Events. From the Visual to the Artifactual

Ślosarski, Bartosz

Adam Mickiewicz University, Poland
b.slosarski[at]gmail.com

The aim of my paper is to put forward partial results of the research project, which is focused on the materiality of contentious performances on the street after 2008 (Butler 2015; Tilly 2008). The primary theoretical goal of the research project is to locate material artifacts in the center of contentious politics studies – which is realized through visual research methods: the content analysis of press-photos, ethnographic observations and photo-elicitation interviews with activists and organizers of street protests (Collier 2001; Philipps 2012). Materiality of social protests was considered in social movements studies as a part of visual culture (Doerr, Mattoni 2007; Garrett 2015; Khatib 2013); as a an element of politics of the senses (Kim 2017); as a part of contentious communications - material devices of protest media (Fahlenbrach 2016) and also as an element of fashion and lifestyle movements (Haenfler, Johnson, Jones 2012; Tarlo 1996). In my paper, I would like to discuss and emphasize the

mediation of material objects in protest. A single act of street protest can be considered as a complex medium, which was expressed by Charles Tilly (2006) as a "WUNC display" – where the public impact of demonstration is based on the accurate use of bodily/fleshly, material and visual components. Mediated things, such as smartphones, functions as a weapon in the information struggles (Chiumbu 2012). Things also take part in diverse forms of protest communications, as a material base of framing (Snow, Benford 1988; Goffman 1974) – as a material interaction with the police, as an expression of movements symbol, and also part of political aesthetics of protest (Sartwell 2010) and street humour (Hart 2016, Tancons 2014).

Feminist Politics in Neoconservative Russia

Perheentupa, Inna

University of Turku, Finland
inna.perheentupa[at]gmail.com

A new feminist generation has emerged in Russia in the 2010s after a more quiet period of feminism in the 2000s. The contemporary feminist movement has been formed in a political context, in which opportunities for civic activism have been significantly curtailed. Simultaneously, the Russian government has introduced increasingly neoconservative policies that have targeted most severely women and LGBTIQ individuals, limiting their rights. This PhD thesis analyses, what kind of dimensions feminist politics takes in a context characterized by shrinking political opportunities, while the internet and social media spaces simultaneously create a set of new digital opportunities for activism. The thesis argues that in this kind of context, feminist politics takes four key dimensions: it turns into reparative politics, politics of sheltering, politics of knowledge and politics of appearances. This presentation introduces these four dimensions of feminist politics. I suggest that all the dimensions are closely connected to movement resources and the shortage of them. Furthermore, the differences in activists' access to resources put forward struggles between feminist groups and individuals. At the same time, feminism itself is understood as a significant personal resource for the activists. The research draws theoretically from social movement studies, analysing both covert and overt forms of resistance as well investigating the spatial and temporal dimensions feminist activism takes in a neoconservative and increasingly authoritarian context. The research is based on a material produced ethnographically in St Petersburg, Moscow and Russian speaking online feminist spaces in 2015-2018. The material consists of 42 feminist activists' interviews as well as participatory observation in different feminist gatherings, events and demonstrations.

RN25_10a | Digital activism and social media

One Response to the 'Refugee Crisis' In Northern France. Cyber Union and The Mobilization of a Responsive, Without Borders Social Work.

Kramer, Lyndsey

The University of York, United Kingdom
lk892[at]york.ac.uk

This paper analyses the use of Human, Social and Cultural Capital in respect of the internet and social media as tools to create cyber union and mobilize e-collectivism within Social Work. It is argued and evidenced that technology has enabled a redefinition and reconstruction of Social Work, one 'without borders'. It has been argued, (Ferguson, 2008a, Lavalette, 2011), that Neo-Liberal agendas are dominant within Social Work in the UK and that these agendas prevent the social worker from viewing problems in the context of inequalities inherent within a capitalist, austerity-driven society. This has created a chasm between Social Work and the weakest members of society. However, it can be argued, that using Human, Social and Cultural capital it is possible to circumvent restrictive Neo-Liberal practices and thinking. This paper researches the response of a network of Social Workers to the politics of austerity, especially in respect of vulnerable refugees. This paper argues that a different kind of Social Work is not just possible, but reflective of the essential nature of Social Work and the International Association of Social Work's definition of professional practice. It is achievable through cyber union and e-collectivism. Bibliography Ferguson, I. & Woodward, R. (2009) *Radical social work in practice Making a difference* Policy Press: Bristol Lavalette, M. [ed] (2011) *Radical Social Work Today Social Work at the crossroads* Bristol: Polity Press.

Social Media Activism and the Impact of Urgency, On-line Solidarity and Resistance Upon the Perception of Time. A Case Study of a Patients' Social Movement.

Bocchino, Antonello

University of Westminster, United Kingdom
a.bocchino[at]westminster.ac.uk

Through an analysis of the on-the-ground activities of the Occupy Wall Street movement, Castells describes 'timeless time' as an interruption in the routine of daily life, coupled with a hope "born from the material verification that another life is possible" (2015:172). This paper examines and validates 'timeless time' using a case study of an Italian patients' social media-based movement (Vicari and Cappai, 2016; Della Ratta

and Valeriani, 2012) that grew out of a medical discovery which challenged the existing medical orthodoxy (Kuhn, 1996), about the causes of the chronic disease, Multiple Sclerosis (MS). This discovery also challenged the drug companies that profit from MS by offering alternative treatment options. Based on auto-ethnography (Balsiger and Lambelet, 2014) and on over 60 semi-structured interviews (Della Porta and Keating, 2008) of the movement's activists, this paper argues that, during its first year, the movement generated an experience of timeless time solely through its activities on social media. Two elements were essential in fostering the experience of timeless time within the movement. Firstly, social media facilitated timelessness by allowing for simultaneous social practices (Barassi, 2015) and emotional condensation (Gerbaudo, 2012) at a distance in pursuit of justice, thus fostering connectedness (Van Dijck, 2013). Secondly, a sense of urgency fuelled the sense of timeless time, as MS is a disease which progressively worsens patients' quality of life, thus any delay in funding research into the new discovery could result in further disabilities.

Digital Mobilization: The Social Movement Built Around A Telecommunications Network Based on A Commons Model Called Guifi-net

Rodon, Joan; Arenas, Daniel; Yter, Mireia

Universitat Ramon Llull - ESADE, Spain
joan.rodon[at]esade.edu, daniel.arenas[at]esade.edu,
mireia.yter[at]esade.edu

The growth of the new digital economy along with the need of having universal access to certain digital resources has led to the emergence of groups of activists who develop common goods online such as wikis or free software. In this context, the aim of this study is to analyse how a social movement around a telecommunications network based on a commons model called Guifi-net has been able to combine a mixture of hacktivists, associations, companies and the foundation behind it. While it was initially conceived as a Do-It-Yourself wireless network of activists, nowadays it is the most populated community network, agglutinating more than 35,012 working nodes. The paper has one main research question: how can a social movement organize itself to protect and sustain the digital commons? Concretely, we focus on what governance mechanisms are developed to organize the movement allowing user-activists to co-exist with multiple for-profit actors operating in the same ecosystem in order to protect the digital commons. The study relies on qualitative evidence following a longitudinal, in-depth case study design (Yin 2009) covering the history of Guifi-net between 2004 and 2018. It combines both primary and secondary data. So far, we have conducted 31 interviews within the ecosystem of Guifi-net: volunteers, user associations, local movements supporting Guifi-net, local network operators of Guifi-net, the customers of those operators, municipalities, county councils, policy makers, the Guifi-net Foundation, and private organizations that have contributed to the expansion of Guifi-net. Secondary data is composed by both non-participant observation and documentation.

The Diffusion of Radical Left-wing Activism Through Mass Media And Movement-controlled Alternative Media

Wennerhag, Magnus (1); Lundstedt, Måns Robert (2)

1: Södertörn University, Sweden; 2: Scuola Normale Superiore, Florence, Italy
magnus.wennerhag[at]sh.se, robert.lundstedt[at]sns.it

It has long been established that waves of protest unravel through direct and indirect mediation. According to the discursive opportunity structure framework, the visibility of protest events in the mass media signals new openings for a movement to reach a broader audience, which might lead to further protest activity. The mass media has therefore been considered an important factor in social movement mobilization. With increasing opportunities for movements to control their own communication – using alternative media and social media – activists might, however, be less reliant on the mass media for gaining public visibility. While there is a substantial literature on diffusion through mass media channels, there is less research on the diffusion effects of activist controlled media. Even less so have authors attempted to compare the two types of sources. This paper uses two merged protest event datasets to compare the diffusion effects of traditional (printed) mass media reporting (N=627) vis-à-vis reporting in (mainly online) activist-controlled alternative media (N=4,727), focusing radical left-libertarian movement groups' protests in Sweden 1997–2016. We ask whether there is an independent effect of mass media or alternative media reporting on subsequent protest events, and whether this effect has remained constant across the last two decades despite far reaching changes in the media landscape. Since mass media generally favours reporting on large-scale and disruptive protests about controversial issues, while alternative online media tend to continually report about most protest events, we also control for the effect of protest size, protest type, and protest issue.

RN25_10b | The interaction and structure of social movement organizations

Organizing the Polish and Swedish Women's Movements

Karlberg, Eva

Södertörn University, Stockholm Centre for Organizational Research (SCORE), Sweden
eva.karlberg[at]sh.se

When social movement actors want to create collective action they sometimes need to set up organizations, and sometimes these organizations need to cooperate and speak with one voice. The paper analyses two processes (in Poland and Sweden) of creating and maintaining women's movement associations of organizations with the purpose of becoming national members of the European Women's Lobby, a Brussels-based NGO lobbying the EU. The analysis shows that the two cases of organizing national-level women's movements turned out completely differently due to different conditions for the two fields of women's organizations. However, whereas differences are evident, there are also noticeable similar issues within the two cases which I argue are connected to the process of organizing a social movement in relation to the international level, and in particular to the process of creating meta-organizations (Ahrne & Brunsson 2008) – that is, associations of organizations. Drawing from new perspectives within organization theory which looks beyond formal organization and organization as entity, the paper seeks to contribute with a combined social movement and organizational analysis. The paper contributes with an understanding of how the EU impacts on social movements and how national-level social movement increasingly need to relate to the international level. The paper aims at showing how, at the same time as social movements are self-emerging in character, collectively forming order through networks and institutions, organization is at the heart of movements. It also contributes to an understanding of the intricacies of having one organization 'speaking for' the movement.

Contemporary Processes of Social Self-Organization in Spain: Movements of the Multitude

Malaina, Alvaro

University Complutense of Madrid, Spain
alvaromm[at]pdi.ucm.es

We will study the two most outstanding events of social self-organization in Spain that took place in recent times: the 15-M in Madrid and October 1 in Catalonia. We will present them as a paradigm of social self-organization. As a theoretical framework we will draw on the theory of the multitude by Hardt and Negri and on the theory of complexity by Edgar Morin. In the case of May 15 2011, in a context of economic crisis and neoliberal adjustment policies and bank rescues, thousands of "outraged" young people occupied the squares in Madrid and other Spanish cities, self-organizing a protest movement, through social networks, regardless of political parties and unions. A structure of "rhizome" (Deleuze and Guattari) was adopted, horizontal and without leaders. In the case of the October 1 2017, half of the Catalan society self-organized to launch a referendum of self-determination against the recentralizing and neoliberal policies of the Spanish conservative government. In a context of violent police repression, polling stations were occupied, ballot boxes were bought and hidden, and scrutiny was carried out in a self-organized manner. Both are recent expressions of the complex self-organizing potential of what Hardt and Negri call the multitude, thus transcending their specific location and determined political context and becoming part of a general paradigm of anti-systemic social movements in the era of neoliberal globalization, which operating from "a plane of immanence" (Deleuze) seek to build new subjectivity, more cooperative than competitive, and new social structures more just and democratic.

Policy Professionals in Civil Society: Power on the Members' Mandate?

Mellquist, Joanna

Södertörn University, Sweden
joanna.mellquist[at]sh.se

This article examines the role of policy professionals in civil society organizations. Scholars have noticed a change in the organizational structure of civil society: more and more organizations organize fewer members (Amnå, 2008., Ahrne & Papakostas, 2014., Harding, 2012). At the same time, the organizations have become more professionalized, and the amount of employed staff of these organizations is growing, leading to an increasing gap between those who lead and those who follow (Amnå, 2008). The professionalization and development of highly skilled expertise at national civil society level raises questions about the political power of these organizations. Who are formulating the organizations' goals and how is political power organized in civil society? This article theorizes policy professionals in relation to members' participation, legitimacy and policy impact. When and how are the members part of formulating the organization's policy?

What are the relations between policy professionals and the member-groups they serve? Drawing from thirty ethnographic interviews and shadowing in Swedish civil society organizations this article investigates member organizations' policy impact on formulating processes. This research brings together the literature of political elites, policy professionals and the professionalization of civil society. From the ethnographical fieldwork, focused on the incentives, norms and attitudes that policy professionals promote in civil society, policy professionals' roles have been explored. This article furthermore points towards a growing tension between the member-based organizations and their growing professional elite.

EU Legacies: A Panel Study of Czech Social Movements

Vrablikova, Katerina

University of Bath, United States of America
kv327[at]bath.ac.uk

Democracies in East Central Europe (ECE) are currently going through a hard test. Unlike at the beginning of the 1990s when democracy was "the only and the best" type of political regime, major political actors – prime ministers, significant political parties, and prominent figures of political life – are now challenging the democratic system of government. Either in the form of "illiberal democracy with strong leadership" (Orban in Hungary) or "effective governance by experts from business" (Babis in the Czech Republic), many ECE countries experience democratic backsliding. What role do various advocacy organizations play in this process and what determines their advocacy strategies? The paper distinguishes between the guardian (civic and voluntary associations as agents that control and oppose the state, typically protest) and governance (advocacy organizations as an integral part of governance, related to policy-formulation types of advocacy) role of social movement organizations. It suggests that variation in the forms of advocacy in the context of democratic backsliding is closely related to advocacy styles that organizations had developed in the past, specifically in the context of Europeanization of civil society and state structures that promoted governance styles of advocacy. Consequently, organizations that were "socialized" into the governance type are less likely to use the guardian strategies. Importantly, this effect is conditioned by the current access to state structures (i.e. the acceptance by the current governments) that allows the organizations to use governance style of strategies. The study uses panel survey data on 150 Czech social movement organizations collected in 2008 and 2018.

RN26 | Sociology of Social Policy and Social Welfare

RN26_01 | Non- takeup of benefits or services

The Non-take-up of Welfare Benefits - A Strange Normality

Wilke, Felix

German Statutory Pension, Germany
felixw83[at]gmail.com

The non-take-up of social benefits has so far played a negligible role in social policy research. At first glance, this seems justified: Who would deliberately waive support to a considerable extent? In contrast, the few research projects conducted so far show that non-take-up is widespread in a range of means-tested welfare programs. These studies, however, have some limitations: First, they focus on means-tested programs. Second, they deal primarily with practical issues, like ‘How many people are eligible and yet do not claim benefits?’ and ‘Why are benefits not claimed?’. While revealing interesting empirical insights, they lack a thorough understanding of the phenomenon. In my contribution I will develop a theoretical understanding of social policy that deals with the non-take-up of benefits as an integral part of social welfare. It analyses the phenomenon from a relational perspective between personal actions and institutional rules. Institutional rules are set by social rights that define certain standards of normality, to which individuals have to relate their actions. In contrast to a deficit-oriented approach, individuals are considered as carefully considering consequences of claiming benefits with regard to their living situation. Based on the theoretical analysis, it will be shown empirically with special focus on Germany: (1) that non-take-up is an integral part of welfare programs, way beyond means-tested programs; (2) that the extent of non-take-up depends on the relation between institutional normality standards and the individuals’ living situations; (3) which consequences high levels of non-take-up have for the legitimacy of the welfare state. The empirical analysis will be based on a wide-range of existing non-take-up studies from different social policy realms and the European Social Survey from 2016.

Shifting Welfare Boundaries: Paradoxical Outcomes of Activation Policies

Rosenstein, Emilie; Bonvin, Jean-Michel

University of Geneva, Switzerland
emilie.rosenstein[at]unige.ch, jean-michel.bonvin[at]unige.ch

Social policies rely on specific expectations vis-à-vis their beneficiaries, who have to abide by certain eligibility criteria or behavioral standards in order to deserve the benefits or services provided. As such, social policies draw boundaries between the deserving and undeserving, which results in the following paradox: while social policies claim to be universal, they actually exclude potential beneficiaries by imposing on them the compliance with these eligibility criteria and behavioral standards. In other words, purportedly universal social policies may have exclusionary effects, in the form either of selectivity (street-level bureaucrats select what they perceive as legitimate beneficiaries) or of auto-selection and non-take-up (people entitled do not claim benefits or services). Based on the case of the Swiss disability insurance, this contribution explore the extent of, and the reasons underlying, this paradox (universal policies producing exclusionary effects) resulting from a universalistic approach to activation, esp. regarding vulnerable groups’ access to benefits and services. It relies on a mixed-method research design, combining quantitative data (i.e. sequence analysis, showing the selectivity of active reforms regarding people’s access to disability benefits) and qualitative data (i.e. biographical interviews, revealing paradoxical outcomes of active reforms on the “sense of entitlement” of disabled people, towards auto-selection and higher risk of non-take-up). The results presented draw on research conducted in the framework of the NCCR “LIVES – Overcoming Vulnerability: Life Course Perspectives” funded by the Swiss National Science Foundation.

Barriers in Accessing Services and Monetary Benefits – A Comparative Perspective with New Insights from a Study on the German Basic Safety Net

Lüth, Ralf Maxime

University of Kassel, Germany
lueth[at]uni-kassel.de

Means-tested basic safety nets have become integral to modern welfare states, providing a replacement income for those individuals lacking sufficient market incomes. While comparative welfare state research has focussed on the variance of services and benefits provided in different countries as to their adequacy and the groups that are covered by them, a new research agenda has emerged highlighting the actual access to services and benefits. In light of phenomena summarised under the term “non-take-up”, arguments are brought forward, that the impact of social policies is not sufficiently captured if researchers restrict their scope to differences in formal rules, regulations and stated rights – rather than studying problems and shortcomings in certain social policy fields empirically. Building on a study on the basic safety net in Germany, this presentation focusses on the barriers to taking up benefits and the ways in which a variety of mixed methods can be applied to shed light on these phenomena. The possibilities and challenges of comparing scope and structure of these phenomena in different European countries will be discussed. Conceptually access to these benefits is shaped by the intertwinement of state and non-state organisations, professionals and the (potential) service users themselves as well as institutions and norms beyond the specific subsystems. For instance attitudes (moderated by media depictions and peer groups) play a significant role in the formation of behaviour vis-à-vis the welfare state and should be taken into account when attempting to paint a fuller picture of the actual impact of different welfare states.

RN26_02 | Labour administration and activation policies

Dare more Autonomy in Job Placement? Barriers and Belongings in Contractual Relations between Job Seekers and Job Centres

Freier, Carolin; Senghaas, Monika

Institute for Employment Research, Germany
carolin.freier[at]iab.de, monika.senghaas[at]iab.de

Under the label of activation policy, European welfare states developed between different paths of workfare and enablement. In the German public employment service, an important element of this activation policy is a public law contract between job seekers and job centres. The so-called integration agreement defines what benefits the unemployed receive for integration into work, what efforts they should make themselves and how these can be proven. Moreover, the agreements inform about financial sanctions imposed if job seekers fail to meet their obligations. On the one hand, the binding form of a contract allows job seekers to have a voice in the process. On the other hand, it is a power asymmetric situation with limited bargaining power of the job seekers. The presentation examines the barriers and belongings that characterise the contractual relationship between job seekers and job centres. The Institute for Employment Research conducted a field experiment: In the years 2017-2018, on the options to sanctions integration agreements varied in participating employment agencies. Empirically, the presentation draws on qualitative data from this field experiment: semi-structured interviews and group discussions with caseworkers as well as participatory observations of counselling interviews with subsequent interviews of both contracting parties. The presentation shows barriers in the contractual relationship for both case managers and job seekers. The analysis further indicates that the quality of membership in contractual relations depends on whether caseworkers assign the attribute of a “motivated unemployed person” to job seekers. Overall, the results suggest that increased autonomy for job seekers and caseworkers may strengthen the cooperative and supportive aspects of the integration agreement as well as social policy.

Job Search Requirements, Unemployment Duration, Job Related Concessions and the Reform of Welfare in Germany

Christoph, Bernhard; Lietzmann, Torsten

Institute for Employment Research (IAB), Germany
bernhard.christoph[at]iab.de, torsten.lietzmann[at]iab.de

The German welfare reforms of the early 2000s constituted a major effort to modernize one of the key pillars of the German welfare system. In the course of these reforms, the government introduced the Unemployment Benefit II (UBII) as a new, means tested, basic welfare measure that the unemployed receive if there are not or no longer entitled to unemployment insurance benefits. A particular characteristic of the UBII is that the unemployment administration expects unemployed recipients to accept job-offers that—in comparison to their former job—carry several disadvantages. This builds on the assumption that being less selective regarding future employment should improve employment chances. We test this assumption using a unique administrative data set. As these data include detailed longitudinal information on unemployment and job-search spells, we are able to detect changes regarding the job searched for within spells of unemployment. This allows us to analyze recipients' chances to regain paid employment and whether making job related concessions improves these chances. Doing so, we can operationalize concessions using occupation-based indicators (e.g. required qualification) from recipients actual job search histories and not (as in most of the literature) based on hypothetical survey questions (e.g. on reservation wages). While our analyses find no positive effect of making concessions on reemployment chances, searching a different job (that not necessarily implies a concession) has a substantial and positive effect. Thus, it appears that being generally flexible regarding one's future occupation might be more important for reemployment chances than accepting less qualified employment.

The Role of Knowledge in Social Policies: Providing Access or Creating Barriers?

Mozzana, Carlotta

Università degli Studi di Milano-Bicocca, Italy
carlotta.mozzana[at]unimib.it

The contribution addresses the issue of the role of knowledge in social policies, with a focus on the deployment of numbers in accessing them. The paper is divided in two parts. In the first one, the conditions that have contributed to push the use of quantification tools in every stage of the policy process are analysed and a theoretical toolbox that can help to investigate the role of numbers and indicators in governing public policy is developed. The second part is devoted to the analysis of quantification tools in active labour market policies, where those instruments are widely used in order to allow policy administrators to distinguish among different levels of risk in

individuals approaching the labour market. A recent case study is here presented: the national profiling system adopted in Italy in fulfilment of Youth Guarantee, a European public policy whose aim is to support young Neets (individuals that are currently not in employment education or training) entering the labour market via dedicated services. The contribution will show how, instead of providing young persons with highly tailor-made projects, the use of a quantification tool to regulate the access to services and economic support not only standardises the personal paths, but also perpetuates the most fragile Neets' disadvantage, while at the same time it contributes to the process of depoliticization of public action.

Enabling Dimensions in Evidence-based Collaboration Practices of Activation Workers and Mental Health Professionals

Bakkeli, Vidar

Oslo Metropolitan University, Norway
bavi[at]oslomet.no

Literature on active labour market policies (ALMP) have focused on disciplining dimensions of activation and social security, such as increased conditionality and sanctions. Less attention has been given to enabling dimensions such as counselling and support practices in activation services, implementation of more holistic and tailor-made approaches, as well as the role of cross-sectoral collaboration, networks and service integration. Knowledge about these dimensions is important in order to solve wicked social problems related to inclusion, marginalisation, unemployment and health. Using qualitative data collected in two municipalities in Norway in 2017-2018, this paper explores how frontline activation workers and mental health professionals reflect on enabling, supportive as well as disciplining elements in their follow-up and treatment practices. These professionals participate in an evidence-based supported employment model called Individual Placement and Support (IPS), aimed at unemployed people with moderate to severe mental health illness. User orientation, integrated services and individualized follow-up are central principles in the model, and IPS is currently being implemented in a growing number of labour and welfare administration offices and municipalities in Norway. The paper contributes to the literature on ALMP, activation and welfare services in several ways. First, it shows how frontline professionals' reflects on supportive, enabling and disciplining elements in their practice. Second, it explores how the evidence-based model influence and change professional practice. Third, it identifies tensions between professional practice, manual requirements and the organizational implementation context.

RN26_03 | Populism and welfare chauvinism

Welfare Attitudes and Support for Different Types of Populist Parties

Saxonberg, Steven (1,2); Sirovatka, Tomas (1)

1: Masaryk University, Czech Republic; 2: Comenius University, Slovakia
saxonberg90[at]gmail.com, sirovatk[at]fss.muni.cz

Much has been written lately about the rise of populist parties, but much less on the connection between welfare attitudes and support for such parties. In addition, the literature on welfare attitudes and populism has mostly focused on radical right-wing populist parties. However, recently more centrist types of "entrepreneurial populist parties" have arisen, such as ANO in the Czech Republic, while "left-wing" populist parties have come into power in such countries as Slovakia and Greece and have gained support in such countries as Spain. This article will use ESS survey data to examine the links between socio-economic variables, welfare attitudes and voting for various types of populist parties. We will apply multi-level multinomial regression.

The Welfare State and Welfare Chauvinism in Europe: Keeping Pace or Losing Ground?

Boskovic, Branko

University of Donja Gorica, Montenegro
branko.boskovic[at]judg.edu.me

Populist movements are increasing their presence in European countries and even becoming regular partners in governments. Their political strength is fueled by globalisation and migrations, but also by other internal and external pressures, ageing population, unemployment, insecurity, to name just a few. The welfare state is being neoliberalised, retrenched and under pressure and there are rising fears that populists will only further contribute to its demise. The paper will address the issue of welfare chauvinism as the main ideological standpoint of populist parties. Existing studies look at perception of populists or at specific case studies but the question of their actual effect on the welfare state, especially of funding of social protection is not debated. Do populists contribute to decreases of the welfare state budget or not? Welfare chauvinism raises the question of who is entitled to welfare services and natives are counter-positioned to non-natives but the crucial question is whether the budget for social protection is decreasing. In other words, do populists just keep their discourse or the welfare funding is under threat? The paper will use Eurostat and OECD data to present welfare chauvinist effects on social protection budgets, presenting budgeting for specific policy areas. It will show which policy areas are closely related with welfare chauvinism

and whether their funding is affected, also pointing to differences between welfare regimes on the European continent.

The Wrath of The Honest Working Man: Structural and Attitudinal Covariates of Welfare Chauvinism in A Country Without Immigrants

Hatos, Adrian

University of Oradea, Romania
ahatos[at]uoradea.ro

Welfare chauvinism has been a debated topic in social sciences in the aftermath of the great recession of 2008-2010 and the sudden raise in popularity of populist movements all across the world and especially in the European Union. While the correlation of welfare chauvinism with the conservative-populist thinking is well-acknowledged, the debates on the issue relating it to immigration - welfare nationalism - can be misleading. The attitudes that consider welfare provision illegitimate to undeserving categories can have a firm ground even in absence of immigration but with a background where social exclusion is correlated with ethnic heterogeneity as in the case of Romania. In my article I explore the extent and the structural and attitudinal covariates of welfare chauvinism in Romania in a large sample of adults (N=1712) surveyed online using as dependent variable a score built using a three-item scale to measure hostility towards unmerited welfare. While bivariate analyzes show strong correlations with indicators of subjects' structural position in the world (education, income, occupation, age, gender, type of residence) as well as with measures of core political values - including right-wing authoritarianism, trust and placement on the materialism-postmaterialism scale and interesting correlation with political partisanship I employ multivariate analyzes to discern the fallacious correlations and mediating effects. In the interpretation section the relationships of anti-Roma narrative with increasing right-wing populism and its' outcomes including welfare chauvinism are discussed.

Welfare Stigma and the Public Gaze

Syltevik, Liv Johanne (1); Lundberg, Kjetil Grimstad (2)

1: University of Bergen, Norway; 2: Western Norway University of Applied Sciences
Liv.Syltevik[at]uib.no, Kjetil.Grimstad.Lundberg[at]hvl.no

The aim of this article is to discuss the social division and dynamics of welfare stigma. The Norwegian case is suitable to explore these issues in a context of low unemployment rates and a social democratic welfare regime. The role of receiver of welfare support is, however, under scrutiny in ways that resembles the discussion in other European countries. The discussion of how to keep welfare expenditure down is high on the public agenda, and there is concern about commitment to work and whether it has become too easy to get economic support. This article explores how welfare recipients are framed in the public debate and subjected to welfare stigma in this context. Empirically we analyze several public welfare related debates the last decade and compare the dynamics of welfare stigma in relation to different types of welfare benefits. Theoretically we use Goffman's work on stigma and Titmuss' discussion of the social division of welfare as points of departure. Keywords: Stigma, welfare benefits, social division of welfare, dependency, activation policy.

RN26_04 | Parenthood and family support

Bottom-up Approach in Social Planning and Outcome Evaluation: A Case-Study of Parenthood Support Program in South Italy

Balenzano, Caterina; Moro, Giuseppe; Cassibba, Rosalinda

University of Bari, Italy
caterina.balenzano[at]uniba.it, giuseppe.moro[at]uniba.it, rosalia.cassibba[at]uniba.it

The qualitative study analyzes a parenthood support group (PSG) provided in the context of a Family Centre Services (FCS) located in a suburban-area of South-Italy, putting together data from participant observation and focus group discussions (FGD) involving users and social workers. Parents' requests, expectations, outcome and unmet needs have been considered: a) to evaluate the experience of a PSG and to guide the planning of new project activities in the service (bottom-up social planning); b) to identify specific constructs of the parenthood - representing both users' needs and expected outcome of the program- usable to experiment evidenced-based need assessment and outcome evaluation systems (bottom-up assessment and evaluation). Regarding the first aim (a), results highlighted that initial parents' expectations to receive a practical help regarding family conflicts and sons' problems (explicit needs) become awareness of their need for

interpersonal confrontation and social sharing, in order to improve oneself as persons and as parents (implicit needs). The high level of satisfaction expressed by participants confirms the social workers' ability to intercept their real needs and planning a tailored-made intervention aimed to promote parental competences. The coherence between parents' needs and outcomes denotes a strength of the implementing model adopted by social workers, but the lack of a direct confrontation between parents and sons represents a barrier to the family cohesion. These results have guided the planning of specific activities where more family members are involved. Regarding the second aim (b), researchers have hypothesized an evaluation protocol to use both to estimate the effectiveness of parenting support activities (pre-post comparison) and to adopt an empirical need assessment model usable to plan specific activities, according to a bottom-up approach.

How Unconditional Cash Transfers Can Change Social Welfare? The Impact Of The "Family 500+" Programme On The Structure Of Welfare Recipients In Poland

Trochymiak, Mateusz Robert

Warsaw University, Poland
trochymiak.m[at]gmail.com

The "Family 500+" is the name of the child benefit programme dedicated to the all polish households with more than a one child. The "500+" benefit cannot be treated as income to those who apply for the social welfare support and means-tested cash transfers. Before the programme was introduced in 2015, there were two competitive hypothesis about the impact on the welfare recipients. The first one assumed that financial situation of the welfare recipients will improve and they will give up other cash benefits, mainly because of the high cost of receiving it. The second, more popular, assumed that welfare recipients are "welfare dependent" and despite an improvement of financial situation they will continue to consume other cash benefits. Analysis of the changes in the structure of population of social welfare recipients between 2014-2017 verified those hypothesis. The analysis focused on change in the households with children (target group of the "Family 500+") and lonely parents. The data cover the population of the social welfare recipients in Poland. Data used in analysis was shared for the purpose of the project "The role of the social transfers in the household budgets of the welfare recipients in Poland" financed by the National Science Center 2017/25/N/HS5/01623.

Expectant Parents and Midwives' Experience Following a Maternity Ward Closure: Risk, Distance and Power

Larsson, Emelie

Mid Sweden University, Sweden
emelie.larsson[at]miun.se

Centralization politics have affected the organization of maternity care in countries around the world, often resulting in closures and relocation of smaller maternity units. In sparsely populated countries with vast distances, such changes have meant an increased number of people who need to travel far to reach maternity care. In Sweden, a reorganization of the health-care system in the 1990s – transforming the previous welfare model to one inspired by New Public Management – has been a key reason to the closure of several maternity units, the majority located in Sweden's northern region. In 2017, the closure of the maternity ward at the hospital in Sollefteå, an 8000 inhabitants town, sparked a broad public debate as the locals occupied the ward. The study builds on interviews with expectant parents in the town, as well as midwives who used to work at the ward, focus being on how the interviewees narrate risk and distance. Drawing on a feminist theoretical perspective, risk and distance are in this context understood as simultaneously material and abstract phenomena that intersect with power structures such as gender and center-periphery. Preliminary results suggest that parents and midwives associate risks with three categories of distance: geographical (the route to the hospital), social (feeling dislocated in the "new", bigger hospital), and political (feeling ignored by decision-makers). In different ways, the interviewees' social position determine how they perceive risk and distance in the new situation.

Single-parenthood and the Welfare State - Towards Adaptive Universalism?

Wagener, Martin

UCLouvain-CIRTES, Belgium
martin.wagener[at]uclouvain.be

The Belgian welfare state was historically structured regarding socio-professional situations and family status, which also referred to different forms of solidarity and care inside the family. Based on a research regarding single-parenthood in Brussels, we will address how recent transformations struggle to better adapt to transformations regarding the way individuals live together with others and how they share parental responsibilities. Inspired by the founding works of Blumer (1971), we will retrace through a sociological perspective how different actors (public administrations, governments, unions, as well as the « civil society » and researchers) have participated at a long process of « collective definition » that constructed single-parenthood as a new category (Dubois, 2009) of regional work policy and federal social welfare policy. Based on a qualitative survey

(observation and interviews), as well as longitudinal statistics, we analyse how the various situations of single-parenthood are approached through the tension between the will to assert and recognize the specificities of these situations (cf. targeting), and the choice to favour a universal approach. The notion of "adapted universalism" permits to explain, following our hypothesis, the connections that were carried out the last years with work and welfare policy.

RN26_05 | Healthcare policies and provision

Government-market Conflict in Chinese Health Policy Development: A focus on Public-Private-Partnerships

Cheng, Qiuxian

University of Sydney, Australia
qiuxian.cheng[at]sydney.edu.au

Chinese health policy has been undergoing a pendulum-like movement since 1978. This paper traces the development of Chinese health policy from a centrally planned system to a market-oriented one since 1978, a recovery of government's leading role in 2009, and a swing back to the market with the introduction of Public-private-partnerships in recent decades. The major conflicts producing such a movement are discussed, with specific focus on conflicts underpinning the use of Public-private-partnerships. Conflict between improving the efficiency and guaranteeing the fairness of healthcare system, as well as the big context of economic reform since 1978 and people's growing medical and health need jointly drove the historical change of health policy both endogenously and exogenously, and the conflict sharpened with the health field opening up to private investment. As a consequence, an unfair healthcare system has emerged, where accessibility and the quality of health care is decided by a patients' payment ability. These problems with China's health system serve as a critical lesson for other countries.

Regulatory Challenges in Turkish Internal Market in Health Care: The Case of Financial Protection of Patients

Yilmaz, Volkan

Bogazici University, Turkey
vyilmaz[at]boun.edu.tr

Establishment of internal markets in health care in publicly funded health care systems brings forth a number of new regulatory challenges. During the 2003 health care reform in Turkey, achieving universal health coverage (UHC) occurred in concurrence with the establishment of an internal market in service provision and a subsequent increase in private sector activity in health care provision. In this context, this paper explores how internal market in health care, as practiced in the Turkish context, has influenced the financial protection of patients in the Turkish health care system. In doing so, the paper examines the emergent modalities of informal payments in patient access to public service providing private hospital services and reasons behind the emergence of informal payments. Data for the study came from the customer complaints appeared on a private online platform and 20 patient interviews. The study found that internal market in health care in service provision has undermined the publicness of the system by engendering new forms of informal payments that include unregistered payments and registered overpayments. Two reasons, information asymmetry between patients and providers and the contestations over the norms upon which the hybrid health care system rests upon, underpin the emergence of informal payments.

How Public Perception and Expectation Affect Welfare Evaluation: An Empirical Study of The Chinese Public Healthcare Provision

Cai, Chang

Nankai University, China, People's Republic of
caichang0206[at]gmail.com

The Chinese government has invested heavily to establish a more universal and equitable public healthcare system for welfare provision since 2009, but the satisfaction of public healthcare system remains relatively low. Previous researches have demonstrated that individual socioeconomic characteristics and service quality are influential factors affecting their perception of a satisfactory system. However, few studies shed light on the process of cognitive reasoning, which affects an individual's characteristics and perception of satisfaction. Using the data from 2015 Chinese General Social Survey, this research explores how socioeconomic factors are associated with (1) people's perception of distribution inequality and (2) expectation of the government as welfare provider, as well as how these two cognitive factors determine the satisfaction of public healthcare provision. The structural

equation model showed that socioeconomic factors have both direct and indirect impacts on public satisfaction, while people's perception of distribution equality is the most important factor in determining their satisfaction. Educated individuals have a higher expectation of the government and inequality perception, contrary to upper-class people. Although socioeconomic factors affect people's cognitive reasoning differently, there is an overall coherence that people may express more dissatisfaction due to the relatively high expectation of government and perception of inequality. This paper addresses the importance of establishing widely accepted distribution rules and coverage of welfare. It provides a different perspective to reduce people's deprivation and enhance public evaluation of welfare provision. Keywords: inequality perception; expectation; satisfaction; public healthcare.

What is Social Isolation? Exploring Isolation as Theoretical Concept and Empirical Phenomenon in Science

Rasmussen, Erik Børve; Johannessen, Lars E. F.; Haldar, Marit

OsloMet, Norway
fossan[at]oslomet.no, larsem[at]oslomet.no,
mariha[at]oslomet.no

Social isolation is receiving widespread political attention – especially in Western societies, where it is considered a growing problem due to increasing individualization and compartmentalization. The issue also attracts much academic attention, with studies particularly addressing the extent and consequences of social isolation, asking questions such as 'who and how many people are isolated', 'is the isolation problem increasing' and 'what kind consequences can social isolation have'. These studies are inevitably based on assumptions about what social isolation is and implies; however, while social isolation is often conceptualized within each article, there has been little research into how the concept is defined and operationalized across current studies. In this study, we thus ask how social isolation is understood in the research context. Based on a critical and explorative document analysis of the 100 most cited articles on 'social isolation' (published in English between 1998 and 2018), we show that the literature is dominated by articulations of social isolation as a health problem for the isolated individual. As such, it is a personal problem of reduced physical and mental well-being, and primarily a matter of health care for the sick and elderly. Moreover, we show that the literature asks many questions about how to amend this problem by technological interventions, but few questions about its societal causes. We then discuss some seminal blind spots regarding the understanding and management of social isolation in existing conceptualizations, and suggest how these may be overcome in future research and debates on this highly pertinent topic.

RN26_06 | Child and youth welfare

Who Benefits from Child And Youth Welfare In Germany? An Analysis of Social Inequalities Based On New Standardized Data

Sander, Tobias (1); Weckwerth, Jan (2)

1: International University of Cooperative Education, Darmstadt and Berlin, Germany; 2: University of Göttingen, Germany
tobias.sander[at]internationale-ba.com,
jan.weckwerth[at]gmx.de

Besides the central social securities regarding (un)employment, health and (old) age, the German welfare state provides substantial services in the field of child and youth welfare beyond formal education. Costs have increased considerably in recent decades, which is paradoxically partly a result of concerns about a subsequent, and even more cost-intensive, need of help. The educational family support is labeled as a 'help for all', not only for the lower classes. In fact, the paper argues that these public-sector services are accessed in a V-shape-distribution: In addition to the lower classes as the typical recipients, the highly educated middle classes benefit in particular from these services. Why are the lower middle classes underrepresented? To explain these findings, data from the panel-study 'families in Germany' is evaluated for the first time. The paper applies different concepts of social inequality to this data and deals with the specific views of social inequality in German social work.

A modern-day Pied Piper? Migrants to Norway, the Child Welfare Services, and rumour

Vassenden, Anders (1); Vedøy, Gunn (2); Handulle, Ayan (1)

1: University of Stavanger, Norway; 2: Norsk Lærerakademi, Norway
anders.vassenden[at]uis.no, gunn.vedoy[at]nla.no,
ayan.handulle[at]uis.no

Numerous media accounts and a growing body of research reveal that many migrants to Norway are distrustful of the country's Child Welfare Services (CWS). Migrants' and ethnic minorities' fear of the CWS's equivalents has been noted in other countries, too, most notably the US, but as a social problem and sociological question, it is under-theorized and its causes are not well understood. Using a unique combination of survey data on trust in Norway's CWS among migrants and non-migrants, and qualitative interviews and ethnography with migrant associations and Somali parents, this paper provides novel findings and theoretical interpretations of this social problem. We highlight an aspect that prior research has

neglected, namely the role and impact of rumour. Using regression analysis, we first show that exposure to other people's stories about the CWS reduces individuals' trust in the agency to a considerable extent. The reasons for this are found in the qualitative data we collected: they show that distrust of the CWS needs to be understood as a social dynamic in which bonding social capital, stigma, shame and stories play important roles. The result is very little discussion among parents and their acquaintances about their positive or non-consequential encounters with the CWS and a corresponding overemphasis of drama and traumatic experiences, such as care orders and forced removals. In conclusion, we call for research on this topic in the virtual world, as stories and rumor about the CWS proliferate on social media and thus have unbounded dissemination potential.

Not in Charge, But Affected: Open Youth Work and Young Refugees in Germany

Mairhofer, Andreas

German Youth Institute, Germany
mairhofer[at]dji.de

Supporting and integrating refugees is an issue that concerns the whole of society. But formally, as long as the refugees are (unaccompanied) minors, responsibility lies with the child and youth welfare system. Primarily, local authorities' Child and Youth Welfare Services are in charge of providing shelter and support. Additionally, public and private child welfare organizations are involved in providing accommodation, education, psychosocial support, leisure time activities and so on. Amongst these are open youth work institutions, e.g. youth clubs. Using the example of open youth work, I will illustrate how broader societal developments affect welfare sectors, even if they are not directly 'connected' to these issues. There has been ample political reforms of the (child) welfare system in the light of the growing number of refugees, but not with regard to the field of youth work. Nevertheless, the activities and even the structure of the field are changing, although the changes were neither politically intended nor are they being recognized. My presentation will be structured as follows: I will first outline the main services and responsibilities for young refugees in Germany. Second, I will introduce the field of open youth work. Finally, I will describe how youth work organizations have been affected by and have reacted to the arrival of thousands of minor refugees from 2015 onwards. I will do this using data from a national survey on youth work provisions, carried out in 2018.

Sustainability Dilemmas of a Program to Combat Child Poverty

Kiss, Márta (1,2); Perpék, Éva (1,2)

1: Hungarian Academy of Sciences, Centre for Social Sciences;
2: Corvinus University of Budapest
Kiss.Marta[at]tk.mta.hu, eva.perpek[at]yahoo.com

The sustainability of public-funded projects is not only an expectation of the financiers and duty of the implementers, but because of large scale investments also a kind of moral issue. In our concept, sustainability as a process primarily means a durable continuity of interventions which can be realized in several forms and degrees. Additionally, it is a dynamic and cyclical process responding to the needs of the target group(s) during which the original mission of the project does not change. Our research aims at exploring sustainability angles of the Hungarian Program to Combat Child Poverty. This program was and still is implemented in disadvantaged subregions of the country. The main goal of the program is to alleviate child poverty and level social inequalities. The program is mainly realized by strengthening the mainstream social services institutions. Our research was conducted in 9 selected subregions in 2015. To tackle sustainability aspects of the program we used qualitative methods: 90 semi-structured thematic interviews and observation in the field. In our presentation, we analyze both general and specific factors essentially affecting the program's sustainability. First, we introduce external and internal elements and limits of the project maintenance. Then we point out the ways in which the local programs responded to the challenge of sustainability. Finally, we present preliminary conclusions of a new fieldwork accomplished in 6 subregions, where we started longitudinal research in 2018. In this phase of the research we examined the design and set up of new projects to Combat Child Poverty.

RN26_07 | Attitudes to and perceptions of welfare

A Neoliberal Framework for The Italian Welfare Changes

Ficcadenti, Cecilia

University of Rome - Sapienza, Italy
cecilia.ficcadenti[at]uniroma1.it

The last global economic and financial crisis definitely challenged the European social model, pushing for economically efficient and socially effective strategies. Since then, Italy faced a huge State retrenchment in funding social policies. Moreover, Italy is a country where welfare services are mostly supplied at the local level and cities and regions are limited by the internal budget balance. In this scenario, private and economic actors, slowly but steadily, begun to engage in welfare supply and financing, even that scholars devised a new label for this turn: second welfare. The literature argues that market and private actors' commitment are social innovations able to counteract welfare dismantling, led by the crisis'

pressure. Conversely, the research hypothesis is that the case of the "second welfare" is an empirical derivation of the longstanding neoliberal paradigm in Italy. The theoretical argument is supported by the analysis of the actors involved, the operational mechanisms, and the ideas that the post-crisis welfare turn carries on. The research findings show that economic actors advancement in welfare arena is a driver for welfare services privatization and commodification, under theegis of welfare sustainability. To strengthen the research result, data analysis has been contrasted to the main stream theoretical concept that frame contemporary welfare changes: social innovation and social investment. The analysis is a first step for a wider empirical research. Indeed, other questions have –yet –to be answered, which can be sum up in: is the Italian welfare state changing into a space for capitalist accumulation?

Does Support for Redistribution Vary Over the Life-Cycle? A Pseudo-Panel Approach

Moreira, Amilcar (1); Barslund, Mikkel (2); Manso, Luis (1)

1: Instituto de Ciências Sociais da Universidade de Lisboa, Portugal; 2: Centre for European Policy Studies, Belgium
amilcar.moreira[at]ics.ulisboa.pt, mikkel.barslund[at]ceps.eu, luis.manso[at]ics.ulisboa.pt

Going all the way back to the work of Meltzer and Richard (1981), a vast literature has developed on the factors that shape support for redistribution as a means to promote a more equalitarian distribution of economic resources - be it income or wealth (see, Neher, 2011). Most of the literature on this topic suggests that individuals' attitudes reflect individuals' perceptions of the need for social protection, and to how this is shaped by the different contexts in which they find themselves over their lifecycle, and the institutions that regulate collective life (see Galasso and Profeta, 2004; Goerres 2007). This contrasts with the findings of Tilley (2002) or Fullerton and Dixon (2010), who argue that individuals' political preferences are fundamentally shaped in the historical period in which they have formed their political views, and remains stable there forward. Taking advantage of a cross-national pseudo-panel, built using data from the European Values Study, this paper looks at whether, once we control for cross-national and institutional differences, support for redistribution varies over individuals' life-cycle or remains (relatively) stable over the life-course.

The Sectoral Boundaries and Power in the Governance of Welfare – A Sociological Analysis of the State Funding to the Third Sector Organizations in Finland

Kankainen, Veera Emilia

University of Helsinki, Finland
veera.kankainen[at]helsinki.fi

This study unfolds how the state grants to Finnish third sector organizations (TSOs) reproduce the sectoral boundaries and power relations in the governance of welfare. Traditionally, the mainstream non-profit theories describe the state and civil society power relations as zero-sum game and assume the public funding to TSOs to corrupt their voluntary nature. Recently, scholars have addressed that the third sector rarely functions without any public funding. The relationships between the public and third sector are understood interconnected and complex. To tackle this complexity, the study takes the theories of Niklas Luhmann and Michel Foucault as the methodological starting point for the discourse analysis of the 26 interviews conducted in welfare promoting third sector organizations (20) and administrative bodies (6) governing the grants. Luhmann's concepts of autopoiesis and structural coupling enable to simultaneously analyse how TSOs become both differentiated from and coupled with the administrative organizations. Completing the analysis with the Foucauldian notions of power, the study resolves the public steering embedded in the couplings. The results indicate that TSOs are not subsumed into the public sector. On the contrary, the grant discourses reproduce the difference third sector/state by relying the idea that TSOs can grasp the 'needs' of citizens or marginalized groups better than the public sector. Meanwhile, grant receiving TSOs must still practice self-governance and translate their activities into the administrative language. The study ends with a critical discussion about the possibilities of third sector to act as the solution to the wicked problems in the welfare provision.

Welfare as a Right, Gift, or Transaction

Sebrechts, Melissa; Kampen, Thomas

University of Humanistic Studies, Netherlands, The
m.sebrechts[at]uvh.nl, t.kampen[at]uvh.nl

Since 2004 Dutch welfare policies have been decentralized to the local level, thereby giving municipalities more room to design and implement their own policies with regard to unemployment. So far research has paid little attention to people's experiences of welfare in this decentralized policy landscape, especially with regard to how they judge the fairness of the emerging differences between municipalities. Based on empirical findings, we show how welfare clients' perceptions of fairness depend on whether they interpret their welfare benefits to be a right, a gift, or a transaction. How they frame welfare profoundly matters for how they think and feel about the fairness of their rights and duties. In a gift- and

barter-discourse people speak in terms of gratefulness, bad luck or good luck, and express emotions of shame and humiliation. As opposed to a rights-discourse on welfare, in which people tend to describe their situation or differences between municipalities as unjust and express corresponding emotions (anger, indignation). This paper explores how these frames and emotions are related to the municipal welfare regime people are subjected to. By bringing into view experiences of welfare clients under decentralized welfare regimes, we aim to contribute to the debate on devolution from a social justice perspective.

Social Justice through Affirmative Action Policy in BRICS Countries: A Global Perspective

Chowdhuri, Joy Prakash

Shri Venkateshwara University, Amroha, Uttar Pradesh, India
drjoyprakash[at]gmail.com

Affirmative action means special consideration for disadvantaged groups in publicly funded opportunities. The purpose is to level the playing field as the groups preferred are often those that have discriminated against in the past. Many governments around the world have affirmative action policies in public service composition, in publicly provided education and in government contracting decisions. The public service is a vital ground for governments to demonstrate their commitment to affirmative action. The words, affirmative action does not appear in the 1948 Universal Declaration of Human Rights, the foundation document for contemporary human rights discourse. The declaration does, however, contain two intellectual anchors for affirmative action. First, the declaration repeatedly endorses the principle of human equality. Second, it declares that everyone has the right to work, to an adequate standard of living, and to education. The declaration does not command that all will share equally, but it does suggest strongly that there are minimum levels of employment, education, and subsistence that all should share. If we take seriously the promises of employment, education, and sustenance made in the Universal Declaration of Human Rights, the discrepancies in racial well-being in the United States noted by the United Nations report demand affirmative government attention. It seems implausible that such marked differences would occur with no discrimination lurking in the background. The European Court of Justice's (ECJ) interpretive experience with a directive on gender equality in the workplace and affirmative action has evolved incrementally. The International Convention on the Elimination of All Forms of Racial Discrimination stipulates (in Article 2.2) that affirmative action programs may be required of countries that ratified the convention, in order to rectify systematic discrimination.

Evolving Welfare Policies in Fighting and Preventing Violence Against Women in the Euro-Mediterranean context

Donato, Stellamarina

LUMSA University, Italy
s.donato[at]lumsa.it

European welfare states deal with international policies and practices when tackling current sociological issues. Addressing the topic of violence against women is patently part of this structural relation. Cultural tendencies and ideological points of view influence the perception and the degree of understanding of the phenomenon. At the same time, the interest of the community and of stakeholders in the latter is deeply a consequence of international special attention and policies gaining momentum. Welfare policies and violence against women come together in a regional comprehension of the differences that bring about contextualizations of the international fervors and strategies aiming at fighting and preventing the problem of Violence Against Women (VAW). This paper intends to look at the terminology and the implementation in terms of policies, which have broadly spurred the interest in VAW inside the European Union and, specifically, in the Mediterranean area of the regional organization, causing multiple welfare policies and plans of actions. An in-depth analysis of the EU policies on the fight against gender-based violence constitutes an interesting framework for the development of the project, which aims at grasping the degree of welfare policies in forging and having an impact on facing violence against women. In detail, proceeding through the tools of a top-down approach, and accounting for different theoretical approaches on VAW, the goal is to open the debate on the factors that cause different receptions of international documents within the EU-regional system, with a particular focus on the Spanish and Italian context. Keywords: Welfare policies; gender policies; Violence against women; European Union; Mediterranean social welfare.

Understanding Inclusion Policies and Practises in Post-Socialist EU countries

Fylling, Ingrid (1); Baciú, Loreni (2)

1: Nord University, Norway; 2: West University, Romania
ingrid.fylling[at]nord.no, baciú.loreni[at]gmail.com

Former socialist countries that have recently joined the European Union face difficulties in adapting to and implementing EU policies on the inclusion of disadvantaged populations. The European Union has addressed this through redistributive regional programmes, extensive inclusion policies and action plans targeting the most vulnerable populations. Nonetheless, development is slow and the question remains how well the social policies developed by the EU, and the mechanisms established to enforce them in various countries, address the actual problems on the ground.

Although the EU policies are often incorporated into national policies and legislation, research suggests that they do not seem to have the intended impact on the situation for the groups in question. The new post-socialist EU member states from the expansion in 2004 and 2007 are poorly integrated in comparative welfare research. However, during the last years we have seen some fruitful contributions to understanding the characteristics of the welfare systems in the Central and Eastern European (CEE) new member states. These important contributions has largely focused on social policy analysis (Kuitto, 2016, Rasell et al, 2014), while comparative analysis focussing on the implementation of inclusion policies in particular have so far been scarce. Rose (1991) argues that 'before we can understand interaction between nations we must understand what goes on within them'. Using observations from eight different empirical studies from seven post-socialist EU countries, we discuss how focussing upon inclusion practises in different post-socialist EU countries might give some new insights into implementation challenges in EU inclusion policy.

Decollectivization Of Social Risks: Welfare State Reform Revisited

Tonkens, Evelien; Trappenburg, Margo

University of Humanistic Studies, Netherlands, The
e.tonkens[at]uvh.nl, m.trappenburg[at]uvh.nl

As opposed to the dominant view of welfare state reform as an issue of austerity, in this paper we aim to understand welfare state reform as a broader social trend of decollectivization of social risks. We contrast this process with collectivization, which was how the Dutch sociologist Abram de Swaan understood the development of European welfare states in the 19th and 20th century in his seminal book *In Care of the State*. Small-scale, unpaid arrangements (often performed by women and linked to Christian churches) were gradually replaced by collective social arrangements arranged and paid by the state. Currently we witness developments in the opposite direction. Politicians and policy makers urge citizens to take (unpaid) care of family members and friends. Professionals in care and welfare are replaced by volunteers. Fixed jobs with collective protection are replaced by flexible unprotected contracts. In this paper, we try to explain this process of decollectivization. While collectivization was for example instigated by an equal risk ethic, the recent predominance of a meritocratic ethic gave rise to decollectivization. Other factors that we argue to contribute to decollectivization are the rise of the precariat, two earner households, secularization and the promise of tailor made services. The implication of our analysis is that a critical perspective on welfare state reform should not merely address austerity but reflect on the broader causes of decollectivization as well as on possibilities, conditions and desirability of de- or re-collectivization.

Is Hungarian Society a Class Society? The Changing of the Hungarian Class Structure in European Comparison

Huszár, Ákos

Hungarian Academy of Sciences, Hungary
huszar.akos[at]tk.mta.hu

The main question of my paper is to what extent Hungarian society can be regarded as class society? By analysing the strength and nature of the relationship between social class and different indicators of living conditions this paper follows the Weberian way of class analysis. Has the explanatory power of class strengthened or decreased in the last decades in Hungary? And how significant is the role of social class in Hungary compared to other European countries? The analysis is based on the 1-8 waves of the European Social Survey (ESS) that was conducted biannually between 2002 and 2016 in Hungary and in several other European countries. Thus, the database makes it possible to examine the changes of Hungarian society in a quite long period and in international comparison. The class position of the members of society is measured here according to the tradition of occupational class analysis on the basis of the occupation and other labour market characteristics of the individuals. Living conditions is represented by two indicators that provide information on two different aspects of material difficulties. On the one hand the paper analyzes how the experience of unemployment is shaped by class and on the other how difficulties in meeting basic needs are arising in the different levels of class structure. By analyzing the role of social class on the terrain of material living conditions in the long run the paper contributes to the debate on the significance of social class.

Understanding the nature of Agricultural work as a Survival Strategy of Rural Poor

Çelik, Kezban (1); Kalaycıoğlu, Sibel (2)

1: TED University, Turkey; 2: METU, Turkey
kezban.celik[at]tedu.edu.tr, ksibel[at]metu.edu.tr

From the 1980s and especially after 2000 neo-liberal policies were applied to agriculture in Turkey. Agricultural production has slowed down, and the rural employment opportunities have decreased accordingly. Especially in the production of certain cash crops like cotton, tea and sugar beet as well as in subsistence crops like wheat, cereals, potatoes, onion and the like employment opportunities exist on a seasonal basis. In this presentation we will first try to describe the dynamics of agricultural work as the seasonal nature, high rates of mobility between different regions, low earnings and profitability, lack of social security, lack of access to social services and the informal work schedules. In the second part of the presentation we will try to discuss how these dynamics lead to poverty for all groups in the rural areas irrespective of whether they are property owners and settled or landless and mobile, including the Syrian and non-Syrian refugees. Hence dynamics of agricultural work does not create a sustainable livelihood for the rural groups. On the other hand, competition for limited jobs requires development of different strategies and practices to combat poverty which then creates competition and hostility between groups. The presentation will be based on research with the rural poor households, Syrian refugees and seasonal agricultural workers in different regions of Turkey. For all those groups the livelihood strategies and challenges are different but a common point among them is that they are all involved in an endless struggle to combat poverty through agricultural work which is not considered as a "real work". Finally, the presentation will discuss possible social policy recommendations about how to handle these conflict and competition among these three groups.

All Around the House: Temporalities Of Activation In Local Housing Policy

Frangioni, Tommaso

Università di Torino, Università di Firenze, Italy
tommaso.frangioni[at]unito.it

While we often consider housing to be one of the least innovative sectors of welfare systems, the case of Torino permits to show the entanglements between different government levels (housing policy is designed locally, but it's still reliant on national funds); public and private actors (policies that are reliant on private resources and know-how); and to deepen our comprehension of the relation between housing policy and activation, an emerging trend in the broader Italian welfare system. Housing is recognized as a relevant issue in strategic documents produced by Torino Municipality, leading to develop a discourse and a praxis where housing is a pivot around which social investment projects could be developed. So, the once called "wobbly pillar", becomes embedded in a strategy of tailored policy design, focused on producing responsible and self-reliant citizens. I'd focus on the importance of time, as a constructed and ambiguous dimension at play in this field: evicted tenants are often marked by precarity, and the degree of discretion of street level bureaucrats (both in the public and in the private sector) heavily affects their perception of housing policy and its capacity to respond to their needs. At the same time, the interventions to support evicted tenants are mostly temporary in nature, and this temporariness is framed as a resource to develop activation in users. This narrative is harshly contested by the local housing movement which, paradoxically, offers a more stable time-frame to its "users", while at the same enacting a logic of self-responsibility and activation itself. My fieldwork is based on interviews with both functionaries and street level bureaucrats, and on a period of observation in a local politic organization.

Is a Universal Non-contributory Social Pension Desirable and Feasible for China's Rural Pension Scheme?

Shen, Ce (1); Johnson, Jessica K.M. (1); Chi, Zhenhe (2); Williamson, John B. (1)

1: Boston College; 2: China Institute of Industrial Relations
shenc[at]bc.edu, jesskmjohnson[at]gmail.com,
chizhenhe[at]gmail.com, jbw[at]bc.edu

China's pension reform in the past three decades has allowed the majority of China's population to be covered by at least one type of pension scheme. One cornerstone of the coverage expansion was the establishment of the New Rural Pension Scheme (NRPS) in 2009. Using recent (2013 and 2015) national-representative survey data and other government statistics, this study summarizes the strengths and weaknesses of China's rural pension scheme. Although NRPS currently provides much needed income for many elderly people, it has serious limitations. The pension benefits are far below the government defined rural poverty line. When NRPS is viewed in the context of China's over-all pension system, our analysis presents a dire picture of striking pension income inequality between rural and urban populations. Our data reveal, that the rural pensioners, though making up 62% of nation's pension population, receive only 8% of the nation's total pension benefits, approximately the same proportion received by the country's civil servants who make up approximately 2% of China's pensioner population. With more wealth and government pension spending going to high-income subgroups, the current pension system is a factor contributing to the current trend toward ever increasing income inequality. Compared with countries at similar levels of economic development, China's spending on pensions is very low. Our analysis leads us to propose the substitution of a universal non-contributory social pension to replace the current quasi-social pension component of NRPS, a reform that would help reduce both inequality and poverty while fostering social development in rural China.

Work Based Welfare and New Social Services in the Rural Communities of Hungary

Csoba, Judit; Sipos, Florian

University of Debrecen, Hungary
csoba.judit[at]arts.unideb.hu, sipos.florian[at]arts.unideb.hu

The purpose of the presentation is to examine the transformation of the welfare paradigm and to analyze the consequences of the welfare state transformation on the local communities. With extensive centralization of welfare services in Hungary, the former welfare functions of the local governments disappeared. It is no longer a local responsibility to support the welfare of disadvantaged social groups and to organize the traditional welfare services for them (such as social benefits family care, etc.), nor the resources are locally available for it. In the 'work based' society model of Hungary, the local governments are under pressure to organise the economic activities of citizens and to move from a social service-oriented approach to an entrepreneurial one on community level. It is demanded by the state to create of a self-sustaining village or a 'village company', and to also involve the most disadvantaged social groups in employment and self-care. With the transformation of the welfare paradigm and the redefinition of the role expectations of local governments and mayors in Hungary, local actors in small villages of rural areas need new skills, knowledge, alternative programs, and innovative public services. In the framework of two consecutive studies organized in the framework of two H2020 projects (InnoSI and CoSIE) we studied local economic development programs to answer what alternative public welfare/economic services can be developed and under which conditions can this new service type be successful. The present paper is based on an extensive empirical fieldwork involving 18 local communities and ca. 200 households. With the involvement of communities and households, a survey and 54 individual interviews were conducted in the past three years.

Who Lives There Now? Differences in Affordability and Income Between Housing Tenure Groups In Europe

Angel, Stefan

Vienna University of Economics and Business, Austria
stefan.angel[at]wu.ac.at

The discussion of housing policy in the overall social policy mix Europe gained a strong momentum in the 1980s and 1990s. In the dualistic rental system (Kemeny 1995), predominant in Anglo/liberal nations, the bulk of rental housing is provided in the private market whereas the social sector is reserved for low income households. The other type is referred to as integrated rental market where state-subsidized social housing is open to broad classes of the population. In this paper we do not look at eligibility rules but focus on the income structure of inhabitants. Following Hoekstra (2009) we hypothesize, that the association between income and social housing should be stronger in dualist countries. Moreover, a decomposition of overall income inequality in a between- and within-tenure-group component should reveal whether residualization of the subsidized housing sector (Scanlon et al. 2014) is a general trend or different between housing regimes. We use cross-sections from the SILC UDB 2004 to 2015 covering 20 European countries. We analyze the income structure for three groups: owners, tenants paying rent at a market rate, tenants paying a reduced rate. In a second step, we estimate country-specific regression models for the effect of income on the probability to be tenant in social housing, controlling for various socio-demographic variables. Third, we apply inequality decomposition methods. Preliminary results show that the effect of income on the likelihood to reside in a dwelling with a reduced rate is still most articulated for countries traditionally assigned to Kemeny's dualistic type of housing regime.

Politicized by Crisis: Ideological Currents and Attitudinal Dynamics Amid the Greek Youth

Kontogiannis-Mandros, Angelos (1); Zafeiris, Constantinos (2); Ntouraki, Stella (3); Sotiropoulou, Mania (4)

1: King's College London, U.K; 2: University of the Aegean, Greece; 3: National Centre for Public Administration and Local Government (EKDDA), Greece; 4: Universitat Pompeu Fabra, Spain
angeloskm[at]outlook.com, constantinosras[at]gmail.com, stellant[at]outlook.com, mania_msn[at]hotmail.com

The aim of this paper is to illuminate the main ideological currents that underlie and shape the political culture of the Greek youth in the (post-)crisis era. Our definition of youth follows the standard U.N. convention, i.e. persons between the ages of 15 and 24, but our field research has a rather narrower focus centring on the analysis of the ideologico-political profile of University students. This is so for two main reasons: a) the centrality of the University milieu vis-à-vis youth politicization, and b) the determining impact of the student movement on shaping the political culture of the entire social category. It is worth noting in this regard that from the late 50s up until the December 2008 youth revolt universities became a hotbed of political radicalization with University students leading or being at the forefront of all the major socio-political contests. This resulted in the formation of a distinctive political culture that radiated from campuses to political parties and civil society organizations. In this context, and stimulated by the sharp decline of student mobilization and student union membership during the crisis we have conducted a PanHellenic student survey with a sample of 1.100 respondents so as to illuminate the root causes of the phenomenon. Our analysis indicates that students' attitudinal profile remains relatively distinctive and more left-wing than the population at large but exhibits a clear tendency towards normalization. Political radicalism and interest in politics is in decline, while there are evident changes as to the means and patterns of youth politicization.

Indicators and Consequences Of Tertiary Education Impoverishment In A Country Being Led To Bankruptcy. The Case Of Greece.

Papakonstantinou, Antigoni Alba

National and Kapodistrian University of Athens, Greece
albakonstantinou[at]hotmail.com

The first Economic Adjusted Programme for Greece was signed on May 2010 aiming to help the country fulfill its financial obligations and respond to the government dept-crisis. Up until today three similar memorandums have been signed between the Greek government and the European Commission, on behalf of the Eurogroup, the European Central Bank (ECB) and the International Monetary Fund (IMF). Various measures have been implemented in the context of this financial memorandum, mainly aiming to reduce the size of the public sector and minimize the expenses in the annual state budget. As expected, the educational sector was also affected, not only in the annual state budget percentage attributed to this sector, but also in aspects concerning its organization, its function, the salaries and the work conditions of the teaching personnel in all levels of education, and consequently the quality of the provided education. Thus, the present study aims to describe and interpret the impoverishment of the Greek tertiary education, using indicators related to the level of efficiency and quality in Greek Universities and the job satisfaction of academics and researchers. Starting from a macro-level approach, we proceeded with a metadata analysis of PISA results and a study of Greek universities world ranking from 2009 up to 2019. Moving to a micro-level approach, we realized semi-structured interviews with professors and researchers in the country's top universities, in order to examine their job satisfaction levels and understand their opinions on the consequences of the Greek tertiary education impoverishment.

Gender, childcare and the crisis in (post)austerity Southern European societies. A cross-national comparison between France and Spain.

Jarty, Julie

Toulouse 2, France
julie.jarty[at]univ-tlse2.fr

This proposal addresses, from a comparative perspective, the gendered consequences of recent transformations in childcare policy within Southern European countries. Indeed, since the most serious economic crisis EU had ever known, the EU have encouraged budgetary restrictions for all its members. However, feminist scholars have demonstrated the major (direct and indirect) impact of childcare regulations on working life and social living conditions, specially for women. To what extent Southern European member states have cut down welfare services and benefits that women relied on? Does it lead to a new trend in the promotion of gender equality? How does this austerity turn fit with the neoliberal gender equality model? To answer these questions, I will explore and compare, from a gender perspective, the recent evolutions of (child)care policies and debates in 2 Southern European countries studied in the INCASI EU-funded project: France and Spain. I will first characterize their different positions on the (gender) welfare states typologies: France, as a corporatist welfare state; Spain as Mediterranean/Latin welfare state. While these 2 countries were differently impacted by the so-called "2008 crisis", I will then show how they have all embrace a liberal policy turn as far as care policies are concerned. Drawing on a comparative analysis of the last 10 years childcare policies, as well as on a feminist theoretical background, I will argue that this (gender-blind) economic priority has, far from undoing gender norms, contributed to promote a new form of "maternalism". Finally, I will highlight how different childcare policies have similarly combined both liberal and conservative injunctions for mothers: being rational and autonomous economics actors and first care givers.

The Gender Impact of The Crisis in Southern European Countries: So Similar, So Different?

Salido, Olga

Universidad Complutense de Madrid, Spain
olga.salido[at]cps.ucm.es

Southern Europe countries share numerous cultural and historical connections, but they nevertheless offer a very disparate panorama from the point of view of female labor participation and gender balance. Historically, women have participated intensively in the labor market in Portugal, making this country an anomaly in the context of Mediterranean welfare states. On the other side, Italy, Greece, Spain represented a typical example of 'male breadwinner model' until the mid-nineties, with one of the lowest employment

rates in the EU. The expansionary cycle prior to the crisis doubled the number of women employed in Spain, significantly reducing the gap in the employment rate with the European average (from 15.7 to 4.2 percentage points). This trend of convergence has been halted by the crisis, especially for women with lower educational levels and younger. At the same time, the gender gap was reduced in these countries during the crisis, mainly by the selective impact of the crisis on male employment. This paper is aimed at exploring the gender impact of the crisis and fiscal austerity for Southern European countries, trying to detect commonalities and differences across them.

RN27_03 | Migration and Refugee Flows

Spain Italy and Greece: the migratory routes to Europe and the AMIF Fund

Consoli, Teresa; Mazzeo, Francesco

University of Catania, Italy
consoli[at]unict.it, fmazzeo[at]unict.it

In the last decades, the main entrance to Europe for migration flows has alternatively been through Greece, Spain and Italy. Before the humanitarian crisis starting in 2011, these natural frontiers of southern Europe expressed common characteristics (i.e. economic development and informality) and similar responses (i.e. weak control and regularisations) to migration. The role of EU and the impact on law and policy in these countries, has been considered either limited or primarily oriented towards external border control and, in the last years, it weakly turned to regulate procedures for refugee status. In 2014 the AMIF fund (Asylum, Migration and Integration Fund Reg. EU.516/2014) was set up in order to "promote an efficient management of migration flows and the implementation (...) of a common EU approach to asylum and immigration" with a total of 3.137 billion for 7 years (2014-2020). Spain, Greece and Italy received the highest percentage of assignation (from 11 to 13%) apart from the UK. The largest share of the total AMIF fund is channelled through shared management and each state implement a National Programme. How the aims defined in the AMIF have been translated into state policy action? Which kind of National Plans has been implemented in the three countries? Which actors and legal processes are governing the migration flow in these countries? Are there still some indicators of the southern European model? The paper, analysing the AMIF Interim Evaluation Reports of the three countries explores some possible responses to the questions posed.

Protection of The Rights of Unaccompanied Refugee Children in Greece Of the Socio - Economic Crisis

Tsiami, Pangiota; Dreliozzi, Angeliki; Tzavella, Foteini

Laboratory of Integrated Health Care, Nursing Department, University of Peloponnese, Greece
giotatsiami_124[at]hotmail.com, adreliozzi[at]gmail.com, ftzavella[at]hotmail.com

It has been conducted research in Greek legislation, literature review in the databases PUBMED and Google Scholar and research on the websites of UNHCR, UNICEF, Amnesty International and World Health Organization for the period of 2000 to 2019. The study deals with the evaluation of the institutional framework for the protection of the rights of unaccompanied refugee children in Greece. In recent years, the waves of refugees from the Middle East and Africa in Greece have increased due to wars and turmoil and refugees arrive in Greece in a state of constant hardship and suffering and at the risk of their lives. Refugee rights are being violated in various ways. Among the refugees arriving in Greece, there are many unaccompanied children who are even more vulnerable to difficulties and dangers. The Greek state, in cooperation with other international institutions, takes measures to protect their rights and their rehabilitation and integration. Basic care required for unaccompanied children includes healthcare, education and finding a solution for their permanent settlement. Although the Greek state, in conjunction with other agencies, has taken many steps in this direction, there are still many weaknesses, which should be overcome for human rights and children's rights to be met.

Transnational Strategies of Welfare Provision of Ecuadorian Migrants in Spain

Oso, Laura; Martínez-Buján, Raquel

ESOMI, Universidade da Coruña, Spain
laura.oso[at]udc.es, raquel.bujan[at]udc.es

Drawing on 44 biographical interviews, carried out in Spain and Ecuador, with migrants and their families the aim of this paper is twofold. First, the article assesses how migrant women in Spain have become a resource for the provision of formal social protection hired as care workers in the domestic service regime. This process must be addressed within the framework of Spain's long-term social care policy and its impact on the creation of an irregular, gendered and ethnicised labour niche. Secondly, the paper identifies those informal social protection strategies developed by Ecuadorian migrant women and their families in the transnational space. Given that access to social rights and benefits in Spain are linked to employment and depend on job stability, Ecuadorian migrant women employed as care workers have more difficulties to gain access to formal social protection than other migrant workers. We argue that these transnational exchanges become the only resistance strategies to cushion social risk and imply the deployment of

gendered informal strategies. The concept 'transnational social inequalities' (Lutz 2018; Amelina 2017) is the core theoretical approach to link these aforementioned aims. This term links the disadvantaged position of migrant care workers in both the labour market and in the social structure of the country of destination. This inequality takes place at a transnational level but has a localized impact reflected on the marginalization of care workers in relation to the public schemes of social protection as well as to the emergence of transnational practices of support within the family.

Networking Mobility: An Analysis of The Interrelation Between Transnational Migration And Social Capital

Domínguez Amorós, Màrius (1); Suárez-Grimalt, Laura (2)

1: Universitat de Barcelona, Spain; 2: Universidade da Coruña, Spain
mariusdominguez[at]ub.edu, laura.suarez.grimalt[at]udc.es

This paper aims to analyse the role played by the assets derived from the participation of the migrant population of Latin American origin in transnational social networks when defining their social mobility strategies. For that purpose, this research deals with the study of social capital in which these migrants invest as a means of ascending the social hierarchy. A further objective is to study the effect the composition and nature of these networks have on the social position of different generations. To this end, a proposal of analysis of social capital is presented through different indicators expected to identify which type of investments in social networks result in more successful social mobility strategies for migrant households in the different social spaces in which they develop and apply their strategies (social space of origin, social space of destination and transnational social space). These indicators are based on the combination of classical analysis measurement of social capital (Granovetter, 1973; Bourdieu, 1986; Portes, 1998; Lin, 2002) with variables applied to the study of transnational social mobility, such as gender, generation, social class, etc. (Oso and Suárez-Grimalt, 2017). The methodology strategy is based on a qualitative study (biographical narrative), multi-situated ethnography and a longitudinal fieldwork with Latin American population. The main results show the unequal effect that the different social networks, in which parents and children invest, perform in the configuration of their social mobility paths. Thus, it is important to highlight the importance of family networks of a transnational nature in the case of the first group, and the importance of informal social capital in terms of second family generations.

mikel.olazaran[at]ehu.eus, eneka.albizu[at]ehu.eus

In the Spanish vocational education system context, relationships between education and industry have not been widely studied. This paper aims at analysing the intensity of relationships between industrial SMEs and vocational education and training (VET) centres from the firms' perspective. The study is based on a survey carried out to a sample of 1,388 Spanish industrial SMEs which had vocational education graduates among their employees. The study belongs to a wider project about VET-level workers' participation in innovation, which was conceptualised as interactive learning processes involving social relationships both internal and external to the firm. Multivariate hierarchical segmentation techniques have been used in order to identify the main explanatory variables. As a result, a typology ('tree') of eight organisational profiles has been obtained which are associated to different intensity levels (from higher to lower) of relationships between firms and educational centres. The results obtained show many significant interactions between explanatory variables. The main characteristic which explains and classifies relationship levels is "experience of cooperation in innovation activities", which can be seen as related to SMEs' innovative culture. Another explanatory variable related to firms' culture which has discriminant effects is VET workers' participation in innovation activities. On the other hand, more 'structural' characteristics (so to speak) such as VET graduate presence (VET personnel in technical jobs and proportion of higher level VET workers), as well as firms' basic characteristics such as size and sector, also contribute to the typology. The organisational profile having the highest level of relationships with education and training centres refers to SME's with cooperation experience which have VET workers in technical jobs and which are bigger in size.

Europe and Beyond: Professional Trajectories from The Army to International Organizations

Romão, Ana (1,3,4); Baltazar, Maria da Saudade (1,2,3,4); Rosado, David Pascoal (1,3,5); Fonseca, Dinis (3,4); Santa Comba Lopes, Helga (1,3)

Despite being a small country, Portugal actively participates in international security policies and in the last few years the Portuguese soldiers were involved in the most prominent military operations and crisis management missions (under the umbrella of the UN, NATO, and the EU). The budgetary constraints after the financial crisis of 2011 affected the commitment; even so over 36,000 troops participated in peace missions in over 30 different theatres of operations, covering all the world continents (Arena, 2017). The new generation of Peace Support Operations include conflict prevention, peacemaking, peacebuilding, peacekeeping, peace enforcement and humanitarian operations. This huge challenge engages mainly military personnel (with multiple and flexible capabilities), but also a large composition of civilian actors, such as police forces, NGO's and members of multiple agencies. The participating in those scenarios opens possibilities for multinational civil-military cooperation which defies traditional boundaries. We will analyze professional trajectories of Portuguese military that after participating on peace missions are presently engage in civilian international organizations, still contributing to global security activities, under different roles and statutes. Based on deep interviews applied to ex-military, we will follow professional and personal trajectories, first in the military career then in civilian life. Special attention will be given to understand how previous military experience (education and profession) enable and facilitates the integration into international organizations and the commitment to human security. Keywords: Portuguese Army, Professional Trajectories, Peace Support Operations, International Organizations.

Cultural Differences in Worktime Flexibility: A Comparison between Northern and Southern European Countries

Giachi, Sandro (1); Vallejo-Peña, Alberto (2)

1: University of Sussex, United Kingdom; 2: Universidad de Málaga, Spain
sandroenmalaga[at]gmail.com, favallejo[at]uma.es

The objective of this research is to analyse the relationship between the organisation of work schedules and labour productivity, identifying different organizational models according to national cultures and institutional models developed by each country. In particular, the study focuses on the case of Southern European countries, assuming that a low diffusion of flexible work schedules could contribute to explain their lower productivity of labour. Our hypothesis is about the existence of cultural factors explaining the higher rigidity of work schedules in Southern Europe. We analyse data from the fifth and sixth waves of the European Survey on Working Conditions (EWCS 2010; 2015) using logistic regression techniques. Findings show that workers in Northern European countries (most productive) are also characterised by a greater degree of flexibility in their working hours. This correlation between working in Northern countries and time flexibility is robust to several control variables, like sector, occupation, gender, age, etc. In conclusion, the national context seems to influence worktime flexibility and, therefore, labour productivity, beyond sectoral, organisational and socio-demographic factors.

Being Employed is no longer Enough? Labour Participation and Poverty Risks in Southern Europe

Tejero, Aroa; Gutiérrez Palacios, Rodolfo

University of Oviedo, Spain
tejeroaroa[at]uniovi.es, rgutier[at]uniovi.es

The economic recession in Southern Europe has revitalized the debate on the specificity of this welfare capitalism mode. These countries have shared the highest levels of job destruction and the strongest tendencies of increasing income inequality. The analysis of poverty risks related to employment can enrich the debate exploring two basic dimensions of these welfare states: the inequalities in labour market participation and the redistributive and protective effect of monetary social benefits targeted to working-age population. Southern Countries have been typified as a set of very similar countries, instead of comparing similarities and differences among them in a systematic way. In addition, this research usually presents two limitations: first, it deals only with the risk of poverty of workers, paying little attention to the risk of poverty of self-employed and non-employed; second, cross-sectional analyses predominate; little is known about whether those risks are mobile, recurrent or persistent. This article aims

to analyse, using EU-SILC data, the risks of poverty related to employment in Southern European countries (Spain, Greece, Italy and Portugal) and their transformations during the most recent stages of economic recession and initial recovery (2009-2016). First, the at-risk of poverty is analysed for the entire working-age population: employed, self-employed, and unemployed; as well as its profiles and determinants. Second, the longitudinal component of poverty is examined looking at the different levels of mobility, recurrence and persistence, and to the factors that explain the chronification of poverty.

Constructing the Spanish Higher Education Student: Evidence from A Six-Nation Comparative Study

Jayadeva, Sazana; Lainio, Anu

University of Surrey, United Kingdom
sazanajayadeva[at]gmail.com, a.lainio[at]surrey.ac.uk

Assumptions are often made, within both academic scholarship and policy texts, that what it means to be a higher education student is the same across Europe – influenced by the increasing encroachment of neo-liberal ideals and market policies, as well as the implementation of a European Higher Education Area (e.g. Moutsios, 2013; Voegtle et al., 2011; Wright and Shore, 2016). Nevertheless, such assumptions are rarely held up to empirical scrutiny. In this paper, we draw on data from a variety of social actors in Spain - including policymakers, higher education staff, media and students themselves – to explore dominant constructions of the higher education student. We then compare these to constructions in the five other countries in our (European Research Council-funded) study – Denmark, England, Ireland, Germany and Poland – to show key ways in which understandings are shaped, at least to some extent, by the particular national context. Our analysis also highlights the ways in which understandings are contested even within the Spanish state, demonstrating how social actors can effectively interpret, translate and sometimes resist policy imperatives (Ball et al., 2011) and that nation-states are not necessarily coherent entities in educational terms (Phillips and Schweisfurth, 2014).

From the Semi-periphery to the Centre: Transnational Migration in the Context of the Greek Crisis

Koniordos, Sokratis

University of the Peloponnese, Greece
sokratiskonio[at]gmail.com

This paper discusses the "new" emigration from Greece to several EU member states in Central Europe and Scandinavia during the current decade. Available data indicate that there has been a significant increase – more than doubling – of the number of, mostly young, Greeks who have been moving to abroad, when compared to the pre-crisis situation. A central idea explored is that behind this migratory wave one may identify the pervasiveness as well as impact of the severe socioeconomic crisis that the said country has been experiencing during the last nine years. To probe into the differentiated root causes of this migration and actors' meanings of it several questions are raised. Responses are drawn from a set of 44 qualitative semi-structured interviews completed in September and October 2018, and from an earlier study of 230 persons undertaken in 2015. The prime aim is by understanding migrant socio-economic profiles as well as structural factors to ascertain the social contexts and reasons for which such migration occurs. Thus, what is from the actors' viewpoint and meaning the impact of the crisis on themselves, and their milieu? What factors specifically facilitate the decision to emigrate to Europe? The expectation is that this exercise would lead to the identification of the "dynamic" drivers of migration (push factors) and of attraction abroad (pull factors), as well as the settlement of such migrants in Europe, including the channels and social mechanisms that facilitate it, if not formulate it.

Romanian Migration and Territorial Inequalities in Greece in the Era of Austerity

Fratsea, Loukia-Maria; Papadopoulos, Apostolos G.

Harokopio University, Greece
fratsea[at]hua.gr, apospapa[at]hua.gr

Throughout 1990s Greece was transformed from an emigration to an immigration country. During that time, international migration flows contributed to new socioeconomic realities in Greece. Moreover, international migration has become an important aspect of local labour markets both in urban and rural areas. However, since 2008 the economic recession has transformed the socioeconomic conditions and deteriorated the integration prospects and challenges for both migrants and natives. Since the collapse of the socialist regime, there has been a stable flow of Romanian migrants to Greece. Due to the geographical and cultural proximity between the two countries, Romanians have been among the top immigrant nationalities in Greece. Despite that they initially filled up the less prestigious occupational positions, in the process they moved up the occupational

ladder, while in parallel they increased their spatial mobility. Drawing from an empirical research in the context of the IMAJINE Project ("Integrative Mechanisms for Addressing Spatial Justice and Territorial Inequalities in Europe IMAJINE" received funding from the EU Horizon 2020 Research and Innovation Programme, under Grant Agreement No. 726950), the paper aims at discussing the developments of Romanian migration in Greece in the era of austerity. The paper explores migrants' individual and family strategies for social upgrading, improving their quality of life and becoming resilient during the economic crisis. Finally, the analysis of the empirical findings sheds light on migrants' perceptions and experiences regarding their wellbeing and the way inequalities affect their mobility decisions.

"New Emigrants or New Spaniards? A typology of Spanish emigration to America in the wake of the economic crisis"

Golíás, Montserrat; Oso, Laura

University of A Coruña, Spain
montserrat.golias[at]udc.es, laura.oso[at]udc.es

The onset of the economic crisis brought a change of direction for migratory flows. Statistical data reveal a growing outflow of Spaniards moving abroad. This paper aims to answer two key questions: Who are these Spanish emigrants? Where do they go? The objective is to draw up a classification to identify whether Spaniards living in America are "new Spaniards" who have acquired citizenship, or whether they were born in Spain and have decided to move to other latitudes in order to flee the crisis, attracted by more dynamic labour markets. Furthermore, it attempts to determine whether the current migratory movements of Spaniards are a consequence of the vast wave of historical emigration towards Latin America, or whether they are the consequence of new associations forged as a result of Latin American immigration to Spain during the period of economic prosperity. In order to do so, we will rely on a mixed methodology, based on the analysis of flows and stocks provided by official statistical sources, as well as in-depth interviews and life stories. A transnational approach will be adopted that seeks to account for the interconnections between the inbound and outbound migrant contexts, as well as an intergenerational perspective that highlights how migratory chains form part of the family strategies constructed on both sides of the Atlantic.

RN27_06 | Social Inequalities and Social Welfare

Multiple Discrimination: From Perceptions and Experiences to the Proposal of Anti-discrimination Policies

Cea D'Ancona, M^a Angeles; Valles Martínez, Miguel S.

Universidad Complutense de Madrid, Spain
maceada[at]ucm.es, msvalles[at]ucm.es

As multiple forms of intolerance (sexism, racism, ageism, classism, xenophobia, homophobia or sexual prejudice) are interrelated, this paper extends previous research on multiple discrimination, its conceptualization, perceptions, experiences and proposals of anti-discrimination policies. It offers main results of the MEDIM II Project, supported by a grant from the Spanish Ministry of Finance and Competition (CSO2016-75946-R). A project aimed at developing a conceptual framework of multiple discrimination and the proposal of anti-discrimination measures. Different methodological strategies of social research are applied. It combines the analysis of available sources and data (literature review, quantitative and qualitative archival data), and material generated by the research team. The first approach includes the analysis of two nationwide surveys on perceived discrimination made in Spain by CIS (the Spanish Centre for Sociological Research), in 2013 and 2016, and Special Eurobarometers on discrimination in European Union from 2006 to 2015 (Special Eurobarometers 263, 317, 393 and 437). The primary data correspond both to qualitative materials (available in institutional or private web sites, or gathered through focus groups and interviews with members of NGOs, policymakers or social experts), and quantitative data from a CAWI survey to professors of Spanish universities. It is a longitudinal comparative study (Spain is compared with other European countries), which shows the evolution of experiences, perceptions and demands to combat discrimination. The diagnosis concludes with the proposal of specific anti-discrimination measures (either from research or social intervention fields), aimed at improving coexistence in increasingly diverse European societies (where different experiences of discrimination converge).

Objective Life Conditions and Interethnic Relations/Representations Between Gypsies and Non-Gypsies in Santa Tecla Neighbourhood, Braga, Portugal Cardoso, António (3,5); Silva, Manuel Carlos (1,2,4,5); Cruz, Rui (5)

1: University of Minho, Portugal; 2: National University of Brazilia, Brasil; 3: Instituto Politécnico de Viana do Castelo, Portugal; 4: Centro de Estudos Multidisciplinares Avançados (CEAM,PDSCI), Brasil; 5: Centro Interdisciplinar de Ciências Sociais (CICS.Nova_UMinho)
amfc2008[at]gmail.com, mcsilva2008[at]gmail.com, rmvcruz[at]gmail.com

In this communication, the authors' study object was Santa Tecla neighbourhood in Braga (Portugal), a public housing complex composed and inhabited by gypsy and non-gypsy families. We intend to understand and explain not only the emergence of this semi-segregated neighbourhood built in the 1970s, nonetheless how it has remained degraded until nowadays. The research results of a work carried out originally in 2002 and updated in 2018 by a project coordinated by the first author. It aims not only to update data about this neighbourhood, but also to deepen the reasons for the relative social distance between Roma and non-Roma. Data were obtained through several methods and techniques, particularly surveys, interviews and life narratives collected in field work with participant observation. Once the problem of interethnic relations and representations in a context of urban (peri) contiguity has been questioned, the authors focus the central problem on how to explain the institutional inertia and omission by municipal (and national) public policy, and the absence of initiative and collective action by the neighbourhood interethnic community, despite their proximity in terms of class. Therefore, in addition to seeking to understand and explain the various groups and entities social representations, we highlighted these omissions, silences, both institutional and societal absences, as well as the adoption of individual and familistic strategies within a framework of racial-ethnic exclusion and segregation, patronizing condescension, hence sketching semi-hidden transcripts and/or latent conflicts both at family and community spheres.

The Transformation of the Italian Third Sector Between Marketisation and New Politicization

Polizzi, Emanuele

University of Milan Bicocca, Italy
emanuele.polizzi[at]unimib.it

In the last decades, many Italian third sector actors developed their social activities in the social and political dimension: as providers of social services, as innovators of approaches and repertoires of social action, as advocacy actors claiming for citizens social rights. At the same time, most of them were shaped by the welfare public policies: after being acknowledged for creating or delivering goods and services that the public sector was no longer able to do by itself, they went through a process of incorporation in the welfare public programs. This shift implied a professionalization, standardization and formalization process in their organizations. They strengthened their economic stability and their public legitimization but weakened their autonomy, their innovative potential and their political role of advocacy actors. The economic crisis started in 2008 had a double effect on this dynamics. On the one hand, the social expenditure retrenchment of central and local governments led them to search for a less dependent relationship with public institutions and potentially to rediscover their own native innovative capacity and advocacy attitude. On the other hand, a national third sector reform was introduced in order to let these organization hybridize with other sectors and to make them more able to live and develop their activities in a market dimension. So now they are more autonomous from the public welfare, but also more dependent from the market logic. Starting from the literature about civil society and civic engagement, this paper focuses on these third sector transformation processes, by drawing from data and case studies, and on its possibility to keep on playing an innovative and political role in the Italian society.

Living standards inequality in the European Union between 2004 and 2016: Multidimensional convergence and fragmentations

Blavier, Pierre (1); Lebaron, Frédéric (2)

1: CNRS; 2: University of Paris Saclay, France
pierre.blavier[at]univ-lille.fr, frederic.lebaron[at]ens-paris-saclay.fr

The 2008 Great Recession is commonly said to have had serious consequences for Inequality in Europe and in particular in Southern countries (Spain, Greece, and Italy). Massive increase in unemployment is often seen as an heavy source of divergence both within and inter-countries. In this paper we propose to decompose the evolution of inequality in terms of living standards across countries, regions, and social groups. To do so, we use the European Union-Statistics on Income and Living Conditions (EU-SILC, 2004-2016) and the European Community Household Panel surveys (ECHP, 1994-2001) and

apply both Geometrical Data Analysis (GDA) and structured data analysis. We show that the 2008 Great Recession has reversed the egalitarian trend that prevailed since the middle of the 1990's. Until then, the eurozone was in a path of convergence, concerning in particular Eastern Europe and Baltic States lower class. However, the zone remains rather heterogeneous. Since 2008, this trend has stopped and the recession has hit most strongly the lower class of the southern European countries. Greece is the typical case of this evolution, which concerns almost all the social groups and regions, whereas in countries like Italy it remains more limited to certain regions and occupations. Thus the 2008 Great Recession and its aftermaths have led to increasing living standards heterogeneity in the eurozone, and we assess this degree of heterogeneity more precisely, and its evolution during the period. This raises question as to which extent Europe can be politically unified.

RN27_07 | Educational Policies in Southern Europe

Neoliberal Policies and Education Models in Europe: Possibilities, Boundaries and Barriers of the “Competence Society”

Gremigni, Elena

University of Pisa, Italy
elena.grem[at]tin.it

This paper aims to study how neoliberal policies have influenced education models, by analysing European Union recommendations concerning “key competences” and Italian school reform as a case of adaptation to the dominant leanings. From the documents selected, clear references to neoliberal ideology emerge. In particular, the competence related to the sense of initiative and entrepreneurship has assumed a strategic role within the “Lifelong Learning Programme” and the “Europe 2020 Programme”, fostering the spread of a new labour market model no longer based on the prevailing paid employment. Italian legislation acknowledged the European Union guidelines regarding promotion of the key competences, and more specifically of alternating school-work pathways. Although it is too early to make an overall evaluation of the effects these laws have produced, the actions promoted so far do not seem to overcome the existing inequality in Italy's educational and employment opportunities, as the objective of promoting competences that can be directly used on the labour market to the detriment of broader cultural preparation impoverishes the education of the most disadvantaged students, who have the fewest opportunities to acquire knowledge and critical thinking outside the school context. The transformations taking place in the educational field appear to proclaim the advent of a “Competence Society”, the last metamorphosis of an epiphenomenon with its roots in the globalised capitalist system, which is leaving social reproduction mechanisms unchanged.

Management of HEIs: A Holistic Approach in The Context of Greece

Mastrokourou, Sofia (1); Fafaliou, Irene (2)

1: University of Milano Bicocca, Italy; 2: University of Piraeus, Greece

s.mastrokourou[at]campus.unimib.it, fafaliou[at]unipi.gr

In the last few years, Higher Education Institutions (HEIs) are going through a major resurgence in Europe and elsewhere in the world. The quest for this evolution is the enhancement of the operations of the Universities in order to cope with raising demands for better educational services and higher value added for all stakeholders. Despite the fact that quality management in HEIs has been a relatively old issue, there is no consensus regarding the definition of the term. Similarly, the research in the field is limited, in particular, in Southern European countries. This paper aims to fill this gap by exploring, initially, the status of quality management in the case of a Greek University, located in the prefecture of Attica. In doing so, we collected primary data using an ad-hoc questionnaire addressed to teaching and administrative staff and undergraduates. The preliminary outcomes of our research indicate that there is a need for an alternative approach to this institution quality management focusing more on good practices and excellence. This work in progress is going to be further elaborated via the examination of similar issues in the context of Italian HEIs and, finally, through the construction of a comparative analysis concerning the findings entailed by the two cases investigated. Keywords: HEIs, quality management, Greece, good practices

Mapping the Institutional Quality of Innovation Systems: A methodological outline and its implications for southern European countries

Espinosa Soriano, Paula

Consejo Superior de Investigaciones Científicas (CSIC), Spain
pespinosa[at]ies.csic.es

This article develops an alternative approach for analysing the role of institutional quality in higher education, research and innovation. Institutions are acknowledged as important elements that determine the functioning and outcomes of organizational fields. The mainstream frameworks that study innovation systems consider that 'the specific features of institutions and organizations that form the innovation systems shape the innovation capacities of countries and regions'. In this paper we use a cross fertilization strategy that combines the institutional quality perspectives with the innovation systems approach in order to provide a systematic account of the role of institutions. We define institutional quality as a set of practices that intervene in the real functioning of institutions. Namely, 'meritocracy', 'immunity to corruption', 'absence of islands of power', 'proactivity' 'openness to technologies and flexibility' and 'external alliances'. Our background hypothesis is that the dimensions

of institutions determine the outcomes of innovation systems. We outline a viable methodology for comparative purposes. Firstly, as units of analysis we consider a set of organizations/institutions that are strategic for an innovation system. Second, we design a fieldwork procedure that focus on direct observations of social dynamics based on documents, interviews, internal surveys and output indicators. Third, we propose an analytical approach that combines narratives with an explanatory account that tries to find the determinants of innovation systems by using Qualitative Comparative Analysis. The study is in a phase of fieldwork in Spain. In this paper we provide a methodological framework, discuss the possibilities for comparative research in the region and raise implications for southern European countries.

Drama and Theatre in Education: Theoretical Considerations and Policies in Southern European Countries

Nina Pazarzi, Eleni (1); Pazarzi, Iliana (2)

1: University of Piraeus, Greece; 2: OkypousTheater Company, Greece

enina04[at]yahoo.gr, iliana.pazarzi[at]yahoo.gr

Drama and Theatre is an essential tool for education because it develops significant life skills such as intuition, creativity, sensitivity, etc and it can be a mechanism for the socialization of the individual. The importance of art and especially theatre as a tool and not solely as subject in the curriculum of educational systems is recognized in many countries around the world. Our presentation will refer to the theories, mainly the sociological ones, which analyze the necessity of drama and theatre in educational systems, especially in primary educational level. Another issue of our presentation will be the policies for art in education in southern European societies with special focus in the Greek educational system.

RN27_08 | Aspects of Southern European Societies

Determinants of indebtedness in Southern European countries

Massó, Matilde; Abalde, Nazaret

University of A Coruña, Spain
m.massó[at]udc.es, nazaret.bastero[at]udc.es

The aim of this communication is to analyse the socio-demographic determinants of household indebtedness in Southern European countries in order to examine how these factors form different patterns of indebtedness. This analysis is conducted within the context of an increasing process of financialization in which housing finance is an integral part of macroeconomic policy (see Van der Zwan, 2014). We will begin by identifying different models of household indebtedness in southern Europe and then determining the individual variables that best explain those differences and variations in household debt levels. The processes are examined by using the Household Finance and Consumption Survey (HFCS), a new dataset drawn up by the European Central Bank (ECB) and conducted in 15 euro area countries between 2009 and 2014. The methodological plan consists of a combination of a multiple correspondence analyses in order to identify the various household debt models and a logistic regression analysis in order to detect the explanatory variables that best explain the differences between the indebtedness models. The main contribution of this paper is the identification of institutional arrangements that explain the economic differences in household debt levels.

The Social Construction of Healthy Times and Spaces in A Mediterranean City

De-Gracia-Soriano, Pablo (1); Jiménez-Delgado, María (2); Jareño Ruiz, Diana (2); Jiménez-Delgado, Antonio (2)

1: Universidad Complutense de Madrid, Spain; 2: Universidad de Alicante, Spain
pablodeg[at]ucom.es, maria.jimenez[at]ua.es,
diana.jareno[at]ua.es, antonio.jimenez[at]ua.es

This communication presents some results of a project carried out by the AEDIFICATIO research group, with the collaboration of researchers from the universities of Alicante, Valencia, Cartagena, Berlin, Milan, Bogotá, La Habana and New York. The general objective of the project is to design a sustainable and healthy city model, which serves as a global reference in the Mediterranean area. From an interdisciplinary perspective, the research process carried out to obtain a diagnosis and plan future actions that allow the municipalities of the Mediterranean arc to reach a status of healthy territory is detailed. For this, the multidisciplinary analysis of secondary sources and the Participatory Action Research Techniques

(PAR), which have been collected in a workshop of citizen participation, have been used. This activity was divided into two sessions: the first was composed of four activities (mental maps, population, tourism and leisure, healthy municipality, participatory activities for landscape assessment); and, the second session consisted in the preparation of a SWOT matrix based on the interaction between the participants and the emergence of their themes and speeches about the municipality. In the specific case of L'Alfàs del Pi, there is a general consensus on the issues that affect the municipal reality. In the discrepant topics, the participants consider that they would be solved with a more stable and fluid communication between the political class and the citizens. Thus, citizen participation is revealed as an efficient solution that allows us to respond to a specific social reality. Key-words: healthy territory, Mediterranean arc, social time and space, Participatory Action Research, social change

Education- "Quality"-Assessment: The Greek case

Tsiknakou, Eleni Ioannou

Panteion University of Athens, Greece
elenistkal[at]yahoo.gr

This paper relies on my Phd thesis at Panteion University of Athens and discusses the Greek Evaluation System of Secondary Education and its connection with the Quality of Education. It is a known fact that nowadays all over the world there are several European and World organizations which study the connection between education and "quality" (PISA/TALIS, UNICEF, EERA). At the same time each country has its own educational system, which aims at a "quality" of education through assessment procedures. In the Greek educational system a new assessment law regarding Secondary Schools was voted in 2019. This law sets certain criteria about assessment of school units. These criteria/standards are connected to the perspective and the meaning of the provided education by the Greek state. In this paper we will try to answer the following questions: How does the Greek state view the situation at Secondary Schools? What is the Greek state's perspective on "quality"? Is this perspective similar to what teachers, principles, students and parents believe or witness to their every day interaction? The theoretical context of this research is based on Sociology of Education and critical theories approaches. The methodology involves content analysis of the assessment law, of Greek newspapers' articles and of the teachers' answers regarding the actual problems of their work, as recorded during our research for a MA degree in Sociology at Panteion University of Athens. Keywords: Assessment Law, Quality of Secondary Education, Greece

For a Theory of “Paramafia”. When Non-Mafiosi Act as Mafiosi

Bonzanni, Luca

Università degli Studi di Milano, Italy
luca.bonzanni[at]unimi.it

Is it possible that people unrelated to mafia develop mafia-type organizations? This paper aims at investigating in deep how mafia modus operandi has spread into non-traditional areas also generating imitative processes; in particular, the focus will regard group of people who are totally extraneous from mafia contexts, such as entrepreneurs, politicians, officials, with no connection to organized crime. Studies on mafia hybridization put emphasis only on criminal groups that evolve into a mafia-type one. This research has a different focus. For 'paramafia criminality' we mean the systematic assumption of a modus operandi typical of mafia repertoire by organizations whose members are formally and originally unrelated to traditional mafia organizations. Members of a paramafia group are connected to each other in a lasting relationship, are hierarchically ordered according to a division of labour and aim to achieve profits and power, committing systematically crimes. The research investigates two case studies localised in Bergamo, a district in Northern Italy. The research uses qualitative methodology, mainly through with analysis of judicial documents and interviews. A paramafia phenomenon could rise when there is an extended, strict (monopolizing) relationship between a group with public functions (politicians, entrepreneurs, officials) and the social fabric in which the group is operating. The group also needs a large relationship network, and the settlement area must be relatively small – therefore, there is a high density of social relationships. The target of the research is developing an 'intermediate' model of organized crime, complementary to mafia model and economic crime.

Corporate Governance in the Contemporary Corporation

Camiris, Despoina (1); Pekka-Economou, Victoria (1); Pazarzi, Georgia (2,3)

1: University of Piraeus, Greece; 2: Hellenic Open University, Greece; 3: Open University of Cyprus, Cyprus
depicamiris[at]gmail.com, vpekk[at]unipi.gr, gpazarzi[at]yahoo.gr

Corporations have experienced significant transformation from the traditional model to the contemporary modus operandi. The term “corporate governance” has a widening of meaning; the semantic evolution of the word usage is referring to evolutions and progress in the micro and macro levels. According to this assumption, the external environment had a continuous influence on the corporate context because of the progression of the sociocultural and economic living forms. The modern corporation contributes to the health and welfare of society, recognizing its ethical responsibility to both shareholders and stakeholders. Therefore, corporate governance is about enhancing economic efficiency, financial stability, and sustainable growth. To this extent, we will make a special reference to accounting. Corporate governance should apply high ethical standards by taking into account the interests of stakeholders. In this regard, the role of corporate governance in the contemporary corporation is influential because ethical leadership values as integrity, mutual respect, and ethical behavior, create a trusting work environment and ensure transparency, corporate disclosure, and profitability. The scope of this paper is to analyze through an initial study, the quality of the relationship between stakeholders in the work environment. Primarily, we examine the quality of ethical leadership relations in the Greek corporations, based on subordinate’s perceptions. In this context, we consider the importance of ethical values as a key element for corporate responsible conduct. Greek corporations confront the challenge of global competition, in the context of corporate social responsibility. Socially responsible conduct is part of the corporate culture and of the proactive leadership that both define corporate strategic decision. This aspect of the ethical corporation will probably conduct to a competitive edge, creating a different perspective on the contemporary corporation. Keywords: corporate governance, contemporary corporation, corporate culture, ethical values, ethical responsibility, ethical leadership, work environment, strategic decision, accounting. *This work has been partly supported by the University of Piraeus Research Center.

Refugees, Physical Activity and Sport. A Systematic Literature Review of Qualitative Research

Michelini, Enrico; Krause, Birte

TU Dortmund, Germany
enrico.michelini[at]tu-dortmund.de, birte.krause[at]tu-dortmund.de

Since 2011, the massive forced migration from the Middle East and North Africa into Europe has spurred discussions on refugees, which include their post-migration participation in sport. This paper systematically reviews recent literature based on qualitative research concerning refugees, physical activity and sport. Utilizing a search of major electronic databases, we identified 25 eligible sources on this topic. Basing on their discipline, content and aim, we separated them in two groups: a health sciences group (15), which is concerned with the physical, mental and social health of refugees and has leading health goals; and a sociology group (10), which has broader explorative goals and focuses on social interactions of refugees in and through sport. After describing their main features, this paper separately analyses topics specific and common to these two groups. The discussion explores similarities, differences and bridges between the two groups. This constitutes the basis to analyse critically the state of the art of qualitative research, identify research gaps and outline a future scientific agenda.

Midnight-Football: The Rationalities and Technologies of Discipline in a Sports-Based Intervention in Suburban Sweden

Ekholm, David; Dahlstedt, Magnus

Linköping University, Sweden
david.ekholm[at]liu.se, magnus.dahlstedt[at]liu.se

Following increased segregation and social exclusion in the suburban landscape of Sweden, social inclusion has become recurrently spotlighted as a central objective in social policy. Today, sports-based interventions have emerged as a common feature of social policy, often promoting social pedagogical objectives targeting youth in distressed urban areas. Based on interviews with representatives of two midnight-football interventions and on-site observations, this paper aims to explore the social pedagogical rationalities and technologies imbued and deployed in the intervention. Guided by a Foucauldian understanding of power, we outline two main technologies of discipline in the intervention, perceivably

enabling social inclusion of urban youth. These technologies are underpinned and enabled by problematizations of the areas and the youth targeted, focusing on notions of risk. Youth are portrayed as subjected to the risks of the segregated society and simultaneously posing a risk to community – thus forming an object of intervention. First, technologies of control provide a structure of time and space, diverting youth from sites of risk and disorder as well as diverting will of and attention from delinquency. Second, technologies of hierarchical observation refer to how the activities are sites of participant and coach relations, where coaches observe, examine as well as role-model the conduct and discipline of youth. Together, these problematizations and technologies produce a specific conduct among the participating youth, facilitating social inclusion. The technologies and rationalities outlined are discussed in relation to contemporary notions of democracy and citizenship, inclusion and equality. Particularly with a focus on contemporary forms of youth social work in suburban Sweden.

Sport and New Digital Communities

Tallarita, Loredana Maria Anna

University Kore of Enna, Italy
loris.tallarita[at]tin.it

Sport has become an increasingly a phenomenon “Social”. The emerging sports practices highlight the interweaving of open-air running and the use of gaming apps for fitness. Open-air fitness lovers with Facebook, Twitter, Instagram (Appadurai 1990, 1996, Horne 2006, Sassatelli 2010) advertise weekly events to train together, experimenting with a more active approach to sport through the web. If training together is the motivating effect, the sharing on the social network of the athletic performance is the new trend. The objective of the research is to investigate the relationship that has been established between the use of social networks, the applications of digital fitness and open-air fitness, using Palermo Parkrun community as a discriminator. The research was conducted with a qualitative methodology. The field of research (Glaser and Strauss 1967, 2009) and the identification of the case study (Yin, 2014) made it possible to identify the usual runners of the Palermo circuit: Parco Uditore and Foro Italico, registered on Facebook and on the Parkrun website. A set of 60 in-depth-interviews were conducted inside of the Palermo Parkrun community. The symbolic meanings (Geertz 1973) that are emerged from the in-depth-interviews (Schwartz, Jacobs 1979) have allowed us to understand the universe of values thanks to the connections established between members and the use of social networks and their impact on sports, health and on the links built within the community. Keywords: Parkrun, Body, Health, Social network, Community.

Social Practice Theory as a Toolbox in Children's Physical Activity Program

Korp, Leene; Uibu, Marko

University of Tartu, Estonia

leene.korp[at]ut.ee, marko.uibu[at]gmail.com

To identify and universalise intervention methods that fruitfully tackle complex public health challenges like insufficient physical activity (PA), a functional toolbox becomes crucial. In the original intervention programme Schools in Motion that was launched in 2016 to tackle insufficient PA of Estonian children by changing the school culture, elements of social practice theory have been introduced to the schools. Based on a case study of the programme, the paper suggests that concepts and models from social practice theory are at hand for detecting initial situation of a complex problem of insufficient PA during the school days, for intervening and for analysing the results of the intervention. Using examples of initiating outdoor break times in participating schools, the presentation introduces (1) three-element-model of Shove et al (2005/2012) that maps and monitors the problematic social practice in focus; (2) practice change model of Vihalemm et al (2015) that helps to design trajectory of practice change; and (3) the notion of agency that successfully deals with involving key stakeholders and with potential resistance. Relying on those concepts and models, a so-called practice-based approach can be formed that might function as a promising toolbox for dealing with various public health issues.

Volunteering in Sport in Italy and EU. Some Empirical Evidences and Possible Future Scenarios

Bortoletto, Nico

University of Teramo - Italy, Italy

nbortoletto[at]unite.it

Volunteerism is generally seen as one of the central elements of the contemporary democratic societies. Volunteering in sport is something difficult to identify. Much athletes contribute with their unpaid work to the life of their organization, giving time, energy and ability. Much parents perform duties in sport organization in a very informal way and they seem to undervalue this type of involvement in terms of volunteer service recognition. Sport organization are in Italy and in Europe the main employer of volunteers. In Italy, for instance, more than one million of volunteers operate within sport organizations (Istat 2011) with an increment of more than 80% during the first decade of this century and 83% of sport organizations uses volunteer work. Our hypothesis is that this increment of volunteerism in Sport organization is linked

partly to a progressive complexification of the normative aspects involving sport organization, even at the very first amatorial level. In this work we will try to compare the evolution of the Italian voluntary sport sector with the European one, using Eurostat, Istat and Gesis database with Eurobarometer data. We are expected to find on one hand the suggestion that volunteerism is a form for regaining personal meaning in a society that tends to expel the individual from the construction of social meanings, on the other hand to note that the growth of the phenomenon it's linked to the bureaucratic increase of the sport organization necessities, especially in terms of fulfillment of (legal) obligations.

What Is the Bet About? The Betting Strategies and the (Sociological) Knowledge

Nosal, Przemyslaw

Adam Mickiewicz University in Poznan, Poland

przemyslaw.nosal[at]gmail.com

The betting industry has become the key actor at the sport consumption stage. The gambling companies have a great impact on the sport teams as a sponsors or advertisers; the bookmaker's money fuels the professional leagues and the grassroots competitions. Besides, the large number of fans participate in the every-week (or even everyday) betting activities. All of these things make gambling on sport an important sociological phenomenon. Most of the betting studies are focused on the relations between betting and social stratification, gender, consumption or addiction. However, the betting can be analysed in terms of the sociology of knowledge. The bettors use the different types of knowledge to make a bet. They apply the expert's tips, do the statistical analysis, listen the "Significant Others" or follow the hunch/intuition. In this way the betting strategy is the indicator of some wider problems: the role of knowledge, the social complexity, the risk culture, the future forecasting. The presentation is based on the quantitative research. It shows the key findings of the survey (N=400). The speech will try to answer on two main questions: (1) What are the betting strategies? (2) What is the social role of betting?

UEFA and FIFA Top-list Referees: Homogeneity, Heterogeneity and Elite Group's Boundaries

Duvant, Gregoire

Université d'Artois, URePSSS, Atelier SHERPAS, France
gregoire.duvant[at]gmail.com

FIFA and UEFA elite referees passed hardships, stages and difficulties before entering the elite group. The refereeing committee spotted, recruited, selected, valued, sorted, promoted, elected and consecrated them. In a hypercompetitive system, they managed to enter a group at the highest level of prestige and remuneration scale (Charle, 2006). They lived experiences and career path with common characteristics. These elements help to make a clear distinction between the elite group and other "refs". The first aim of this paper will be to analyze this common base of practices, experiences and values to draw the boundaries of the elite group. This group seems homogeneous. However, when we analyzed pathways and referee's careers, it reveals a strong internal heterogeneity. Although they are part of a common framework, "refs" carry different experiences. Generational effects and geographical spaces can explain differences between individuals. Previous pathways and the result of socialization lead "men of the middle" to invest differently their refereeing activity. At the heart of UEFA and FIFA elite group, internal boundaries and various issues can be uncovered. Indeed, officials have some flexibility to individualize their rapport to the refereeing world. This paper is about a sociological survey, funded by the International Center for Sport Studies (CIES) and FIFA. This work based on 85 biographical interviews with retired and still active referees, and an ethnographic survey at the heart of the action, in two international tournaments, in the daily lives of referees. Beyond differences and similarities, we would like to discuss about the elite referees' group boundaries. In other words: how can we define the elite group and officials who compose it?

The Olympic City, Before and After: Analysing the Intangible Legacy of Hosting the Rio 2016 Summer Olympics

Nogueira, Maria Alice de Faria (1,2);
Buarque de Hollanda, Bernardo Borges (2)

1: Universidade Estácio de Sá (UNESA), Brazil; 2: Centro de Pesquisa e Documentação de História Contemporânea do Brasil (CPDOC), Brazil
prof.maria.alice[at]gmail.com,
bernardobuarque[at]gmail.com

As cities engage in the Olympic candidature process, they also engage in the process of developing a new identity for themselves. This new identity – here named The Olympic gaze (Nogueira, 2017) – offers tourists as well as residents a fresh perspective from which to view and experiment the (host) city

as a (new) locality. Drawing on Urry's "tourist gaze" (Urry, 2001; Urry e Larsen, 2012), the Olympic gaze is here seen as being socially systematized, a result of several marketing and communications actions which, grounded mainly in urban and architectural changes, give the city its new Olympic shape and identity. Based upon Rio 2016, this paper presents the preliminary results of a post-doctoral multidisciplinary research on the intangible legacy of hosting the Games, which aims to be a reflection on image transformations experienced by the host city, particularly in terms of tourism, marketing and business, as it becomes – even temporarily – a present-day "mythical Olympia" (Rubio, 2008). To that end, the research comparatively analyses three communication pieces from three different moments that covers the process of hosting the Rio 2016 Olympic Games - the pre-Games period of the bidding, when the local government provides the IOC a bid promotional video; the opening of the Games, with special attention to the Opening Ceremony as a major communication and marketing piece; and the post-Games period, during which an evaluation of the media coverage on the Olympics' legacy is performed one year after the Games.

Head Injuries In Swedish Ice Hockey And The Associated Risk Regulation Regime

Hemmingsson, Olov Mikael

Mid Sweden University, Sweden
olov.hemmingsson[at]miun.se

Due to the progressing knowledge regarding long-term health effects of head trauma in certain contact sports, the question of regulation is likely to be raised. In the case of Sweden, sporting activities are still part of a large civic movement mainly financed through public resources. Explicitly justified through claims of health promotion as well as alleged effects on social capital, the Swedish state and its municipalities spend a substantial amount of public resources in support of sports organizations each year. With numbers of active athletes as well as spectator numbers and public resources spent considered, ice hockey is arguably one of the biggest sports in Sweden. The legitimacy given to the sport through public funding and explicit recognition regarding positive societal effects is likely to be increasingly questioned due to the increasing amount of head injuries happening in the game as well as the aforementioned knowledge on the long term risks of such injuries. With this problem in mind, this PhD-thesis aims to advance the knowledge on the risk regulation regime associated with Swedish ice hockey through three empirical studies. First, a corpus assisted discourse study of the media narrative related to the specific risk. Second, a quantitative content analysis of the information communicated by the Swedish ice hockey association. Third, a network analysis intended to map the organizations involved in the regulation regime and the dynamics between them.

Risks, Drug Addiction And Social Inclusion In a Life-Course Perspective: An Ethnographic Study of Drug Users' Participation In a Norwegian Street-Soccer Program Aimed At Rehabilitation

Blaalid, Bjørnar

Nord University, Norway
bjornar.blaalid[at]nord.no

This project is a part of my Ph.D. in sociology, and the objective is to study recovering drug users in Norway and their struggle to move on with their lives. I explore how participating in drug-intervention activities, like street-soccer, can help the drug users cope with addiction, strengthen non-addict identities, better their mental health and quality of life. Two overarching research questions have guided the process: 1) How do young people involved in drug rehabilitation describe and reflect on their ways into drugs and their struggle to move on with their lives? 2) What social processes are crucial for people with an addiction problem to break with drug abuse and over time become re-integrated into society? Through an ethnographic approach, I have spent time in a street-soccer team managed by a non-profit organization, using participating observations and in-depth interviews to produce thick descriptions on the everyday lives of recovering drug users. The study makes use of a life-course perspective, focusing on the drug user's own experiences with drug abuse and how activities like street-soccer over time might develop processes of social inclusion enabling them to become re-integrated in society. Recovering from drug abuse, street-soccer is a vital arena to reduce risks of drug relapse, giving former drug users opportunities of social inclusion through interaction, forging networks, making friends and create positive growth through physical activity.

Sleep, Physical Activity and Beliefs. A socio-ecological approach based on the Universanté research

Porrovecchio, Alessandro (1); Masson, Philippe (2); Kuehn, Carl (1); Esposito, Maurizio (3); Pezé, Thierry (1); Hurdiel, Rémy (1)

1: University of the Littoral Opal Coast, France.; 2: University of Lille, France.; 3: Università di Cassino e del Lazio Meridionale, Italy
alessandro.porrovecchio[at]gmail.com,
philippe.masson[at]univ-lille.fr, carl.kuehn[at]univ-littoral.fr,
m.esposito[at]unicas.it, thierry.peze[at]univ-littoral.fr,
remy.hurdiel[at]univ-littoral.fr

The interaction between sociology and the world of sleep has always been difficult and controversial. The activities of sleeping and dreaming have always been the prerogative of some specific disciplines as neurophysiology or psychology.

Roger Bastide, who has always been attentive to the world of imagination and to the Other, writes in one of his books "for Sociology, interested only in the man awake, the sleeper might as well be dead [...] The question I have asked myself is whether the sociologist is right to ignore the other half of our life, to envisage man standing and sitting but never asleep and adream". The recent studies of some sociologist, as Simon J. Williams and Bernard Lahire, started opening this perspective. Starting from the idea that the interaction between sociology and sleep is complex and problematic, we hypothesize that we can analyse the interaction between sleep, physical activity, social inequalities and beliefs in a complete and comprehensive manner only if we base on a socio-ecological perspective. In this communication we will introduce and discuss the first results of the Universanté research, based on a panel of 700 University students of the Opal Coast area (France) focusing on the social-constructed beliefs and on the interaction between sleep, physical activity and social inequalities.

"I think it's cooler, when you achieve it all by yourself": A Qualitative Investigation of Primary School Students' Constructions of Doping Use and Risks

Frydendal, Stine; Thing, Ida Friis; Thing, Lone Friis

University of Copenhagen, Denmark
sfrydendal[at]nexs.ku.dk, ift[at]nexs.ku.dk,
lfthing[at]nexs.ku.dk

The use of performance-enhancing drugs among athletes has been a concern for decades. In recent years anti-doping organizations, politicians and researchers have drawn attention to the use of doping in the general population, including the use among adolescents. Research have shown that a small but significant number of adolescents have tried performance enhancing drugs (Dunn & White, 2011; Sagoe, Andreassen, Molde, Torsheim, & Pallesen, 2015; Sandvik, Bakken, & Loland, 2018). However, it is still rather unexplored how young people in general relate to the issue of doping. This study investigates how non-using students in primary schools in Denmark construct doping use and doping users as well as perceived risks of use. 28 individual interviews and 7 focus-group interviews were carried out with 8th and 9th grade students (age 14-15) from three different Danish schools in order to gain insight into the students' social constructions of doping users, acceptable/unacceptable use and risk perceptions. The paper deploys notions of risk adopted from Lupton (1995) as well as Bengtsson and Ravn (2019) as a theoretical framework for the analysis, in order to understand how young people ascribe meaning to these issues. The paper will contribute to current knowledge about prevention of doping use among adolescents and provide an important qualitative insight into this research field, which is almost exclusively dominated by quantitative accounts as well as studies concerning current users.

Relationship between sports and persistence among Higher Education students in Central and Eastern Europe

Kovács, Klára

University of Debrecen, Hungary
kovacs.klarika87[at]gmail.com

Our presentation aims to reveal the interrelation between students' doing sports and the subjective indicators of their persistence in their studies in Hungary's Northern Plains region, and in Slovakia, Ukraine, Serbia and in Romania. The theoretical background for our research was constituted by the development model, as well as the institutional integrational model of Tinto (1975), Pascarella and Terenzini (1980). Persistence was measured through a nine-item inventory. We intended to find out how determined students were in connection with the completion of their studies, how useful they found their selected courses, and how committed they were in connection with meeting classroom and exam requirements. The database contains data regarding students in the region of Hungary that borders on five countries, as well as minority Hungarian students in the neighbouring countries (IESA 2015, N=2017). Our results contradict the integrational model, as membership in a sports club reduces the persistence of the student concerned, regardless of the gender, country and the effects of the social background variables. Although the regressive analyses did not show the effects of doing some sport at sports clubs outside the campus, or doing sport at both place, the comparative analyses clearly show that students who do sport at sports clubs or associations outside the campus are at a distinct advantage in terms of their attitude to their studies. Students who are members in some sports club on and outside campus tend to express their commitment to their studies.

Chronic Traumatic Encephalopathy: Head Trauma and Sporting Subjectivity

Hollin, Greg

University of Leeds, United Kingdom
g.hollin[at]leeds.ac.uk

'Chronic Traumatic Encephalopathy' (CTE) is a form of neurodegenerative disease associated with head injuries and linked to a range of mood and motor disturbances. CTE most frequently results from sporting activity and there is growing concern about a 'silent epidemic' of dementias associated with the disease. Indeed, there are increasing demands for action to prevent CTE with rule changes proposed in a diverse range of sporting arenas. In the wake of such debate, it has been

argued that 'CTE has transcended its status as a medical diagnosis and become a cultural phenomenon' (Ventresca, 2018, p. 2). In this paper, I ask how CTE, as a 'cultural phenomenon,' has affected the way we render those who play sport and how we make sense of their actions. Utilizing discursive analysis, I examine the six long-form biographies of two NFL players who died by suicide and were posthumously diagnosed with CTE. I find that, first, CTE does indeed play a prominent role within these players' biographies and is used to understand their behaviour – not only their suicides but also perceived changes in character and criminal acts of violence. Second, I find that these neurological discourses do not simply replace established narratives but rather diffract through longstanding discourses based around masculinity and race. I conclude that while CTE plays an increasingly prominent role in our understanding of sporting subjectivities, any straightforward notion of medicalization or neuro-reductionism in sport may well be misplaced.

Physical Activity in the Different Domains of Daily Life

Iannucci, Laura; Bologna, Emanuela;
Cialdea, Laura; Michelini, Manuela

ISTAT, Italy
iannucci[at]istat.it, bologna[at]istat.it, cialdea[at]istat.it,
mamichel[at]istat.it

Numerous studies on lifestyles in modern societies have shown that one of the main characteristics is the tendency to sedentary lifestyle. The most part of time is spent on the internet, watching television or doing other sedentary activities. This is worrying because of the negative repercussions to health; being physically active is essential for health and well-being and the benefits of physical activity are well-known. Recent data show that most part of people in Europe do not reach the minimum level of physical activity recommended by the WHO: only 30.8% of adult population engage at least 150 minutes of moderate physical activity in a week. In Italy only 18.3% of adults is active. The aim of this work is to analyze active versus sedentary lifestyles in the different domains of daily life (leisure, work, housework). Data analyzed come from different surveys carried out by ISTAT from 1993 to 2017 (Aspects of daily life, EHIS, Time use; Citizens and leisure time). Preliminary results show that on average in a day 34% of time is spent sleeping, 28% in sedentary behaviors and only 37% in physical activities. If we consider the different domains, 26% of adults is active exclusively at work/housework, while only the 17.5% is active in all the domains. Multivariate analysis were applied to estimate the risk of sedentary habits in the different domains, according to individual sociodemographic characteristics and other unhealthy behaviors. The results show that especially socioeconomic factors (level of education and economic resources) play an important role.

Eudaimonic Happiness in the Biographies of Amateur Athletes

Rożdżyńska, Kaja

University of Warsaw, Poland
kaja.rozdzynska[at]gmail.com

Happiness can be captured not only from the perspective of emotions, but also as an ethical category. As Julia Annas (Annas, 2004) notes, happiness, eudaimonia, is treated in philosophical reflection as an achievement - a desirable condition to be endeavor through a set of appropriate practices. I would like to propose a look at biographies of amateur athletes through the prism of eudaimonia, happiness in the category of goal to achieve. Such an approach requires looking at life from a global perspective and making reflections on how the adopted life plans shape and organize its course. I will present the proposal for this interpretation on the chosen case of an aspiring runner, striving to run her first marathon. The material subjected to analysis and interpretation was collected by a method of narrative biographical interview, allowing for a free, uncontrolled and spontaneous statement of the interviewee about the whole of her life. This technique summarizes current biography and as such is a good starting point for eudaimonic reflection. The proposed approach may also contribute to a broader reflection on the role of amateur sport in the postmodern world. A reflection on the happiness in the category of goal to achieve and the resulting life plans allows for the interpretation of amateur sport as a tool to regain control and agency in a liquid, uncertain reality.

RN28_06 | Identities in sports

Stigma, Health and Physically (In)active Bodies

Seal, Emma; Nicholson, Matthew; Randle, Erica; Stukas, Arthur; O'Halloran, Paul

La Trobe University, Australia
e.seal[at]latrobe.edu.au, m.nicholson[at]latrobe.edu.au,
e.randle[at]latrobe.edu.au, a.stukas[at]latrobe.edu.au,
p.ohalloran[at]latrobe.edu.au

The focus of this presentation is the experiences of currently physically 'inactive' women and the micro-level, stigmatising processes that inhibit their engagement with, and experience of, physical activity. The research is situated at the nexus of physical activity, health promotion and associated exercise is medicine discourses. The current Australian government health agenda is strongly informed by neoliberal economic imperatives to reduce the burden of disease that 'unhealthy' lifestyles generate and the potential loss of productivity they cause. Consequently, individuals are urged to take up responsibility for their own conduct in line with cultural norms, market forces and advanced liberal governments. The framing of health in this way leads to a focus of resources on fostering individual behaviour change, rather than attempting to

examine the socio-cultural determinants of health (and physical inactivity). The research draws from recent reconceptualisations of stigma (e.g. Tyler and Slater, 2018), which focus on unpacking how stigma functions as a form of power. Women experience stigma in relation to their physically (in)active bodies in a variety of ways, which often operates as an inhibiting mechanism that forces disengagement from physical activity and negative emotional impacts. The research is significant for presenting and exploring women's day-to-day contestations with physical inactivity, via the lens of stigma, to trace the wider socio-cultural processes that produce these experiences. This is a timely contribution to the growing body of literature that expresses the need to move away from individual health behaviour interventions (Holman, Lynch & Reeves, 2018) and to consider more fully the structured and contextual aspects of behaviour and health.

Football Fans And The Gentrification Of Stadiums: The Case Of Turkey

Inal, Rahsan (1); Sahin, Mehmet (2)

1: Erzincan Binali Yıldırım University, Turkey; 2: European University of Lefke, Northern Cyprus
rahsan.inal[at]gmail.com, cumsahin[at]hotmail.com

As one of the various consequences of the spatial division of capital, gentrification is a relatively new process in Turkey. It has started in 1990s in megacity Istanbul and has become more visible since 2000s. It must be noted that not only moving stadiums to the places far away from down town but also renovating of some are regarded as gentrification in this study. Also, classification of sports fans resulted from gentrification is remarkable. Sports club administrators who welcome new customers instead of fans of the past into their stadiums can be defined as symbols of the commercialisation of collective memories. Indeed, stadiums are collective memory places shaping the emotional and historical connections of the fans that Gentrification destroys this collective memory which has been accumulated for years and replaces them with new memories. Study discusses the process and consequences of gentrification of stadiums through examination of two samples in Istanbul. Study intends to analyze the issue theoretically through descriptive analysis method; by using the newspapers, the content on the official web pages of football fan groups and football clubs and especially the chat pages of these web sites where fans can write their own ideas. Then it concludes that both indoor and outdoor gentrification processes of stadiums built a new spatial barrier for fans that these barriers may have both been surpassed and led reactions among them in opposite directions against commercialisation of sports and destruction of stadiums' collective memories time to time.

Jewish identity of football fans: a comparative study of Ajax Amsterdam and Tottenham London supporters

Wilczyńska, Bogna

Jagiellonian University, Poland
bogna.wilczynska[at]doctoral.uj.edu.pl

Football has become a very important tool in the process of social identity construction and maintenance. In many cases, a fan's affiliation with a particular club represents the combination of a number of specific social, political and religious attributes. This phenomenon takes numerous local variations. In this paper I will analyse the cases of Tottenham London and Ajax Amsterdam supporters who refer to themselves as "Jews" and use various symbols and contents that are traditionally seen as Jewish, even if their clubs have never been Jewish organizations. The objective of this paper is to describe and explain the main characteristics of what I refer to as "Jewish identity" of the fans. It is an on-going project as part of which field research was performed in the autumn of 2017 and 2018 in London and Amsterdam. The research was based on sociological and anthropological qualitative methods, mainly in-depth interviews with the fans and participant observation in the stadiums during Tottenham and Ajax games. The analysis and interpretation of the collected research material will allow me to answer the questions of "how", "why" and "what" happens in the stadiums (and outside of the stadiums) of those two teams in the context of the "Jewish identity" of their fans, and what kind of anti-Semitic content is used by the fans of their football opponents. Of key importance will be to explain the motivation the fans have for developing this specific identity.

"Better Than Men!": A Feminist Research on Boxing

Ergin, Nezihe Başak

Giresun University, Turkey
nbasakergin[at]gmail.com

Wacquant (2012), in the (auto-)ethnographic study, "Body and Soul" in a boxing club in Chicago, discussed the limitations and possibilities of being both a researcher and a boxer. The aim of the paper is to explore why and how gender operates (Krueger & SaintOnge, 2005) within bodily and emotional experiences of boxing vis-à-vis challenges of this "wo- (Heiskanen, 2012) manly (Wacquant, 2012) art" in the "masculine space" (Wacquant, 2012) of the gyms located in two cities, namely Istanbul and Giresun in Turkey. The study will revisit the sociology of sport and "masculinities" based on feminist studies on boxing and gender (Mennesson, 2000; Lafferty & McKay, 2004; Heiskanen, 2012; Paradis, 2012; Trimbur, 2013; Tjønnndal, 2016; Nash, 2017). As an (auto-) ethnographic research, I will focus on this embodied process (Woodward, 2008; Nash, 2017) of research/practice of boxing fitness through challenges of being both a feminist researcher and a woman who enters the ring/field. Conducting semi-structured interviews, the study aims to explore different and changing meanings of boxing –based on "dualisms" (Woodward, 2008)- considering comparisons with "men", which reproduce masculinities (Kimmel, 2005; Connell, 2016; Nash, 2017) and stereotypes about inclusion/exclusion of women. Keywords: gender, bodily and emotional experiences of boxing, wo-manly art, (auto-)ethnography, Turkey.

RN28_08 | Gender and football

How Do Women Perform Their Roles as Women and Fans in the Stands? The Similarities and Differences Between Various Sectors of Football Stadiums

Jakubowska, Honorata (1); Antonowicz, Dominik (2); Kossakowski, Radosław (3)

1: Adam Mickiewicz University in Poznań, Poland; 2: Nicolaus Copernicus University, Toruń, Poland; 3: University of Gdańsk, Poland

honorata[at]amu.edu.pl, Dominik.Antonowicz[at]umk.pl, radoslaw.kossakowski[at]ug.edu.pl

The aim of this presentation is to reveal the female fans' performances on football stadiums by answering the following questions: (1) How do women perform their roles in the stands? (2) Do they construct their own scripts about being a fan and (3) Can one observe identity conflicts between being a fan and being a woman? As the theoretical framework for the analysis, the concept of 'Performative Sport Fandom' (Osborne, Coombs 2013) will be used. Although female supporters' behaviours have already been analysed by several authors (e.g. Stacey Pope and Carrie Dunn in the UK; Gertrud Pfister, Svenja Minter and Verena Lenneis in Denmark), they have been usually focused on one type of fans. Our approach takes into account the presence of female supporters in various sections of football stadiums—those for VIP, regular fans and staunch supporters. By exploring the various parts of the stadium separately, we investigate different segments of the fans' population. We assume that female fans might be driven to different parts of the stadium ('sub-worlds' of fandom community) by various motivations, their experience of fans' attitudes and behaviour can be distinctively different. The presentation is based on a research project 'Women entering the male-dominated world of football fans: causes, course and consequences' financed by the National Science Centre (2016/21/B/HS6/00846).

Gender And Football: A New Age For Media Coverage of Women's Sport And Future Research Agendas

Pope, Stacey

Durham University, United Kingdom
stacey.pope[at]durham.ac.uk

This paper examines English print media coverage of the England national women's soccer (football) team during the 2015 FIFA Women's World Cup. It draws theoretically upon Connell's 'gender order', along with feminist thinking, building upon and extending existing studies on gender, media and sport. The methods draw on a quantitative and qualitative analysis of five English national newspapers from 24 May to 14 August 2015. Findings examine three main themes: the amount of coverage of the 2015 FIFA Women's World Cup; task relevant themes (including skill of the players/team and comparisons to men's football) and task irrelevant themes (including personal life and gendered hierarchy of naming and infantilization). A wide body of research has demonstrated that women's sport is greatly underrepresented in the media and where such coverage does occur, a number of techniques are used to devalue their sporting achievements. But these findings are important as they demonstrate that during this tournament, women's soccer received a significant amount of print media coverage and that this coverage was largely positive. We argue that we have entered a new age of media coverage of women's sport in the UK, with a shift towards greater gender equality in sports media coverage. I move on to consider future research agendas by overviewing further research in the area of gender and sport connected to my current AHRC funded project.

RN29_01 | Refigurations, Reflexivity and Rebellion

(Not) Beyond The European Perspective Of Social Theory: Analysing Relationship Within New Service

Hahn, Kornelia

University of Salzburg, Austria
kornelia.hahn[at]sbg.ac.at

Most of the classical theory of sociology is conceived in reference to European culture. There is a need to contextualize even the most fruitful concepts and to prepare them for contemporary empirical phenomena. The social context of e. g. Karl Marx, Max Weber and Georg Simmel is the so-called bourgeois society which is based upon dichotomous private and public spheres. While theory most prominently deals with the rather "public" spheres of work, production and consumption, the "private" bourgeois household is not exactly included into the analyses. This holds particularly true in regard to domestic service, hierarchy, or status communication. In the course of the twentieth century, we witnessed refigurations of European life style. Status representation changed, domestic service got (seemingly) replaced by machines and the industrial labour market became more attractive. As a consequence, domestic service declined. Probably due both to the decline and the gap in theory, service in Europe had been often neglected in sociological analysis. However, the transformation of European private life style, influenced by global phenomena like digitalization or migration, gives rise to new service. It produces a specific social relationship different from that of the former master/lady and servant relationship. I want to show how the characteristics of this new relationship can be observed by innovatively referring to classical theory in order to highlight dimensions of inequality, division of labour and status communication beyond traditional class and gender concepts.

The Everyday Spatiality of Rebellion

Szaló, Csaba

Masaryk University, Czech Republic
szalo[at]mail.muni.cz

The work of Michel Foucault represents a powerful critique of the established accounts of human freedom. His genealogy of the modern individual revealed how places ruled by the optics of power separate and rank individuals. His theoretical model of individualising disciplination was challenged by his critics because of his alleged technocratic functionalism and masked biologism. For instance Michel Pécheux claimed that this theoretical model conceals a distinction between the

procedures of animal domestication and subjection of human individuals. I would like to address this critique by drawing upon the concept of counter-memory, to single out what, in regions of everyday spatiality can give a rise to rebellion.

Market Reflexivity, Media Reflexivity and Reflexivity in Japan

Nakanishi, Machiko

Chukyo University, Japan
machikon[at]mecl.chukyo-u.ac.jp

The purpose of my presentation is to discuss the transformation of reflexivity and to suggest Market Reflexivity, Media reflexivity, comparing reflexivity in Japan with it in the West. Reflexivity is the concept of reflecting on oneself in the presence of others, and changing oneself in relation to others. By repeating this process, the agent changes. Scott Lash criticizes the reflexive modernization theory of Ulrich Beck and Anthony Giddens, as they presuppose that reflexivity is essentially cognitive and institutional. Lash draws attention to the aesthetic dimension of reflexivity over the cognitive. He insists capitalism opens up possibilities for, not only cognitive but also aesthetic reflexivity. He also discusses hermeneutic reflexivity. In a global information society, reflexivity changes the reflexive tying together of knowledge and action, so that there is no distance between them, which Lash terms phenomenological reflexivity. I suggest that new reflexivities can be born and transform in and through markets, which I call market reflexivity. I also suggest media reflexivity, which can be born and transform in and through medias. Lash and John Urry discuss Japanese systems involve collective reflexivity. Collective reflexivity is so effective, that 'Kuuki' is dominant factor in Japan. Sometimes Japanese society and policies are changed without explicit discussion. Market reflexivity and media reflexivity with collective reflexivity work very well in Japanese society. In the global information society, they will continue to change us ever more radically and quickly. I conclude, compared with Western society, it is important for the Japanese, to be conscious of market reflexivity and media reflexivity with collective reflexivity, to predict its future affects of our society.

The Refiguration of Society

Knoblauch, Hubert

TU Berlin, Germany

Hubert.Knoblauch[at]tu-berlin.de

The paper is addressing a general diagnosis of contemporary societies. In the recent decades, sociology has been either highlighting aspects of modernization such as differentiation, individualization on the one hand postmodern tendencies in societies on the other, such as globalization, glocalization, transnationalization and the transgression and hybridization of structures and identities often grasped in terms of poststructuralism. These tendencies have been expressed in the rather optimistic visions of cosmopolitanism, world culture or world society, or in rather dystopic concepts of surveillance society, the anthropocene or heterotopia. While sociology had little doubt in the continuing dynamics of these tendencies, in the last years and decade we have witnessed the rise of tendencies, such as the ideological rise of nationalism, the reinforcement of nations and quasi imperia, the return of modern wars. Most of these phenomena are not mere reactions to postmodernization; rather, they inhibit those features which have been part of the classical modernity, such as the nation state and consequently the national society, the role of central organisation, hierarchies etc. By the notion of re-figuration I want to underline that these recent developments are the results of the conflictual nature between the sociologic of modernization vs. postmodernization. This sociological becomes particularly visible if one looks at the spatial order but other evidences will be hinted at too. Refiguration, we will argue is a broad category which designates the re-ordering of societies resulting from these conflicts. The paper will present this theoretical argument – which seems quite adequate to a session in social theory. It will provide empirical support for this argument and will try to present a model of refiguration which can be discussed in the session.

RN29_02 | Solidarity, Imagination, and Real Utopias

Why Affective Relations of Love, Care and Solidarity matter in Sociology

Lynch, Kathleen

University College Dublin, Ireland

Kathleen.Lynch[at]ucd.ie

Knowing how people relate together normatively is vital for knowing them sociologically as people know and live in the world in an evaluative, value-laden way. Morality exists within people ‘... as a set of standards of correct behavior that define, orient, and regulate their actions...’ (Vandenberghe, 2017: 410), so things matter outside of political and economic self-interests (Archer, 2000; Midgley, 1991; Sayer 2011). Among the things that frame people’s evaluations are their affective

relations, their commitments to love, care and solidarity. This paper argues that the care and gender-indifferent character of much political egalitarian theory (Lynch and Baker 2009, Lynch, 2014) has impacted on sociological theory, leading to a deep disregard for the relational dimensions of social injustice arising from normatively-driven (love, care and solidarity) affective relations. The non-recognition of affective relations has led to a failure to appreciate their pivotal role in generating injustices in both the production and reproduction of people in their humanness. Recognising the salience of affective relations would enhance a normatively-led sociology of inequality, that is distinguishable from, but intersecting with, studies of inequality based on class (redistribution), status (recognition) and power (representation). It would contribute to the debate about the constitutive place of values in social scientific analysis (Sayer, 2011, 2017; Vandenberghe 2017), and would help provide an enhanced sociological framework for challenging the care-indifferent immoralities of neoliberal capitalism.

Speculating on Progress: Catastrophe, Remembrance and the Critical Value of Narrative Utopia

Davidson, Joe Peter Lionel

University of Cambridge, United Kingdom

jpld2[at]cam.ac.uk

One of the central criticisms directed against the concept of progress by critical social theorists in the last century is that it is unable to adequately respond to catastrophes – from the Gulag to the Holocaust, the Middle Passage to Hiroshima. Progress, it is feared, is necessarily triumphalist, with its empathy with the victors (in Benjamin’s terms) resulting in a forgetfulness of the horrors of the past. Given this, in this paper, I ask whether it is possible to formulate a viable and defensible notion of progress in the face of disaster. That is to say, can progress be reconstructed such that it retains the memory of catastrophe? In this context, I argue that narrative utopias offer a fruitful means for rethinking the relationship between past and future, posing the question of how a progressive society should relate to the disasters that preceded it. In particular, imaginative reconstructions of society provide a means of indexing improvement to remembrance, not forgetfulness. To elaborate this claim, I turn to Nalo Hopkinson’s *Midnight Robber* (2000). The novel presents a vision of black liberation on a new planet, tellingly named Toussaint, which has been colonised by the people of the Caribbean. The utopian world of Toussaint, however, remains shaped by the twin tragedies of colonialism and slavery; the “second passage” from earth to space has assuaged but not extinguished the traces of the “first passage” from Africa to the Caribbean, with the oppressed past maintaining an active presence in the liberated future.

Real utopias. Erik O. Wright's legacy and contribution to social theory

Soler-Gallart, Marta (1); Flecha, Ramon (1); Sordé, Teresa (2)

1: Universitat de Barcelona, Spain; 2: Universitat Autònoma de Barcelona, Spain
marta.soler[at]jub.edu, ramon.flecha[at]jub.edu, teresa.sorde[at]uab.edu

Having revisited Marx's understanding of class in the 1980s as a main contribution to understanding social structure of the times, in the year 2000 Erik O. Wright abandons his previous project to pursue a new avenue that starts by stating the need for emancipatory social sciences oriented by the fundamental moral grounds of equality, democracy and justice (Wright, 2010). He then engages with scholars working on participatory democracy, gender equality, inclusive education and successful cooperativism, to name some, in order to build a framework to analyze the conditions of viability for the extension of what he called "real utopias". Focusing on real utopias moves social theory to focus on the analysis of possibility, of what works, to develop models that can be transferable to diverse contexts an enable real social change. In this paper we will revisit Wright's theory and discuss how the analysis of real utopias needs, on the one hand, the study of successful actions, and on the other hand, a dialogical collaboration between scholars and citizens from diverse disciplines, contexts and beliefs, in the way Erik O. Wright did.

RN29_03 | Knowledge, Ideology and Method

A Self-Delusive Account Of The Practice Of Philosophy

Salinas Lemus, Francisco Javier (1,2)

1: Institute of Education, University College London, United Kingdom; 2: Instituto de Ciencias Sociales, Universidad Diego Portales, Chile
f.lemus.15[at]ucl.ac.uk

Philosopher Penelope Maddy recently published a book entitled *What do Philosophers do? Skepticism and the Practice of Philosophy* (2017) – here I would like to present the main arguments of this work and also offer some sociological observations to some of the gaps in Maddy's depiction of the practice of philosophers. This book is interesting in at least three senses: (1) because it wonders about the obsession that philosophy has with questions; (2) tries to distinguish the figures of the Sceptic Philosopher to those of the Plain Man and the Plain Inquirer; and (3) it is aimed to a broader (non-philosophical) audience. I would argue that, despite the relevance of these three points, her arguments have many tweaks that make her proposal to what do philosophers do rather obscure and self-mystifying. Moreover, I would argue that she misses the opportunity of showing the concrete ways in which the abstract concepts and questions in the toolbox of

philosophers relate either to the concrete problems of an abstract society or to the actual experiences of those working in the discipline. The result: in her work we do not seem to learn much about how philosophy is done in practice.

On The Methodological Significance Of Ontology and Normativity In Social Science

Carleheden, Mikael

University of Copenhagen, Denmark
mc[at]soc.ku.dk

Typically, method is discussed in association with empirical research and in contrast to theory. This understanding should be related to an epistemology that has dominated conceptions of science ever since the scientific revolution and Descartes. Commonly, knowledge has been understood as the inner depiction of an outer reality. Such an epistemology is probably the basic explanation why method so seldom has been reflected upon in the subfield of social theory. Method in the customary epistemological sense has been understood as a "technique" or a "machinery", which ideally in an almost automatic way produces valid descriptions and explanations. Hence, it is implicated that methods are both value-neutral and ontologically empty, i.e. they presuppose nothing in particular about the research object and remains external to it. However, at least since the linguistic turn and the attempts to "overcome epistemology" in philosophy such a notion of method has been refuted persistently. Sociologists of science have shown that methods tacitly include particular ontological and normative presuppositions. In my paper, I will argue that such presuppositions should not be minimized or concealed, but theorized. My main claim will be that if we are able to relate epistemology, ontology and normativity in the right way, we can take a significant step towards a clarification of the role of theorizing in empirical research.

SN Eisenstadt and Zygmunt Bauman: The Possibilities of a Dialogue

Palmer, Jack Dominic

University of Leeds, United Kingdom
j.d.palmer[at]leeds.ac.uk

This paper – based on research currently being undertaken for a Leverhulme Early Career Fellowship called 'Zygmunt Bauman and the West: Exile, Culture, Dialogue' – discusses the relationship between the life and work of two sociological giants who seemed on the surface to have little to say to one another: SN Eisenstadt and Zygmunt Bauman. Indeed, when interviewed in 2011 by Shalva Weil for European Sociologist, Bauman was dismissive of Eisenstadt's work, and there are very few references to Bauman's work in Eisenstadt's sociology. Taking its point of departure from unseen correspondence found in the developing Janina and Zygmunt Bauman archive at the University of Leeds, the paper will address how, in the late-1980s, their social thought converged on several key themes including the postmodernity debate, the sociology of culture, and the Holocaust. They arrived at this dialogue from very different directions - Bauman via a confrontation with the Holocaust and Eisenstadt via comparative civilizational analysis - and seemed to cease communication soon afterwards. Nevertheless, taking this correspondence as a springboard, putting them into conversation again has great potential for informing key debates in contemporary sociology, including the problems of collective identity and the possibilities of barbarism in 'multiple modernities'.

Sociology Of Detachment: Staging An Encounter Between Sociology Of Critique And Sociology of Knowledge

Bacevic, Jana

University of Cambridge, United Kingdom
jana.bacevic[at]gmail.com

This contribution interrogates the epistemic and political implications of the relationship between critique and the production of knowledge, especially in contexts where sociologists are simultaneously participants in and observers of social and political processes. Later work in the pragmatic sociology of critique (e.g. Boltanski, 2009) has opened the question of 'complex externality', that is, the need to ground claims to epistemic authority of sociological knowledge in a context (or normative order) that is external to it. However, given that knowledge of this order is also an object of sociology, how do sociologists go about negotiating this boundary? Engaging in a critical reading of some of the recent work that revisits Weber's doctrine of 'axiological neutrality' (e.g. Hamati-Ataya, 2018, Hammersley, 2017), this contribution maps different routes of grounding epistemic positioning in the context of 21st century sociology. It discusses the possibilities and limitations of different theoretical approaches to the 'double bind', including Bourdieu's and Elias', and puts them in conversation with different forms of philosophical grounding of this problem,

including Arendt's and Sloterdijk's. Illustrating this with own research on academic critique of neoliberalism, it discusses possibilities and limitations of different ways of approaching this issue, particularly in relation to shifting framing of expertise and the 'post-truth' epistemic landscape.

RN29_04 | Borders and Boundaries: Europe and Beyond

Transcending Internal Epistemic Borders: From Diagnostic to a more Visionary Sociology

Žažar, Krešimir

University of Zagreb, Faculty of Humanities and Social
Sciences, Croatia
kzazar[at]ffzg.hr

In the period of its earliest induction, sociology had a twofold task: diagnostic and emancipatory. Alongside scientific scrutinizing of a society, sociology also aimed to refine it. Nearly two centuries later, emphasis is centred on the diagnostic task, while the emancipatory remained neglected. Certainly, sociology today accurately unfolds the increase of inequalities, disparities and injustice in contemporary societies primarily framed by the dominant global neoliberal paradigm. The mentioned phenomena and processes are infrequently conceived as a deviation from the classical welfare social system model. While sociological analyses provide tremendously valuable insights into the shortcomings of contemporary societies, they do not indicate how these flaws can be overcome. Hence, current sociology fails to provide completely novel models and proposals of (re)organizing society entirely outside already known boxes. The crucial thesis claimed here is that there is a burning necessity for sociology to (re)consider how particular social phenomena and challenges topical nowadays, like artificial intelligence, robotics, automatized systems and current technological advancements, can be directed towards the development of a more just and emancipatory society. The utopian dimension of sociology thus ought to be invoked, but not in a manner of dreaming about a barely attainable ideal future, but by outlining concrete models of a novel social (re)organization that can emerge soon. Sociologists are encouraged not to restrict themselves to the analytical diagnosis of societies, but to make a leap further and pursue scenarios for a better future. In this manner, sociology would accomplish emancipatory prospects that it once announced.

Border, Grenze, Confine limes: New Political Representation of The Mediterranean Sea

Riccioni, Ilaria

Free University of Bozen, Italy
ilaria.riccioni[at]unibz.it

The concept of border implies the concepts of space, of no space, and the border between them. There are material borders as physical borders, but also psychological borders (perceptions and mental constructions); time borders or temporal limits (deadlines, age, death). Human being are defined by borders as limits and we might make a big distinction between the concept of Space which is dimensional and quantitative; and the concept of Place which is on the other hand affective and qualitative. The border in sociological terms can be a way to recognize the other, to create a differentiation in reality, to experience the dialectic of inside - outside (culture, nationality, ethnicity, values). The concepts of border in sociology are found in Max Weber, for whom borders have historic-material implications as well as historic-political ones. Every type of community (Gemeinschaft), also political community, are characterized by the sentiment of belonging as the result of long-lasting cohabitation and of reciprocal caring (Weber, 1894; Scaglia, 2008). Georg Simmel dedicates in *Excursus* a detailed analysis where borders, as delimitations of space, give sense to any relation in society. (Simmel, 1908). Any border creates identity, belonging, and differentiation. The concept of "champ", according to Bourdieu, is the category through which any social dynamic and phenomena can be explained or understood (Bourdieu, 1975). Borders also create a peculiar relation to mobility. And mobility is for Simmel the core of modernity, because it is continuously in dialectic with the negotiation of space, and its borders. The paper will analyze the changed perspective towards Mediterranean sea from a bridge across life into place of death, the consequence to new border politics in Italy and Europe.

Peter L. Berger's "Invitation to Sociology": Beyond Europe, Beyond the West?

Steets, Silke

Leipzig University, Germany
silke.steets[at]uni-leipzig.de

Although Peter L. Berger's "Invitation to Sociology" (1963) was first published more than 50 years ago (in the US), it remains one of the most widely adopted introductory books in the field. Not least due to its numerous translations – ranging from Hebrew to Indonesian, and from Norwegian to Catalan – generations of undergraduate sociologist all around the world have learnt from Austrian-born American sociologist Peter L. Berger 'what sociology is all about' (blurb). Based on a careful re-reading of the book as well as of review articles, an interview I did with Berger in 2016 and archival research, my paper follows a twofold aim: First, I will reconstruct what

influenced Berger in his approach to sociology as a 'humanistic' enterprise. Having spent his formative years as a graduate student in sociology with eminent European emigré scholars at the Graduate Faculty of the New School in New York, Berger developed an understanding of the discipline that follows the tradition of German 'Geisteswissenschaften' emphasizing its close relationships with history and philosophy. However, through connecting this perspective with the reality of the American society, Berger points out that sociology can help to debunk the mechanisms of the social machinery and thus contribute to a fundamental understanding of personal freedom. Against this background, I will, in a second step, critically evaluate the potential of some of Berger's ideas that mostly come as timeless 'humanistic' concepts of social theory and ask whether or not they can inspire contemporary sociological thinking – even beyond the West.

Exit, Voice and Loyalties: Contributions Of Continental Sociological Theory

Verpraet, Gilles

Sophiapol, University Paris Nanterre, France
Gverp2015[at]gmail.com

Sociological and philosophical analysis have been framing the question of frontiers within a dialectic of flux and territories (Deleuze and Guattari, 1980), as a dialectic between center and periphery (Amin, 1970) specifically with the control of population (Noiriel, 2005). So have been developed some researches on the policy of transaction at the frontiers processes (Sassen, 2006; Verpraet et Boudreault 2011). Our paper intends to specify the contribution of cosmopolitan studies so to specify the social contents of interdependence, such as collective network organizations, such as a feeling of US inside a liquid society (Butler 2015). Transaction and Coordination, Exchange and Solidarity constitute the social concreteness acting the design of societal interdependences (Beck, 2003; Faist, 2010.) On these analytical basis can be developed the dialectic of control inside a multilevel society. The dialectic between center and periphery was constituting the State formation in the 19 century (Tilly, 1970), developing the top/ down struggle between elites and republic (Piketty, 2015). The post modern formations amplified the mixed hybrid processes between flux and territories (Boltanski 1999), between transactions and public controls (Hirshman, 1970). The struggle between belonging and learning coming from the 19 century inaugural debate of classic sociology (Tonnies versus Durkheim) can be questioned by the modern dialectic between flux and recognition ensuring openness and hospitality with the migrant (Honneth, 2001; Verpraet et Salzbrunn, 2010). Inside this analytical construction, we may observe some extension of the socialization processes connecting belonging, learning and recognition, supporting both inclusive society and open society. We may also observe a diversification inside the exit forms (level of abstention, liquid subjectivity, transnational actors, weakening of the National references)

RN29_05 | Structure and Action; Lifeworld and Systems

Latour and Anti-Dualist Social Theory: The Case of Structure and Agency

Kemp, Stephen

University of Edinburgh, United Kingdom
s.kemp[at]ed.ac.uk

One key plank of Bruno Latour's social theorising is its anti-dualist character. Latour has questioned the value of divisions such as culture/nature, subject/object and human/non-human and developed modes of analysis which try to avoid these divisions. In this paper I consider another division that Latour has rejected – structure/agency – and place his arguments in the context of existing debates between dualist and anti-dualist thinkers within this area. I explore the consequences of his argument for those who explicitly defend dualist approaches to structure/agency, such as Margaret Archer. I also consider how Latour's approach relates to existing anti-dualist positions in this area such as the work of Anthony Giddens and the writings of John Holmwood and Alexander Stewart. I contend that Latour's criticisms of dualism offer useful support to previous arguments in this area, but that his anti-dualist framework leads to problems of its own.

Reconsidering Habermas's System-Lifeworld Distinction

Condon, Roderick Anthony

University College Cork, Ireland
roddycondon[at]gmail.com

The multiple crises of contemporary Europe force social theory to once again confront a longstanding thematic constellation of empirical-theoretical problems. Precarious prospects for deeper democratization in the wake of the neoliberal turn highlight the issue of capitalism forming a barrier to democracy. Furthermore, the pervasive concept of neoliberalism itself indexes a problematic boundary relation between economy and society that is as heavily criticized as it is under-theorized. Over 30 years ago, Jürgen Habermas outlined a theoretical framework especially suited to the consideration of these issues in his two-level system-lifeworld scheme. Subjected to considerable critique at the time, this framework has come to be virtually rejected by contemporary critical theory. Yet, forming the basis of the now remarkably prescient thesis of the colonization of the lifeworld, the system-lifeworld scheme clearly retains considerable explanatory force. This urges its reconsideration at the contemporary juncture. This paper will return to Habermas's two-level theory of society, reframing the system-lifeworld distinction and rethinking economy-society boundary relations in turn. It will argue, beyond existent critiques, that the problem with Habermas's systems theory lies in its

confused elaboration in the Theory of Communicative Action, in which Parsonian and Luhmannian systems are intermixed. Seeing the true innovation of Habermas's social theory as its communicative understanding of social order, it will reference pertinent innovations in *Between Facts and Norms* to recast the system-lifeworld boundary on firmer, explicitly communicative foundations. The resulting reconstruction has implications for the colonization thesis, reframing its diagnosis in way especially applicable to the critique of neoliberalism.

The World Society as an Observer: In Search of Revitalization through Sociological Systems Theory

Akahori, Saburo

Tokyo Woman's Christian University, Japan
akahori[at]lab.twcu.ac.jp

Although society is one of the most important concepts in sociology, theoretical argument over it has almost been ignored both outside and even inside sociology. In this paper we investigate how the concept of society can be useful as a technical term of sociology. For this purpose, firstly we revisit Niklas Luhmann's "Theory of Society". In his terminology: (1) Society is defined as a special type within social systems that consist of communication. (2) Society is called "the encompassing social system" which includes all communications. (3) As a result, it is also called "world society". However the concept of world society seems to be insufficient to describe contemporary times because it is not fully universal. Then we move on to ask what we need for re-describing this globalizing era. We do not need any utopian premises. Instead we look for theoretical materials inside Luhmann's conception. The candidates are: (1) the concept of communication media and (2) "difference-theoretical approach". As for the former, we ask what kind of communication media enables us to communicate with each other despite increasing heterogeneity. The answer is: common platforms for communication. As for the latter, we question what kind of distinction is appropriate to observe world society. The answer is: just a simple distinction between communication and non-communication. In conclusion, through the amendments, the concept of society (i.e. world society) as singular form should be a basis to describe modernities as plural form.

Critical Theory as Social Practice

Welz, Frank

University of Innsbruck, Austria
frank.welz[at]uibk.ac.at

Following Thomas S. Kuhn, social theories are usually understood as Kantian frameworks that enable the identification, interpretation, and reflection of social phenomena. Instead of understanding theories as neutral background assumptions of thought, my paper claims that social theories have themselves to be understood as normative social practices. Theories are both, shaped by societal changes but also intentional interventions into very specific circumstances. Inspired by historical epistemology, my exemplary discussion will include theories of Adorno, Habermas, Rosa and Luhmann. It will point out their approaches as specific reactions to specific societal transformations. - Shaped by the Keynesian capitalism of the mid-20th century, Adorno's critical theory introduced a theoretical framework that still assumed and promoted the possibility to steer the economy. From the 1980s onward, paralleling the transformation from the Keynesian welfare state to the post-Keynesian neoliberal order, unlike Adorno, later social theories gave up any analysis of political economy. For Habermas (promoting the public sphere), Luhmann (emphasizing the contingency of the world), and, most recently, Hartmut Rosa (promoting 'resonance'), capitalism has already won. Their forms of theoretical 'critique' are no longer questioning market-society, as Adorno did. Accepting that the functional differentiation of Western societies and its underlying economic order can no longer be put into question, all three consequently developed new versions of a 'critical' analysis of contemporary society – aimed as practical interventions – that are quite different from Adorno's original critical theory. Theory construction and normative practice go hand in hand.

RN29_06 | Power and Authority Today

A Bhaskar-Cartwright Synthesis for Studying Political Process

de la Banquise, Balthazar

Cornell University, United States of America
rap348[at]cornell.edu

Roy Bhaskar and Nancy Cartwright are two contemporary philosophers of science committed to a realist ontology and a relativist epistemology, each with a significant following in the social sciences, with Bhaskarists focused more on Marxism and sociological metatheory and Cartwrightists more on mathematical economics and evidence-based policy. Both schools subscribe to entity realism, the position that the world is composed of real things with causal tendencies, all of which are often unseen: the job of science is to explain these hidden causes. Unfortunately, there has been no significant exchange between or synthesis of the two schools, to their mutual

detriment. This isolation is particularly damaging because each side can benefit from the insights of the other, as when two people in a rowboat suddenly become aware of their copresence. The current paper begins to connect these schools, first by highlighting their common philosophical background, second by showing their conceptual complementarity (in particular the open-closed and transitive-intransitive distinction from Bhaskar, and the nomological machine and dappled world concepts from Cartwright), and third by addressing a potential incompatibility (viz., that Cartwright is a weak actualist, in Bhaskar's terms). Finally I illustrate how a Bhaskar-Cartwright synthesis can help when theorising political process and change, by analysing the coemergence of new parliamentary parties with new parliamentary procedure, "not so much to identify similarities among instances as to account systematically and parsimoniously for their variation." (Tilly 1995:1601).

Populism, Political Disorientation and Reluctance to Confront Fascistization and Criminal Politics

Frade, Carlos

University of Salford (Manchester), United Kingdom
c.frade[at]salford.ac.uk

This paper takes issue with 'populism' as a category to understand the contemporary moment and puts forward the alternative idea of 'fascistization' – a process whose initial stages would include the contemporary phenomena which today are habitually referred to as extreme right-wing politics or populism. Populism is considered a term of disorientation. Indeed, the existence of two populisms (right-win and left-wing) cannot but create confusion, while the fact that no real oppositional category to populism can be found suggests that in reality populism is opposed to the status quo, which ultimately makes it a term of the system. 'Fascism' is treated as a process, not as a final form, and while contemporary manifestations of the extreme right lack two distinctive traits of classical fascism as regime (a mass movement and storm-troops), however, understanding fascism as a process that follows a logic, evolves through stages and grows in spaces of disorientation should help us to take the measure of our situation. The second major problem we face is the historically-rooted disinclination to seriously confront fascistization. Today this is chiefly manifested in the tacit consent granted by democratic subjectivities to a crucial aspect of fascistization: 'criminal politics', a category used here to encompass all the contemporary state and media politics of scapegoating, dehumanization and persecution of the lower classes (both 'national' and 'immigrant', many of whom are in addition put in 'detention centres') which not by chance take place together with the imposition of austerity as a permanent situation. The paper thus seeks to bring some orientation to our present and to encourage a more active and politicised stance against current catastrophic politics.

Contemporary Governance and Rationalisation: Examining Institutional Reforms from a Weberian Perspective - An Example from Greece

Kantzara, Vasiliki

Panteion University of Social and Political Sciences, Greece
vkantz[at]621anteion.gr

The contemporary 'governance' discourse has its roots in the social conditions that prevailed after World War II. The discourse gradually managed to incorporate different and even contradictory critiques on the poor functioning of state institutions as well as on some ethically suspect actions of large private corporations. The solution to the problems, at the time, was perceived to be 'structural reforms' or 'adjustment' that in due course took the name 'new public management'. With the help of international and supranational organisations, reforming public institutions on, for instance, education, health, local government or labour were spreading quickly in European and North American countries, especially after the 1980s. Part of the appeal of this new policy was that it aimed at 'increasing efficiency' and 'reducing costs'; some of the consequences, however, point to increasing privatisation of public services, social inequality, and precariousness, as well the rising of populist ideologies and xenophobia. The societal effects have been mostly interpreted as the effects of applying a neoliberal agenda. In the proposed paper, I suggest that institutional reforms could be examined and understood as part of rationalising the steering of institutions and public goods. Rationalisation, in Weberian terms, means that humans attempt throughout history to change society, according to an image they have about how they ought to live. A worthy pursuit, that nonetheless has, sometimes, unfavourable effects. On basis of research done in Greece, I shall discuss how the institutional reforms incorporate a kind of rationality called 'formal' and what the consequences are. Last, I shall refer to the implications of employing the notion of rationalisation for theorising, understanding and explaining current societal changes.

Putting Authority Center Stage Again in Sociological Theory

Tonkens, Evelien; Hurenkamp, Menno; Trappenburg, Margo; Kampen, Thomas

University of Humanistic Studies, Netherlands, The
e.tonkens[at]juvh.nl, m.hurenkamp[at]juvh.nl,
m.trappenburg[at]juvh.nl, t.kampen[at]juvh.nl

Authority has for long been a central theme in sociology, but it has been neglected since the 1970s, when attention shifted to problems of power. Authority has been rejected as redundant and paternalistic (with a few exceptions). However, authority – as legitimate power as Weber defined it – is highly present and cannot be neglected in egalitarian, democratic societies. Authority is faced with deep ambivalences that sociologists

need to address. Authority is not only rejected but often at the same time also demanded, to coordinate processes, regulate relationships, end otherwise everlasting discussions, and provide moral guidance to (other) citizens. Interestingly, egalitarian societies have developed new forms of authority, ridden with these ambivalences. Examples are: upside-down authority, that comes from below, like the authority of patients, volunteers or parents towards doctors or teachers. Or (formally) absent authority, like 'self-steering' teams of social professionals. Or fallible authority, for example of doctors or judges (or referees on the football pitch) whose work is ever more transparent so that their mistakes are in the spotlights. Or digitally-hidden authority, coming from machines that do not allow much contestation but effectively control our behaviour in ways we hardly notice, in conflicts with for instance government or insurance companies. Such new forms of authority deserve empirical as well as theoretical analyses from sociologists. In this paper, we aim to analyse current ambivalences in these new forms of authority, and thereby put authority centre stage again in sociology.

RN29_07 | Religion, Secularity and Global Modernity

Islam, Christianity and the Development of Machine Capitalism: The Weber Hypothesis Revisited
Gould, Mark

Haverford College, United States of America
mgould[at]haverford.edu

This paper analyzes the effects of religious commitment on the development of machine capitalism. I explicate the logic of Weber's analysis, providing a characterization of the economic preconditions for the institutionalization of machine capitalism. My characterization of Protestant religious commitments clarifies how they led to the rationalization of the first stage of manufacture (Marx's formal subsumption of labor under capital), created the "spirit of capitalism," and thus resulted in systematic capital accumulation leading to machine capitalism. I then characterize the nature of religious commitment in (Sunni) Islam, arguing that while the economic preconditions for the development of machine capitalism were sometimes present in Islamic lands, Islamic religious commitments neither rationalized economic production, created a tendency towards capital accumulation, nor created the "spirit of capitalism." Weber was correct in assigning an autonomous role to ascetic Protestantism in the genesis of machine capitalism, and in denying a comparable role to Islam.

The Secularisation Debate(s) Revisited

Chernilo, Daniel

University Adolfo Ibáñez, Chile
D.Chernilo[at]lboro.com

From the revival of right-wing politics to the universal jurisdiction of human rights and the “definitive failure” of multiculturalism, the question of secularisation is never too far in public debates. Even if the term itself may not seem to attract now the explicit interest it once did, its ultimate reference point – the presence or otherwise of religious beliefs in public life – remains as consequential as ever. All historical narratives on the formation of modern societies offer an answer to the question about the role of previous religious traditions in the rise of the modern state, economy and culture. 1 My starting point in this paper is that there are in fact several debates on secularisation rather than just one over the past 100 years. And my goal is to revisit the most salient ones. These debates partly intersect but, more often than not, also talk past one another. I suggest they be grouped into four main ones. 1. From secularisation to post-secularism: Does modernity imply the decline of religion? (Weber, Parsons, Taylor). 2. Gnosticism and the devaluation of values: Is religion always an attempt the foundation of normative values? (Jonas, Voegelin) 3. History and the self-positing of modernity: Is modernity an historical time like no other? (Löwith, Blumenberg) 4. Political theology: What is politics and what is its relationship with religion? (Schmitt, Taubes, Strauss) In all four cases, I seek to unpack not only their main arguments but also the points of intersection, alignment and differences between them.

Politics of Being-With in the Global Modernity

Tasheva, Gallina

University of Muenster, Germany
gallina.tasheva[at]uni-muenster.de

The question now is: How to rethink the idea of sociality beyond the understanding of the world society in terms of “Cosmo-Europeanization” or “Westernization,” grounding solely in human rationality, increasing growth and normative orders. Endorsing the idea of a new method of conceptualizing of sociality in terms of Existential Analytic of “Being-With” (Heidegger – J.-L. Nancy) the paper argues for an “other” or “third” social order as a “Being-with”, different to the social orders of community and society. To this “third” social order of the “Being-With” belongs the manifoldness of human forms of existence and the sociality of human life, which go beyond the typical social interactions and communications in the community and society, based on the mediation by the common and general as shared values of belonging, historical roots, traditions, cultural dispositions, social habits of self-understandings or normative orientations. Even more unfolds this social order of “Being-With” a subversive character in relation to the social orders of societies and communities as inaugurating possibilities of new forms of politics in difference

to all forms of politics as “police” (J. Ranciere), governmental techniques, social administrations and normative orders.

A Nietzsche-Inspired Historical- Genealogical Approach? The Contemporary Relevance of Weber's Mode of Questioning for Social Theory

Silla, Cesare

University of Urbino, Italy
622nalys.silla[at]unicatt.it

The paper aims to assess the relevance for contemporary social theory of Weber’s mode of questioning directed toward making sense of the correspondence and the mutual influence between human types and orderings of societal relationships, as conveyed in The meaning of “value freedom”. First, by explicitly connecting the Freiburg Address of 1895 with the essay on value freedom (1917), via the work on the East Elbian rural laborers, I argue that his mode of questioning was already present in his early works, even if expressed in an “immature form”, as Weber himself put it (1913). Second, by 622nalysing selected passages from The Protestant Ethic and The “objectivity” essay, I show how Weber devised what can be tentatively defined a Nietzsche-inspired historical-genealogical approach. This approach enabled him to address his “ultimate standpoint” – the fate of the Menschentum under mechanized capitalism – both objectively and significantly, since the objective inquire on the conditions of emergence of mechanized capitalism became the basis for the significant subjective evaluation of its lasting effect on the “last men” of the cultural development: ‘Specialists without spirit, hedonists without heart, these nullities imagine they have climbed to a stage of humanity never before attained’. In conclusion, through the example of contemporary consumer capitalism, I suggest that the joint of the Weberian mode of questioning with the historical-genealogical approach help social theory to properly account for the mutual influence between the objective forms of social life and the related cultural problems of humanity within modernity in transition.

RN29_08 | Reason, Recognition and Ideology Critique

Modernity And The Critique Of Ideology

Mouzakitis, Angelos

Univeristy of Crete, Greece
amouzakid[at]uoc.gr

Since the inception of modernity the notion ideology was employed as a means of critique against pre-modern forms of life and their symbolic systems and conceptual frameworks, while serving also as a vehicle of self-reflection as it was directed against modern political Weltanschauungen and modern philosophical and scientific accounts of the world. The critique of ideology was pivotal to Marx's assault on capitalism, while it also informed Marxist attempts at the unmasking of the role of capitalist elites in the shaping of modern social and political life. Mannheim's sociology of knowledge provided the social sciences with a more complex account of ideology and utopia, while a number of significant developments in philosophy, epistemology and the social sciences themselves rendered the very notion of ideology problematic: Hence, the emphasis placed on 'language games' by thinkers that followed the late Wittgenstein (e.g. Winch and in a more radical manner Lyotard) brought to the fore the problem of incommensurability and showed the difficulty of establishing a metalanguage or a set of principles on the basis of which a form of discourse could be unanimously and irrefutably characterized as ideological. Similar was the effect of Foucault's introduction of the notion of "discursive formations" and of various Feminist critiques of "masculine" reason. Having Ricoeur's lectures on ideology and utopia as its starting point, and employing therefore a phenomenological-hermeneutic perspective, this paper wishes to thematize the importance that the critique of ideology holds in late modernity and the forms it might legitimately take in view both of the ongoing debates in philosophy and the social sciences and the multiple ways in which the modern project has been historically expressed.

Sociology, Reason, and the Critique of Eurocentrism

O'Mahony, Patrick Joseph

University College Cork, Ireland
p.omahony13[at]icloud.com

The proposed paper takes cues from yet radicalizes Axel Honneth's essay on the social pathology of reason (2004). According to Honneth, critical theory, in line with its long legacy, requires orientation from the positive idea of a rational societal universal, but also requires a macro-sociological approach to negatively explain those obstacles which prevent it forming. In so thinking, Honneth is aware of the

contemporary challenges to a comprehensive idea of a rational society, always directly or indirectly intrinsic to critical theory, arising from the various critiques of perspectival hegemony, neglect of the subject, and indifference to power assumed to lurk within the theory of reason. The basic tenets of Honneth's position will be briefly outlined at the outset of the paper. Its main body will be to propose in very broad outline the nature of the sociological approach – realist, cognitive-hermeneutic, normative, immanent-transcendent, mediated, multi-perspectival, dissensual, and consensual – required to advance a contemporary theory of what such a rational universal might consist, arguing that the sociological contribution must be 'positive', oriented to the possibility of a reasonable society, and not just 'negative', concerned with obstacles to ideas of a rational society diagnosed by philosophy. Building on these insights, it will move on, in conclusion and in line with the theme, to address the critique of reason as Eurocentric, attempting to show that even while admitting the importance of this critique a trans-contextual and cosmopolitan idea of democratic, cosmopolitan and communicative reason must be retained.

(In)visibilization: a Critical Theory

Herzog, Benno

University of Valencia, Spain
benno.herzog[at]juv.es

Excluded or marginalized social groups often face problems of representation in the public sphere. The very notion of exclusion usually refers to communicative or discursive produced mechanisms of not being considered relevant for (public) processes of interaction. These mechanisms could therefore be understood as processes of invisibilization of important social groups. Thus, it is no wonder that invisibilization seemed to be the new buzz word in critical social, political but also artistic works. However, in the diversity of applied of the concept it is seldom clear what exactly is meant when the term invisibilization is used. The aim of the presentation is to offer a critical and comprehensive conceptualization of invisibilization. Therefore, I will first present classical critical theories of the public space (e.g. Habermas, Honneth) that understand invisibilization as a social pathology. Where the social is thought as a space of interaction, invisibilization must be perceived as a threat to basic human equality and inclusion. In a second step I will turn towards critical theories of invisibilization (e.g. Papadopoulos et al.) who see in individual and collective acts of imperceptibility the possibility to escape regimes of visibility and control. When visibility leads to oppression through categorization, then invisibility might be a step towards desubjugation (Foucault). Finally, I will explain the inherent dialectics of visibility and invisibility and show that there is never an act of visibilization without invisibilization. When we want to do critical research on (in)visibilization we therefore have to turn away from mere states of (in)visibility asking questions about power to control processes of (in)visibilization.

The Guiding Role of Scientifically Grounded Ideology for Social Conflict Resolution (in the Context of Catalan Crisis)

Matveeva, Natalia Yurievna

Russian Transport University (MIIT), Russian Federation
pmatveyev[at]yandex.ru

Ideology is the leading force of social development. Ideological conflict leads to social and political confrontation. The ideologies of the parties may be based on various sources, but always manifest themselves in the social meanings of people. Catalan crisis has bright ideological expression of two opposite ideological narratives: the narrative of integrity and indissolubility of the Spanish nation and the narrative of the Catalan separate identity with its own original culture and historical peculiarities. These narratives as they expressed themselves now seem to be mutually exclusive. Their unfolding in the social practice is in stalemate. Moreover, no one of the sides has got any serious gains during the conflict. At the same time, the negative effect for both sides is obvious. The ideological ignoring of the opponent's social identity leads to the traumatization of the communities because they have felt their core values under the threat. The roots of the conflict as well as the ways for its resolution are ideological. Both sides have no deeply argued ideas founded on the scientific researches. Politicians of both sides are forced to find decisions under the pressure of circumstances and often these decisions are not the best ones. The sides try to stay on their positions and find the meanings for them in the processes of spontaneous communications. Ideological way for the conflict resolution is the way that has to rise above the fray analyzing of both sides' ideas, values and meanings from the neutral positions but streaming to the positive decision. Such scientific ideology should find out the social meanings that will lead to the conflict resolution through higher level of social development of the nations.

RN29_09a | Techno-Scientific Civilisation and its Consequences

A Possibility of Sociologically Theorizing of AI Phenomenon: An Ethnomethodological Inquiry

Liu, Yu-Cheng

Nanhua University, Taiwan
ycliu15[at]gmail.com

The research project will focus on the topic of artificial intelligence and its relation to sociological theory. There is no doubt that human intelligence is still unique in almost every way, comparing to other organisms. The uniqueness of human

intelligence presents itself in some aspects such as adaptability, plasticity, and creativity. Through perspectives from STS, whose contributions to sociological studies of science and technology, this uniqueness emerges from the interactions between human and non-human objects. Things may have been changed since the 1960s when people not only start to imagine that they can build a machine thinking like humans, but also realize that they are capable of doing it. "What it means to be human" became a challenge to human beings. This challenge also questions the boundary between social actor and society, which has been a traditional and presumptuous idea in sociological theory. The research project will adopt the viewpoint from ethnomethodology and reconstruct artificial intelligence as a social phenomenon and put it into the discussion of sociological theory. In practice, the research project will design a situation in order to observe and record how people converse with AI-based chatbot. With ethnomethodology and conversation analysis approach, the project expects to investigate how two kinds of intelligence interact and in what ways it may reframe the oldest questions of sociological theory: "what it means to be human" and "what it means to be social."

The Ontological Turn And Critical University Studies: On Dialogue And The Critique Of Neoliberal Technocracy In English Higher Education

Cruickshank, Justin

University of Birmingham, United Kingdom
j.cruickshank[at]bham.ac.uk

There is a growing interest in ontology in the social sciences. Critical realism, which stemmed from debates in Marxism, is one of the most influential approaches to ontology. Critical realism is contrasted here with the work of Gadamer. Both approaches to ontology are assessed in relation to the neoliberal technocratic changes in the public sector, exemplified in English higher education, whereby markets are constructed by the state and maintained in this case through audit culture proxies for the 'price signal'. It is argued that education is central to any understanding of ontology and that Gadamer's position, which addresses the importance of education, especially higher education, is better able to analyse the harm caused by the development of a neoliberal technocracy, to the self and to democracy. In making this case it is argued that Gadamer's ontology can be of use to the rapidly expanding interdisciplinary field of critical University studies. Foucaultian work on neoliberalism makes important points about the shaping of the neoliberal subject. However, a turn to ontology which focuses on our 'being' is best able to develop this further, by exploring why education has the potential to resist neoliberal technocracy and reprioritise democracy over economics, and assess how such technocracy creates objective harm for our being. The turn to ontology is of use to critical University studies and it is argued that it is Gadamer's ontology rather than the currently influential position of critical realism that is best suited to this task.

Metamorphozation Of Social Realities: Ambivalent Side-Effects And New Power To Act With Reflexive And Complex Reality Of Europe

Kravchenko, Sergey

MGIMO Univercity, Russian Federation
sociol7[at]yandex.ru

The theory of metamorphosis of the world (U. Beck) states the becoming of a radical transformation in which the old institutional structures and their functions are falling away and quite new ones are emerging. The metamorphozation concerns Europe that is mainly manifested in the form of side-effects. Thus, climate change as an agent of metamorphosis has altered our thinking about boundaries, barriers, and belongings: traditional boundaries between nation-states are becoming less important than new liquid catastrophes permanently producing dead land, water, and ever increasing genetically modified products. Metamorphosis takes place in energy security: the existing geopolitics not only failed to solve the problems of the declared equal access for residents of Europe to energy resources, but also have given birth to man-made risks of local conflicts around the construction and functioning of pipelines with their trend to become globalized. The digitalization of scientific knowledge and the development of digital technologies are new factors in metamorphozing of society, economy, man into anti-society, anti-economy, anti-person that leads to the emergence of a new type of power exercising digital violence against people. At the same time metamorphozation is not only about negative side-effects but about positive side-effects of bads. In any case metamorphosed realities are coming into our life and, correspondingly, new type of knowledge with cultural and humanistic core is demanded in order to produce people's power to adequately act. The answer to the challenges of the metamorphosis of Europe the author sees in the humanistic turn that might give as a valid non-linear knowledge of complex new risks and vulnerabilities as well as grounds for better futures that people want.

Some Remarks for a New Sociological Theory on Sustainability

Nocenzi, Mariella (1); Zocchi, Angela Maria (2)

1: Sapienza University of Rome, Italy; 2: University of Teramo, Italy
mariella.nocenzi[at]uniroma1.it, amzocchi[at]unite.it

The paper aims to explore the opportunity of a rethinking – and, when necessary, of a new formulation – of the theoretical and methodological categories for the analysis of the social action in modified social spaces and times. If the sociological characterization of the Anthropocene society by means of quantitative data is increasingly applied in the sociological investigations (see at the intersectional approach or at the evidences about a platform society), the deductive process to build a theoretical definition of the current processes is far

from to be outlined grabbing on to the classical paradigms. The analytical exploration of some environments of social actions – as the urban ones – allows to read these processes using the social categories of time, space, relation first through a traditional approach and, then, with those differences that outline the current increasing trends to the sustainability approach.

RN29_09b | The Social Shaping of Research: Adequacy, Impact and Elites

Theoretical Foundations of Social Impact

Torras-Gómez, Elisabeth (1); Elboj Saso, Carmen (2); Oliver, Esther (1); Herrera, Julia (1)

1: University of Barcelona, Spain; 2: University of Zaragoza
etorras[at]ub.edu, celboj[at]unizar.es, estheroliver[at]ub.edu, juliaherrera.210[at]gmail.com

The dominant discourse of social impact is trying to exclude the theoretical developments created by sociology and other social sciences. However, some counter discourses are being successful at demonstrating the contributions of social theories to the improvement of societies and their key role in the promotion of the social impact of all sciences. In this vein, the theoretical developments made by sociologist like Weber and Habermas are now being taken into account in the documents and publications about social impact. Furthermore, even the process of evaluation of science is increasingly following the insights about dialogue and consensus elaborated by Habermas and other social theorists. Besides, there are other contributions that have directly influenced social transformation, for example the Public Sociology (Burawoy) and real utopias (Erik Olin Wright). In Spain, the socialist government has created this year 2019 an evaluation of the University professors based on their economic and social transference to society. Consequently, an increasing number of researchers and research groups from different sciences (including health, biology engineering, neuroscience,...), in order to undertake the analysis and the presentation of evidence of their social impact, are asking for help to social science researchers. Taking all the above into account, this paper follows a twofold aim: on the one hand, to collaborate with the social theory critics against the dominant discourse of evaluation of social impact and, on the other hand, to restore the role that social theory should have in the improvement of all sciences and society.

When “Adequacy” is Actually its Opposite: Reading Social Reality Against the Grain

Sabetta, Lorenzo

Sapienza - University of Rome, Italy
lorenzo.sabetta[at]uniroma1.it

A still widely accepted criterion of interpretations' validity is considered to be that of adequacy: sociological interpretations must be attuned to and consistent with the subjectively intended meaning expressed by social actors, as these interpretations should be "reasonable and understandable" for the actors themselves. Even though the principle of adequacy has very seldom been criticized, it has never been expressly claimed that an opposite criterion could be viewed sometimes as more appropriate, i.e. that sociological interpretations have to be, in certain situations, diametrically at odds with the subjective meanings attached by social actors to their actions and statements. The paper aims to explore three research macro-areas where sociological interpretations not only cannot meet the criterion of adequacy, but that also need to be in contrast with the first-order constructs involved, in order to provide reliable and persuasive descriptions, and even for establishing (and labeling) the very phenomenon under study: (a) Study of the routine grounds of everyday activities; (b) Study of hegemony, ideology, and the whole sphere of the Bourdieusian "symbolic"; (c) Study of unintended consequences. This paper contends that when sociologists have to deal with (a) unmarked, (b) self-deceived, and (c) unforeseen social actions (actions for which, by definition, social actors do not even have a label) the principle of adequacy cannot work. Instead, it can be claimed that researchers are forced to brush social reality «against the grain» (against reasons and intentions of people concerned), to borrow Benjamin's expression. If subjectively intended meaning cannot directly furnish a proper validation, this last one becomes a matter of indirect evidence left inadvertently behind by social actors – they become rather "witnesses in spite of themselves".

The Moral Elites: A Conceptual Approximation and Research Agenda

Sevelsted, Anders

Copenhagen Business School, Denmark
ase.mpp[at]cbs.dk

The paper aims to set out a new research agenda on the 'moral elites' by developing the concept and sketching some methodological implications. I first define three generations of elite scholars (the 'founding fathers', American political sociologists of the 1950s, and 60s and current scholarship) in order to show how current sociological research on elites has focused on the 'power elite' while neglecting the historical and present moral influence of other types of elites on the institutions of society. Building on the research of the three generations, and adding insights from research on the 'axial age', I then flesh out the concept of the moral elites as those groups in society who 1) have disproportionate access to

resources of universalist knowledge and 2) manage to articulate moral principles for society based on their claim to knowledge. I further illustrate this conceptualization by analyzing three societal groups that have historically contributed significantly to the moral elites, namely religious elites, professional elites, and political-ideological elites. Through a discussion with certain strands of institutionalism, I then present a theory of the process of articulation through which universalist knowledge is translated into societal principles and institutions. At the end of the paper, some methodological considerations on the operationalization of the concept and its use in Social Network Analysis are presented, based on my work on the early 20th century Danish moral elites.

Socially Responsible Research and Social Impact Assessment of Scientific Organizations: a Case Study

Martins, Inês Almeida

University of Coimbra, Portugal
almeidamartins.ines[at]gmail.com

The context of "reinvention of capitalism" (Boltanski & Chiapello, 1996) is permeated by configurations and relations of risk and social and economic inequality. This scenario is based on the interaction of state, market and society sectors, in the context of renegotiation and dilution of boundaries and multilevel governance forms, for instance (Ferreira, 2009). Thus, knowledge also transforms its modes of production, appropriation and valuation (Gibbons, 1999). Knowledge production is pressured to conduct itself by market logic as in the knowledge economy sphere (Jessop, 2008); nevertheless new forms emerge in order to integrate in society, through the dissemination, exchanges and promote the knowledge production focused in multidisciplinary and co-construction. Therefore, the production and diffusion of scientific knowledge can generate other outputs in society, which maybe evaluated in terms of their impact. The Social Impact Assessment (SIA) perspective prioritizes active and participatory models, with the implementation process itself as research action (Becker, 2001, 2003) and pursuit for results practice for continuous improvement of the organization and its stakeholders (Becker, 2001; Nichols, 2009). This paper come up with Social Impact Assessment, focused on stakeholders, from a Socially Responsible Research perspective (Daedlow, et al., 2016), which takes into account the organic and complex nature of knowledge producing institutions and be possible to be observed in the ecosystem of results and values (Almeida, 2016). It aims to understand how nonprofit scientific organizations can appropriate evaluation logics and results monitoring that show their social value within a socially responsible science.

RN29_10 | Social Contradictions and Social Pathologies

The Modern Political Imaginary and the Problem of Hierarchy

Browne, Craig

University of Sydney, Australia
craig.browne[at]sydney.edu.au

Hierarchy has been a central concern of work on the modern political imaginary. The need to elucidate hierarchy's deeper sources and its legitimations were some of the motivations behind Castoriadis' development of the notion of the imaginary. Claude Lefort's analysis of the political imaginary similarly commences from a critical analysis of the hierarchical form of bureaucracy and its place in the constitution of totalitarian political regimes. In a different vein, Taylor's conception of the imaginary details a long-term process of the erosion of preceding forms of hierarchy. In the contemporary period, the opposition to hierarchy has penetrated into organisations and institutions that had previously been shaped by hierarchies, like the family, the capitalist firm, the school, and the political movement. Despite the potentials that these initiatives suggest of a change in the political imaginary, it will be argued that forms of hierarchy have, to varying degrees, been reconstituted and that the problem of hierarchy appears in new ideological forms, both with respect to institutionalised power and the legitimating justifications for how things are organised. The critique of hierarchy was once associated with the radical democratic imaginary, however, there have recently been perverse mobilisations of the oppositions to hierarchy by neo-populist movements. These neo-populist movements actually sustain and instantiate versions of hierarchy, whilst rejecting the claims of 'expertise', scientific rationality, 'elites', and 'cosmopolitan' institutions. My paper will explore the problem of hierarchy and its relation to the modern imaginary through reflections on these historical dynamics. It will clarify and apply a series of interrelated concepts that are associated with notions of the imaginary, like those of institution, dialectic of control, displacement, incorporation, justification, and collective subjectivity.

Deconstructing Social Acceleration: Towards a Discrete Model of Temporality for Social Research

Uibos, Andre

University of Tartu, Estonia
andre.uibos[at]ut.ee

The concept of social acceleration provides a model explaining some of the key spatio-temporal processes occurring in the present-day society. However, the inherently temporal function of acceleration in the context of social research could benefit from a clearer methodological approach to temporality. This paper aims at contributing towards a new discrete model of temporality, applicable not only in conceptualizing social acceleration, but also in social research generally. Firstly, I provide an approach to discrete time by using an example of chess and its temporal properties. Time in chess can be seen from two different aspects: a) the (continuous) "time on the clock", and b) the discrete systemic time "on the chessboard", which postulates that each move takes one "tempo" in chess theory. Thus, the discrete model of temporality presented in the paper builds itself on a notion of "change" in a system. The methodological approach is interdisciplinary, combining a) linguistics (following the example of Ferdinand de Saussure) b) semiotics (Juri Lotman's concept of text) and c) social system theory. In a broader sense, the presentation would address the issue of theoretical dichotomy of subjective and objective temporalities in sociology, a problem set by Norbert Elias. The new discrete model of temporality can be used in analysing the character of present-day communication media as a driving force of social acceleration resulting in new spatio-temporal relations in everyday life. Keywords: temporality, social system theory, discrete modelling, chess, social acceleration, communication

Rationality - Cultivation - Vitality: Simmel on the Pathologies of Modern Culture

Bueno, Arthur

University of Frankfurt, Germany
arthur.bueno[at]uni-erfurt.de

This paper reconstructs Georg Simmel's writings on money and modernity with a view to outlining a multi-layered diagnosis of the pathologies of modern culture. The resulting framework allows for the distinction of three different perspectives, each of them based on a specific philosophical anthropology and presenting a distinctive assessment of the potentials and problematic features of modern life. In Simmel's oeuvre, the pathologies of culture are understood as (1) irrational (from the perspective of rational teleological action); (2) alienating (from the perspective of subjective cultivation); and (3) mechanistic (from the perspective of trans-subjective vitality).

The Resonance of Resonance: Critical Theory as a Sociology of World- Relations?

Susen, Simon

City, University of London, United Kingdom
Simon.Susen[at]cantab.net

The main purpose of this paper is to examine Hartmut Rosa's account of 'resonance'. The first part focuses on the concept of resonance, including Rosa's differentiation between horizontal, diagonal, and vertical 'axes of resonance' and their role in the construction of different 'world-relations'. The second part centres on the concept of alienation, notably the degree to which it constitutes an integral part of modern life forms and, in a larger sense, of the human condition. The third part grapples with the dialectic of resonance and alienation, shedding light on the assumption that they are antithetical to each other, while contending that their in-depth study provides normative parameters to distinguish between 'the good life' and 'the bad life'. The fourth part scrutinizes Rosa's attempt to defend his outline of a sociological theory of resonance against objections raised by his critics. The fifth part comprises an assessment of Rosa's plea for a resonance-focused sociology of world-relations. The paper concludes by suggesting that, notwithstanding its limitations, Rosa's approach represents one of the most promising developments in 21st-century critical theory.

RN30 | Youth and Generation

RN30_01a | Work and employment I: Pathways from education

Routes Through Education Into Employment As England Enters The 2020s

Roberts, Ken

University of Liverpool, United Kingdom
k.roberts[at]liverpool.ac.uk

Throughout the 1980s and 90s there was international interest in the UK's relatively extensive experience (which began in the 1970s) with measures to alleviate youth unemployment. Today the UK attracts international attention on account of its low rates of youth unemployment and NEET, its (still) relatively rapid education-to-work transitions, and (according to the OECD) its sustainable system for funding mass higher education. This paper overviews the outcomes of 40 years of change in England's lower and upper secondary education, government-supported training, welfare provisions, economy and labour markets. It is argued that the low unemployment and NEET rates owe much to a weakly regulated labour market's capacity to create swaths of low paid precarious jobs and self-employment, that young people's prolonged participation in full-time academic education (by UK historical standards) is largely a response to the absence of attractive alternatives, and conceals a persistent inability to create competitive vocational routes through technical education. However, the paper shows that remedies, if needed, have always been and are still in employers' hands, and are now being activated by employers.

Learner Identity: Young Chinese People and Their Path-keepers in School Transition

Wang, Ziyu

University of Helsinki, Finland
ziyu.wang[at]helsinki.fi

It has been well-recognized that young people explore their own path, for example through education, as they respond to the individualized societies. In the special case of Chinese individualization, however, the way in which the contemporary Chinese adolescents make their "choice biographies" has been less investigated. Drawing on the analytical concept of identity, this article concentrates on how the ninth-grade young Chinese people plan their transition to post-compulsory education and what are the roles of their parents and teachers in this process. The field work was conducted in a public middle

school in a Chinese town, about 250 miles to Beijing. All of the gradutors of the school (N=560) expressed their challenges, copings and the support and expectation of their parents and schools in the form of written account. This qualitative method was used to access the big amount of sensitive information in a short time, and gave young people enough time and space to narrate their own history alone. A content analysis is conducted to analyze the data, and the preliminary findings are threefold. First, young people express the learner identity as the dominance of their present everyday lives, which is tangled with other identities in relation to gender, family and employment. Second, the participants perceive and agree that the involvement of their teachers are limited inside classroom. Third, their parents are considered as the committed keepers who push the adolescents towards high school. Keywords: education, school transition, subjective experience, qualitative

The Impact of Lifelong Learning Policies on Youth Life Projects

Kovacheva, Siyka Kostadinova

University of Plovdiv, Bulgaria
siyakovacheva[at]gmail.com

In the globalized world of today numerous lifelong learning (LLL) policies have been designed to support young people to face social change and overcome the barriers to their social inclusion. Recent policy developments display a trend toward a narrow focus on employability and attempts for a re-standardization of the life course which do not fit with the diverse trajectories of young men and women through the institutions and social structures. How do the young explain their own choices of life projects and how are these affected by school failure, experience of unemployment, migration, change in social relationships with significant others and by the training programs in which they get involved? This paper examines the subjective interpretation of the individual life courses of participants in learning programs beyond school and the ways in which this participation shapes their aspirations and future plans. It is based on qualitative interviews with 150 young adults conducted in 2017 in 8 European countries as part of the Young_Adults research project funded under the Horizon2020 program. The interviewees were selected from the participants in LLL programs in two regions in each country who were from different social backgrounds in terms of their gender, class, ethnicity and specific degree of vulnerability. The analysis presents a typology of young adults' learning biographies and the specific evaluation of programs' effectiveness by the young participants themselves.

Use Of New Technologies And Family Sociodemographic Characteristics. A Descriptive Study Of University Youth

Navalón-Mira, Alba; de-Gracia-Soriano, Pablo; Ruiz Callado, Raúl

University of Alicante, Spain
alba.navalon[at]ua.es, pdgsoriano[at]gmail.com,
raulruiz[at]ua.es

The aim of this research is to determine if the type of family and the maternal-parental education styles are involved in the use of new technologies in young University students. The starting hypothesis suggests that college students who have socialized in a single-parent family context make greater use of Information and Communication Technologies. To test the goal and the hypothesis proposed, a study was developed using the quantitative methodology, based on the design and application of an ad hoc self-administered questionnaire. The sample is composed of 1,022 students of the University of Alicante enrolled in the academic year 2018-2019, selected by proportional stratified sampling by sex and area of knowledge. Key words: social change, family, ICT, non-formal education, youth, University students.

Young People's Pathways From Education To Employment: Contexts, Methods, Policy and Explanation

Irwin, Sarah

University of Leeds, United Kingdom
s.irwin[at]leeds.ac.uk

Youth research has very effectively described how general structural changes in the labour market, and wider cultural discourses, require young people to manage risks and societal failures as their own individual responsibility. In developing their arguments youth researchers have emphasised the ways in which young people's experiences, subjective understandings, actions and prospects are embedded in, and shaped by, their social position and circumstance. They are extremely critical of policies which trivialise the social structural shaping of unequal pathways and outcomes. In youth research the relevant processes and contexts are often rendered in terms of family background, classed and other inequalities and the economic, social and cultural resources on which young people draw. Employment demand is seen as important, yet it is often described in quite general terms and viewed, methodologically, through young people's accounts and experiences. Employers' involvement in education, their assumptions about skills, recruitment policies and early employment trajectories remain opaque within recent youth research. This is an important gap. Turning to the literature and policy in this area shows it to be characterised by individualising assumptions relating to human capital, skills mismatches and employability. Labour demand problems are framed in terms of labour supply: of young people's skills, competencies and the acquisition of adequate careers information. In the presentation I ask if a more sufficient

conceptualisation of employment demand, and alternative research designs, can extend and enhance explanation of the contextual shaping of young people's changing experiences and prospects in paid work and beyond, as well as inform alternative pathways for policy.

RN30_01b | Participation I: Political engagement

Accounting Participation in Political Groups. Individual Meanings and Collective Perspectives in Young Activists' Narratives

Genova, Carlo

University of Turin, Italy
carlo.genova[at]unito.it

Focussing on the European context, research about youth political activism shows that few young people are completely un-interested and un-informed on politics, few of them completely abandoned every political coordinate of reference, as well as every interest in these topics, but at the same time very few of them belong to political organised groups or are anyway personally involved in some form of political action. A lot of research is trying to explain this misalignment, also because in scientific literature often political forms of action are essentially intended as means for the actualisation of a set of values through their translation into specific aims and strategies on the basis of correspondent wider representations of society. Few research however focusses explicitly on the analysis of the complex meanings connected with these forms of action by the young activists, few attention is paid to the analysis of the processes through which their representations, values, aims and actions are really reciprocally connected, as well as are connected to the meanings they attribute to their engagement. Aim of this article is then to propose some starting points in filling this gap, analysing in particular the narrations, the accounts, given about these topics by young activists involved in political groups. The paper is based on thirty qualitative interviews conducted in Italy with young activists (19-29 years old) involved in groups of political intervention, and on analysis of their representations and narratives about: today's society and its main problems; the group of peers they are engaged with and its distinctive traits with reference to most of youth; the perspectives of intervention shared in this group; the activists' personal motives of engagement.

Social Manipulation Of Contemporary Youth In Russia

Osipova, Nadezda

Lomonosov Moscow State University, Russian Federation
kirill99d[at]mail.ru

Social manipulation of youth is a process of destructive social influence on young people, carried out through various socio-economic and political means in order to control ways of thinking and behavior models of young people against their own interests. Around the world, but especially in transitive societies including Russia, manipulation often undermines democratic institutions and brings false motivation of political participation. Destructive personalities and oligarchic structures, politicians and political parties, public associations, totalitarian religious sects, some international organizations all can be actors of social manipulation. They use a common mechanism that is launched with the help of general and specific resources, means, political and social technologies. Throughout history younger generation in Russia embraced by protest sentiments, have always taken an active part in state coups and revolutionary upheavals, popular unrest, often being victims of manipulation rather than true democratic consciousness. Studies conducted by the author in 2014-2018 among students showed that the social manipulation among youth result in desocialization, social degradation and political disorientation, dissatisfaction with authorities that lead to emergence of asocial behavior and radical youth groups. However, not all Russian youth fall under the influence of manipulation, but only its specific part. In a post-communist transition marked by authoritarian tendencies and controlled democracy major political actors, including United Russia, Communist Party, Liberal Democratic Party, Fair Russia are mobilizing youth rather not through classic democratic mechanisms, but through manipulative and populist political technologies. These technologies are aimed at creating artificial political participation and false political motivation that doesn't have serious ideological or value background but is efficient in achieving short-term goals during electoral and public campaigns.

Political Engagement Through Life Course And Youth Transitions

de Almeida Alves, Nuno

ISCTE-IUL, Portugal
nalmeidaalves[at]iscte-iul.pt

Life course and protracted transitions into adulthood have a significant explicative power in respect to young people's relation to politics and civic engagement. Life cycles, better than age, may explain a progressive interest in politics and a growing engagement in political issues along the successive steps and transitional processes of individuals: from high school to University; from education to work; from initial sentimental relationships to stable partnerships and new household formations. The protracted transitions perspective helps the understanding the contemporary average delay of each of this transitional processes and respective implications in young people's autonomy and completion of citizenship

rights and duties. However, these two perspectives will have a different contribution in the present abstract proposal. It will help to build the understanding of a specific group of young people, and more specifically of the individual trajectories or careers (Fillieule 2001) of their members into deeply involved activists, through a process started in secondary education, changed though their enrolment in tertiary education and finally transformed by their difficult and precarious integration in the labour market. This proposal is based on a set of interviews and ethnographic research undertaken with Precarious Inflexible, part of the qualitative work done between 2012 and 2013 for the international project MYPLACE, financed by the 7th Framework Program of the European Commission.

Cohort, Age and Time Effects on Political Participation of Young People in Serbia 1995-2018

Stanojevic, Dragan

Faculty of Philosophy Belgrade, Serbia
dstanoje[at]f.bg.ac.rs

This presentation describe the changes in political participation of young people in Serbia from 1995 – 2018. The aim of the paper is to examine the effects of age, cohort and period on the level and type of political participation (conventional or civic). Despite recent debates and literature, the key question is still ongoing. Whether the changes in political behavior of young people are caused by a particular historical context, or are related to certain cohorts. We use a recently developed method of simultaneously estimating age, period, and cohort effects, to examine changes in the level of young people engagement in the conventional forms of politics - party membership, political campaigns, trade unions, and civic engagement – different NGOs, social movements etc. For that purpose we use four ways of cross-sectional survey conducted in Serbia in 1995, 2003, 2012 and 2018. Results show that party membership has an Inverse U-Shaped Curve. Membership is lower among older and younger cohorts, among those who were born before 1934 and after 1975. During the 1990s there was a significant increase in party membership, which points to the period effect. Union membership decline among all age cohorts, and during the 1990s there was a significant drop in membership among young people, showing the importance of the period – post-socialist transformation, wars, international isolation, and political tensions within the country. During this period civic engagement is on the rise, with younger age cohorts as bearers.

Cat Calling, Sexual Harassment And Women's Strategies Of Resistance During The Second Largest Festival in Europe The Roskilde Festival Michelsen la Cour, Annette

University of Southern Denmark, Denmark
amlacour[at]sam.sdu.dk

During the second largest music festival in Northern Europe 130.000 participants with an average age of 25 meet and celebrate for 7 days each year in July. Security has become an issue after the report of several rapes or other sexual harassments of girls and women on festivals in neighboring countries. In a pilot study of the theme of security from the recent 2018-festival in Roskilde, 7 qualitative focus group interviews in 7 camps involving male and female participants between the age of 17 and 23 as well as qualitative interviews with organizers and NGO's were conducted. Findings showed that participants are afraid of neither sexual harassment neither of rape. Findings showed that the sexual harassment of girls is organized through verbal call-outs named "cat calling" and the belittling "tiger-mis" (baby tigress) as well as through physical attempts to force the girls to do lap dances, in sexually inviting gestures as well as through grading their looks and breasts offering them a "free beer for free tits". This can be seen as a sexual assault. But findings showed, that girls do take precautions and have developed strategies of resistance to unwanted sexual encounters in which the camps and their camp mates play a significant role in protecting them from others seeking unwanted sexual intimacy. The findings also showed that both sexes can be aggressive in their attempts to have sex but also that females find, that so-called tent sex is overrated as all participants are often smelling, dirty and drunk or on drugs. The strategies can be seen as acts of resistance towards sexual consumption in the sexualized space of the festival.

Young People, Well-being and Risk-taking: Doing Gender in Relation to Practices of Health and Heavy Drinking

Törrönen, Jukka Antero; Roumeliotis, Filip; Samuelsson, Eva

Stockholm University, Sweden
jukka.torronen[at]su.se, filip.roumeliotis[at]criminology.su.se, eva.samuelsson[at]socarb.su.se

Young people's current alcohol consumption provides an expressive case to study their gendered performances of health and risks. In Sweden young people's alcohol consumption has declined since 2000 and been challenged by competing activities, some of which are related to health promoting practices such as doing sports. This makes the comparison of young people's masculinities and femininities in health and heavy drinking an important topic. Our data consists of semi-structured interviews about alcohol, health and leisure time activities among young people between 15 to 19 years old (N=56). By drawing on Butler's work on 'gender as performative' (1990) and Connell's understanding of gendered identities as 'configurations of practices' (2005), we analyze how our interviewees are doing masculinities and femininities in relation to health and heavy drinking in the contexts of their everyday life routines. The interviewees emphasize that the practices of pursuing well-being involve multiple tensions between social, physical, cultural, emotional and symbolic dimensions. Some interviewees see heavy drinking as part of healthy practices, others exclude it from healthy life style. The interviewees contest the status of heavy drinking as a cool and compulsive ritual in the transition to adulthood. There is more room for young men to get recognition for their masculinity through other activities, such as in computer gaming and sports. For young women, in turn, risk-taking by heavy drinking does not appear as exciting an activity as for previous generations. The female interviewees tend to limit their drinking by identifying with the conventional images of women as vulnerable to male violence and sexual harassment. For them, other arenas seem to provide more attractive activities to play with or contest traditional feminine boundaries.

The Code of Civility: An Ethnography of Youth Culture, Adaptation and Survival in Croatia's Post-War Apartheid

Carpenter, Jenae Michelle

The University of Melbourne, Australia
jenae.carpenter[at]unimelb.edu.au

Three decades after the collapse of Yugoslavia, Vukovar remains a deeply divided town. Today, social relationships between Croats and minority-Serbs remain organised around the logics of war but have metastasised into an invisible system of ethnic apartheid, written onto the built environment in memorials and shelled buildings, through to the ethnically-divided school system and labour market. As young people were born in the aftermath of the war, they offer a window onto the impacts of segregation and mechanisms through which ethno-nationalism is produced, transmitted, and transformed, over time. Existing literature, however, has failed to appreciate the burdens of post-conflict segregation upon young people in Vukovar, or elsewhere. Combining six-months of ethnographic fieldwork with thirty-five qualitative interviews, this article explores the experience of growing up within this coercive system of apartheid. Initially, I had thought ethnic conflict would prove a ubiquitous presence and expected to write about how hostile social boundaries stemming from an uneasy mix of institutional segregation and multi-ethnic proximity would act as a flashpoint for violence. To my surprise, however, everyday relations were not described as outwardly hostile or antagonistic. In everyday life, young men drew on a range of adaptive strategies to fashion the illusion of peace, imposing severe restrictions on their movement, speech and dress. Ultimately, these strategies pertain to a street-code—'the code of civility'— as 'civility' became a valuable cultural resource and socially sanctioned form of masculinity in Vukovar. Rather than providing a sustainable solution to ethnic conflict, however, the code of civility remains highly constrictive and amounts to a new form of psychological warfare which lies at the heart of persistent, yet invisible, victimisation within the town.

"No One Learned": Interpreting a Drugs Crackdown Operation and its Consequences Through the 'Lens' of Social Harm

Mason, Will

The University of Sheffield, United Kingdom
w.j.mason[at]sheffield.ac.uk

This article seeks to extend sociological studies of youth, deviance and policing by detailing young people's interpretations of a drugs crackdown operation, in a northern English city. Using a two-staged longitudinal qualitative approach, unique insights are reported both from the time that the operation took place and a point in time, five years afterwards. The data offer rich accounts of the immediate,

short and longer term impacts, as interpreted by youth workers and a group of mostly Somali young people (aged 13 – 19). Social harm, it is argued, offers a useful 'lens' through which to critically explore the culpability of well-meaning state intervention in the (re)production of structural inequalities for young people.

RN30_02a | Education, gender and class

Sisterhood and Respectability: Muslim Girls' Perceptions of Sexual Harassment in an Urban Secondary School

Odenbring, Ylva; Johansson, Thomas

University of Gothenburg, Sweden
ylva.odenbring[at]gu.se, thomas.johansson[at]ped.gu.se

This study aims to explore how Muslim adolescent girls experience different forms of sexual harassment in school. The study draws on semi-structured interviews conducted in an urban secondary school located in one of Sweden's most socially disadvantaged urban areas. The results reveal that the girls repeatedly experienced misogynist comments such as "whore" and "slut," and were subjected to moral judgments connected to their manner of dressing and behaving. The girls' narratives were also framed as tough girl femininity, which is related to how they had to show a tough façade against acts of harassment as well as other students at the school. When the name-calling became personal, the girls stuck together against the harassing boys and fought back verbally. The study contributes important knowledge about how adolescent girls perceive sexual harassment at school; this knowledge is important in efforts to create a safer school environment for all students.

Vocational Education Students and Labour Market Citizenship

Ågren, Susanna Marja

Tampere University, Finland
susanna.agren[at]tuni.fi

This presentation introduces a critical perspective on the discourse about young people's attachment to society. It is based on research which looks for new ways to strengthen youth's social belonging in a rapidly changing late modern society. The current discussion around the NEETs (young people Not in Education, Employment or Training), demonstrates the over-emphasis that society places on young people entering the labour market. Additionally, it demonstrates the fear of the official system about how young people outside the labour market might burden society (Aaltonen & Berg 2015). As recent research has suggested, the fear creates problems by reflecting back to young people as feelings of unbelonging and anxiety (Gretschel & Myllyniemi 2017, Lögdberg, Nilsson & Kostenius 2018). My argument is that the pressures young people are now competing with could be reduced by relieving the obligations of the labour market citizenship. Furthermore, I propose that alternative opportunities for operating in society might strengthen the well-being of young people. At the centre of the presentation is the concept of welfare citizenship which is based on the Capability Approach by Martha C. Nussbaum and Amartya Sen. The presentation relies on research data collected from two vocational education providers (VET) in Finland. It gives a voice to VET students and presents their expectations and concerns about their transition to working life. The presentation aims to provide new insights into young people's social belonging, suggesting that one way for constructing a more sustainable society might be by acknowledging the value of welfare citizenship.

"I Am No Longer Tough". Minority Danish Boys Changing Paths in Danish Schools.

Gilliam, Laura

Aarhus Universitet, Denmark
lagi[at]edu.au.dk

Based on fieldwork and interviews with boys of migrant background in various multi-ethnic Danish schools, this paper explores cases in which these minority Danish boys seek to opt out of their previous stigmatized positions as 'bad boys' and 'troublemakers' in school. Drawing on the concept of 'figured identities' from Holland et al. (1998), Bourdieu's practice theory (1972, 1992) and Bakhtin's dialogism (1935), it is described how the boys, supported by key others such as teachers, parents or peers, make an attempt at re-authoring themselves and hereby transgressing social and often ethnic boundaries. The paper argues that the boys, envisioning other futures, sketch out new identities and paths for themselves, by drawing on available cultural resources, scripts and practices. Yet their success depends precariously on how these attempts are 'answered' by others, and especially whether these others

assess their adoption of linguistic and bodily practices and educational strategies as both appropriately authentic and ethnically appropriate for them. Looking at boys who succeed to make the change, it is argued that the presence of 'co-travelers' and convincing 'voices' help this re-authoring of selves. Yet, the racialization of body signs, the boys' embodied practices, majority gatekeepers' varying definitions of criteria for passing, and the burden of acting 'integrated' and 'Danish' in the peer group (cf. Fordham & Ogbu 1986), make up 'invisible fences' (Gullestad 2002) for the boys, showing the vast amount of barriers, which the boys face, as they try to do what parents, teachers and politicians urge them to.

Parental Influence on Students' Educational Trajectories: Overemphasis on Academic Track at the Cost of Vocational Education

Jonsdottir, Heidur Hrund; Blondal, Kristjana Stella

University of Iceland, Iceland
hhj18[at]hi.is, kb[at]hi.is

Iceland's participation in vocational educational programs is lower than in most other OECD countries. There is a strong emphasis on academic education in Iceland while vocational education is seen as a lesser option regardless of students' strengths and interests. Family is one of the primary contributors to students' education and majority of Icelandic parents prefer that their children choose academic track. Students in academic track at upper secondary school who liked vocational subjects better in compulsory school have been found to have lower levels of academic interest and being more at risk of dropping out. Iceland has a high rate of early school leaving and choosing a suitable track can be critical for school success. Using both survey and registered data for approximately 2000 students, we explore the influence of parents' educational emphasis when their child is in the 10th grade (end of compulsory school) on students' trajectories at upper secondary school over three year period. We explore this relationship in light of students' academic interest in the 10th grade. We expect to find that students whose parents emphasize academic studies are more likely to choose academic track regardless of their academic interest. We expect the relationship to persist even after taking family background and gender into account as well as previous academic achievement which is a strong predictor for educational choice. The study will contribute to our understanding of how to reduce early school leaving that is affected by choosing a stream that does not fit students' academic interest.

RN30_02b | Participation II: Activism and social movements

Constructing Youth As Political Actors: A Comparative Study Across Higher Educational Institutions In Europe

Gupta, Achala (1); Brooks, Rachel (2)

1: Asia Research Institute, NUS; 2: University of Surrey
achalatiss[at]gmail.com, r.brooks[at]surrey.ac.uk

Higher education students have often been viewed as important political actors in wider society, stemming largely from their activities in the 1960s. Indeed, despite only a relatively small proportion of students taking part in the 1960s protests, there remains – in many countries of the world – an expectation that students should be involved in politics and, as Williams (2013) has argued, a perceived need to offer explanations for their lack of involvement. Such debates have recently been entangled with others about students as part of a ‘snowflake generation’, unable to engage in rigorous political debate with those who hold different political views and in need of ‘safe spaces’ within higher education (Finn, 2017; Fureidi, 2017) – while an alternative body of work has suggested, in contrast, that students have often been at the forefront of many contemporary protests, both on and off campus (Brooks, 2016). Nevertheless, like much of the literature on youth political participation, research has rarely explored the extent to which student political participation varies across nation-states. This article begins to redress this gap by drawing upon data collected from 54 focus groups with undergraduate students, and interviews with 72 higher education staff across six different European countries (Denmark, England, Germany, Ireland, Poland and Spain). We highlight some notable differences in understandings of students as significant political actors both between nation-states and within them, and explain such differences in terms of a range of historical, social and political factors, including the degree of marketisation evident in the higher education sector.

Youth Conditions, Student Movements, Neoliberal Education Policies, and Protest: a Case-Study

Lo Schiavo, Lidia

University of Messina, Italy
loschiavo[at]unime.it

Young people in different regions of the world are facing a multifaceted crisis: economic, social and political. According to scholars, youth conditions are characterized by increasing inequalities and have worsened after the global economic recession. A lengthy cycle of neoliberal education and labour market policies are part of a global transition regime that

hugely impacts on young people’s opportunity structures and lives. Thus, a generational perspective is central to the theoretical and empirical debate, which emphasizes the transnational resonance of youth protests against austerity and neoliberal policies in the aftermath of world recession. The empirical case study proposed here seeks to assess the main aspects of this constellation of factors by focussing on three Italian student organizations (the Students Union, Link, the Knowledge Network, for secondary school and University students) observed in a two-year qualitative research project, which included sixty interviews, and participation at their assemblies and mobilizations. Following the last waves of student mobilizations in Italy, the identities of these three organizations lie in-between social movements and student unions, and have continued to mobilize against a long-term cycle of neoliberal education reforms. Their members include different generations, providing a setting enabling students of different ages to interact while expressing themselves via different practices and forms of political participation. This proposal aims to assess the main empirical findings analytically and critically, and also to highlight the innovative modes of political action adopted by these student movements in response to the impact of neoliberal education policies on youth conditions.

Activation of Student Protest : Reactions, Repression and Memory at Nanterre University, 1968-2018

Ridley, Simon; Stuppia, Paolo

Université Paris Nanterre, France
simon.ridley[at]hotmail.fr, paolo.stuppia[at]yahoo.fr

After a decade of low intensity activism in French higher education, 2018 seems marked by the return of mass students protests. The “ORE” reform blamed for introducing heightened selection in a public sector that has been put under pressure by a series of neoliberal policies is criticized by left wing students and their unions. In a context of high state policing of social movements, the students have suffered important levels of repression. On April 9th, at Nanterre University, the riot police entered the campus and violently disrupted a general assembly of students. As a result, the movement was galvanized, and 1800 people gathered to protest the reform. The historical and local context is particular: 2018 marks the 50th anniversary of the May 68 protests, hailed as the model for modern student movements. We can observe that the general focus for this anniversary is no longer only on protests, but that it has been used by the University Administration as a tool for depoliticizing May 68 and infantilizing the current movement; and as a resource for student unions to recruit new members, as a symbol of continuity of struggles. Hence, we aim to examine the different framings of the movement and the activation of collective memory. As scholars at Nanterre University, working on student protests, we have conducted a study concerning the relationship between history, memory and technologies of student movements. From an interdisciplinary approach, and making use of a variety of first-hand sources, this proposal aims to look at the diversity of performances taken by students to protest the reform, responses by institutional actors and their linkage with collective memory.

Making It Political? Young Animal Rights Activist - In And Between Social And Political Activism In Estonia

Pirk, Reelika

Tallinn University, Estonia
reelika.pirk[at]gmail.com

The repertoires of political participation - ways how people participate in democratic decision making processes - are in modern democratic countries changing. The most vivid changers are young people, who have been widely ascribed to conventional political apathy (e.g. abstaining from voting and participation in formal political institutions). And, at the same time, are young people seen as revivers of social movements and users of other, less institutional forms of social activism for political cause (political consumerism, protest actions, internet activism, etc.). These new forms, which can be described as fluid, informal and non-binding are showing signs of growing popularity for political actions, at least among young. What brings youth to take part in forms of activism, which in some cases, claims more knowledge, time and self-sacrifice than voting in elections? Are young making it political with other means? The aim of this paper is to describe the actors from this new line of political participation - what makes young people to dedicate themselves to social actions, that aim political change. What are the motivating aspects for youth to stand for change that has little to do with their own wellbeing? The research is based on my ongoing PhD study, where I investigate youth's political participation repertoires. The empirical part of the paper considers the initial findings from youth socio-political (an animal rights) movement in contemporary Estonia. An in-depth analysis is based on case study including interviews, field notes and observations.

RN30_02c | Methodological innovations

What Counts As Data? Re-animating Young Lives, Re-visioning Youth Transitions Using The UK National Survey Of Health And Development

Tinkler, Penny; Cruz, Resto; Fenton, Laura

University of Manchester, United Kingdom
penny.tinkler[at]manchester.ac.uk,
resto.cruz[at]manchester.ac.uk, laura.fenton-2[at]manchester.ac.uk

Intended principally for quantitative analysis, cohort studies nevertheless offer rich insights into the lived experiences and meanings of young people's life transitions. This paper critically examines the potential of the UK National Survey of Health and Development (NSHD) to enrich historical and social scientific understandings of young women's pathways into

adulthood in postwar Britain. While much has been written about youth and popular culture in this period, understandings of young women's lives remain underdeveloped. Yet, this generation of women has immense historical and contemporary significance. As young women, they were in the vanguard of postwar social change. They are now part of the largest group of over-60s in British history, and are redefining ageing and making new demands on, and contributions to, society. Their pioneering approach to later life is widely believed to be shaped partly by their experiences of growing up. This paper reflects on how NSHD data are mediated by the voices, interests, and perspectives of adults, institutions, and the state. Despite this, the NSHD contains traces of postwar women's own thoughts and perceptions—regarding their own lives, but also family, friends and peers, and society at large. Such traces challenge what is recognised as data by the NSHD, but also by those who have argued for the qualitative restudy of existing cohort studies. Hence, repurposing cohort studies for the qualitative analysis of youth lives and transitions, we argue, entails a more expansive notion of data and a willingness to go beyond the original parameters of those studies. Keywords: youth; postwar Britain; longitudinal methods; cohort studies; life course; generation

Researching Youth at the Margins: Do different methods reveal different data?

Keating, Avril; Benckekroun, Rachel

University College London, United Kingdom
a.keating[at]ucl.ac.uk, Rachel.Benckekroun.16[at]ucl.ac.uk

The aim of this paper is to advance our understanding of how we collect data with/ for/ and about young people. Recent technological developments have generated a range of tools that can be used to collect and analyse data. In tandem, there has been increasing interest among social researchers in co-producing research with young people and giving them more 'voice' within the process. Nonetheless, collecting high-quality data from/about youth remains fraught with challenges: be they ethical, practical, or political. Furthermore, young people at the margins (economically, socially, and/ or geographically) continue to be 'hard to reach', often because of the limitations of our research tools and budgets. In a recent project we therefore set out to examine how we could tackle some of the methodological challenges we had faced in previous projects. This was a small-scale project, but it enabled us to explore the potential benefits, problems, and outcomes of different data-collection strategies. Core questions included: would walking interviews generate more insights into youth attitudes about their community, and make young people more comfortable than a more traditional face-to-face interview? Can researcher-led photo-elicitation activities tell us more about young lives than the photos they post on social media? And how can we support young people to design their own research-based activities and to have more agency? This paper will report the results of our project. By comparing and contrasting the data that emerged from these different strategies, we will demonstrate the benefits of using multiple methods when researching youth at the margins.

antti.kivijarvi[at]helsinki.fi

A shared aim of scholars doing empirical research among marginalized, underprivileged or demonized groups is to find effective and ethically reasoned ways to enable them to participate in research and in identifying research needs. However, the art of listening as phrased by Les Back (2007) calls for context-specific reflexivity and sensitivity towards practices. Although research can be considered as a context where political voice of underrepresented groups is co-produced it is equally important to be critical towards the naive idea of “giving voice” to silenced groups. The effort for listening or co-producing a political voice is further complicated in an intervention research, reasoned not only by the aim of producing data jointly by a researcher and a research participant but of changing behavior or perspective or the young adults. In this paper we discuss ethics, the notions of listening and the limits and possibilities of participatory approach in the context of two sub-projects of a larger consortium (PROMEQ) that aimed at developing interventions to promote wellbeing of underprivileged groups in Finland. We focus on two groups of young adults: one consisting of young clients of targeted youth services who were on the margins of education and employment and the other one of young asylum seekers with a residence permit. Besides drawing upon both quantitative and qualitative data produced in the sub-projects we scrutinize our research practices aimed at co-producing knowledge and activities for promoting wellbeing.

Family Interviews: Exploring Intergenerational Occupational Transmission in the Middle Class

Schad, Miriam (1); Hense, Andrea (2)

1: Technical University Dortmund, Germany; 2: Sociological Research Institute Göttingen (SOFI), Germany
Miriam.Schad[at]tu-dortmund.de, andrea.hense[at]sofi.uni-goettingen.de

The talk presents the methodological design and first results of a research project on intergenerational stability and status maintenance in selected occupational fields of the middle class. A central research question is under which conditions which kind of mentalities, values, or dispositions are passed on or modified across three generations in order to maintain the social status of the family. To analyze intergenerational occupational transmission, we explore the career choice motivation of the younger generation and how they balance the aspirations of their family and their own interests. Theoretically, we refer to intergenerational dynamics and social inequalities as well as life course research of linked lives. The project compares three typical occupational fields of the middle class: professions like doctors, teachers and lawyers, family-owned craft business, and qualified employees in the technical field. We conduct family interviews with members of three generations who are interviewed simultaneously. Family interviews offer the opportunity to analyze communication and collective perceptions in families and directly relate them to individual perspectives and individual positions within the family. Sampling and data analysis are based on the Grounded Theory Methodology. As we use narrative interview techniques and genograms, we also reconstruct the life stories of the family members embedded in the narratives of their family history and their kinship networks. The empirical analyzes aims at developing a typology of cross-generational strategies of status maintenance. Firstly, the talk focuses on the benefits of the family interviews to explore intergenerational relationships and dynamics. Secondly, we present first findings. Keywords: family interviews, intergenerational occupational transmission, status maintenance, linked lives.

RN30_03a | Work and employment II: Precarity

Graduates' Over-qualification. Performing the Border of Precarious Employment in Romania's call centres Pantea, Maria-Carmen

BBU, Romania
pantea[at]policy.hu

Europe has the most educated generation in its history. Yet, many graduates work in other fields; have jobs that require lower skills, which offer limited opportunities for professional growth. They are overqualified/ under-employed. Guy Standing considered this a 'historically unique' defining feature of the precariat (2011). While statistical data builds up, there is a weak sociological understanding of what over-qualification means to young people, how it reconfigures their views on themselves, on education, work and the future. Also, the evidence on employers' perspectives remains ambiguous. The notion of 'right skills' is overused, but under-defined, as employers send confusing or conflicting messages about the actual skills they are looking for. This research takes the case of call centre operators as illustrative for thinking through the complex problem of over-qualification in the particular situation of Romania, the home of an expanding outsourced customer-support industry. The presentation will introduce the preliminary findings of a qualitative sociological project, now in progress. The research is based on in-depth interviews with call-centre operators and workplace supervisors/ HR staff. The presentation argues that graduates elaborate complex strategies for making sense of their otherwise precarious employment. Their narratives combine overlapping, yet-contradictory layers: (i) prospects of white-collar career progression; (ii) the appearance of choice and exploration; (iii) the crude realization that employment is tiresome and instrumental (read: 'a way to pay the bills' cf. Koeber, 2002). Ultimately, the presentation interrogates recruitment and managerial strategies that maintain the appearance of white-collar jobs while accommodating precariousness.

Exploring the Concept of "Long Term Precariousness": Towards a New Indicator

Nico, Magda; Alves, Nuno de Almeida; Carvalho, Helena; Carvalho, Diana

ISCTE-IUL, Portugal
magdalalanda[at]gmail.com, nalmeidaalves[at]iscte.pt,
dianadiascarvalho[at]gmail.com

Precariousness' increasingly academic and political popularity and its undeniable presence in the contemporary labour market call for a more critical and thorough analysis and measurement of the process, especially when arguments of it being "the new normal" for the younger generations are so current. The team of the Project "Linked Lives: a mixed multilevel longitudinal approach to family life course" develops a two-folded argument in this presentation. 1) The conceptual confusion and ambiguity of the term "precarity" is tackled, even if recognized as consequence of the complexity and variation of the phenomenon over historical time and across generations. Labour market precarity has varying definitions, ranging from aspects of salary to dignifying work, to stability or existence of contract, to relative inequality towards other professional classes, genders or qualifications, to moral or sexual harassment, or failure to fulfil promises concerning social mobility. An alternative, but more comparable – namely generationally -, definition is proposed. 2) On the other hand, albeit the conceptual vagueness of "precarity", longitudinal qualitative evidence has shown that the effects of precarity, such as what happens with unemployment, are not immune to the influence of the duration of the experience, nor are they equal across generations. Therefore, just as long term unemployment produces more serious and scarring effects than isolated or short episodes of unemployment, so does the experience and effects of precarity vary in intensity, content, and duration. We argue for the need to create a "long term" precarity indicator, and explore some of the existing longitudinal variables and data sets to do so.

Living on the Brink: Enforced Liminality in the Lives of Young University-educated EU Migrants with Precarious Paths

Simola, Anna Maria

University of Helsinki, Finland
anna.simola[at]helsinki.fi

In the context of labour markets where young people risk becoming marginalized, intra-EU migration has come to appear increasingly compelling for young Europeans looking for opportunities to transit from education to professional careers. However, when young EU migrants experience precarious conditions in their employment paths, they may find themselves in an ambiguous position, shaped by unexpected barriers that hinder the access to welfare rights and legal residence for foreign EU citizen in precarity. The paper draws on narrative interviews with young University-educated migrants from southern and northern Europe who had moved to Brussels with hopes of advancing their careers, but subsequently experienced unemployment and work under precarious arrangements. How do they make sense of their stalled transitions after getting caught in a limbo between precarious work and the institutional barriers that together constrain them from striving towards their aspirations? The article suggests the concept of 'enforced liminality' to illustrate these experiences that, despite the variation in young migrants' circumstances conditioned by their social and national backgrounds, were often characterized by a sense of living on the brink. This means that they faced risks of falling, not only from the career ladder, but also through the unreliable safety nets of the welfare state, as well as, falling into exhaustion and falling back to parental home. The findings indicate that migratory experiences like this may carry along material, professional, social, psychological and even physical scarring effects over time.

The Dynamics of Youth Employment Precarity: Drivers, Trajectories, and Life-Course Outcomes

Kiersztyn, Anna

University of Warsaw, Poland; Institute of Philosophy and Sociology, Polish Academy of Sciences
chaber[at]is.uw.edu.pl

I present the results of a quantitative study of employment precarity in Poland, using longitudinal data on the occupational careers of labor market entrants. The study is focused on conditional effects shaping the dynamics of employment precarity and its life-course outcomes, in particular, the ways in which individual and family resources available to youth affect labor market trajectories or mitigate the negative outcomes of early career instability. Employment precarity is conceptualized as a specific career pattern, observed over many years, involving spells of recurrent non-standard employment separated by periods of joblessness, coupled with low and/or unstable income. Such a conceptualization

overcomes the limitations of previous research, which attempt to capture precarity by analyzing either the type of employment contract observed at one moment in time, or indicators of subjective job / labor market insecurity. Non-standard contracts do not always entail employment precarity due to their possible stepping-stone effects for some individuals, while subjective indicators are affected by psychological coping mechanisms and perceptions of reference group status. The analysis is based on data from the Polish Panel Survey POLPAN. POLPAN is the longest-running panel study in East Central Europe, covering the period 1988-2018. Data are collected every five years using face-to-face interviews with a national sample of adults aged 21 and older (for the youngest cohort, renewal samples are used). The POLPAN database includes detailed longitudinal information on each job held by the respondents since the start of their careers, their full educational histories, income and household composition, and health/well-being indicators.

RN30_03b | Migration I: Migration and mobilities

Interethnic Friendships Of Young Adults. The Importance Of Opportunity Structures And Individual Characteristics

Tran, Kein

German Youth Institute (Deutsches Jugendinstitut), Germany
tran[at]dji.de

Based on Verbrugge's (1977) concept of "meeting" and "mating", the following contribution examines the effect of structural and personal characteristics on the formation of interethnic friendships among young adults. A differentiated consideration of young people both with and without a migration background is given. Analyses (partial proportion odds models) with data from the AID: A survey (1st. wave) show that young migrants have a significantly higher degree of mixed ethnic circles of friends than their German peers. Structurally, an ethnically heterogeneous residential setting proves to be conducive to making interethnic friendships, especially for native Germans. At the individual level, the positive influences of openness to new things and multilingualism in the household are particularly noteworthy. On the other hand, the proportion of friends with different ethnic backgrounds decreases considerably with increasing years of education. An effect of religiousness could not be found. The empirical findings suggest that the majority society plays a significant role in process of social integration. Establishing a friendly and intercultural coexistence depends not only on the efforts of immigrants and their descendants, but also on the concessions of the majority population. Sufficient adequate opportunity structures should be created and openness to other and new cultures promoted. Young people, in particular, seem to have optimal prerequisites in this respect in the wake of globalisation and digitisation.

Unequal Youth Migrations: Exploring The Synchrony Between Social Ageing And Social Mobility Among Post-Crisis European Migrants

Varriale, Simone

University of Lincoln, United Kingdom
svarriale[at]lincoln.ac.uk

This paper explores how symbolic boundaries between youth and adulthood shape experiences of upward and downward social mobility among EU migrants. Drawing on 56 biographical interviews with Italians who moved to England after the 2008 economic crisis, and focusing on three individual case studies, the paper reveals that normative understandings of adulthood emerge as a central concern from participants' biographical accounts, and that they mobilise unequal forms of cultural, economic and social capital to maintain a feeling of 'synch' between social ageing and social mobility. Drawing on Bourdieu and lifecourse theory, the article proposes the notion of synchrony to explore how tensions in the relationship between social ageing and social mobility shape experiences of migration. This allows for an innovative theoretical bridge between cultural class analysis, youth studies and migration studies, and for a better understanding of how intersections of class and age shape intra-European migrations. The paper draws on a three-year research project funded by the Leverhulme Trust (UK) and titled Transnationalising Class: Culture and Inequalities Among Post-Crisis Italian Migrants (2015-18). The project used in-depth interviews (N = 56) and participant observation at social and cultural events in two urban areas: Birmingham and Greater London. Drawing on a Bourdieusian framework, the analysis focused on participants' social biographies (before and after migration), the forms of capital they mobilised for moving to the UK (and sometimes for returning to Italy), and their strategies of distinction in the UK context.

Challenges of Making and Maintaining Friendships in the Context of Flight and Forced Migration

Schwittek, Jessica; König, Alexandra

University of Duisburg-Essen, Germany
jessica.schwittek[at]uni-due.de, alexandra.koenig[at]uni-due.de

Having friends can be viewed as key to young people's sense of belonging. Flight and migration challenge existing friendships, and making new friends in the receiving country becomes a concern of utmost importance for the newly arrived. Current research in Germany shows that refugee children and youth perceive the process of establishing and maintaining friendships with local peers as being difficult for a number of reasons. Not only language barriers, but also unfamiliar styles of peer-interaction and strategies of self-presentation encountered in their new environment are seen

as obstacles. Our study comprises group discussions and individual interviews with refugees aged 10-15. In our presentation we will discuss firstly, how they make friends in Germany and reflect on the kinds of barriers they perceive in face-to-face interactions with peers. Secondly, we will look at the transnational dimension of friendship. Our data show that young refugees maintain close relations with friends (and likewise with same-aged relatives) in other countries via social media. This is not only true for those 'left behind' in the home country, but also for friends made during flight or at places of temporary residence and schooling. Based on our analysis of our respondents' practices of national and transnational friendships we will explore their understandings of friendship and how these are structured by family, ethnicity, gender and/or generational expectations. We argue for a differentiation of young refugees' notions of friendship (regarding 'classical' criteria such as reciprocity, choice and trust), taking into account their interaction-strategies and sense of belonging in a transnational/multi-local peer group.

The Impact of Migration on Social Skills of Generation of Change and Generation of Migration

Grabowska, Izabela

SWPS University of Social Sciences and Humanities, Poland
izabela.grabowska[at]swps.edu.pl

The paper explains the impact of international migration on social skills of two generations of Poles: the 'Generation of Change' (born in 1970s and the beginning of 1980s) and the 'Generation of Migration' (born in 1980s and at the beginning of 1990s) (Szewczyk 2015). We use data from extensive quantitative study on Human Capital in Poland (migrants=4040; stayers=67174) and qualitative studies on Peer-groups & migration (n IDI=160). International migration has the strongest impact on social skills of 'Generation of Change', particularly on those born 1968-1972 who were 18 in 1989, and were also called 'Generation of Historical Hope and Everyday Risk', and were treated as testimonials of system transition (Mach 2003). In general, the effects of migration on social skills persisted in birth cohorts born till 1989. The younger cohorts were, the more migration impacted on life skills. Therefore, the mobile transitions approach (Robertson et al. 2018) was needed to capture how younger cohorts, born after 1989, also from the 'Generation of Migration' formed, enhanced and consolidated various life skills through international migration. Especially for young post-accession migrants from Poland, working abroad went far beyond the impact on formal qualifications and just employability. It related to life skills of self-making, making biographical transitions, communicating and relating to people and understanding society. Next to acquisition and impact of migration on social skills we will also show transfer and their outcomes- what positions people achieve in the labour market after return (or while experiencing return mobilities, King 2017).

RN30_04a | Work and employment III: Guidance and integration

Young People's Employment Paths and Working Life Guidance in Scope

Määttä, Mirja Tuulikki (1); Westerback, Frida (2)

1: Centre for Economic Development, Transport and the Environment, Finland; 2: University of Helsinki
mirja.maatta[at]ely-keskus.fi, frida.westerback[at]helsinki.fi

Young people are more likely to find themselves in precarious labor market positions and lower employment security than the older population: adequate income is not guaranteed, even if they have jobs (Eurofound 2013; France 2016, 133–4). Instead of linear progress, young people's daily life consists often of alternating employment, training and unemployment periods. For policy makers, the biggest concern seems to be persistent share of inactive, NEET young people. The Finnish Governments (2011–2019) have offered multi-agency face-to-face guidance services, One-Stop Guidance Centers, as one solution for this concern. In our on-going follow-up research among 40 young adults (2018-2020), we ask how they evaluate these services and their own working life prospects. In our presentation, we analyze the first round of interviews and the working life-lines the informants have drawn in the interviews. These illustrate their educational backgrounds, (un)employment histories, and job-seeking and working life experiences. Some of these young adults seem to have found a stable foothold in the job market, some of them are trying to find (new) careers, and some have repeated difficulties in finding their place in working life. By presenting differing labor market entries we demonstrate what kind of opportunities and challenges do the modern labor markets and working conditions produce. We also analyze what is the significance of the guidance young people receive from One-Stop Guidance Centers. Theoretically, our analysis leans on youth transition and life course studies, and it prepares us for the second round of interviews.

The Micro of Shifting Young Refugees through Castle's Zones – Labour Market Integration of Young Refugees in Germany

Verlage, Thomas; Seidelsohn, Kristina

Freie Universität Berlin, Germany
thomas.verlage[at]fu-berlin.de, Kristina.Seidelsohn[at]fu-berlin.de

Crossing boundaries and facing new barriers go hand in hand for refugees. From 2015 to 2017 more than 1,3 million refugees applied for asylum in Germany. The biggest group are

youth and young adults. Integration in the labour market is a key source of personal and societal recognition and a non-marginal social status for them. Especially people in vulnerable situations like the aforementioned group have to cope with a variety of barriers, while entering the labour market. Deeper and systematic knowledge about the successful mediation of refugees in work, as well as the conditions of successful, sustainable work income are hardly available for this group. This paper is an attempt to contribute to reducing this gap. By using Castel's model of social exclusion, we focus on the micro of the statics and dynamics of shifting young refugees from unemployment to employment. In his "Les Métamorphoses de la question sociale" (1995) he divides the social sphere into three zones of integration: the integration zone (secure job, solid social network), the zone of vulnerability (unsecure job, under-employment, unstable relationships) and the exclusion zone ('shaken off' from labour market, educational participation). While focusing the micro of the transitions from one zone to another, specific boundaries, barriers and belongings within and between the zones become clear. This contribution is based on data and analysis of the multi-perspective, qualitative IAB (Institute for employment research) study "Integration and Participation of Refugees" conducted in co-operation with the Freie Universität Berlin.

Staying True to the Self: Young Women and Commodification of Personality in New Media Work

Lamberg, Emma Maria

University of Turku, Finland
emmalam[at]utu.fi

While new media work has long been a focal point for studies of aspirational work culture that emphasizes self-branding and subjective investment in work, less is known about the injuries related to being subjected to these demands. The article addresses this gap by investigating the lived contradictions caused by the demands to demonstrate aspiration through constant self-promotion. By drawing on 20 interviews with young women in higher education attempting to build careers in new media work (e.g. graphic design, journalism, digital communications), the article takes issue with the idea that young women have, in a post-feminist spirit, internalized the meritocratic, individualizing ethos of contemporary capitalism. The study finds that the participants share a sense of injury in a situation where to be rejected as a worker means to be rejected as a person. As a result, they do not only adapt to the normative ethos of commodifying their personalities but rather, struggle to distance themselves from this framework. The participants draw on a range of strategies to 'stay true' to themselves and harness their personalities for work that they perceive ethical. By shedding light on the strategies that young women use to keep their selves to themselves and resist what they deemed as an alienating logic of selling one's soul, the study pushes forward the contemporary debates about aspirations of young women in a postfeminist, neoliberal era. Keywords: aspirations, gender, subjectivity, new media work

Title Case: Youth unemployment and the crisis in Luxembourg: what social partnership?

Thill, Patrick

Luxembourg Institute of Socio-Economic Research (LISER), Luxembourg
patrick.thill[at]liser.lu

Youth unemployment rates in the EU increased dramatically during the international financial crisis. The European Commission proposed in its 2013 recommendation on a European Youth Guarantee a social partnership to combat unemployment, thereby shifting responsibilities downwards to trade unions, employers' representatives and associations. The dynamics of implementing employment policies were given a European focus in Luxembourg as a result of increasing multilevel governance and top-down pressure from European institutions to achieve EU 2020 targets. The policy area of youth unemployment serves the purpose of analysing how Luxembourg responds to peer pressure at the various interacting levels of governance (EU-government-social). Due to its peculiar labor market characterised by a large number of cross-border workers, its coordinated market economy and law-embedded neo-corporatist collective bargaining instruments, Luxembourg constitutes a laboratory to study forms of governance, policy management and social appropriation processes. The crisis-related balancing between allotting limited financial resources and achieving common EU objectives through peer pressure raises the question of what scope of action there still is for governments and social partners to comply with a constructed agenda of employment objectives. By applying a qualitative research framework based on semi-structured interviews, we critically assess if national traditions of policy implementation and collective bargaining processes in Luxembourg are circumvented or reinforced, and what elements of resistance stakeholders mobilise during the implementation process. Our preliminary results highlight that Europeanisation occurs at all levels of policy implementation, but to varying degrees and with some actors not participating in the partnership.

RN30_04b | Migration II: Attitudes and identities

Context and Change: A Longitudinal Analysis of Attitudes About Immigrants in Adolescence

Mitchell, Jeffrey

Umeå University, Sweden
jeffrey.mitchell[at]jumu.se

Research has explored many different relationships between contextual influences, such as levels of immigration or economic condition, and attitudes about immigrants with mixed results. These have largely been international

comparative studies using cross-sectional data, therefore they have been unable to make claims about changes in environmental context translating to changes in attitudes of respondents. Furthermore, the previous literature has almost exclusively tested these relationships using data from adults, despite research showing that attitudes are most subject to change during adolescence. This study addresses these issues by employing a longitudinal dataset of repeated measures of 2,328 German adolescents (ages~ 14-18) over four response waves (2010-2014). Using a multi-level analysis, results show that contextual changes including the percent of foreign born people and unemployment rates within respondents' states, correspond to changes in attitudes towards immigrants consistent with group threat theory. These results were stable even when controlling individual level factors.

Populism in Action: Xenophobia, Anti-migrant Attitudes and Identity of Hungarian Youth, Across Borders

Veres, Valér

Babes-Bolyai University Cluj-Napoca, Romania
veresv[at]socasis.ubbcluj.ro

During the last decades, several studies have pointed out how Kin-state politics influence majority and minority communities and how external minorities become the tools of the populist political discourses (see Brubaker, Hroch, Smith). The aim of this paper is to analyse how the anti-migration and new citizenship-related populist political and national discourses from Hungary, influenced the anti-migrant attitudes, by increasing the social distances, general xenophobia and prejudices against different groups including migrants (such as refugees, migrants, Muslims or Chinese), related with the national identity profiles, among the Hungarian youth, in Hungary, and in neighboring countries (Romania, Slovakia Serbia and Ukraine). Methodologically we used survey data (survey, 15-29 old, 4000 cases, 5 countries) and, mainly quantitative methods (regression models), but also focus-group results from last four years. Attitudes towards national groups and minorities are discussed along the system of relations majority-minority and national identity. The literature about xenophobia, antisemitism and the anti-Roma attitudes delimits four factors that have an influence on and determine the xenophobic and prejudiced, negative attitudes towards ethnic and social, minority groups in Hungary. These are the following: social demographic background, social-psychological and social values factors, migration experiences, as well as variables related to political values and options (Csepeli et.al, 2006). Our results show that the anti-migrant campaign and the political discourse about the Hungarians living outside the borders of Hungary contributed substantially, as expected, to increase the xenophobic attitudes of Hungarian youth from both Hungary and its neighboring countries. It may be observed that the historically formed prejudiced behavior is in closed connection with the factor of anti-migration and xenophobia, followed by other social-demographic, national, minority identity-related and political culture factors.

"When I Was A Child It Was Different". Young Daughters Of Migrants' Retrospective View Of Their Biographical Path To Belonging

Satta, Caterina (1); Camozzi, Ilenya (2)
1: University of Bologna, Italy; 2: University of Milan Bicocca, Italy
sattacaterina[at]gmail.com, ilenya.camozzi[at]unimib.it

Multiple and processual belonging of migrants' descendants is an established issue in migration studies. However, few studies concentrate on the transformation of belonging throughout a person's life course and the relationship between belonging and transition to adulthood, as an effect of scant dialogue between migration studies and youth studies. Starting from both these two fields of studies and adopting a temporal perspective, our paper focuses on the moving barriers and opportunities young people with ethnic background tackle along their "path to belonging", throughout their life course, from childhood to adulthood. Our specific focus is on migrants' young daughters (aged 20-26 and born or raised in Italy) and their retrospective view of their gendered and generational process of transitions. Drawing from recent qualitative research, we explore their everyday practices (within family and with peers) and shed light particularly on the triangulation of age, gender and ethnicity in shaping their experiences of transition to adulthood and belonging. Results show that migrants' daughters deal with intergenerational and intragenerational expectations both within family and institutional contexts (school and workplace), from childhood onwards. In particular, their life course is affected by dominant regimes of visibility, in terms of age, gender and ethnicity, through which their "difference" is reified, practised and challenged. However, results also show that their new biographical trajectories are experienced mainly when they reach across age boundaries (along the journey from childhood to youth and adulthood). Indeed, age operates as a structuring dimension which can enhance or constrain their transitions towards new belongings.

RN30_05a | Religion and integration

Studying "integration" among unaccompanied Syrian refugee youth in Germany: Alfred Schütz applied in ethnography

Zalewski, Ingmar

University of Applied Science Potsdam, Germany
zalewski[at]fh-potsdam.de

The current debates on refugee youth's integration and belonging are flawed in two ways. On the one hand, little attention is paid to phenomena of social exclusion that go

along with these processes. Dynamics of "successful integration" are investigated in their own right instead. On the other hand, studies lack a perspective that focuses on subjective meaning and might explore how youth themselves perceive these challenges in their everyday life. In this paper I want to present a framework inspired by Alfred Schütz and apply it to these shortcomings. Its focus lies on social exclusion within the everyday challenges of integration, captured from the standpoint of the subject. The underlying data derives from long-term ethnographic research studying the process of integration within a clique of adolescent unaccompanied refugees from Syria in Germany (ongoing dissertation project). Within the complex shifts of belonging from Syrian to German (host) society, it will be shown that the youth's status as social subjects is threatened and overshadowed not just by ongoing asylum procedures and precarious living situations. What is more, the lack of societal and cultural knowledge – since knowledge, gathered in Syria, tends to be devalued in Germany – may lead to a severe state of social exclusion. However, youth are not portrayed as victims, but instead their counter strategies are emphasized as they take to adapting and reclaiming agency. Applied within ethnographic methodology, Alfred Schütz' tools to focus on lifeworld and subjective meaning are helpful here to better understand the subjective scope of questioning youth's belonging in contemporary Europe. Keywords: refugee youth, integration, social exclusion, everyday life, Alfred Schütz

Challengers or Moderators of fundamentalist Islamic perspective? The "Woman to Woman Concert Group"

Oral, Ayça

Mimar Sinan Fine Arts University, Turkey
oralayca[at]gmail.com

This paper examines the formation of the personal and communal life of young, conservative Muslim women as cultural participants and culture makers in the current social and political climate in Turkey. Nationalistic tendencies accompanying the process of Islamization, have been noticeably reflected in the cultural sphere in recent years. Based on the empirical data gathered since 2018, the concert group shows that it has the capacity to challenge how participation and production of the community are performed and to transform the sphere within which the youth exist, whilst preserving its status within the prevailing community. While the selection of the songs, largely out of step with conservative norms, emphasizes interaction with other cultures and encourages greater intercultural engagement, the backgrounds of songs are adapted to fit what is acceptable within their community. Therefore, I will argue that in their performances, singing multicultural songs to women-only audiences, and gatherings, these women are in fact creating a new way of life, escaping conservative, routine daily life. The research is conducted in the framework of the Horizon 2020-CHIEF project "Cultural Heritage and Identities of Europe's Future" (No 770464).

Raising a Religious Generation as a Primary Target: Quran Kindergartens in Turkey

Ertem, Ece Cihan

Lund University, Sweden
ece_ertem[at]yahoo.com

This paper presents a part of a post-doctoral research in progress and scrutinizes a very new step taken by Turkish state to raise a religious generation with the integration of Islam to early childhood education in a secular country. Introduced by Turkish government in 2013, Quran kindergartens are a recent project on early childhood education and presented as “Quran courses for preschoolers” project. Even though these schools are called “courses”, all of them are executed as kindergartens where children spend their whole day. These schools are also known with the name “Sıbyan Mektepleri”, in reference to the schools for children aged from five to six years old during the Ottoman Empire. The choice of this name is not a coincidence; hence, this paper argues that this name is a cultural reference for non-secular education of the Ottoman Empire and related to neo-Ottomanism discourse of the ruling party, AKP as well as related to a strategy of “institutional layering” in the sense Kathleen Thelen discusses. Within this context, it focuses on the preliminary field work results composed on the in-depth interviews with parents and educators in Quran Kindergartens. It will also supply some information about the environment of kindergartens based on field observations, curricula and legal infrastructure of the schools. In a nut shell, as expressed in the official statements of the AKP government Quran kindergartens are a state funded project for the transformation of Turkish youth by raising a pious Muslim generation and a new case for academic research.

Disengagement Among Young Adults from the Salafist-Jihadist Scene, Supported by Preventive Interventions

Nagel, Christoph; Moeller, Mika Josephine

Technical University of Berlin, Germany
christoph.nagel[at]tu-berlin.de, moeller[at]ztg.tu-berlin.de

Recently, various research projects have emerged in Germany focusing on the deradicalization of radical Islamists. In many cases, the group of foreign fighters who have moved to relevant conflict areas has been looked at. Investigating the phenomenon of returnees, empirical social research was able to identify a variety of push and pull factors, find reasons for return, and evaluate their possible deradicalization. In our research project, we focus at another group of actors, namely the persons who are in (state-sponsored) prevention programs. We suspect that these mostly juvenile actors are different from the returnees who are often examined. For returners, disillusionment, the desire for a “normal” life, and “the fear of being caught” (M.B Altier et Al. p. 320 2017) play an important role in disengagement. The group we examine differs from this one. Our partners in interviews are often only

at an early stage of radicalization, inspired by social media and usually less tied to radical groups. Participation in prevention programs is initiated by parents or teachers or the police. The paper discusses the question, which factors are relevant in disengagement processes from radical attitudes related to those adolescents and young adults and what role does integration play in communication and cooperation contexts that are oriented towards communication and mutual respect? The research project started in October 2017 and we want to present the first results at ESA.

RN30_05b | Migration III: Mobilities and immobilities

Fixing Your Gaze On The Sea. Young People, Place and Intergenerational Relations in a Faroe Islands Village

Gaini, Firouz

University of the Faroe Islands, Faroe Islands
firouzg[at]setur.fo

This paper, looking at a village community through the eyes of its youth, aims to examine and analyse the (local) knowledge, identity and intra- and intergenerational relations of people from a coastal community in time of societal shift. Focusing on the place and the sea, we ask what is the social and cultural meaning of the sea and the coastal landscape for identity and belonging? Based on their everyday lives, family histories, and narratives of past-present-future continuity, we review young people’s sense of ‘belonging’ to place and ‘bonds’ to the past. This paper – at the intersection of island studies, youth studies and rural sociology – is connected to the international research project ‘Valuing the past, sustaining the future. Education, knowledge and identity across three generations in coastal community’ (2016-2021), funded by Research Council Norway. It is based on 35 qualitative biographical interviews (from 2017) with members of 13 families representing three generations. The Faroe Islands, a North Atlantic island community heavily dependent on fisheries, represent a society in transition facing similar challenges as many other islands and small-scale societies, regarding out-migration, economic restructuring and relative ‘remoteness’ (‘islandness’). The presumption of the paper is that we need to rethink the human impact on local development and societal revitalization by putting young people in focus: How do contemporary girls and boys envision the future of their islands?

“I've Been Here My Whole Life. I'll Just Stay Here”. Young Women's Narratives of Place-Making, (Im-)mobility and Imagined Futures

Ravn, Signe

University of Melbourne, Australia
signe.ravn[at]unimelb.edu.au

This paper draws on findings from an ongoing qualitative, longitudinal research project focusing on the everyday lives and imagined futures of young women with disrupted educational pathways in Victoria, Australia. In this paper I focus on the participants' place-making practices (cf. Benson & Jackson 2013) and sense of belonging in the present as well as in the futures they imagine for themselves. Drawing on Cuervo and Wyn's (2017, p. 220) argument that 'everyday practices over time build the layers of an affective experience of place', I explore the young women's sense of belonging in their current everyday lives via a mapping exercise and supplement this with interview data about their imagined futures. Central in these narratives is how their negotiations of their future dreams takes place in the context of an ever-present mobility 'imperative' (Farrugia 2016). However, the ways in which this imperative was present in the participants' narratives differed significantly, showing complex relations between their present and future place-making practices. The paper discusses this by linking place-making practices to 'people-making practices', or in other words how imagining futures also means imagining future selves; a self in time and place.

Aspirations, Place and Belonging: Young Adults' Imagining the Future in a Swedish Industrial Locality

Uddbäck, Hanna

University of Gothenburg, Sweden
hanna.uddback[at]gu.se

This paper explores how place and a sense of belonging influence young adults' imagined futures and aspirations. The paper draws on analysis of 19 qualitative interviews with young adults between 22 and 28 years old in an industrial locality in Sweden. The structural changes of the labour market have reduced the opportunity to get an entry-level industrial job. To meet the new situation the municipality is aiming to raise the level of education among its inhabitants by changing their 'cultural attitude' towards higher education and encourage spatial mobility. Research from the UK has critically engaged with politics of 'raising aspirations' where aspirations are seen as crucial to enhancing employability and social mobility. Place attachment is, within this politics, seen as an obstacle for young people to realise their aspirations (Allen & Hollingworth 2013, Brown 2011, Evans 2016). There is also a dimension related to the urban-rural divide, where staying in rural areas is (de)valued as a less ambitious and passive choice while leaving is seen as the only way to "get on" with life according to middle-class values (Jamieson 2000, Svensson 2006). How do the young adults' in this study articulate their

emotional attachment to their home locality? How do they relate to and understand the rural-urban divide? How do their sense of belonging influence their aspirations and imagined future? The results suggest that the young adults' imagined future involves contradictory emotions of belonging and conflicting aspirations, including both dreams of mobility and immobility as well as continuity and change.

Young Peoples' Aspirations. Social And Spatial (Im) Mobility In A Rural Context

Mandich, Giuliana

University of Cagliari, Italy
mandich[at]unica.it

It is possible to explore aspirations and social mobility through a variety of perspectives. I embrace Appadurai's idea of 'capacity to aspire' as able to emphasise the embeddedness of people's wants, wishes, and projects in the social condition people live in (Appadurai 2013). Similarly to the concept of habitus the 'capacity to aspire' shape what individual conceive as un/thinkable, ab/normal, un/ desirable and is/possible (Reay, 2004). In defining these possibilities, locality is a major factor. Both as a set of structural conditions impeding or enhancing young people's aspiration and as a lived place providing a feeling of belonging crucial in the possibility of young people to go forward in life. Whiting this frame, this paper joins the growing literature debating the link between social and spatial mobility. I analyse 40 semi-structured interviews with young people (aged from 18 to 24) in two rural areas in Sardinia characterised by depopulation, a high percentage of students' drop-off from the educational system and high rates of unemployment. These narratives about young people's aspirations not only support the idea that mobility and belonging are not in opposition (Cuzzocrea 2018, Juvonen and Romakkaniemi 2018, Farrugia, Smyth, and Harrison 2014) but also identify varying configurations of social and spatial (im)mobilities. Young people's affective experience of the place they live in frame thus individual aspirations and projects of social and spatial mobility.

Perceptions Of Culture and Cultural Practices Among Students in Georgia: Declared And Actual Engagement In Urban And Rural Settlements

Khoshtaria, Tamar; Shubladze, Rati

CRRRC-Georgia, Georgia
tamuna[at]crrccenters.org, rati[at]crrccenters.org

Many studies in the past (MYPLACE, 2013; FES, 2016) have shown that Georgian youth regard preserving Georgian heritage, traditions, and identity as important for the country's future and development. However, there are discrepancies between declared and actual levels of participation in Georgian culture (Khoshtaria et al., 2018). This paper examines how Georgian youth perceive their culture and what their attitudes are towards cultural participation and cultural events. Apart from looking at the perception of culture from the youth's perspective, the paper also explores two heritage sites (museums) and presents young people's perspectives on how youth collaborate with historical sites and how reported interest in culture is reflected in engagement with cultural events and historical sites. The study is based on qualitative interviews conducted with 60 young people aged 15-16 in three Georgian schools in urban and rural areas. In addition, data from participant observation at two heritage sites in Tbilisi and Gori are used. The interviews and participant observation were conducted within the framework of the CHIEF (Cultural Heritage and Identities of Europe's Future) project. The paper argues that youth in Georgia view Georgian culture through the lenses of tradition and heritage, and they value cultural experiences. Yet, they are less involved in cultural events and visit heritage sites only as part of school activities. One explanation for detachment from cultural activities could be that while Georgians value "traditional" and high culture, they are more engaged with modern culture, despite not considering it as consensual culture.

How Does The City Become A Place Of One's Own? City Capital and Young People's Different Relations to City Spaces

Tolonen, Tarja-Riitta; Aapola-Kari, Sinikka

University of Helsinki, Finland
tarja.tolonen[at]helsinki.fi, sinikka.aapola-kari[at]nuorisotutkimus.fi

In this paper, we analyze young people's relationships to city spaces: the meanings they give to various sites, their use of space, mobilities as well as the social and material dimensions of their practices. Our theoretical background derives from Bourdieu's theory of capitals (1997/1986). We developed a new concept, 'city capital', which refers to the knowledge and skills young people acquire about the city as a forum for their own actions. 'City capital' intertwines with social capital (friends, family) and with economic capital and materiality (public transportation, affordable leisure activities and

purchases). Our data originates from the qualitative longitudinal research project "Youth in time". It consists of individual and group interviews with 76 ninth-graders from three different urban areas around Finland. We applied thematic analysis, comparing local trends and differences between young people based on social class, gender and ethnicity. We also analyzed narratives the research participants told us. Young peoples' knowledges, resources, mobility and ways of making use of the city space differ considerably. Controlling actions by adults and threats of violence by other youth diminish young people's potential to cumulate city capital. This paper is based on an article published in *Nuorisotutkimus* 3/2018 (The Finnish Journal of Youth Research) jointly with Jenni Lahtinen and Matilda Wrede-Jäntti. Key words: Young people, cultural capital, city space, (urban life), qualitative methods.

Creating Co-operative Leadership As A Community Youth Worker To Challenge Power within corporations

Blake, Brett Elizabeth (1); Yaghubzad, Yasaman (2)

1: St. John's University, New York, United States of America; 2: University of the West of Scotland, Glasgow, Scotland
blakeb[at]stjohns.edu, j.edris26[at]hotmail.com

Youth workers need to challenge power through the experience of "knowing." Therefore by "knowing" who is or is not a member of a particular community, one can "give" that individual the power of challenging practices and be able to change the context of how they want to run things in their corporations or communities they work with. This is why it's so important to connect people and communities to what they DO know, giving them voice (and validation of their experiences). Their experiences are essential to society and how it works. Corporations and communities need to understand the phenomenon of "Corporate Social Responsibility," however the voice of the corporation often neglects the voice of communities. It is important to understand that corporate leaders and community leaders need to work together (i.e. "shared leadership") to come up with solutions to collaborate and move forward. In fact, "the tragedy has been the failure of the corporate community and the social activist to work together to find commonly acceptable solutions to society problems" (Boehm, 2002, pg.172) And yet, on the other hand I would argue that there needs to be more of a focus on 'leadership'. "Community leaders can reflect community attitudes and also influence community participation and community projects". (Boehm, 2002, pg. 172) Both corporations and communities have key roles in policymaking to change the activities and to be able to provide inspirational decision-making in organizations. In fact, "Corporate leaders are the key to the motivation and success of the organization and they play a key role in their communities. (Clarkson, 1995, pg. 172).

“Ordinary life is so surprising that(*)” ... : Youth formations in daily life. Goblin Game House in Istanbul

Kurban, Saim Buğra; Oral, Ayça

Mimar Sinan Fine Arts University, Turkey
sbkurban[at]gmail.com, oralayca[at]gmail.com

This paper draws on ongoing ethnographic fieldwork in Kadıköy, Istanbul, which allows for a niche experiment for youth from different socio-economic strata engaged in the production of culture. Kadıköy is multi-diverse and encourages the practice, adoption, and transformation of the culture. Goblin Game House, where manga/anime, cosplayers and board-gamers gather, facilitates an understanding of how these groups construct their own culture and space. Goblin Game House opens a rich discussion into how subcultures are formed within the given culture without being isolated. In-depth, open-ended and unstructured interviews provide evidence that gender, occupation, marital status, and age are not critical determinants in the formation of the subcultures being observed. The groups experience both Western and East-Asian cultural practices, localizing and transforming them into a new sociality. The study also questions the terms “cultural inclusion” and “intercultural interaction”, which are restricted to western cultures in Turkey. These social groups create new symbols and codes beyond the dominant and contrastive Westernized and Islamic codes. The methodology incorporates qualitative content analysis through visual technics (photo diaries and video interviews) providing a self-portrayal of individuals within their cultural sphere as an output of the study. The paper is based on the case study of CHIEF (Cultural Heritage and Identities of Europe’s Future) a Horizon 2020-SC6-CULT-COOP research project (770464) on social investment and social innovation. * Title is inspired by Steve Jones’ sentence which is: “Ordinary life is so dull that I get out of it as much as possible” (Steve Jones, a Sex Pistol, quoted in Melody Maker)

RN30_06b | Housing transitions

Young Adults In The Swedish Periphery: Resources, Choices, And Outlooks For The Future

Bennich-Björkman, Anna

Uppsala University, Sweden
anna.bennich-bjorkman[at]edu.uu.se

Based mainly on in-depth interviews with young adults in small Swedish towns, the study aims to capture conditions of growing up in non-urban environments, and its implications. Results from field work in Söderhamn will be presented, a town where saw mills, and later cellulose industry, dominated the labor market. Following the shutdown of these industries, the labor market has diversified; where heavy industry once reigned, the municipality is now, by far, the largest employer. Interviews with adolescents between 16 and 21 aim to answer questions regarding how they relate to this geographical place, how they envisage and plan for the future, what options and choices they make. With higher education sometimes appearing both geographically and mentally distant, adolescents in traditionally working-class towns are faced with, I argue, more complex options, than previous generations. Preliminary results show a number of factors affecting adolescents’ options and choices for the future. Families are firmly rooted geographically; parents, grandparents, and extended family remain in the area, contributing to adolescents’ sense of geographical belonging, and sometimes inability to imagine life elsewhere. Parents’ education and work seemingly impact the adolescents’ aspirations and capacity to navigate education and labor markets. Results suggest that those opting for studies and high-skilled work have a largely positive view of their hometown; but given their ambitions, moving often becomes inevitable. Adolescents who want an occupation which the labor market in Söderhamn can offer, appear negative about remaining, often expressing a want to leave – but rarely knowing where to go.

Housing and Migration Intents in Post-Socialist Europe: the Case of Serbia

Andic, Tanja

University of Minnesota, Twin Cities, United States of America
andic004[at]umn.edu

Over half of Serbians under the age of 35 report an intent to emigrate abroad. Among the stated factors influencing this decision are the Serbian economy, how youth perceive structures of advancement, and how they understand the post-socialist state compared to Western liberal democracies – all of which impact their transitions into adulthood and independence. In this presentation, I focus on how independent home ownership (typically obtained through family purchase or inheritance), or lack thereof, shapes how young Serbians who intend to emigrate understand their potential migrations. Drawing on data from qualitative interviews of 35 young adults who are considering leaving the country (and some of whom have already left), I find that those who have received or inherited housing consider their potential migration as an 'exploration' of better economic opportunities, which they can pursue safely with the knowledge that they can always return. Conversely, those who were not given housing by their families, and who will not inherit it in the future, feel they will be 'obligated' to emigrate eventually – whether or not they want to. They cite the impossibility of simultaneously paying rent (and especially purchasing a home) and financing everyday needs with the low wages they earn in Serbia. Contextualized historically by the 1990s privatization process of Yugoslav-era social housing, I conclude that home ownership is already restructuring class configurations in Serbia while shaping how young people plan for and understand their futures. In the long term, housing is set to become a significant factor in generating class inequality across the European post-socialist sphere.

Housing Transitions of Taiwanese Young Adults

Chang, Yung Han

University of Kang Ning, Taiwan
yh0419[at]gmail.com

In the context of rapid social changes, young adults' transition to full adulthood in Taiwan has gradually deviated from the traditional track with prolonged education, delaying marriage, and a growth in singlehood. For those young adults in the "waithood", as the "independence at the age of thirty" no longer applies and the markers of adulthood seem unachievable in the foreseeable future, alternative tracks in the transitions to adulthood emerge in the areas of housing, family, and work. Among all the transitions, previous studies in Taiwan rarely examined young adults' housing pathways. Drawing on longitudinal data from the Panel Study of Family Dynamics in Taiwan, this study investigated the housing transitions of young adults from 2003 to 2016. Based on the results from the sequence analysis and multinomial logit

model, this study found different transition patterns among young adults of different genders and areas. Moreover, the comparisons between different age groups showed that the younger generation are facing more turbulent housing transitions than their older counterparts.

Should I Stay or Should I Go? Leaving the Parental Home Patterns among Young Europeans

Isoniemi, Henna Johanna; Salin, Milla Heleena; Rasinkangas, Jarkko

University of Turku, Finland
hejosa[at]utu.fi, milsal[at]utu.fi, jarrasin[at]utu.fi

In general, transition-to-adulthood process involves leaving the parental home, entering the labour market, forming a partnership, and childbearing and childrearing. In this paper, we will concentrate on one of the transition events, leaving the parental home which is often seen as an essential stepping stone towards adulthood. There is major variation in the timing of this event, and the diversity of the durations and timings is part of the pattern common in modern Europe. The differences between countries indicate that the transition process is not as structured as before and that there is more freedom to make individual choices. The purpose of this paper is to perform a cross-country comparison of leaving the parental home behaviour, to describe when this transition happens and to focus specifically on delayed leaving home behaviour and its consequences. Leaving the parental home has been rather widely discussed, but there is a lack of comparative empirical and explanatory research. This paper contributes to filling this gap. This is done by using the EU-SILC data set (2016), by comparing 20 European countries and by using logistic multilevel regression analysis. According to preliminary results, there are several alternative explanations for why young adults in different countries leave their parental homes at different times. The results of the paper show that there is variation between European countries in terms of young adults' leaving the parental home processes and practices.

“Your Mother Has Been on the Street for Too Long... That's Why You Were Born”: Gender Stereotypes and Gendered Slurs in Cyberbullying Role Playing

Calvi, Cristina; Piras, Enrico Maria; Rubini, Ludovica

Bruno Kessler Foundation, Italy
cristinacalvi27[at]gmail.com,
ludo.rubini[at]gmail.com

piras[at]fbk.eu,

Cyberbullying is a deliberate and repeated aggressive act intentionally performed against adolescents using digital technologies. This study flanked CREEP, a project promoted by EIT Digital to design technologies aimed at cyberbullying contrast. We adopted a qualitative research design and a participatory approach to identify the recurring themes and stereotypes repertoires adopted by teenagers to harass their peers. The study was conducted in Northern Italy among lower secondary schools (12-13 years old) as a privileged field of analysis and involved 8 classes (148 students). We organized role play experiments using instant messaging system (Whatsapp) to study cyberbullying interactions among teenagers and focus groups to analyze the realism of the chats. Researchers created instant messaging systems groups supervised by researchers and teachers and assigned to each student a role: bully, support to bully, victim, support to victim. Participants were required to perform their role moving from ad hoc scenarios to trigger the conversation. We performed a thematic analysis of the interactions, highlighting the communicative styles (i.e. stereotypes, insults) adopted by the participants. A recurring theme were gender-based offences, and in general the discursive construction of gendered cyberbullying interactions. The analysis led to identify the presence of two sets of slurs: the first one is used by both males and females and the second one is used differently by boys and girls and connoted on the basis of gender. According to our findings, gender both influences how cyberbullying is perpetrated and experienced and gender stereotypes offer a repertoire to enact cyberbullying.

Young Online Heroes? Differences Between Girls' And Boys' Bystander Strategies In Dealing With Observed Digital Violence

Zartler, Ulrike; Atzmüller, Christiane

University of Vienna, Austria
ulrike.zartler[at]univie.ac.at,
christiane.atzmueller[at]univie.ac.at

In today's mediatized world, young people are not only victims and offenders of online attacks, but also uninvolved observers of digital violence. These so-called online bystanders have the potential to influence conflicts by contributing to further escalation or by acting in morally courageous ways. However, adolescents are reluctant to perform acts of online civil courage. Existing studies indicate that male adolescents intervene less often than female. Research has shown that male and female juveniles differ in their perceptions of digital violence, their strategies in dealing with it, and their intervention behavior. However, detailed studies on gender-sensitive perspectives are still rare. This contribution investigates the contextual factors and the intervention behavior of female and male juvenile online bystanders. We show how girls and boys differ in (1) their perception of online bystanders, (2) their characterization of online victims and online perpetrators, (3) their intervention and coping strategies and (4) their self-perceptions as online-bystanders. Findings are based on 19 group discussions with 142 adolescents aged 14 to 19 years in Vienna, Austria. Results indicate differences in girls' and boys' perceptions of online environments and in their victim or offender related actions. We show that common associations like 'braveness' and 'heroism' are not transferable to the internet, which partly explains young people's reluctance to perform morally courageous actions as online bystanders. Overall, these finding shed light on what prevents female and male adolescents from standing up for others online, and provide knowledge for a successful mobilization of youth for more online civil courage.

Partnerlessness And Anti-Liberal Ideology In The Online Discourse Of Marginalized Male Youth

Kellokumpu, Artti Ilari

University of Helsinki, Finland
artti.i.kellokumpu[at]gmail.com

This work in progress examines the intersection of youth marginalization and loneliness, in particular romantic and sexual partnerlessness, by drawing on online discussions on a Finnish anonymous image board aimed mostly at young men identifying as hikikomori (socially withdrawn NEETs). By utilizing lacanian discourse analysis, I examine how these young men articulate and orient themselves within the structural pressures imposed on them by the modern "mating market" and the late stage of capitalism that Nancy Fraser has labelled "progressive neoliberalism". The discussions on the board share a consensus that there's more demand for young women than young men on the mating market but they differ on who should be blamed for this. The first camp laments the competitive pressures imposed on them as men and blame women for them. This discourse is interpreted as a hysterical discourse revolving around the figure of the narcissistic Woman who forces men to compete for her attention and is further privileged by the liberal elite. The second camp follows the discourse of the capitalist in accusing the first camp of avoiding personal responsibility for one's success in dating and life in general. This discourse further utilizes psychocultural tropes by interpreting social critique as stemming from bitterness and psychic problems. The topic of sexual inexperience also divides the board into those who find it deeply shameful and embarrassing and those who think little of it and remind others that sex won't cure their personal problems.

Umwelt: Exploring and Experiencing Trans Kids' Lives via Video Gaming

Marchbank, Jennifer A; Travers, Ann; Boulay, Nadine; Jordan, Sharalyn

Simon Fraser University, Canada
jmarchba[at]sfu.ca, atravers[at]sfu.ca,
nadine_boulay[at]sfu.ca, sjordan[at]sfu.ca

In "A stroll through the worlds of animals and men: a picture book of invisible worlds," (1934) Jacob von Uexkull, a German biologist working in the early 20th century, claimed that our knowledge of every kind of living creature, whether 'animal' or 'human,' needs to be based on an understanding of their umwelten or 'self-worlds.' Following von Uexkull, our research team, "Gender Vectors of the Greater Vancouver Area (GVGVA)," has used this concept to map the umwelten of transgender and gender nonconforming children and youth - using video game technology to make visible the vectors of vulnerability, security and resilience that shape their life chances. The video game is a non-traditional means of mobilizing knowledge about and on behalf of a vulnerable population via an interactive format, integrating first person and systems perspectives to make visible the ways in which

trans and gender nonconforming kids and teens experience and navigate multiple barriers to care and support. This paper reports on a workshop wherein trans and gender nonconforming youth tested a pilot model of the game and engaged in a community-based and collaborative dialogue with researchers, educators, and policy makers. This workshop promoted a broader understanding of the urgent sites of care and support needed for non-cisgender children and youth in the Greater Vancouver Area of British Columbia, Canada.

RN30_07b | Future aspirations

"Worthwhile" Futures

McVittie, Angus

Newcastle University, United Kingdom
a.mcvittie[at]newcastle.ac.uk

In the UK today "traditional" working class transitions have been disrupted. Industries that historically employed the working class have sharply declined, while participation in higher education has transitioned from elite to mass provision. In a climate of rising tuition fees, employability has become the central pillar for measuring personal and educational success. Despite an oversaturated and highly competitive graduate labour market, young people are presented as empowered consumers "in charge of their own destiny". Much of this discourse has been rightly critiqued by scholars, with a great deal of valuable research into how social and economic disadvantage continues to shape young people's educational outcomes and "choices". Less scholarly attention though has been given to how young people experience and pursue a sense of satisfaction and fulfilment in study and future work. Taken from a wider PhD project which seeks to explore young people's perspectives on apprenticeships and undergraduate degrees, this paper draws on semi-structured interviews with 40 first-generation students studying at a prestigious UK University. The paper will illustrate how a strong desire to "do something worthwhile" shaped the educational trajectories of participants in this study. Whether they sought to; develop skills to help others, pursue knowledge of a subject close to their heart, or simply to attain financial stability so they might "see the world" or provide a "better" life for their families, all participants in the study pursued education not solely for economic benefit, but because they felt it provided them with something they deemed "worthwhile".

The Art of Getting By. A comparative ethnography of young people future orientations in Italy

Domaneschi, Lorenzo

University of Milan, Italy
lorenzo.domaneschi[at]unimi.it

The research combines the analytical tool of intersectionality with Bourdieu's notion of dispositions in order to explore the fluidity of "social location". Hence, the study investigates the temporal orientation towards the future of two different groups of young people with different assets in coping with contingency. I conducted a comparative ethnography and in-depth interviews from March 2017 to May 2018 spending time together with and interviewing two different groups of young adults (aged between 18 and 26) with different cultural capital, situated in two different locations in Milan, Italy (a working class neighbourhood and an artistic lab). The research seeks to uncover the rituals, practices and mentalities produced by the two groups of participants and to understand how such emerging subjectivities and collectivities meet and collide with the existing frame of institutional power. Accordingly, the main findings show that middle class young adults oppose the aesthetics and the neo-liberal discourse of the hard work that inherit from the educational paradigm with a discourse of creativity and talent built collectively outside the scholastic institution, as a mechanism of conversion from the constraints of precariousness in opportunities for creativity and cultural innovation. Yet, this change of perspective is possible thanks to the spaces of "super-reflexivity" opened by the habitus fragmentation generated by the very same precariousness produced by the incongruences between school system and the labour market. Comparatively, the empirical findings suggest how not only different social contexts shape the possibilities to think about the future but, more in depth, how the active management of contradictory structures ("the art of getting by") can be driven by dispositions and their particular intersection shaping practical strategies towards the future.

Young Women's Thoughts about the Future: Comparing across Cohorts and Historical Periods

Nilsen, Ann

University of Bergen, Norway
ann.nilsen[at]uib.no

This paper compares how two birth cohorts of Norwegian women perceived and conceptualised their future when in their early twenties. Data are drawn from two different studies: interviews conducted in 1997 with the birth cohort 1970-75 and interviews from 2016 with the birth cohort 1990-1995. The theoretical framework is a life course perspective while also drawing on ideas of time and temporalities in GH Mead's writings. Analyses demonstrate how period specific conditions are evident in the interviewees' accounts of their 'present' circumstances set in Norwegian society at two

different periods, and how structural dimensions become a taken-for-granted aspect of their future orientation.

Aspirations and Boundaries in the Transition to Higher Education: Self-selection and Self-exclusion in Youth

Palma Amestoy, Carlos

University of Bristol, United Kingdom
cp16122[at]bristol.ac.uk

While the expansion of higher education in the last few decades may be considered as the widening of opportunities for young people in the process of transition from the school to a new stage, at the same time new barriers and symbolic boundaries (Lamont et al. 2015) have emerged which may limit their choices and decisions (Reay et al. 2005). In the case of Chile, a country dominated from the 1980s by neoliberal policies and a market-oriented scheme in the educational sphere, the transformation of the higher education system has entailed its institutional diversification, rapid expansion and extreme privatisation. In this context, this paper explores the subjectivities and aspirations of young people living in Chile who are in their last year of secondary school. Through qualitative interviews, aspirations and desires of 46 students from different types of schools, social class and gender are analysed. The results show that class and gender are essential categories in the formation of students' aspirations. Furthermore, the process of institutional segmentation has brought about a field where the desires of the youth are in correspondence with the structure of the field of institutions of higher education (Bourdieu 1996). Aspirations and expectations, therefore, seem to be rooted in the objective structures of the field. Thus, social segmentation and reproduction of social inequalities in the country are highly associated with self-selection and self-exclusion, which occur as a result of internalised dispositions and aspirations of the youth. Keywords: aspirations, transitions, social class, higher education.

RN30_08 | Transitions and social change

Changing Youth Life Course. Decision-Making Process In Times Of Discontinuity

Chan, Ralph

University of Vienna, Austria
ralph.a.chan[at]gmail.com

Life courses of youths have changed over the past decades due to societal changes. They are experiencing faster-paced changes than before, more fractions, fragmentations and transitions in their life course. These challenges have a big impact on the individual life projects and influence the decision-making process, for instance, on educational choices or career pathways. Career decision-making is considered as complex process where critical moments have an impact in the life course and identity. This presentation on my doctoral research is designed to find out and understand the aspects that are relevant (= rationale) and how they influence the decision-making process of youths. The main research question of is: What is the relative weight of different influences on young people's decision-making about education and/or training on leaving school (e.g. further education, apprenticeships and other youth training programmes or work)? The research gap is that current research on the life course, on youth and their educational choices in Austria and specifically in Vienna and Innsbruck from a sociological perspective remains limited. With a research design, that combines secondary quantitative and qualitative data, it can help to get a broader understanding of the contextual factors how decisions are made. In this presentation the theoretical framework as well as the first preliminary results should be presented.

Young Returning Migrants as Actors of Social Changes in Slovakia

Hofreiter, Roman

Matej Bel University, Slovak Republic
roman.hofreiter[at]umb.sk

The situation in Slovakia is characterised by a high number of young people studying or working abroad. A migration presents a cyclical event for young Slovaks. It involves the process of leaving the homeland but on the other side it is also the process of returning home. The process of return migration is often studied from an economic perspective. However, the return migration presents new themes, some of which are include in the presentation. I will focus on the tendencies of returning young migrants to become bearers of change and development in their home country and I will explain how young returning migrants modify life in their immediate primary circle, community and even society. However, to be young returning migrant does not automatically means ability to bring significant social innovation. Therefore, I will also

present the social and cultural characteristics of young returning migrants that support returnees' ability to bring innovation into community and broader society.

Open-ended Transitions: Changing Metaphors for a New Age

Thomson, Rachel (1); Østergaard, Jeanette (2)

1: University of Sussex, United Kingdom; 2: VIVE - The Danish Center for Social Science Research, Denmark
R.Thomson[at]sussex.ac.uk, jea[at]vive.dk

The field of youth studies has been characterised by a self-conscious use of metaphor with the term 'transition' the focus of debate. In this paper we review the ways that metaphor has been used in youth studies, including a recent term to new metaphors that capture the foreclosure of futures for young people, capturing experiences of waiting, delay and non-institutional notions of temporality. Drawing on the intellectual resources of queer theory we challenge the developmentalism that continues to underpin youth studies, experimenting with notions of the impasse (Berlant) and growing sideways (Bond-Stockon) which in different ways capture the open-endedness of young adults lives. Drawing on data from a qualitative longitudinal study of Danish youth we focus on the way that 47 young people responded to an invitation to talk about and through an object that represented that last three years of their lives, the time that had elapsed since our last interview. These rich accounts can be understood as examples of Riceours 'metaphoric discourse', characterised by the simultaneity of 'is' and 'is not'. The paper offers a categorisation of the biographical objects (trophies, hobbies, turning points, connective, protest and evocative) before engaging with participants' own metaphorical thinking in great depth – suggesting that such examples can help us expand how we understand the struggle for maturity and the way it is mediated both by tensions between individualised and institutionalised markers and by shifting orientations to the past and the future.

The Role Of Leisure Activities On Gender (A)Typical Occupational Aspirations – Discussing The Causal Structure

Zimmermann, Julia

Deutsches Jugendinstitut (German Youth Institute), Germany
jzimmermann[at]dji.de

Research on gender differences in the process of career choice usually focuses on the overall context of the educational and vocational training system. One of the neglected aspects is the impact of informal and nonformal learning environments. There is a shortage not only of longitudinal studies that allow to investigate singular factors (like certain extracurricular activities) influencing career choices, but also of theoretical concepts that consider all causal and non-causal mechanisms of career development. Since most hypotheses-driven regression models do not depict the complete causal structure of a social problem and thus may lead to biased interpretations, we propose a graphical causal diagram, which summarizes theoretical assumptions about the formation of occupational aspirations. It incorporates educational, individual and family characteristics as well as extracurricular activities. By using longitudinal data from the survey "Growing up in Germany (AID:A II)" of the German Youth Institute, we estimate the effects of certain leisure related activities on gender (a)typical career aspirations.

RN30_09a | Intergenerational relations

'If I Compared Them To Myself At Their Age...': Discourses Of Youth Futures And The Generational Bias

Cuzzocrea, Valentina

University of Cagliari, Italy
cuzzocrea[at]unica.it

This paper discusses interviews with professionals working with young people in Sardinia, Italy. These professionals express their views on possibilities for youth's future from specific angles of their educational expertise. In so doing, they produce a generationally -biased set of priorities, emphasising deficits of young people, suggesting what they should or could do, sharply in line with their own generation' values and priorities. Considered in its potential to disentangle intergenerational asymmetries of power, this material is the focus of this paper. Given that the same study had emphasised that students produce narratives characterised by repetition and continuities along family history, in a circular vein which can be interpreted as a difficulty to imagine different futures, I turn here to explore such issues as: if several generations produce imaginaries that could broadly be reconducted to one generation only, whose the future that ought to be created?

Whose are the meanings embedded in lifestyles, values, aims and objectives of actions? Whose agency is behind the capacity to enact in the world, today and tomorrow? Ultimately, what possibilities for social action are left to young people? I conclude my discussion emphasising the need to: elaborate narratives which contain elements of awareness of generational issues as fundamental issues of power relations (a); find ways to conceptualise how social action is structurally based on such generational unbalances (b); rethink data collection and analysis to systematically open the way to creative thinking in view of intergenerational mechanisms (c).

Adolescents' Attitudes Towards The Ideal Division Of Housework Tasks Among Couples: The Impact Of Socialization Experiences

Bernhardt, Janine; Kleinschrot, Leonie

German Youth Institute, Germany
bernhardt[at]dji.de, kleinschrot[at]dji.de

Despite the rise of egalitarian gender ideologies and increasing labor force participation of mothers in Western Europe, parents' division of housework has remained persistently unequal. The literature offers two major streams of explanation: structural constraints and the intergenerational transmission of gender culture. While structural barriers, e.g. to balancing work and family roles, are well documented, only few studies have been able to look into transmission processes of gender roles from parents to children. We still know little about how young people imagine an ideal division of typically gender-typed housework tasks and how their attitudes link to socialization experiences during childhood. In this paper, we use multi-actor panel data for Germany to study how adolescents' attitudes towards the ideal division of housework tasks are related to their parents' actual division of housework tasks earlier in childhood. We investigate how this relationship differs according to child gender and the presence of siblings. Finally, we test whether daughters' and sons' own involvement in housework mediates this relationship. The empirical analyses use two panel waves from AID:A, a national survey of children, adolescents and young adults. We restrict the sample to two-parent families and combine information from 2018 on adolescents' attitudes towards the ideal division of housework tasks among opposite-sex parenting couples with information from 2014/15 on parents' actual housework division as reported by mothers. The final sample consists of 650 mother-child dyads. First results indicate that both female and male adolescents' attitudes towards the ideal division of typically female tasks are far more egalitarian than their parents' task division, whereas their attitudes about typically male tasks are strongly gender-typed.

Behavioral Models of the Last Soviet Generation in Post-Soviet Lithuania

Zilinskiene, Laima

Vilnius University, Lithuania
laima.zilinskiene[at]fsf.vu.lt

The aim of the presentation will be to analyze the last Soviet generation and determine the impact made to its development by the changing modernity of the 20th century. The analysis of the generation will cover search of its specific behavioral models. Particular attention is paid to their adaptation to social and political changes in Lithuania after 1991. The presentation will be based on the comparative research of three generations - the last Soviet generation, the older and the younger. In the research biographical methodology and group discussion material are applied. Will be analysed how different components of modernity determined generation's experience and how this experience is reflected in the generation. Generation's features of socialization in the late Soviet times and adaptation models in the contexts of changing modernity will be analysed giving attention to the family's institution in the socialization. Empirical data consists of 80 biographical interviews with members of different generations (1960-1969, 1970-1979, 1980-1990) and three focus groups.

The Dynamics of Systemic Preferences in Polish Society (An Intergenerational Perspective)

Szafraniec, Krystyna

Nicolaus Copernicus University, Poland
krystyna.szafraniec[at]umk.pl

The final directions of systemic changes in the countries of Central and Eastern Europe are still not a foregone conclusion. In the initial period of the transformation in Poland there was a consensus regarding the direction of changes that had to be implemented. It was generally assumed that they were socially accepted. However, sociological research in Poland shows that there is a growing contradiction between the social awareness (with all its shifts and turns) and the direction of systemic transformations, also in terms of the normative structure of the emerging system. Does this contradiction apply also to young people? For many years perceived as a generation of historical hope, Polish youth seem to be disappointed with the quality of changes that are taking place today. My aim is to present their attitudes and normative beliefs regarding social order in comparison to older cohorts. There are four groups of questions: about the state economy (egalitarian or efficiency-focused), kind of community identity (a closed one that refers to national roots or one that is open to Europe and diversity), political solutions (democratic or authoritarian) and type of citizenship (passive or committed). When discussing these changes, I will refer to indices and ratios based on a number of Likert-type scales. They have been used in quasi-panel studies that have been carried out in Poland on large representative samples since the 1990s. Their sequential and repetitive

nature allows both to capture the dynamics of the studied phenomena and to compare them across generations.

RN30_09b | Participation III: Inclusion and empowerment

The (Em)power(ment) Of Seeing Things Differently: The Possibilities of Co-Research Methodology And Art Projects For Promoting Young Refugees' Well-Being And Social Inclusion

Rättilä, Tiina Sisko (1); Honkatukia, Päivi (1); Koskelainen, Kaisla (2); Sillanpää, Olli (2)

1: Tampere University, Finland; 2: Kölvi Association, Tampere, Finland

tiina.rattila[at]tuni.fi, paivi.honkatukia[at]tuni.fi,
kaisla.koskelainen[at]kolvi.fi, olli.sillanpaa[at]kolvi.fi

The question of the refugees' integration in the host society is currently a daunting political and social issue. In the presentation we focus on the experiences of well-being and social inclusion of young adult refugees who arrived in Finland as minors in 2000s and 2010s, mainly from the Middle East region and the countries of Northern Africa. We present findings from two research processes with a local NGO working with young refugee men, one focusing on art projects and the other on a co-research project around refugee youth's employment. The objective was to examine factors influencing refugee youths' well-being and inclusion (or exclusion) in society. The data includes youths' narratives and photographs produced by Playback Theatre and Empowering Photography methods, peer interviews among the youths, and various ethnographic documentations of the processes. The data is analyzed through mixed qualitative methods. In discussing the research results we utilize an approach which sees individuals' inclusion in society as a phenomenon comprising three dimensions: having (economic well-being and sense of security), belonging (attachment to social life and groups as a recognized member) and acting (participation in social and political activities) (Allardt 1976; Raivio & Karjalainen 2013). While young refugees often face problems regarding all these aspects, our results show that art methods and involving young people in research projects as equal co-researchers carry a lot of potential for promoting their well-being and social inclusion. The presentation, along with the article manuscript in the making, is drafted together with the young co-researchers and their coaches in the NGO.

Political Participation As a Missing Factor of Transition to Adulthood.

Kotras, Marcin (1); Grotowska-Leder, Jolanta (2)

1: University of Lodz, Poland; 2: University of Lodz, Poland
marcin.kotras[at]uni.lodz.pl, leder[at]interia.pl

At the beginning of the transformation (1989), the symbolic elites were describing Poland as a country offering a better future for young generations: civic freedoms and expected cultural changes. At the same time, the symbolic elites introduced to society the definitions of life's success strongly related to material and financial criteria. They were aspiring to control the normative sphere and the meanings of crucial ideas in the public discourse. The freedom offered to young people was associated with taking responsibility for their own fate. This socially constructed adulthood conveyed the accents from familism to individualism that had an influence on setting and reproducing social order. The paper focuses on the group of Poles who reached adulthood little before or not much after Poland's accession to the EU. Their entering into adulthood took place in the conditions of the regime transformation. Their transition to adulthood was usually described with the so-called "Big Five" factors but one rudimental factor was missing – political participation. The main research goals were: firstly, to identify various activities undertaken by the young adults in the political area, and secondly to answer the question if the political issues regarding young adults problem were included in public debate. The combination of 3 FGIs and discursive analysis were used in the research procedure in order to get knowledge about young adults' activity in public policies formulation and implementation. FGIs were carried out among young local political actors and supplemented with the analysis of political party documents, and social media content created by the young adults. The additional data were collected during 60 IDI with people who were born in 1986.

Youth Guarantee - additional guarantee?

Taru, Marti

Tallinn University, Estonia
marti.taru[at]tlu.ee

Since the beginning of 2000s, young people have started to receive increasingly policy makers' attention. Reducing social exclusion is one of the goals of the EU. Today youth social exclusion is recognised as one of the core challenges in the EU and the EU developed a youth-specific concept of social exclusion – NEET-status: Not in Employment, Education, Training. In 2013, the Council of the EU issued a related policy initiative – Youth Guarantee aiming to reduce the NEET-rate, together with financing mechanisms: European Social Fund and Youth Employment Initiative. In all countries, the YG came on top of national measures already addressing social exclusion in general as well as youth unemployment, school dropout and transition from education to labor market in particular. Against this background, the research question asks What is the potential impact of the YG on youth social exclusion? The presentation focuses on three countries, which

differ in terms of severity of the NEET-problem as well as in terms of social policies addressing social exclusion: Estonia (the rate of 15-29 year old NEETs in 2017 11%, level of social protection expenditure 16,1% of GDP in 2015), Italy (24,1% and 29,9%) and Belgium (12,6% and 30,3%). Empirical analysis is based on Horizon 2020 financed projects Enliven, Except, Edumap. Research identifies significant path dependence – the YG is built on interventions, that have been launched earlier. As a result, it adds little to addressing youth social exclusion. Additionally, impact analysis of the YG measures is mostly missing and the existing impact analyses of similar measures tell of low efficiency of such measures. Therefore, the potential impact of the YG is weak if significant at all.

The Potential Of The European Youth Programmes To Strengthen Inclusion And Participation Of Young People

Akarçeşme, Sümeyra (1,2); Fennes, Helmut (1,2); Gadinger, Susanne (1,2); Karsten, Andreas (1,2,3); Strecker, Tanja (1,3)

1: RAY Youth Research Network; 2: GENESIS Research Institute; 3: Think Tank Youth Policy Labs
sumeyra[at]researchyouth.net, helmut[at]researchyouth.net, susanne[at]researchyouth.net, andreas[at]researchyouth.net, tanja[at]researchyouth.net

As of late 2018, Europe has two major European youth programmes: Youth in Action, a major strand embedded in the Erasmus+ programme, and the new European Solidarity Corps. In the context of the European Union's new Multiannual Financial Framework 2021-2027, both programmes will soon be renewed: a good time to not only consider their achievements, but critically consider their potential. Through the European Research Network RAY, multi-lingual online surveys have been conducted to analyse the implementation and impact of the European youth programmes in more than 30 countries, complemented by qualitative research projects on the long-term effects of these programmes on participation of young people, as well as the effects on young people with fewer opportunities. More concretely, through our mixed-method research projects, we explore the effects of projects funded through the European youth programmes on the actors involved, in particular on project participants and project leaders, as well as their organisations and the local environments of these projects and the (lack of) access to the European youth programmes at the level of young people (in particular of young people with fewer opportunities) as well as at the level of organisations, bodies and groups in the youth field. In our contribution, we will draw on this wealth of data to identify aspects where the European youth programmes currently stay below their potential to strengthen inclusion and participation, and will illustrate these aspects with quantitative and qualitative data from all current RAY research projects.

RN30_10a | Wellbeing and inequalities

Youth Participation In Times Of Neoliberal Urbanism - Expert Discourses On The Effects Of Social Stratification And Unequal Living Conditions In The City Of Gothenburg Becevic, Zulmir (1); Dahlstedt, Magnus (2)

1: University of Gothenburg, Sweden; 2: Linköping University
zulmir.becevic[at]socwork.gu.se, magnus.dahlstedt[at]liu.se

During past couple of decades there has been a significant proliferation of interest regarding youth participation, on policy level as well as in research. Generally, the immense interest for the topic can be traced to a growing public concern regarding the 'youth participatory deficit' and youth dissatisfaction in European societies. This dominant discourse posits young people as low-degree participants in the economic, social and political processes of the established arenas of society, which in the long run threatens the foundations of democracy. Taking into consideration the neoliberal transformation of West European cities towards increasing socioeconomic and ethno-cultural segregation we argue for a pressing need to analyze youth participation as shaped by structural arrangements and unequal access to resources which create spatial and symbolic divisions between different categories of young people. This paper examines the enigmatic concept of 'youth participation' through the prism of structural inequality, placing it at the heart of the current order of neoliberal politics. The idea of structure is brought into play aiming at examining participation as embedded in the societal matrix of unequal power relations and life opportunities which are essential characteristics of the neoliberal city. The individual acts, but always in relation to a web of relations that shape the framework within which participatory action evolves. Young people's experiences are inevitably shaped and differentiated by social divisions. Building on interview and ethnographic data from a recently completed Horizon2020 project on youth participation in European cities (PARTISPACE), the analysis aims at bringing into the understanding of youth participation the idea of social stratification that profoundly shapes and structures the worlds of young people.

Subjective Well-being and Agency of Young Adults Leaving Care in the Russian North

Kulmala, Meri Susanna (1); Chernova, Zhanna (2)

1: University of Helsinki, Finland; 2: Higher School of Economics, Russian Federation
meri.kulmala[at]helsinki.fi, zhchernova[at]hse.ru

Russia is currently on-going a massive reform of its child welfare system. Besides strengthening support services for families at risk, the reform develops out-of-home care in foster families and transforms the previously large and segregated residential care institutions into small family-like units in order to promote better social inclusion of this specific group of young people left without parental care. As elsewhere, these Russian young adults face multi-layered (structural) inequalities and carry out a high risk of social exclusion. They typically face numerous challenges in their aftercare life, for instance, in the sphere of education, employment and income, housing and family life, and show poor health outcome and involvement in criminal activity. The listed spheres of life are usually considered as key components of well-being. In our research, we aim is to move beyond such a problem-frame to focus on the positive outcomes. By analyzing the so-called successful cases, we zoom to resources and resilience of this group of young adults leaving care whom we consider as the best 'experts by experience' over the best practices of support in their aftercare lives. We aim to understand what kinds of elements might have positive effect on the experienced well-being and ability to have impact over their life course, i.e. we explore different components of their subjective well-being and modes of agency. Our analysis is based on the qualitative interviews that we have conducted with young care leavers (aged 21-25 years) and peer-interviews conducted by young care leavers themselves in the Murmansk region (Russia). Thus, our scope of analysis is how these young adults themselves narrate their current life satisfaction and future prospects.

Anime Youth Scene In A Muslim Region of Russia: (Sub)cultural Identities, Global trends and Local Barriers

Maiboroda, Alina Vladimirovna

National Research University Higher School of Economics St. Petersburg, Russian Federation
avmaiboroda[at]gmail.com

The paper is focus on one youth cultural scene in Makhachkala, the capital of the Republic of Dagestan, and the third largest city in the North Caucasus region of the Russian Federation. The uniqueness of Makhachkala's youth space is associated with the specific geopolitical and cultural circumstances of the history of the republic. This is set against the context of post-Soviet transformation: rising unemployment and severe inequality; the revival of Islam; radical changes in the gender regime, the ethnic and religious composition of Dagestanis; and a complicated political agenda involving the struggle with radicalization, and the growth of a terrorist threat. Thus, it important and timely to study local youth sociality, which exist in such a contradictory context. The research is focused on the anime fans, who symbolically resisting to the pressure of social "normativity". They represent themselves as 'non-formal' youth and seek to be separated from 'common', 'normal', 'ordinary' young people. Participants demonstrate specific values. Using the theoretical concept of cultural scenes and a case-study approach (in-depth interviews, participant observation, community mapping), the potential to categorize youth that are not centred (that is, who are outside the 'core' of the capitalist world-system) is critically considered through the opposition between subcultural and mainstream groups. The key aim of the paper is to describe the intra- and inter-group solidarities and the value conflicts of youth in a complex and contradictory local urban environment.

'I've missed out on being young': The Construction of Young People's Life Courses in the Context of Parental Dementia

Hall, Melanie (1); Sikes, Pat (2)

1: Manchester Metropolitan University, United Kingdom; 2: University of Sheffield
melanie.hall[at]mmu.ac.uk, p.j.sikes[at]mmu.ac.uk

Dementia is the umbrella term applied to a group of symptoms associated with a range of terminal diseases affecting the brain, leading to cognitive change. Developments in medical knowledge have resulted in an increase in diagnoses, including young onset variants. However, research has yet to explore how this is experienced by children and young people who have, or have had, a parent with dementia. This paper reflects on findings from a study based on narrative interviews with 24 British 6-31 year olds. Findings illustrate the impact on the life course and how having a parent with dementia calls established phases of the life course, such as childhood and

youth, into question. Data indicates tangible impacts on young people's lives in terms of: planning their education/career; mobilities and navigating personal lives. Participants described the 'limbo' their lives were in or had been in, until their parents' death. This resonates with Turner's (1969) concept of liminality which is applied to phenomena that are in some way, 'non-normative' and render individuals 'betwixt and between'. Participants were not considered bereaved and thus denied the social exemptions usually afforded to the bereaved, while also experiencing loss, and are thus 'in-between'. Parental dementia disrupted their expectations of their lifecourse on account of their parents illness. Theorizations of these narratives illustrate the social construction of the lifecourse (Holstein & Gubrium, 2007) and argue for more nuanced approaches to these. The research contributes to understandings of young people's constructions of the lifecourse in the context of loss.

RN30_10b | Citizenship and self

Young People and the Making of the Self as Enterprise: New Work Orders and Global Grammars of Enterprise.

Carbajo, Diego (1); Kelly, Peter (2)

1: University of the Basque Country, Spain; 2: RMIT University, Australia
diego.carbajo[at]ehu.eus, peter.kelly[at]rmit.edu.au

In this paper we want to suggest that 21st century neo-Liberal capitalism is energised by a spirit that sees in the cultivation of the self - as an ongoing, never ending enterprise - an ethically slanted maxim for the conduct of a life (Weber 2002). This spirit is identifiable as an institutionally structured, individualised ethic of enterprise: a structured series of incitements and imperatives to manage the biography as an entrepreneurial DIY project. This 'point-of-arrival' for young people's 'transitions' through education and training, and onto the 'real' world of work, is, we will suggest, a complex, precarious risky, and globalising arena central to the process of making a self. This paper, which is grounded in two ongoing research projects related to self and social enterprise in Europe and Australia, will deploy the analytical concept of global grammars of enterprise to identify, examine and analyse a number of things, including: the shifting, unstable, always strategic power relations between governmental discourses of 'enterprise'; and the performances and actions of enterprise, the enterprising behaviour and dispositions of persons and groups, the 'vernacular', local, particular, 'translations' of the ideas of entrepreneurship that organisations and young people perform in particular places. Our use of grammar is a way of addressing the preferred, normative rules of use of the institutional and orthodox representations of the self as enterprising. The concept gestures toward the materiality of agencies, apparatuses and institutions that converge in the implementation and development of an ethic of enterprise.

Sometimes More is Less? Young Finnish-Russian Dual Citizens and the Weight of Citizenship

Kananen, Marko; Ronkainen, Jussi; Saari, Kari

South-Eastern Finland University of Applied Sciences, Finland
marko.kananen[at]xamk.fi, jussi.ronkainen[at]xamk.fi,
kari.saari[at]xamk.fi

“Citizenship Constellations” research project has explored the variety of ties, identifications and participation of young Finnish-Russian dual citizens in Finland. Although dual citizenship has brought along many benefits, such as unrestricted mobility across the Finnish-Russian border, it has also brought challenges to the lives of young dual citizens. As the political climate has shifted towards neo-nationalism and the tensions between Russia and the “West” has risen, dual citizens’ loyalty and status as plenipotentiary Finnish citizens have been questioned. As a result, the role of Russia and Russianness is getting increasingly restricted in the lives of young dual citizens. Whereas their sense of Finnishness builds on societal participation and vocal membership in the Finnish society, their sense of Russianness becomes private and apolitical. Building on a mixed method approach of representative survey (n=194), thematic interviews (n=25) and media analysis, this presentation explores how a stigma associated with a formal citizenship status can affect dual citizens’ inclusion and participation, as well as their sense of possibilities and belonging both in Finland and Russia. These questions are particularly relevant for young people who are engaged with envisioning their futures and exploring their place and role as citizens of two countries.

Mobility and Active Citizenship

Allaste, Airi-Alina; Nugin, Raili

Tallinn University, Estonia
airi-alina.allaste[at]tlu.ee, nugin[at]tlu.ee

This paper examines active citizenship practices and attitudes among Estonian young people over a 3-year period. Active Citizenship, an amorphous term used to describe various forms of participation in civil society, community and/or political life to foster democracy, encompasses both formal and informal political activities and community organisations. However, there is no shared understanding of the meaning of active citizenship and how young people should acquire the skills, attitudes and knowledge required for it. The empirical part of the paper is based on semi-structured interviews with young people focusing on their individual perspectives on citizenship. Informants have participated in projects in the framework of Erasmus+, a programme whose aim has been to inspire active citizenship, solidarity and tolerance as well as involve young people in shaping the future of the EU. Young people with an Erasmus+ experience were interviewed 3 times between 2015 and 2018 – before the project, 6-12 months after project and 2-3 years after the project. The analysis focuses on changes in their active citizenship standpoints and practices with respect to the possible impact of the mobility project, as well as other changes in their life and society during their late teens.

Cultural Practices, Daily Life and Participatory Processes of Young People. The Perspective of Cultural Welfare

Volturo, Stella; Martelli, Alessandro; Zurla, Paolo

University of Bologna, Italy
stella.volturo2[at]unibo.it, a.martelli[at]unibo.it,
paolo.zurla[at]unibo.it

Cultural and artistic practices play a significant role for constructing and consolidating the bases for social cohesion, individual and collective wellbeing and has positive effects at cognitive, behavioural and community level. Particularly for young people, artistic creativity is an everyday activity through which they project meanings and expectations related to their life spaces, social practices and group identities (Willis 1990). Moreover, both cultural consumption and production are significant processes to promote the balance between individual and collective identity (‘what we are’) and the need to act for subjective and social recognition (Honneth 2008). From this perspective, the presentation considers the culture as a complex and articulated phenomenon, which is represented by a variety of expressive and participatory actions: from leisure activities to forms of critical participation and, sometimes, it constitutes an entrepreneurial sector. To explore the interplay between cultural practices, participation and social inclusion, we adopt the analytical lens of ‘cultural welfare’, which is mainly related to three fields: 1) life styles prevention initiatives; 2) practices of social inclusion for vulnerable people mediated by socio-cultural activities; 3) community building processes. The proposal reports the findings of an empirical research carried out in Italy, which has involved - through in-depth interviews - young people (aged between 18-35 years) and experts. The research results unmask the myth of passive, detached and uninterested young people. Interviewed young people expose themselves and they devote their energies to create a more inclusive social context, where cultural and artistic practices are catalysts for a renewed sense of ‘togetherness’ (Amin 2012).

RN31 | Ethnic Relations, Racism and Antisemitism

RN31_01 | Anti-Roma Racism in Context

No Pollution and no Roma in my Backyard. Class and Race in Framing Local Activism in Eastern Slovakia Škobla, Daniel (1); Filčák, Richard (2)

1: Slovak Academy of Science, Slovak Republic; 2: Slovak Academy of Science, Slovak Republic
danielskobla[at]gmail.com, filcak.richard[at]gmail.com

The fight against ‘pollution’ had been an important item on the agenda of the local government in town of Trebišov, in Eastern Slovakia. It has, however, intertwined two main issues. First, it was air pollution linked to a highly controversial plan to build a coal-burning power plant in the immediate vicinity of the town centre. Second, it was an issue of municipal waste management, which was, by local ruling class, increasingly re-categorised as an ethnic problem. While the former could be considered a successful example of local resistance to environmentally irresponsible big capital investment, the latter was an example of racialisation and re-production of prejudices against local Roma, living in segregated settlement. Thus, this study can be seen as an account of the racialisation and class division in an environmental justice struggle and a contest of framing between ‘justice’ and racial oppression, in which the Roma ethnic minority are cast as no more than equivalent to environmental pollution. The study is methodologically based on ethnographic fieldwork and the analysis are guided by extensive literature on ethnicity, inequalities, and class divisions of society. Special attention was paid to Bourdieu’s concept of ‘embodied social structures’, as the cognitive structures that social agents internalise and implement in their practical knowledge of the social world. Analysis was guided also Wacquant’s theorising regarding segregated ghettos as an instrument of ethno-racial closure and control.

SARTUCUE: Roma women contesting gender violence within the Iglesia Evangélica Filadelfia

Sordé, Teresa (1); Aiello, Emilia (2);
Amador, Jerusalem (3); Candamil, Juanita
(4); Abad-Miguélez, Begoña (5)

1: Universitat Autònoma de Barcelona; 2: University of Barcelona; 3: University of Barcelona; 4: Autònoma de Barcelona; 5: University of the Basque Country, Spain
teresa.sorde[at]uab.cat, emilia.aiello[at]ub.edu,
jelen.amador[at]ub.edu, juanita.candamil[at]gmail.com,
begona.abad[at]ehu.eus

The Pentecostal Movement has experienced a rapid growth among Roma communities during the last decades. However, scarce research has focused on analysing its impact on gender-relations among this community and on its contribution to advancing towards more equal gender relationships and violence prevention. The Spanish RTD project “SARTUCUE” (together with you in Romany language) (2015-2019) aims at covering this gap, studying gender violence among the Roma. Specifically, it explores barriers to accessing services for victims and studies the strategies developed by the community to deal with these situations and its prevention. In doing this, one of the sites researched is the ‘Iglesia Evangélica Filadelfia’ in Spain (the Pentecostal denomination that gathers the biggest Roma proportion), focusing on its influence on gender relationships. Findings contest the predominant assumption about Roma women as ‘passive’ and subdued to men, showing their leading role in opening up informal spaces of dialogue within the house of worship, which serving to break the silence about gender violence, helping victims to seek for assistance and preventing other cases. Roma women are knitting networks of solidarity with other Roma women, with Roma men and with non-Roma agents, which interlinked with the Roma identity values, operates in these meeting spaces and serves to challenge and tackle situations of domestic and gender violence. Findings represent an important contribution in the field of Roma, women and religion studies, explicating how Roma women exert their human agency and defy anti-Gypsist stereotypes. In turn, they inform in which ways formal services for victims need to adapt in order to be responsive with ethnic-minority cultural traits.

Dialectic on Enlightenment as a Critique of Antigypsyism

End, Markus

Technical University Berlin, Germany
markus.end[at]tu-berlin.de

Critical Theory has not only been largely influential on theories of antisemitism, it has also shaped our understanding of antigypsyism, especially through Maciejewski's widely recognised 1994 paper. The presentation will show how an analysis of antigypsyism through the lens of Critical Theory is not only possible but will argue, that one of the main texts of early Critical Theory, the Dialectic of Enlightenment, should be read as a materialist theory of antigypsyism. In a second part the presentation will then discuss what such a reading would mean for the theoretical understanding of Antisemitism and Colonial Racism and offer an approach describing the relation and interaction of Colonial racism, antisemitism and antigypsyism.

"Us and Them & the Third": The Politics of Fear within the Far Right in Germany & Austria

Globisch, Claudia

Institut für Arbeitsmarkt- und Berufsforschung (IAB), Germany
Claudia.Globisch[at]iab.de

This lecture looks at the relationships between racism, antisemitism and anti-genderism within the contemporary far right's politics of fear in Germany and Austria as those are the key elements underlying their interpretations of the social. All three include specific imaginations of "we" and "they" constructing an apocalyptic decadent society that has to be heroically saved. The paper presents the empirical findings of research into far right movements and shows that ethnopluralism figures as a key strategy which disguises the far right's racism. This is a discourse that the far right adopts in order to appear not racist, but which in fact functions as a facade which covers the enduring and underlying racialized agenda of these movements and their politics. Ethnopluralism is also intertwined with anti-genderism, which itself sometimes comes packaged as a kind of national feminism. The main enemy of this form of racism are universal postulates that deny an ethnopluralistic world order and are blamed for making cultural differences invisible. Antisemitism serves as an ideology to stabilize ethnopluralistic world views, as Jews are constructed as the third, threatening the imagined ethnopluralistic world order.

RN31_02 | Contextualizing Racism

"The Most Dangerous Racism Today is the White Man in the Suit Who's Got Positions of Power to Employ People": White Privilege, Racial Exclusion and the Silencing of Racism

Abbas, Madeline-Sophie

University of Manchester, United Kingdom
madeline.abbas[at]manchester.ac.uk

The upsurge of racial and religious hate crimes following the Brexit vote has brought these more tangible expressions of disadvantage affecting racial and religious minorities in Britain to the fore. Yet whilst overt acts of hate, although highly disturbing, can potentially be more easily identified, named and countered, implicit and more covert acts of racism that underpin structural inequalities provide a more complex terrain in which to address persistent exclusions facing Britain's minorities within predominately 'white spaces' characterising Britain's institutions. Drawing on interviews with British Muslims, I examine practices of silencing around acts of racism, the intangibility of racial exclusions which are often implicit, unspoken, and denied, and how these enable white privilege, and the racialised hierarchies on which it is premised, to persist. I argue that structural inequalities that permeate spaces such as work propose a more long-standing danger by maintaining hierarchies of social inequality and disadvantage, both economic and social, by denying opportunities for British Muslims to succeed. I show that where British Muslims name acts of racism, their claims are often forcibly denied by a failure to 'see' racism: 'surely racism doesn't still exist?' Whilst policies addressing racial and religious inequalities provide some recourse to counter exclusionary practices, I interrogate their 'non-performativity' (Ahmed, 2004) and the emotional and psychological costs that British Muslims experience to be heard as well as acts of resistance that they engage in. Key words: British Muslims, racial exclusions, racism, silencing, white privilege Ahmed, S. 2004. 'The non-performativity of anti-racism.' *Borderlands e-journal* 3(2).

Racism, Black Movements and Census in Portugal: from invisibility to counting

Ferreira Dias, Nuno Manuel

ISCTE-IUL, Portugal
nmfds[at]iscte-iul.pt

Almost immediately after decolonization, immigration from former colonies started to serve the requirements of the urban Portuguese economy. The incorporation of these populations in the labour market was accomplished predominantly through low pay and low status jobs. Additionally, their phenotypical circumstance added evidence of increasing spatial segregation maintaining non-white populations inside specific metropolitan neighbourhoods. Although their concentration on restauration, cleaning and construction sectors is long noted in literature, correlated with the absence of upward social mobility trajectories of black populations, the constitutional impossibility of collecting data based on ethnic, racial and/or skin colour criteria is preventing the quantitative evaluation and argument validation on structural racism and its objective impact on these populations. The inexistence of such data is also implied as a reason why denial of institutional racism is mainstream in Portuguese society. However, in the last couple of years, black movements have emerged beyond the scope of the traditional immigrant associative movements based on national origin and area of settlement and changed the debate topics from housing and human rights to a broader affiliation area, namely around skin colour and African ancestry. Resorting to a set of interviews with key actors involved in this process (government authorities, academics, black activists, political parties, immigrant associations, etc.), this article opens with a comprehensive view on the current data regarding institutional racism and its limitations; categorizes the different perspectives and protagonists that shaped the public discussion on gathering ethnic data; theorizes its importance in the consolidation of the current black movement in Portugal and vice-versa; and discusses the meaning of this tool to anti-racist movements and their participation on the ongoing debate.

Institutional and Exclusive Solidarity, Racism and Absent Presences – Discussing the Eclectic Foundation for Restrictive Welfare Policy in Austria

Schadauer, Andreas

University of Vienna, Austria
andreas.schadauer[at]univie.ac.at

Austria is facing substantial changes in its welfare system, but not all members of the society are affected equally. To legitimise these inequalities, a majority opinion based on the 2017 National Assembly election is, among others, regularly enacted positioning the voting public as absent presences within the ongoing policy debates. But absent, they are very much subject to eclectic interpretations. Another iteration of this (at least rhetorically) influential actor/actant is enlisted by a survey conducted around the 2017 election on the topic of solidarity in times of crisis (in framework of the project SOCRIS). Within this survey population, rather a minority expresses interest in reducing public support for socially vulnerable groups as currently implemented by policymakers today and in doing so made ontologically powerful and socially influential. The survey material available offers the opportunity to discuss the common denominator unifying these empowered advocates of reduced public support. For this presentation, one specifics will be introduced in more detail. While varying in most quantified characteristics like occupation status, Authoritarianism, etc., variables counting discriminatory attitudes against “foreigners” prove to be the most reliable predictors for the expressed desire for limited institutional solidarity. It is then asked, to what extend this quantitative narrative in conjunction with the (few) studies on the role of racism in Austria supports the depiction of racism as a constitutive mainstay of social inequality and whether the projected welfare arrangements can be seen as (further) institutionalising and cementing inequality based on exclusionary-racifying attitudes? The presentation attempts to address these questions by connecting the concepts of absent presences, institutional and exclusive solidarity and the survey narrative in light of the current welfare policy.

RN31_03 | Multicultural Societies, Social Cohesion and Discrimination

Inter-Group Contact Gone Wrong: The Consequences of Negative and Neutral Out-Group Exposure for Both Native-Born Citizens and Immigrants

Herda, Daniel

Merrimack College, United States of America
herdad[at]merrimack.edu

Researchers frequently link interpersonal contact between members of racial or ethnic out-groups to reduced inter-group prejudice and increased understanding. However, these patterns often pertain to a specific character of contact that may not always exist under real-world circumstances. Individuals undoubtedly experience neutral and negative contact as well and these may produce different outcomes. Negative inter-group exposure in particular may also present unique consequences for minority groups. The current study considers these possibilities by taking a unique approach to the phenomenon of inter-group contact that simultaneously analyzes native-born citizens and individuals with migrant backgrounds. Using data from 15 countries in the 2015 European Social Survey, this paper first considers the native-born population. Motivated by inter-group contact theory, these multivariate analyses examine the degree to which different characters of contact influence perceptions of immigrants and immigration policy preferences. Subsequently, this paper considers the contact experiences of immigrants and the second generation. Motivated by reactive ethnicity theory, these multivariate models will test how negative experiences impact levels of closeness felt toward the host society and trust in host society institutions. In addition, this research attempts to present a more complete picture of respondents' totality of inter-group exposure by testing whether the presence of out-group friends and neighbors can moderate the consequences of negative and neutral contact. Preliminary results suggest that negative contact experiences among the native-born population associate with several negative attitudes toward foreigners. However, the reactive ethnicity patterns among immigrants are weaker and less consistent. The implications of these findings for the incorporation of migrants across Europe will be discussed.

Rigid Group Boundaries, Strong Ethnic Identities And Strong Ingroup Cohesion As A Barrier To Harmonious Intergroup Relations

Terek, Lidia

University of Novi Sad, Serbia
lidijaterek83[at]gmail.com

Based on Erikson's (1968) and Fleming's (1948) understanding that group identities and feelings of belonging have a great impact on the psychical development of young people, on Hutnik's (1991) differentiation of four identity positions, on the standpoints of Social Identity Theory (Tajfel & Turner, 1979), and on the understanding that with strong ethnic identity we can expect an increase in intergroup bias (Pfeifer, et al., 2007), our goal is to explain the causes of conflicts between Hungarian and Serbian youngsters in Vojvodina. We hypothesized that the conflicts between them are more frequent in those parts of the region, where the identity of the Hungarian minority is stronger, where this community is more closed and where the intragroup cohesion is firmer. In order to proof this, we compared data collected from high school graduates from Subotica and Kikinda. The obtained data confirmed that interethnic conflicts are more frequent in Subotica, where the Hungarian minority is bigger and have a stronger ethnic identity. Here, most of the Hungarian respondents have limited knowledge of the Serbian language and the majority of the Serbian high school graduates are seeing this as a disrespect of the state in which they are living. More than a half of our Hungarian respondents from Subotica stated that they were witnesses of an incident in which members of their ethnic group were attacked due to their ethnicity, as opposed to 20% of Hungarians living in Kikinda, in a city where mixed marriages between Serbs and Hungarians is very common.

Threats and Norms: Cross-Country and Within-Country Effects of Multicultural Policies on Attitudes towards Immigrants

Igarashi, Akira

Tohoku University, Japan
akiraigarashi515[at]gmail.com

Researchers and politicians have debated whether multicultural policies increase or decrease natives' level of prejudice against immigrants. On one hand, multiculturalists argued that cultural norms are developed through tolerant multicultural policies, while anti-multiculturalists argued that multicultural policies foster threats for natives and deteriorate their attitudes towards immigrants. Previous empirical findings have provided mixed findings, and these issues have not fully settled yet. I claim that these mixed findings stem from two issues; the methodology and heterogeneity in policy effects. Previous studies have relied on cross-sectional analyses at single time point but have rarely conducted cross-country analyses in a longitudinal framework, and have paid small attentions to variant effects of policies on different respondents. This study attempts to show whether cross-country variations (i.e., a country's averaged value of multicultural policy index for a particular duration) and within-country variations (i.e., changes in multicultural policies within a country) in multicultural policies affect natives' prejudice against immigrants. In addition, I test how conservatives and economically vulnerable persons react to multicultural policies. I conducted a multilevel longitudinal analysis using datasets from the ESS Rounds 1 to 6 and the Multicultural Policy Index from 2001 to 2011 across 16 European countries. The results indicate that cross-country and within-country variations do not directly influence natives' negative attitudes towards immigrants. Instead, cross-country variations reduce conservative natives' prejudice, while within-country variations increase prejudice among those who are not satisfied with own current income. Thus, although the effects are evident for only a limited group, both cross-country variations and within-country variations are effective for attitudes towards immigrants in an opposite direction.

Senses of Belonging and Connectedness in Multicultural and Multiethnic Society: Measuring Social Cohesion in Georgia

Kirvalidze, Ana

Iliia State University, Georgia
ana.kirvalidze[at]iliauni.edu.ge

Together with the demise of the Soviet Union and Georgia's transition to a nation state as well as challenges of a new wave of globalization the issue of social cohesion in Georgia became an important topic for its further democratic development. The transition to market economy introduced fundamental changes in socio-demographic as well as the stratification of Georgian society. The increased concentration of population in urban centers created a gap between the rural and urban communities with asymmetric or unequal access to resources. The main aim of this study is to investigate the dynamics of social cohesion in Georgia with considerable ethno-cultural and rising socio-economic diversity. In order to develop a complex view of the phenomenon I begin with the analyses of urban social change in socio-historical perspective. I will focus on particular characteristics and specifications of the phenomenon in four urban settings, among them ethnically heterogeneous small cities. I will explore the following questions: What is the impact of recent socio-political changes on community cohesion in the context of urban ethnic diversity? Which socio-cultural factors are responsible for the incoherence between dominant and minority ethnic groups? Which socio-cultural factors determine self-segregation of the minority groups? How do primordial and cultural codes of identity in- or exclude civic ones? What is the role of collective memory in the creation of current self-understanding of citizens from majority and minority perspectives? Which are the main determinants linking ethno-cultural differences with structural disadvantages? I will employ a mixed method approach, which blends quantitative and qualitative methods and produces a richer data set than a single approach.

RN31_04 | Antizionism and Antisemitism

Antizionism Without Israel – On Forms Of Antisemitic Demonization Of Jewish Statehood Before 1948

Uwira, Lukas

European University Viadrina Frankfurt (Oder), Germany
Lukas.Uwira[at]posteo.de

The recent study of the European Union Agency for Fundamental Rights (2018) as well as most of the current research projects on contemporary antisemitism show a major problem of antisemitic antizionism. However, little research has been done on the history of hatred towards Jewish statehood dating back to the end of the 19th century. When reading academic texts regarding antizionism one could even get the impression that it's a phenomenon of the second half of the 20th century. The ongoing dissertation project aims to reduce this gap with a comparative analysis of text sources in German that had been published between 1887 and 1933. Based on a definition of antisemitism as an ideology, which is characterized as an »entanglement of the true and the untrue which differs from the full truth and the lie« (Adorno, 1972), the project primarily focuses on the comparison of the antisemitic reasoning with the empirical historical reality. Another priority is the analysis of the variety and correlations of arguments put forward. The key interest is to point out how this early antizionism was already deeply connected to modern, mostly racial antisemitism – and to assess if and how it is linked to present forms of Israel hatred. So far, two antisemitic and racist texts on the impossibility of Jewish statehood by orientalist Adolf Wahrmund and Adolf Hitler had been examined and could be presented at the ESA conference.

The Ideology of Antizionism

Seymour, David

University of London, United Kingdom
david.seymour.1[at]city.ac.uk

This paper offers an account of antizionism that draws on a critical reading of Hannah Arendt's presentation of antisemitism as ideology that she discussed in *Origins of Totalitarianism*. I argue that Arendt's account of the ideology of antisemitism - that it emerges from and detaches itself from the reality of Jewish/non-Jewish relations - can be seen to be at work within certain, more recent, strains of antizionism. I argue further that as a consequence, antizionism as ideology contains within it elements of the violence and terror that Arendt identified within the nature of (totalitarian) ideology as a whole; most notably the attempt to mould the actually existing world according to its own distorted image. I conclude by discussing the dominance of these developments in discussions of Israel and Palestine and the extent to which the space for rational discussion may or may not remain.

Antisemitism and Identity Politics

Stoegner, Karin

University of Vienna, Austria
karin.stoegner[at]univie.ac.at

In this paper I will critically analyse current notions and practices of identity politics, both on the left and the right political spectre, and compare them as to how they refer or not refer to the possibility of a Jewish identity. The guiding question is whether Jewishness is regarded as a specific identity among others or whether Jewishness is implicitly or explicitly identified with the non-identical.

Measuring Antisemitism in Relation to Israel: a New Psychometric Scale

Hirsh, David (2); Allington, Daniel (1)

1: Kings College London; 2: Goldsmiths, University of London, United Kingdom
hirshd[at]gmail.com, daniel.allington[at]kcl.ac.uk

A range of psychometric scales for the measurement of antisemitism already exist, including the 11-item scale used by the ADL in its international surveys, the 7-item scale used by the Campaign Against Antisemitism, and the 9-item scale used in the 2017 Jewish Policy Research survey of antisemitism. All of these scales are constructed from statements explicitly about Jews. Numerous survey- and experiment-based studies have used scales in order to test the hypothesis that negative untrue beliefs regarding Jews qua Jews (i.e. antisemitism) are related to negative untrue beliefs regarding Israel: a hypothesis that has been supported over and over again by empirical findings. Such studies necessarily begin by treating statements about 'Jews' and statements about 'Israel' as expressions of two separate and distinct underlying constructs, each to be measured using a different scale. However, historical and qualitative research suggests that there may be in reality only a single construct, finding expression in beliefs about Jews qua Jews and in beliefs about Jews qua 'Zionists', 'Israelis', 'Israel supporters' or the metonymic 'Israel', yet modified in its expression by social desirability bias among individuals nominally committed to anti-racist politics. This supposition that is consistent with the repeated empirical finding of correlation. If it is accepted, then certain kinds of statements about Israel should be regarded as expressing not a construct related to antisemitism, but antisemitism itself. We discuss the development and testing of a new psychometric scale for the measurement of antisemitism in relation to Israel. Consisting of demonstrably antisemitic statements that make no explicit reference to Jews, it was piloted on a convenience sample of staff and students at a British University (n = 340).

RN31_05 | Brexit

Brexit on Roma in South Yorkshire

Patel, Tina Girishbhai (1); Martin, Phillip (1); Brown, Phillip (1); Tyler, Philippa (2)

1: University of Salford, United Kingdom; 2: Migration Yorkshire, United Kingdom
t.patel[at]salford.ac.uk, P.Martin5[at]salford.ac.uk,
p.brown[at]salford.ac.uk,
pip.tyler[at]migrationyorkshire.org.uk

Despite anti-discrimination legislation and initiatives to support the inclusion/integration of Roma, there is a level of hostility that disadvantages Roma in ways that few other racialised group experiences. This racialised persecution results in the marginalisation of Roma communities and evidences the fallacy of claims that we are now living in a post-race era. Using qualitative data collected before and immediately after the UK's 2016 European Union Referendum vote, this paper reports on the experiences of Roma communities in South Yorkshire – a region where almost two thirds (61.56%) voted to leave the European Union, which is a figure higher than the national average of 52%. This paper discusses how the presentation of Roma as 'irregular migrants' who pose a security threat to public order, are now more than ever in these post-Referendum times, putting Roma at enhanced risk of the neoliberal agenda to securitise their mobility. It is argued that rather than passively accepting their confined mobility, members of Roma communities are that this has been informed by notions of identity, space and citizenship. Regardless of the actual decision, Roma communities are actively and assertively mapping their future projections.

Brexit And The 'Post-Racial' Fallacy

Connelly, Laura; Patel, Tina Girishbhai

University of Salford, United Kingdom
L.J.Connelly[at]salford.ac.uk, T.Patel[at]salford.ac.uk

There is an emerging body of scholarship which seeks to understand the motivations behind the 'Brexit' vote, including that which centralises explorations of racism, nationalism and post-colonialism. However, little consideration has been given to the way in which 'post-racial' racisms underpin the narratives of Leave voters. By drawing on data generated through 13 semi-structured interviews and 114 questionnaires with Leave voters in Salford (Greater Manchester, UK) – a city that saw a higher percentage of the electorate (56.8%) vote to leave the EU than the national average (51.9%) – this paper explores the subtle and subterranean ways in which xenoracisms were articulated in the accounts of some Leave voters. Although restricting immigration was a key motivator of Salford Leave voters, they vehemently rejected accusations of racism and instead, couched their views in seemingly non-racial ways. Specifically, our participants framed their vote as a response to what they perceived to be the victimisation of the 'marginalised' white 'indigenous' population. Therefore, in discussing our data, we argue that far from living in a 'post-racial' epoch where 'race' and racism are assumed to be things

of the past, racisms continue to thrive through new modes of articulation. These 'post-racial' racisms emerge from the shadows at key moments and are fundamental to understanding 'Brexit'.

'Go Back to Auschwitz, You Polish Bastards': Everyday Experiences of Xenophobia and Racism among White Racialized Young EU Nationals in Brexit Britain

Sime, Daniela

University of Strathclyde, United Kingdom
daniela.sime[at]strath.ac.uk

For young people who migrated to Britain as children, Brexit is personal not political, a major rupture to their sense of belonging and an added insecurity in the process of their identity formation. Brexit has key implications for their future, in the context of their increasingly denied citizenship and rights. This paper draws on a unique study with over 1,000 young EU nationals aged 12-18 who moved to the UK as children. Data included a UK-wide survey, 20 focus groups and participatory family case studies. I examine young people's position as white youth who are subjected to an ongoing process of racialisation by others and examine localised whiteness as it intersects with dimensions of age, class, nation and gender. While EU nationals were mainly viewed as non-racial universal individuals before Brexit through their whiteness, and as 'desirable' migrants, the increasingly hostile and anti-immigration environment fueled by politicians and certain segments of the media has cancelled their invisibility. I show with data how young people are racialized through markers such as their accent or use of European languages in public, food and music they like or clothes they wear, or their migrant background. Their everyday experiences of being othered include racist and xenophobic microaggressions, often disguised as banter or jokes, but also physical attacks in public places or their homes. The paper progresses existing knowledge by focussing on young people's experiences in the context of current public debates on Europe and issues of national and European identity and questions whiteness as a norm or fixed trait which determines young people's life chances post-migration. If there is time, we will show this video: <https://www.channel4.com/news/the-brexit-fears-of-the-children-of-eu-nationals>

RN31_06 | Nationalism and Authoritarianism

Leaving hate behind – Neo-Nazis, Significant Others and disengagement

Mattsson, Christer; Johansson, Thomas

University of Gothenburg, Sweden
christer.mattsson[at]gu.se, thomas.johansson[at]ped.gu.se

The purpose of the study is to contribute to the oral history of disengagement processes of former neo-Nazis. Our main aim is to take a holistic approach to the stories. This means that we intend to situate the narratives in relation to significant others – such as teachers, parents, and others – in order to contextualize the individual stories. Although there are ample evidence for the importance of the relationship factor, most studies in this field of research have focused exclusively on the individual life stories. This one-sided focus tends to contribute to the construction of a highly individualized narrative of disengagement processes. Research has shown that disengagement from extremist movements often are preceded by individual's disillusionment with the movement, but there is also a need for timing for the individual to reconnect with others outside the movement to share his or her doubts. There is, however, scarce research findings on how this process is understood and talked about among the significant others. The empirical material of the study consists of three case studies. Each case story contains a condensed narrative of the neo-Nazis own perception of push and pull factors. In addition to this, voices of significant others are added, and analyzed. The results show that disengagement can be understood as a combination of fateful moments and "interventions" by significant others. The nonjudgmental attitudes among these significant others are rooted in their lived experiences of handling individuals grievances.

Construction of Alternative History: Discourse Analysis of the 'Day of Honour'

Lipcsei, László Péter

Department of Sociology and Social Policy, University of Debrecen, Hungary
laszlo.peter.lipcsei[at]gmail.com

The presentation discusses a significant aspect of the Hungarian neo-nationalist movement building on discourse analysis and participant observation. More precisely, the Day of Honour, a highly performative action organised by Hungarian neo-nationalist groups, is to be investigated throughout the analysis of speeches, symbolic actions and aiming to create a collectivist alternative of historical memory. The Day of Honour has been organised since 1995 in remembrance of the break-out of the German and Hungarian soldiers at the very end of the siege of Buda Castle in February

1945 attempting to reach out to the German front. Following the constructivist approach, neo-nationalist identity constructions and memory are understood as products of discursive actions. Drawing on three years of participant observation at the Day of Honour the presentation aims to classify the most significant mechanism related to the neo-nationalist identity constructions in relation to the event such as the process of the construction of historical narrative, internationalisation of neo-nationalist and neo-Nazi movements, and the role of the creation of 'enemies' as the basis of oppositional collective identities shaped by discursive techniques. Both the positive "us" and negative "they" constructions are not pre-existing social phenomena but they are created through discourses. Furthermore, the lack of public discourses on the past as a more general contextual deficiency is also outlined as a key factor, which contributes, inter alia, to this alternative historical narrative.

Ethnically divided city: the case of Kosovska Mitrovica

Olivera Slobodan, Marković - Savić,

University of Pristina, Kosovska Mitrovica, Serbia
markovic.olivera[at]gmail.com

In the case of the ethnically divided city of Kosovska Mitrovica, the text examines the factors that favor the survival of the division of the city on ethnic basis. For this purpose, the important events in which cultural differences are politically mobilized will be analyzed for the purpose of raising ethnic borders. Kosovska Mitrovica has been an ethnically divided city for twenty years, and during that period of time the ethnic boundaries were more or less permeable. Cultural differences that are mutually tolerated become problematic in certain situations and lead to raising boundaries towards another ethnic group. Therefore, the aim of this paper is to determine in what situations the boundaries of a sharp ethnic division are raised, and through which mechanisms the borders are established. In addition to the above, the text will show how the cultural contact between the two nations looks like in the period of lowering of borders, but also in the period of raising them. This phenomenon has been observed from the perspective of the tellers - the inhabitants of the northern part of the city, who in general represent the party that insists on the division. Key words: Kosovska Mitrovica, ethnicity, divided city, political conflicts, nation.

Will Europeans Overcome Antidemocratic, Populist Nationalism?

Krzeminski, Ireneusz

Warsaw University, Poland
krzemire[at]is.uw.edu.pl

The question about the state of democracy and the European Union is my starting point. It is the growing tendency toward nationalist, antidemocratic and autocratic governments, and nationalistic populism, which good examples are Poland, Hungary, but also Italy. What are the main factors, driving people to accept populist, autocratic nationalists? I'd like to explore the factors, similar for both East and West and peculiar to East Europe. First of all, the deep ties between the nationalistic ideology and anti-Semitism, and xenophobic world views. I'd like to illustrate the case of Poland as a possible pattern for other societies. Secondly, the return of traditional religious customs, and conservative attitudes as parts of an antidemocratic tendency should be analyzed. The role of churches in this process is important. The third issue is the anti-European Union tendency. My thesis is about the crisis of democratic leadership. After the 2008 economic crisis, the credibility of "neo-liberalism" and multiculturalism was undermined, but the political elites engaged in resolving the crisis, not reconstructed the vision of the future. The radical leftists and right-wing groups supported the revitalization of the nationalistic, anti-Semitic, xenophobic, and anti-EU tendencies. Although most Poles are rather enthusiastic about the EU, we can observe how the nationalistic orientation is changing peoples' attitudes. It could illustrate a more general trend. On the other hand, autocratic, populist nationalism activates citizens' attitudes, and acceptance for democracy grew in Eastern Europe during last few years. It also could be a good indicator for the rest of Europe. Lastly, I'll reflect on the ties between anti-Semitic attitudes and anti-Islamic, anti-Arab attitudes.

RN31_07 | Anti-Muslim Resentment and Racism

'When People Complain of the Darkness, We Should Light a Candle': Muslims, Racism and Everyday Life

Britton, Joanne

Sheffield University, United Kingdom
n.j.britton[at]sheffield.ac.uk

The starting point for this paper is that racialised anxieties about the position of Muslims in European societies have become a consistent feature of populist political discourses. The paper reflects on how resentment and fear underpin resulting problematizing accounts of European Muslims that focus on criminality, cultural dysfunction and self-segregation. Racial meanings are brought into play by foregrounding culture

and ethnicity in ways that position Muslims as problematic outsiders requiring regulation and surveillance. The paper presents research evidence demonstrating the ways in which Muslims experience and respond to resulting manifestations of racism in everyday life. It considers how the impact of these has negative implications for the future of a multicultural, convivial Europe, as Muslim minority interests are less willingly accommodated and Muslims feel less at home in local and national space. It shows how negative implications are not straightforward or inevitable by presenting evidence of how Muslims disrupt dominant political discourses through positive claims to local and national space and commitment to belonging. It concludes by reflecting on key challenges of finding ways of being both European and Muslim, publicly and with confidence.

Attitudes and Prejudice towards Islam and Muslims among Croatian Students

Jurković, Luka; Klasnić, Ksenija; Matic, Davorka

University of Zagreb, Croatia
luka.jurkovic1995[at]gmail.com, kklasnic[at]ffzg.hr, dmatic[at]ffzg.hr

Terrorist activities of Islamic extremists and the massive influx of predominantly Muslim refugees in Europe have contributed to the rising Islamophobia in European societies. Islam is increasingly being perceived as an inherently aggressive and violent religion that breeds intolerance and hatred of others. Accordingly, Muslims are viewed as an inferior and dangerous "Other" who poses a real threat to Western civilization, its values, people and way of life. A cross-sectional study conducted among the students of the University of Zagreb (N=650) had the primary goal to assess the attitudes and prejudice towards Islam and Muslims generally, as well as towards Muslims living in Croatia. Results showed that students mostly perceive Islam as a religion that promotes oppression of women and portray Muslims as a people who, when compared with the followers of other religions, are more prone to terrorism. However, results also showed a relatively low level of prejudice towards domestic Muslim population, with a broad majority of students rejecting statements that express negative attitudes towards Muslims living in Croatia. Although results showed a relatively low level of social distance, there was a weak to moderate positive correlation between social distance and anti-Muslim attitudes. Multiple linear regression analyses were conducted in order to assess the role of political attitudes, social distance toward different national, religious, racial and social groups, knowledge of Islam in the attitudes towards Islam and Muslims, controlling for religiosity and gender. The strongest predictor of anti-Muslim attitudes was a perception of threat to European and national security.

Anti-Muslim Racism And 'Intersectional Stereotyping' In Germany's Contemporary Media Discourse On Migration

Wigger, Iris

Loughborough University, United Kingdom
i.wigger[at]lboro.ac.uk

This paper presents main findings of a research article linked to my British Academy/Leverhulme research project 'The end of tolerance? 'Race', sex and violence in Germany's media discourse on migration'. It outlines how German mass print media have represented migrant men with Muslim backgrounds in relation to mainstream society and examines racialised stereotypes these media (re-)produce, including that of the migrant male Muslim as a threatening criminal and sexual perpetrator. Media reports about refugee 'sex mobs' have risen in the wake of wider societal discussions and controversies surrounding the European refugee crisis and the consequences of welcoming over 1.5 Million refugees from predominantly Muslim countries into Germany in recent years. Many of these reports have been written in the aftermath of the Cologne New Year's Eve 2016 sexual attacks by migrant men against German women and there is evidence that at least some of them are unfounded and false. My thematic analysis of three major German newspapers and a Political Weekly between 2015-2017 identifies a racialisation and 'islamisation' of sexual violence in the media portrayal of Muslim migrant men and proposes an original theoretical frame of 'intersectional stereotyping' to conceptualise and historically reflect on the intersecting of racialised, gendered and religious patterns in the media discourse on male Muslim migrants. It also discusses ambivalences within the media representation of this group. These echo recent critical voices and feminist initiatives in German society which question and critique the racialisation of sexual violence. The paper provides a previously unexplored insight into racialised anti-Muslim stereotyping in German society in socio-political and historical context through the lens of Mass print media.

The Link between Anti-Muslim Sentiment and Racism

Bratt, Christopher

University of Kent, United Kingdom
christopher.bratt[at]gmail.com

Immigration to Europe has given rise to overt hostility towards Muslim immigrants. One view of such anti-Muslim sentiment is that it is based on a desire to maintain traditional cultural values in Europe (culturalism). Others regard anti-Muslim sentiment as a form of racism, comparable with anti-Semitism. The present research seeks to use empirical evidence to shed light on the question whether anti-Muslim sentiment reflects racism more than culturalism. Data are from the European Social Survey (N = 32,000), with 20 participating countries. Confirmatory Factor Analysis compares attitudes to Muslim, Romani (Gypsy), and Jewish immigration, as well as a

preference for immigrants being White. Single-level and multilevel analyses regress attitudes to immigration on the belief that some races are born better equipped (traditional racism) and on the view that some cultures are better than others (culturalism). The analysis concludes that anti-Muslim sentiment is well integrated in general attitudes that include hostility towards other groups, even Jews. Further, traditional racist beliefs more than culturalism predict these anti-immigration attitudes, both generalised attitudes and attitudes towards single immigrant groups. The paper concludes with a discussion of whether generalised, racially motivated hostility towards different outgroups (e.g. Muslims and Jews) is a cause or rather a consequence of modern anti-Muslim sentiment in Europe.

RN31_08 | Antisemitism in Context

Evil twins? Anti-globalization movement and Antisemitism revisited

Knothe, Holger

IUBH Nürnberg, Germany
h.knothe[at]iubh-dualesstudium.de

Even in light of anti-globalization movement's current decrease of importance both on a public and political level the analysis of the relationship between progressive and anti-globalization arguments on the one hand and antisemitic narratives within the anti-globalization movement on the other hand provides valuable insight. Especially when it comes to anti-globalization movement's handling of the argument of fostering antisemitic narratives within their agenda. As for the German section of the anti-globalization network Attac for instance it can be determined that Attac's cosmopolitan and universalistic demand according to their self-perception of an emancipatory movement is interwoven with antisemitic argumentative patterns, secondary antisemitic defense reactions, and a rigid and stereotype perception of the Middle East conflict. Attac's handling with the critique of antisemitic linkages within their own argumentation indicated a new amalgamation of rather incompatible elements and thus can be understood as a precursor and catalyst for current political actors with similar issues in handling the argument of being too close to antisemitic narratives. This is in particular appropriate when it comes to positioning processes within the political arena on the subject of antisemitism: A bare refusal of 'classical' antisemitism is not immune from getting involved in multifarious other forms of antisemitism. On the contrary, the variety and ambiguity of splintered antisemitisms might support an increase in their attractiveness.

Antisemitism And Racism In The Populist Era. The Italian Case

Hassan, Claudia Gina

University of Rome Tor Vergata, University of Castell Sant'Angelo, Italy
hassan[at]lettere.uniroma2.it

Antisemitism, always latent, is currently resurging in concomitance with the decline of some taboos heretofore associated with the Holocaust. This recrudescence of antisemitism has become apparent during the 2019 International Holocaust Remembrance Day in Europe. The convergence of different kinds of antisemitism – of European descent and now revamped by Islamism – will constitute the focal center of this paper, aimed at a comparing antisemitism with several diverse manifestations of racism. Contemporary anti-Semitism can be said to rest on three basic assumptions: the racialization of the Jews, the conspiracy approach to history, a historical judgment on modern bourgeois society as the era of Jewish tyranny. Although they partake of the same ideologies of difference and rely on similar stereotypes, anti-Semitism and racism lead to absolutely diverse strategic and political outcomes. While for racists the bourgeois world is the best possible one, and thus worth defending against the new barbarians at the gates of civilization, for anti-Semites the bourgeois world is the worst possible one, because the barbarians have already broken through the ramparts of civilization, and have even succeeded in infecting it with their mores. Racist ideology is an ideology of fear, that originates in the drive for self-preservation. Anti-Semitism is instead pervaded by a logic of subversive mobilization, because anti-Semitism is an ideology of subversion and resentment. We can however state that, as Freud would have said, these mechanisms lurk in society and can always recreate a victimising mechanism. Against this theoretical backdrop, the paper will compare anti-Semitic motifs in populist movements in Italy and other European contexts, such as France and Spain.

Antisemitisms in the 21st century – Sweden And Denmark As Exceptional Cases, Or Forerunners for a General Trend?

Dencik, Lars

Roskilde University, Sweden
lade[at]ruc.dk

There are several studies attempting to measure the degree of antisemitism between certain groups or between countries. We have found this to be a too simplistic way of analyzing the phenomena of contemporary antisemitism. In previous studies we concluded there are rather different patterns of antisemitism, and that these patterns differ between European countries. We found there are actually three different antisemitisms in operation. Based on this we ask: which are images of a secret Jewish conspiracy circulating in today's Europe, and which of them is today the most threatening to Jews in Europe? We base our analysis of the

ongoing transformations of the patterns of antisemitism in macro-sociological tendencies affecting developments in Europe today. Our empirical data show that the pattern of antisemitism differs considerably between the two Scandinavian countries Sweden and Denmark on the one side, and other European countries, in particular the former communist east- and central European countries such Hungary and Poland on the other hand. By way of conclusion we discuss to what extent this should be attributed to Sweden and Denmark as exceptional cases, or whether it rather is so that the development of antisemitism in Europe has just gone more ahead in the two Scandinavian countries than it has in Europe in general? Can the specific pattern of antisemitism we observe in today's Sweden and Denmark indicate what will be a likely future pattern of antisemitism in Europe in general?

The Reception of the so-called migration crisis in Poland: between Islamophobia, Anti-Semitism and Anti-Gypsism

Jaskulowski, Krzysztof

University SWPS, Poland
krzysztofja[at]interia.pl

The aim of my presentation is to analyse the representations of the so called migration crisis and its reception in the context of dominant nationalist imaginary in Poland. Thus, my objective is twofold. On the one hand, I reconstruct dominant and hegemonic representations of migration crisis. I especially focus on the right-wing Islamophobic discourse which dominated public sphere after gaining power by Law and Justice (PiS) party in the end of 2015. I analyse how PiS utilised imported anti-Muslim discourse drawing and the same time on older local Anti-Semitic stereotypes to stir moral panic and secure its electoral victory and support among Polish populace. On the other hand, relying on qualitative research conducted in several local Polish communities I analyse how local people themselves made sense of migration crisis. Drawing on critical media theory I assume that people must be treated as active agents capable of transforming and modifying dominant representations according to its own interests, capacities and identities. However, I focus on those informants (the rejectors) who reproduced dominant Islamophobic discourse and perceived the Muslims as a multidimensional threat to the Polish nation. I argue that the rejectors' attitudes towards refugees takes the form of cultural racism, which in some respects resembles traditional Polish anti-Semitism. However, I also demonstrate that the rejectors appealed to the anti-Gypsism discourse and projected anti-Roma stereotypes on the Muslim refugees. I also show the significance of anti-Muslim ideas circulating through migration networks in a transnational space.

RN31_09 | Ethnic Minorities and Identity

Partner Choice Dynamics Among Chinese Migrants - The Case of Belgium

Shi, Wenlei

Ghent University, Belgium
wenlei.shi[at]ugent.be

This study examines the dynamics of partner choice among Chinese migrants in Belgium. More specifically, we differentiate between mixed marriages and two types of co-ethnic marriages: marriages between two partners of Chinese descent in Belgium on the one hand, and marriages of Chinese partners in Belgium with a partner in China (who migrates to Belgium after the marriage). Based on full population data extracted from the Belgian National Register in the period 2005- 2018, we use multinomial logistic regression analysis to assess effects on partner choice of gender, migrant generation, age at marriage, educational attainment, time and place of residence. Results are compared with those found for larger ethnic minority groups in Belgium, especially Turks and Moroccans - also allowing insight in contextual and structural effects, such as the size of the migrant group and gender ratio. First results indicate a remarkable high degree of mixed marriages among Chinese migrants, with a decrease after 2008. The latter could be understood from the growing number of Chinese people in Belgium. Contrary to other ethnic minorities, an increase in the preference for marriages with a partner from the country of origin is observed among Chinese. These trends and the results from the multivariate analyses will advance our insight in partner choice dynamics in smaller ethnic minorities.

Constructing the Ethnic Identity of Minority Youth in Northern Europe in 2019

Nyman-Kurkiala, Pia Elisabeth
Waldemarsdotter; Östman, Lillemor;
Kurkiala, Henrik; Banyanga, Jean; Dahlgren, Josefine

Åbo Akademi University, Finland
pnyman[at]abo.fi, lostman[at]abo.fi,
henrik.kurkiala[at]gmail.com, jbanyang[at]abo.fi,
jodahlgr[at]abo.fi

The aim of this paper is to describe minority young people's construction of their ethnic identity based on qualitative data collected in the spring of 2019. Data is gathered from minority young people in Finland, Finland-Swedes, whose mother tongue is Swedish while the majority in Finland is Finnish-speaking. The empirical material consists of essays written in the spring of 2019 by ninth-form (15-16-year-old) pupils in

Swedish-speaking upper-level schools in Finland. The qualitative data gathering is conducted in several cities in Finland. The cities are chosen by taking into consideration different language environments and geographical distribution. The aim of the essays is to have the respondents describe their subjective world of experience as young members of the Finland-Swedes. The essays are analysed through a qualitative content analysis (QCA) using NVivo 12. The construction of an ethnic identity as members of an ethnic minority is central in the young Finland-Swedes' identity work and the respondents try to construct a positive ethnic identity. For example, out-group conflicts are used as a means of identity work, which reflects how processes of inclusion and exclusion in the ethnic group may be manifested by group members. The content analysis will show if there is a conflict between the ethnic identity and the identity as a citizen in Finland. The study will shed some light on the ethnic identity construction of minority youth in Europe in an era of globalisation. The first preliminary results will be presented at ESA 2019.

Diasporic Citizenship and the Mapuche Case: The Black and The Red Atlantic in the Reterritorialization of Rights

Nery Fiocchi Rodrigues, Joao Victor (1);
Piza Duarte, Evandro (2)

1: University of Pennsylvania, United States of America; 2:
University of Brasilia, Brazil
nfiocchi[at]sas.upenn.edu, evandropiza[at]gmail.com

This paper is concerned to understand how the silences in the definition of the concepts of citizenship/ Human Rights are articulated with the struggles for rights that tie past and present to a silenced historicity. In other words, this investigation is interested in the concealed dimensions of Modernity that can be accessed if we depart from categories such as Diasporas, the Black and the Indigenous Atlantic, genocide, slavery and colonialism. My argument here is that these are important elements to understand the dilemmas in the sphere of International Law beyond the scope of conflicts among individuals versus states or states versus states. Specifically, when analyzing the Inter-American Court of Human Rights sentence condemning the state of Chile in the Case of the Mapuche Indigenous, the goal of this text is to narrate the palimpsestic dimensions of this decision. The objective is to demonstrate how, in this sentence, the disputes of a past that projects itself into the present remain alive, superimposed and contradictory. Meanwhile, we suggest the need to understand these struggles for citizenship departing from the notion of diasporic citizenship. This is a concept that allows us to interpret those struggles in the face of internal and international legal mechanisms because it reinscribes the tactical/strategic – and not foundational – character of the processes of territorialization and deterritorialization of the struggles for rights.

The peculiarities of Actualization of Ethnic Minority Identities in Inter-ethnic Communication in Latvia

Volkov, Vladislav

The Institute of Philosophy and Sociology, University of Latvia, Latvia
vladislavs.volkovs[at]inbox.lv

The paper shows the nature of inter-ethnic communication in modern Latvia in the areas related to the implementation of identity of ethnic minorities. For the authors it was important to determine whether Latvians as majority are ready to discuss the related issues. It was also important to realise whether Russians as the largest ethnic minority in the country are ready to accentuate these issues in their communication with Latvians. The author relied on materials of two research projects, one in Latvia. The research project revealed a mixed assessment by the respondents of the values of ethnic minority identities in Latvia, and thus the significance of inter-ethnic communication on the issues directly affecting the preservation and development of ethnocultural identities of ethnic minorities. The recognition of equality of people with different ethnic identities in various spheres of social life coexists with the recognition of different roles that collective ethnic and cultural identities of Latvians and ethnic minorities play in the society. The current state of inter-ethnic communication in Latvia suggests differences in the status of identities of ethnic majority and ethnic minorities in public and political life and absence of policies to accommodate these statuses through an active interethnic dialogue. There is a clear evidence of the collision of the proclaimed liberal principles and the existing ethnic division in Latvia

Perceived Discrimination as a Major Reason behind Return Migration From Europe

Yilmaz Sener, Meltem

Norwegian Center for Human Rights, University of Oslo, Norway
yilmazmeltem[at]hotmail.com

This paper explains discrimination perceptions of Turkish qualified migrants who returned from Germany and the United States, and the impact of perceived discrimination on their return. It depends on in-depth interviews with 80 qualified Turkish returnees. Our findings indicate that: (i) returnees from Germany think they experienced ethnic discrimination; (ii) discrimination is a major reason behind their return; (iii) returnees from the US did not mention discrimination; (iv) discrimination is not a reason for return for them. We discuss these findings and explain the differences between German and American contexts in terms of ethnic boundaries. We use

Alba's (2005) distinction between bright and blurry ethnic boundaries to explain the difference between the two countries. However, going beyond his argument, we also connect this distinction to cultural capital. We argue that in a context where there are bright ethnic boundaries, high cultural capital does not free the individual from experiences of discrimination, whereas it can make a difference in a context where there are blurry ethnic boundaries. Qualified migrants choose to return from contexts where there are bright ethnic boundaries to escape from experiences of discrimination, as they can afford return due to their high levels of cultural and economic capital.

Do the Media Affect Concerns about Xenophobia and Anti-immigrant Violence?

Czymara, Christian; Dochow, Stephan

Goethe University Frankfurt, Germany
czymara[at]soz.uni-frankfurt.de, stephan.dochow[at]uni-bamberg.de

A growing field of research deals with the question how mass media shape public opinion about immigration and immigrants using real media data. One of the core arguments is that the media increase the perceptions that certain ethnic out-groups post a threat to the individual or to one's own ethnic or social group. While this reasoning is generally plausible and much research focusses on the sources of threat perceptions, we take the opposite perspective and investigate how media reporting may boost what we call "out-group empathy." Combining a quantitative content analysis of German newspaper and news magazine articles over 15 years with survey data from the German Socio-Economic Panel, we find that national salience of the immigration issue indeed increases individual concerns about xenophobic violence. Moreover, deeper analyses reveal that this empathizing effect of media reporting is especially potent for natives who identify with the social-liberal Green Party or The Left. An explanation of this finding is that these individuals generally tend to see newcomers less as a problem and thus are more concerned about their physical well-being. The large time-span we investigate suggests that this effect is not primarily driven by the recent attacks on refugees and their homes in recent times, but rather generalizable. The fact that media reporting on the same issue affects different concerns (threat vs. empathy) for different individuals points to the potential of mass media to, perhaps unintentionally, polarize the general public on the topic of immigration.

Disinformation and Xenophobia: Syrian Refugees in Turkey

Kurnaz, Ahmet (1); Kurnaz, Zeynep (2)

1: Canakkale Onsekiz Mart University, Turkey; 2: Karabuk University, Turkey
ahmetkurnaz[at]comu.edu.tr, zkurnaz[at]karabuk.edu.tr

Although the immigration crisis and social integration in Europe discussed in Islamophobia context, little effort has been made to study xenophobia towards Syrians in Turkey the bridge between Europe and the Middle East. This study's primary objective is understanding the nature of the relation between disinformation and the xenophobic discourse in Turkish political context. We traced two key events which led discriminative and vituperative argumentation on Twitter and crawled associated tweets. The first incident arose in September 2018, when Syrian asylum seekers spent the religious festival of sacrifice in Syria then returned to Turkey, #SuriyelilerDefolsun (Syrians go away) hashtag became a trending topic. The second one appeared in the new year's eve when the refugees gathered in Istiklal Street, once a symbolic landmark of the secular opposition, and joined the festivities. In the following hours of the celebrations #ÜlkemdeSuriyeliistemiyorum (I don't want Syrians in my country) hashtag burst. To answer our research question, firstly, we examine the fake news' utilisation. Second, we determine the target and the tone of the messages. Third, we categorise the tweets into specific groups such as economic, symbolic, empathetic etc. As a result, by employing qualitative and computational methods, we create a network of both explicit and latent variables to analyse the convoluted nature of the political debate. Preliminary findings show that the perception of Syrian immigrants as a threat produces a shared risk consciousness in Turkish society. Consequently, a new moral judgement emerges from scathing remarks about the refugees.

Who Counts as Muslim

Malancu, Natalia-Cornelia (1); Morales, Laura (2); Kolbe, Melanie (3); Giugni, Marco (4)

1: University of Geneva, Switzerland; 2: Sciences Po, France; 3: The Graduate Institute, Switzerland; 4: University of Geneva, Switzerland
natalia.malancu[at]gmail.com, laura.morales[at]sciencespo.fr, melanie.kolbe[at]graduateinstitute.ch, Marco.Giugni[at]unige.ch

The Muslim population on the move has increased and is expected to grow even further. This is the gist of what most major outlets have been saying since the beginning of the 2015 refugee crisis. In this context, one has to stop and wonder who is it exactly that we are talking about. How is it that we define Muslim migrants and how does this definition affect our ability to analyze and understand their integration trajectories. This article traces the categorization of "Muslim" in recent (post-2010) Europe-related quantitative research. It does so by focusing on both the theoretical and practical underpinnings that guided each such categorization decision. Furthermore, it

highlights the impact of making similar decisions on assessing integration progress with respect to social cohesion, social ties, cultural and social norms, and linguistic skills. To do so it employs descriptive statistics and uses ethnic and immigrant minorities' survey data from several European countries known to have a "Muslim problem". This critical overview serves a cautionary reminder for both researchers and policy practitioners that social categorization is key to biased perceptions of within-group and between-group differences.

RN31_10b | Discriminatory Practices in Europe: Case Studies

Discrimination in the Rental Housing Market: Field Experiment in Ireland

Gusciute, Egle

Trinity College Dublin (TCD) and University College Dublin (UCD), Ireland
gusciute[at]tcd.ie

This paper presents a field experiment on ethnic discrimination in the rental housing market in Ireland. The experiment design involved creating six fictitious applicants with different ethnic and gender names. These applicants applied for vacant rental apartments in the Dublin area that were advertised on the main rental property website Daft. This field experiment is the first of its kind in the Irish context and hence addresses a significant research gap in the area of ethnic discrimination, particularly in relation to ethnic discrimination in the rental housing sector. Furthermore, this is a timely research given the current housing crisis in Ireland, particularly considering the rising homelessness and a sharp increase in the shortage of housing. Our preliminary findings indicate that Nigerian applicants are less likely to receive an invitation to view an apartment than Irish or Polish applicants.

672

An Ethnographic Case Study To Everyday Practices Of Ethnic Discrimination In Flemish Secondary Education

Lippens, Michiel; Van Praag, Lore; Struyf,
Elke

University of Antwerp, Belgium
Michiel.lippens[at]uantwerpen.be,
Lore.vanpraag[at]uantwerpen.be,
Elke.struyf[at]uantwerpen.be

Ethnic discrimination in the educational sector has been a topic of research within a myriad of social disciplines. Yet surprisingly, European sociological research pays limited attention to the different levels and types of ethnic discrimination within specific school settings. The research project aims to accumulate in-depth knowledge about different types and forms of interpersonal and institutional ethnic discrimination and their interconnectedness in specific secondary school settings. This paper presents the results of a four-month ethnographic case study in two class groups of the second grade of secondary education in one school situated in the northern part of Belgium (Flanders). The researcher combined participant observation, document analysis, a diary method for pupils, and interviews with pupils, teachers and leading staff. The results highlight the complexity and diversity in which different types and forms of interpersonal and institutional ethnic discrimination can come to surface in one school setting. Subsequently, the results also show a possible relationship between the different forms and types of ethnic discrimination in everyday school interactions and the way in which ethnic diversity is approached and conceptualized by teachers, leading staff and the school policy. The results emphasize the ongoing need to support school staff in gaining insight about the complex ways in which ethnic discrimination may arise and its relationship with a specific school context.

Ethnic Differentiation of Czech Primary Schools: the Case of Brno Fonadova, Laura (1); Katrnak, Tomas (2)

1: Masaryk University - Faculty of Economics and
Administration, Czech Republic; 2: Masaryk University -
Faculty of Social Studies, Czech Republic
laura[at]econ.muni.cz, katrnak[at]fss.muni.cz

Ethnicity is a fundamental social determinant of educational inequalities in the Czech Republic. It is already manifesting at the level of primary education. The present paper focuses on the question whether Czech primary education shows any segregation tendencies, and whether these tendencies are strengthening or weakening over time. For the purpose of this paper, we work with data from the city of Brno, which has been participating every year since 2006 in a nationwide project that gathers photos of pupils enrolled in first grade of elementary schools. Thanks to the regular attendance in this project (about 80 percent of all Brno schools), this event provides unique data that allow us to map the ethnical composition of first grades of primary schools in Brno. We will focus on how the number, size and, above all, the ethnic composition of the first grades in Brno schools vary between 2006 and 2014. The ethnic composition of the classes is examined by the method of external categorization. We employ both univariate and log-linear modelling analyses to explore our data and present our results. Our findings indicate that there is a double differentiation/segregation of Roma children at the city level. One is structurally conditioned, while the other can be explained by social action.

Digital Clientelism? Microtargeting as Promise and Contextualized Political Tool

Kusche, Isabel

University of Edinburgh, United Kingdom
i.kusche[at]gmx.net

One aspect of the datafication of everyday life are the opportunities that it affords political parties to take recourse to instruments of voter surveillance. Opinion surveys and market research are obvious precursors of data-mining and microtargeting. However, what proponents of microtargeting promise has little to do with attempts to capture the main or average interests and moods of a political public. The promise is instead to enable non-public particularistic pledges of politicians or parties to promote individuals' welfare in a tailor-made fashion. In this regard it resembles clientelism. The paper will first examine the promise of microtargeting by comparing it with clientelistic practices. Similarities concern personalization, the abandonment of universalistic claims and the role of surveillance. A comparison of the clientelistic relationship and the datafied relationship between politicians and voters can therefore shed light on possible consequences of microtargeting for the quality of democracy. At the same time, the realization of datafied political campaigning depends on institutional rules and established cultural frames. It is therefore likely to vary from country to country. In a second step the paper will introduce exemplary cases in which the potential of microtargeting to alter the relationship between politicians and voters varies. The overall aim is to further our understanding of the extent of the digital transformation of politics in comparative perspective.

How Social Capital and Experiences in the Workplace Mediate the Relationship between Education and Political Participation

Geurkink, Bram; Akkerman, Agnes; Sluiter, Roderick

Radboud University, Netherlands, The
b.geurkink[at]fm.ru.nl, a.akkerman[at]fm.ru.nl,
r.sluiter[at]fm.ru.nl

This study examines the relationship between education and political participation. Although there is a strong empirical link between education and political participation, the specific mechanism underlying these effects are often only implicitly theorized. We contribute to the understanding of this

mechanism by testing whether social capital and experiences in the workplace mediate the positive relationship between education and political participation. Individuals' education level affects the types of jobs they work in, and these jobs differ with regard to the extent they socialize individuals politically. We expect that individuals with higher levels of education have jobs involving more social capital, political discussions, and (positive) experiences with workplace voice compared to individuals with lower levels of education. In turn, we expect that this capital, discussions and experiences positively affect political participation. Testing our expectations, applying a structural regression model on a two-wave panel study of over 6000 individuals from the Netherlands, we find that the relationship between education and political participation is mediated by social capital, political discussions, and experiences that individuals have in the workplace. Our findings indicate that political inequalities arising from differences in education are reinforced by the jobs that individuals work in.

Traditional active or monitorial citizens? Citizenship Typology in Lithuania

Imbrasaite, Jurate

Vytautas Magnus University, Lithuania
jurate.imbrasaite[at]vdu.lt

Democracy is rather fragile, when it is based on formal democratic institutions. Support for governmental institutions and citizen participation in the process of political governance is an essential condition for the functioning of democracy and ensuring the stability of society. Citizens are free to choose a number of ways to influence the political process. However, not all modes of political participation are equal with respect to the consolidation of newly established democratic system. High levels of institutional trust and conventional modes of participation constitute a precondition for a stable democratic system. On the other hand, participation in legal protest actions may be considered as acts of self-expression and it is not dangerous for stability of democracy. The focus of this paper is to identify and to investigate types of citizenship in Lithuania. What groups of citizens in Lithuania may be distinguished in accordance with their level of interest in politics, political efficacy, trust to political institutions and participation in political acts? What are the factors that determine the differences between types of citizens? What are the causes and explanations of different patterns of political attitudes and participation between types of citizens? Based on the survey conducted in Lithuania in 2010 and 60 semi-structured interviews, the paper draws conclusions that four types of citizens (trustful participants, traditional voters, distrustful activists, distrustful non-activists) may be identified and they significantly differ by age, membership in nongovernmental organizations, interpersonal trust, satisfaction with life and evaluations of procedural justice in local government. From theoretical perspectives of active traditional and postmodern citizenship, the characteristics of identified groups are mixed, because of socioeconomic and cultural conditions in Lithuania.

Critical Voices and Contention: Modes of Civil Society Mobilisation Around Disability in Russia

Mullins, Philippa Simone

London School of Economics, United Kingdom
p.s.mullins[at]lse.ac.uk

My research examines Russian civil society's interaction with (a) state policy and institutions; and (b) wider societal understandings of disability, as it seeks to reconfigure forms of social control and stigma. Based on 61 semi-structured interviews conducted in four cities from 2017 to 2018 with a mix of GONGOS, NGOs, and informal, grassroots, or fluid movements, the research asks what strategies and network of interactions are leveraged by civil society organisations (CSOs) and with what motivations and understandings of their environment. Previous research on CSOs mobilising around disability in Russia has emphasised gap-filling and medical interventions. This is compounded by some consensus in civil society research seeing Russian CSOs as channelled into service provision with limited room for contention. On this view, the semi-authoritarian government follows a dual strategy of encouraging loyal organisations, while restricting potentially critical CSOs; disability organisation is broadly not seen as a space of radical contention. In contrast to this, my paper argues that disability CSOs demonstrate contention in their understandings of disability and diverse work to reconfigure forms of social control and rebalance power. It presents participant understandings of contention in their work and strategies to achieve change. Notably, it uncovers and analyses the covert links between formal NGOs close to the government and grassroots, fluid movements. The presentation invites broader discussion of CSO responses to repressive regulatory environments. It stimulates debate on how CSOs in these contexts may continue to renegotiate identity and agency through engagement with social policies, policy processes, and wider society.

RN32_01b | Parties, Politics, and Societies

Left and Right on Immigration and Welfare: Representations of the immigration/welfare quandary in party programs in Scandinavia

Grødem, Anne Skevik

Institute for Social Research, Norway
a.s.grodem[at]socialresearch.no

The Scandinavian countries Norway, Sweden and Denmark are typically grouped together in welfare state studies. In immigration and integration policies, however, their approaches have parted in fundamental ways. Levels of immigration to these countries are high, both from EU-

countries and from countries in Africa and Asia, and this inflow of new residents will undeniably influence how the welfare states operate. In all three countries, the challenges and opportunities immigration poses for the "social-democratic" welfare state feed into debates on immigration control and integration, but in different ways. In this paper, we analyse the party programs of the left-of-Labour socialist parties, and the right-of-Conservative / populist right parties, in the three countries, to see how they conceptualise the immigration / welfare nexus. These parties are selected for their historically strong commitment to welfare expansion and immigration control respectively, and also to show the variety in the opposition to the consensus in the three countries. The analysis will show that there is a wide variety: concerns for "social dumping" in the light of labour migration, for institutionalised racism, for worklessness and welfare state dependency, for "multiculturalism" as a threat to the sense of trust that (allegedly) underpins the Scandinavian welfare model. The paper concludes that "left" and "right" stances on the immigration / welfare quandary are multifaceted and vary between countries, even when similar cases are studied.

What Went Wrong with the Theories of Moderation and What Does the AKP Case of Turkey Show Us?

Ayan Musil, Pelin

Anglo-American University, Czech Republic
pelin.ayan[at]aauni.edu

The core idea of party moderation implies a party's embracement of open worldviews that do not contradict democratic principles and compromise with other actors. While much has been written on the factors leading to the moderation of Islamist parties, little is known why such moderation does not sustain or why de-moderation is likely to follow afterwards. In this paper, I apply the method of process-tracing in explaining the transitions between the stages of pre-moderation, moderation and de-moderation of an Islamist party. I argue that when an Islamist party adopts a confrontational discourse and behavior against the repressive state, it transforms into a democratic actor, which represents the transition from pre-moderation to moderation. During the stage of moderation, the party also attracts a heterogeneous group of supporters within the electorate who have either been the victims or the critics of state repression. When the repressive state disappears from the political stage, yet, the Islamist party loses a salient issue that unites this diverse body of supporters. The party instead starts using reward and punishment mechanisms to sustain the loyalty of its supporters. This depicts the transition from the stage of moderation to the stage of de-moderation. To illustrate the proposed explanation, I focus on the case of the AKP in Turkey and use interview data conducted with the AKP activists in the summer of 2018.

675

Left-right Ideological Self-placement In Seven Democracies, 2006-2013

Kotze, Hendrik Jakobus (1); Rivero, Carlos (2)

1: Stellenbosch University, South Africa; 2: Valencia University, Spain
hjk[at]sun.ac.za, Carlos.Rivero[at]uv.es

Ideology in most Western societies, is seen as the driving force behind political behaviour. It has been related to, amongst other things, economic inequality, state intervention in the economy, party identification, moral values and, more recently, to post-materialist values. It is also argued that the general public has a perception of this concept- ideology- similar to the conception of the political elites. This paper analyses the left-right continuum at the parliamentary (elite) and mass levels in seven countries – two consolidated democracies and four consolidating democracies . It investigates: i) the basis of left-right self-placement (values vs partisanship); ii) whether elites and citizens share the same “drivers” underpinning ideology; and iii) whether there have been any changes in these drivers as a consequence of the 2007-2008 financial crisis. The study is a quantitative analysis making extensive use of World Values Survey data and political elite surveys in the respective countries. Findings indicate that both elites and masses concentrate in moderate positions both before and after the crisis; citizens do not follow elites when explaining left-right self-placement; and, the financial crisis has made elites move toward the right and the public toward the left. Before the crisis citizens used to base their position on the scale on partisanship more so than values (mainly economic issues). After the crisis values (mainly economic issues) surpassed partisanship. Elite placements both in 2006 and in 2013 were mainly based on values (economic issues more than moral ones).

Social Causes of Ethnic Parties Formation in Nepal

Gharti Magar, Jhakendra; Thapa, Urika

Tribhuvan University, Saraswati Multiple Campus, Nepal
samananter[at]gmail.com, yurikamagar9[at]gmail.com

The paper intends to explore the social structural causes and conditions of ethnic party formation in the Nepali context. The paper argues that the ethnic political parties (EPs), like other kinds of political parties, are one of the manifest products of the social, political and economic structure of the society and their social foundation of formation is different than non-ethnic parties. In Nepal, despite having a number of national political parties, the formation of ethnic parties have been growing in number with democratic practices after 1990 and intensifying after the political transition of 2006. Therefore, the paper deals with a key question: why ethnic parties form? To answer the question, the paper explores that there are multiple factors like multi-ethnic society and non-inclusive state and party structure; democracy and indigenous social movement; failure of existing political parties to address the ethnic concern; rise of new issues such as identity, federalism and proportional representation; and legal-structural changes

with international factors which are responsible for the ethnic parties formation. The paper concludes that the EPs, as a manifest product of democracy, are contributing to the process of democratization in Nepal. In that sense, the rise of ethnic parties is essentially a social phenomenon rooted in the multicultural society of Nepal. The analysis is based on qualitative and quantitative data collected through keen observations, in-depth interview with purposefully selected key informants and required secondary information.

RN32_02a | Populism, Institutions and Counter- reaction

The debate between Populist and anti-populists in the European Parliament

Loner, Enzo; Ruzza, Carlo

University of Trento, Italy
enzo.loner[at]unitn.it, carlo.ruzza[at]unitn.it

Using the EUSpeech Harvard Dataverse this work focusses on the political speeches of self-identified populist and anti-populist MEPs. The analysis of word frequencies, co-occurrences, and topics' classification and conceptualization show how these types of leaders differently employ texts to pursue strategies of political legitimation. The presentation demonstrates how automated quantitative text analysis can be used to achieve analytical reliability and shed light on the study of populist discourse. Among the topics identified and explored to contrast populist and anti-populists, there are a different vision of the European Project, definitions of 'the people' of reference and relations with democratic institutions.

Voting Intention Polls in the 2019 Italian Election for the European Parliament: Methodological Quality and Predictive Capacity in Times of Populism

Gasperoni, Giancarlo

University of Bologna, Italy
giancarlo.gasperoni[at]unibo.it

In May 2019, the European Parliamentary (EP) elections will take place and one year will have passed since the investiture of Italy's current, and contentious, coalition government, sustained by an unlikely and unsteady alliance between the League (the ostensibly junior partner) and the Five-Star Movement. The government's patent populist policies and its leaders' relentless social media campaigning have apparently engendered exceptionally high levels of public support. Current vote forecasts are favourable for both parties (but extremely so for the League); these expectations are noticeably driving policy decisions, shaping the balance of power between the two allies, fanning their Euroscepticism, and affecting the likelihood of the government's survival until the EP election. Since Italian pollsters' markedly failed to anticipate practically all of the most politically relevant outcomes of the 2018 national elections and significantly underestimated the strength of the two currently governing parties, it is legitimate to wonder whether current polls are reliable, i.e., whether pollsters are collectively "overcompensating" for last year's failures and thus likely to perform badly once again. The paper intends to monitor the methodological quality (especially vis-à-vis past election campaigns) of published polls carried out during the 2019 EP election campaign in Italy (administration mode, sample size, sampling technique, weighting procedures, etc.). Moreover, polls' predictive capacity will be assessed (primarily via examination of voter turnout expectations and, for the relationships between competing parties, via Martin et al.'s "A" measure); characteristics of better-performing polls will be identified and discussed. The role of published voting intention polls and the impact of rules regulating published polls in Italy (especially its two-week embargo) will also be explored.

Eurosceptic backlash? Pro-European and Counter-Populist Movements in Europe

Trenz, Hans Joerg (1); Galpin, Charlotte (2)

1: University of Copenhagen, Denmark; 2: University of Birmingham, United Kingdom
trenz[at]hum.ku.dk, C.A.Galpin[at]bham.ac.uk

Euroscepticism and right-wing populism have been on the rise in Europe particularly since the financial and Euro crisis of 2009-2010, culminating in the UK's vote to leave the EU in 2016. The 2014 European Parliament (EP) elections resulted in the largest number of far-right, Eurosceptic and right-wing populist MEPs ever elected, with the 2019 elections likely to go

a similar way. Considerable academic attention has been paid to understanding the conditions for this spread and success of Eurosceptic and right-wing populist movements. What has been overlooked, however, in both academic research and public debates is counter-populist and pro-EU mobilisation. The case of pro-European discourse is mainly discussed as elitist or intellectual, disregarding the possibility that pro-European mobilisation can be also initiated from below as a form of popular resistance to Eurosceptic discourse. So far, we know very little about patterns of resistance to Eurosceptic and right-wing populist movements within European civil society. In what way and to what extent is European integration being promoted by those who support it? Is pro-European mobilisation mainly defensive reacting to the threat of a Eurosceptic takeover? Or is it also progressive defining the agenda of political parties and leadership? This panel invites for contributions from scholars working on projects relating to pro-European or counter-populist movements in the context of the 2019 EP Parliamentary elections and beyond.

Populist Parties between Protest, Institutions and Interest groups

Ruzza, Carlo (1); Mazzoleni, Oscar (2)

1: University of Trento, Italy; 2: University of Lausanne, Switzerland
carlo.ruzza[at]unitn.it, oscar.mazzoleni[at]unil.ch

Although some initial research has shown the entrenchment of populist formations in a complex system of political exchanges with citizens' associations and business interest groups, few empirical studies have provided evidence of such an articulated system of social exchanges. Our aim is to identify and analyze two such systems involving populist political formations in two countries, namely the Lega, formerly the Northern Italian League – an Italian regionalist party, and the Ticino League, a Swiss-Italian regional and nationalist formation, which is the strongest party represented in regional government since 2011. We aim to highlight how in both cases parties' success was facilitated by a set of multiple even if partially contradictory linkages with different social domains and their interest representation. Through a skillful selection of issues (e.g. immigrant workers), but also through the enablement of careers patterns of conflicting elites, the two parties were instrumental in the activation and mobilization of social and political coalitions. Moreover, we will focus on the distinctive strategies of leaders and cadres over time, and we aim to show how they played a crucial role in retaining needed internal cohesion among the different identities and social networks of the parties – notably, the protest component, the government component and the interest groups component. Their mediating role was essential in preventing internal splits. Our main empirical sources are analyses of speeches delivered by party personnel in various arenas, articles in the regional press and analyses of biographical data conducted on the basis of information collected from in-depth interviews with MPs and other social and political representatives.)

Keep Them Waiting, Keep Them Quiet: Waiting as a Strategy of Social Control for Citizens on Social Assistance

Hansen, Lasse Schmidt

Department of Political Science, Aarhus University, Denmark
lsh[at]ps.au.dk

The amount of time citizens have to wait before bureaucratic authorities attend to them works as a strategy of social control that teaches individuals about their status as citizens. Theoretically, the paper draws on studies of policy feedback and social control. Empirically, the paper analyses data gathered during four months of fieldwork and 30 in-depth interviews with Danish social assistance recipients, who participate in a 13-week mandatory internship to perform unskilled labour in the recreational sector. Social control and status learning work through two interrelated processes. First, street-level bureaucrats unilaterally control the time of citizens by deciding how long citizens have to wait (i) to consult their caseworker, (ii) to change from private- to work clothes, and (iii) when to be allowed to go home. The timing of events changes arbitrarily from day-to-day. As a result, citizens experience firsthand that bureaucratic authorities handle their time carelessly. In consequence, as they are "kept waiting", they learn that their status and worth are less valuable than the status and worth of other groups in society. Second, because citizens highly depend on the people who make them wait, that is, the street-level bureaucrats, they suppress their dissatisfactions. Thus, waiting works as a form of social control to "keep them quiet". Overall, this study demonstrates how ordinary things, such as the amount of time citizens have to wait when dealing with bureaucratic authorities, creates large symbolic boundaries between groups in society and at the same time effectively prevents citizens to voice their concerns.

is on the period when the government announced a shift to austerity policy. Our findings demonstrate that the politics of austerity significantly enacts a politics of fear. It asserts various fears, including the consequences of diluting political and societal trust, to motivate people to accept or oppose austerity. Parties in the government justified austerity by simultaneously articulating series of serious threats that justify extraordinary measures and inciting citizens to trust policy-makers. These threats include ending up going 'the way of Greece' and losing national sovereignty. In the case of parties in the government, they also include warnings about confrontations that would rock the shared societal boat and endanger the welfare of future generations. The opposition parties, by contrast, described austerity as a threat for peace in society since it increases social inequality. In addition, they represented austerity as a faithful 'jump to the past' from the successful path of welfare state policy. We draw on this case study to reflect more generally on how the politics of austerity are connected to the distribution and articulations of fear and trust.

On Justifying Austerity: Politics of Trust and Fear

Autto, Janne (1); Törrönen, Jukka Antero (2); Huysmans, Jef (3)

1: University of Lapland, Finland; 2: Stockholm University; 3: Queen Mary University of London
janne.autto[at]ulapland.fi, jukka.torronen[at]su.se,
jef.huysmans[at]qmul.ac.uk

The financial crisis in 2007–2008 paved the way for policies of austerity, including an intensification of neoliberal dynamics and a larger-scale process of restructuring economic and social relations. However, austerity also sparked criticism and protests against the targeting of already vulnerable citizens, and more generally the unjust nature of neoliberal social order. This paper analyses justifications of austerity and opposition to it, taking political discourses on austerity by both the government and opposition in Finland in 2015. Our focus

Mapping Socio-Economic Determinants of Political Efficacy: Analysis of European Social Survey Data

Morkevicius, Vaidas; Butkeviciene, Egle; Vaidelyte, Egle; Zvaliauskas, Giedrius

Kaunas University of Technology, Lithuania
vaidas.morkevicius[at]ktu.lt, egle.butkeviciene[at]ktu.lt,
egle.vaidelyte[at]ktu.lt, giedrius.zvaliauskas[at]ktu.lt

Political efficacy is one of the most intensively studied subjects in political sociology. Responsiveness of democratic governance is always high on the agenda of both political practice and political studies. At the same time, political competence of the citizens is deemed very important (both in empirical studies and normative theories) for their political agency and consequently political participation. Usually, these two conceptions constitute the two sides of the political efficacy coin – external and internal. Scholars approached studies of political efficacy from various perspectives and many of them analysed factors promoting internal and external political efficacy (for some recent attempts see Kim 2013; Marx, Nguyen 2016) as both of them are important for good democratic governance. However, most of these studies involved socio-economic factors only as control variables of political efficacy. In this paper our major focus is on socio-economic determinants of political efficacy both on individual and macro level. Our main interest lies in identifying how socio-economic inequalities affect public views on government responsiveness and citizens' abilities to effectively participate in politics. We use the European Social Survey (ESS) data from Round 8 for individual level analysis as this source is well-known for its excellence in cross-cultural methodology and has an extensive battery of standardized questions related to socio-economic status of respondents. Importantly, this survey also includes questions measuring internal and external political efficacy. Also, we include into our analysis macro level variables (GDP pc, income inequality, welfare state generosity etc.) reflecting socio-economic development of countries included into Round 8 of the ESS. Analysis of the impact of individual and macro level variables on political efficacy is performed employing multi-level regression models.

The Welfare State at Stake: on the multidimensional Configurations of Solidarity Patterns among the Austrian and Hungarian Population

Flecker, Jörg (1); Altreiter, Carina (1); Nagy, Zsófia (2); Schindler, Saskja (1)

1: University of Vienna, Austria; 2: Eötvös Loránd University, Hungary
joerg.flecker[at]univie.ac.at, carina.altreiter[at]univie.ac.at,
nzsofia[at]gmail.com, saskja.schindler[at]univie.ac.at

All over Europe nationalist and far-right parties are on the rise and put pressure on the current configurations of the welfare state. However, we can identify different approaches: whereas in some countries extreme and populist right-wing parties adopt a rather neoliberal agenda, in other countries the political far-right promotes an “exclusive solidarity” for the national in-group. Against this background the paper explores how questions of inclusion and exclusion regarding the welfare state are negotiated on a micro-level. We will draw on 90 problem-centred interviews conducted in Austria and Hungary (48 in AT, 42 in HU) taken from the ongoing SOCRIS project. The project follows Steinar Stjernø (2004) and pictures solidarity as a continuum: On the one pole, solidarity is limited to a restricted group, whereas on the other pole we locate universal solidarity. In this paper we will focus not on the extremes but on the very heterogeneous centre of the solidarity-spectrum which also covers most of the interviewees in both countries. This approach allows to focus on individual configurations of solidarity but also sheds light on how current discourses and recent political developments manifest themselves in people's orientations. Research results reveal different logics structuring the solidarity concepts of individuals. In the middle of the solidarity continuum we find cleavages along different principles of justice and ideologies such as equality, meritocracy, authoritarianism, nationalism and racism. The cases also show how these principles are intertwined and combined differently within different types of solidarity.

(Dis)Empowerment of “We the People” in Contemporary Russia from a Perspective of Its Constitutionalism

Nedyak, Irina Leonidovna; Kuchinov, Artemy Michailovich

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation
iraleoned[at]gmail.com, arkuchinov[at]yandex.ru

Post Soviet constitution was established without sufficient adjustment to entrenched social practices and social norms. That has been causing the constant informalization of the formal norms and delegitimation of the basic law. It's also worth noting historically short experience of democratic representation, political participation, political and property rights. These features resulted in extending the scope of arbitrary power at the cost of the political order of lawfulness and self-government along with fostering processes of deinstitutionalization, depolitization, erosion of civic virtues. Hence the specificity of constitutionalism development is intimately linked to the processes of disempowerment of “We the People”. One of the aim of state-wide survey (Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, 2018,) was to define most appropriate institutional structures of executive and legislative power that help to provide rule of law and universalization of norms and yet can enforce popular sovereignty. Measurement of the potential to interiorize the two competing models of republican political order - democratic vs legal constitutionalism -revealed a very special entanglement of incoherent and controversial values and reasons of their adherents. We take this entanglement as a pivot of the analysis of the institutional environment and moral order most likely to empower people and to customize the meaning of virtues of both *vita activa* and *vivere libero*. The research is supported by the Russian Foundation for Basic Research (project No.17-03-00446).

Citizens in Training - Youth Participation and Civic Styles in Public Decision-making

Boldt, Georg Mikael

Tampere University, Finland
georgmboldt[at]gmail.com

Citizens are increasingly offered opportunities for democratic participation. One typical case, youth participation, is intended to offer young people a chance to voice their concerns and train them in civic skills. However, little is known about the practices, interaction and use of power in these spaces. This paper is based on an ethnographic study on youth participating in public decision-making processes in the Helsinki metropolitan area. It proposes that successful navigation of the fields of democratic participation is dependent of pre-existing civic skills, capacities and imagination. Although participatory opportunities in this research were designed by local authorities to be easily accessible for young people, participation turned out to be curtailed by gatekeepers controlling whose voices were heard and which ideas were put forwards. Where some participants found a safe harbour for their burgeoning interest in civic action, others realized their opinions were not respected, opting to leave the participatory process, consequently reducing its pluralism. Moreover, the study shows that initiatives relating to the repair of infrastructure and the lack of services are prevalent in disadvantaged neighbourhoods while abstract political claims are typically voiced in well-to-do neighbourhoods. While this reflects the inversion of public spending priorities that often results from participatory budgeting, it also points to the problems of implementing the empowerment style of participation on a city-wide scale. The study shows that, civic imagination is affected by material wealth and political opportunity. It also identifies how differences in civic skills, repertoires and modes of engagement affect participation. Additionally, the research underlines the necessity and reasons for offering different modes of participation from top-down empowerment projects to participation through channels of formal politics.

Civil Society In Flux: Trends In Religious And Secular Volunteering Across The US, 2002-15

Wiertz, Dingeman (1); Lim, Chaeyoon (2)

1: University College London, United Kingdom; 2: University of Wisconsin-Madison, United States of America
d.wiertz[at]ucl.ac.uk, chaeyoon.lim[at]wisc.edu

Since the 1990s, trends in the vitality of civil society have been a topic of intense scholarly and public debates. Some pundits have pointed to declining rates of civic engagement as indicator of an overall decline in social capital; others have countered that civic life has changed rather than declined. This study presents new evidence on how American civic life has evolved in recent decades. Focusing on volunteering for civic organizations, we decompose nationwide and area-specific trends in volunteering into their component parts. We distinguish between volunteering for religious and secular causes, and between volunteering rates and volunteering hours. These decompositions paint a more nuanced picture of how the civic landscape is transforming. Nationwide, we find that volunteering hours per capita dropped by 20% over the period 2002-2015. The decline is largest for secular volunteering, because although secular and religious volunteering rates have declined in parallel, the decline in the latter has been partly offset by a recent upsurge in volunteering hours among religious volunteers. This intensified involvement among religious volunteers has stalled the overall decline in volunteering since 2013. We further dissect these trends by decomposing them by socio-demographics (age, education) and for different metropolitan areas. Among other things, we find steeper civic declines in areas that used to rely more heavily on religious volunteers – even though religious volunteering itself seems more resilient than secular volunteering. This suggests that American civic life is increasingly centred around dedicated believers who are highly committed to religious volunteering yet only sparingly get involved in secular civic activities. We discuss the implications of our findings in terms of the changing character of American civic democracy.

empirically grounded, with the adopted categories that aim at shedding new light on a complex governance strategy chosen as case-study. Drawing on Gramsci notions of civil society and politics, this paper analyze a variety of empirical evidences collected between 2012 and 2015, principally through the author's participant observation in the selected case-study. This is V'Arco Villoresi Green System, a complex governance strategy for managing and developing the vast area crossed by the Villoresi canal (695.80 sq. km and 1,480,401 inhabitants), sponsored by Italian Lombardy Region and other public institutions with the involvement of heterogeneous civil society actors (voluntary organizations, environment local mobilizations, farmers' associations). The main research findings highlight a specific depoliticization mechanism engendered by CS actors and an opposing tendency towards politicization, surprisingly encouraged by the expert figures involved in the chosen case study.

The Depoliticization of Civil Society. A Theory-Driven Empirical Analysis

Citroni, Sebastiano

University of Milan Bicocca, Italy
sebastiano.citroni[at]unimib.it

The reduced ability of civil society actors to take political action and adopt critical positions toward public institutions is often ascribed to the "marketization" of the local welfare systems in which non-profit and third sector organizations act. Such a reading risks assuming civil society actors as simply passive agents, that are subjected to depoliticization mechanisms external to their everyday practices and impacting them from above. Instead, this paper explores how civic organizations - proactively though generally unintentionally - engender depoliticization dynamics that shrink their critical strength. The proposed analysis is both theoretically informed and

Inclusive Decision-making and Campaign: The Participation of Second Generation Migrants for Preventing Radicalization

Macaluso, Marilena; Tumminelli, Santa Giuseppina

University of Palermo, Italy
marilena.macaluso[at]unipa.it,
santagiuseppina.tumminelli[at]unipa.it

This paper deals with the analysis of the first results of Oltre project (ISF - DG Migration and Home Affairs, EU) funding for preventing the radicalization of the second-generation of migrants. The non-standard field research was intertwined with online social network profiles investigation. We present the off-line research results. Starting from the different dimensions of the risk of radicalization proposed by the kaleidoscopic overview of risk factors (Sieckelinck and Gielen 2018: 5; Ranstorp 2016), we created a topic guide for the in-depth qualitative interviews collecting 42 interviews of 2G youths (18-30 years) in 7 Italian towns, interviewing also several privileged testimonies. Then we made focus groups with the target 2G and we organized theatre performances with 2G people (Theatre of the Oppressed) collecting narratives, representations, stories and emotions about second-generation youth lives and about their representation of the radicalization risk and protection factors. These heterogeneous materials are the corpus for imagining a social communication campaign to prevent radicalization, engaging the research participants as key players of communication campaigns, co-designing the counter-narrative contents (Institute for Strategic Dialogue, 2015) and their viral dissemination on the social network in order to promote cultural change (Volterrani 2018). References Ranstorp, M. The root causes of violent extremism. RAN issue paper, 4 January 2016. Sieckelinck S. and Gielen Amy-Jane, Protective and promotive factors building resilience against violent, RAN issue paper, April 2018. Institute for Strategic Dialogue, Counter Narratives and Alternative Narratives. The role of counter- and alternative narratives in prevention of radicalisation, RAN, 2015. Young Finnish-Russian Dual Citizens and Sailing on Two Boats at the Sea of International Politics

Saari, Kari; Ronkainen, Jussi; Kananen, Marko

South-Eastern Finland University of Applied Sciences, Finland
Kari.Saari[at]xamk.fi, Jussi.Ronkainen[at]xamk.fi,
Marko.Kananen[at]xamk.fi

Finnish-Russian dual citizens are the largest group of multiple citizens in Finland. This citizenship combination, however, carries a unique status shaped by the common history and geopolitics between the two countries. Recently, the increased tensions between Russia and the “West” has made the situation even more sensitive. The Russian Federation has announced its commitment to protect Russian minorities in their neighboring countries or the Russian citizens living in these countries. In Finland, in turn, the contemporary debate perceives dual citizenship with suspicion and focuses on questions of control and restrictions (e.g. the access to certain positions in the central administration). These developments place the Finnish-Russian dual citizens in a precarious situation. From the legal perspective, they are Finnish (and EU) citizens with all the rights associated with it, but in the current debates, they are routinely referred to as (potential) security threats and (potentially) disloyal “half-citizens”. Although the situation of Finnish-Russian dual citizens has been debated for several years now, there is still very little research about the impacts that these recent developments have had on the dual citizens themselves. Building on a representative survey (n=194), thematic interviews and analysis of citizenship laws and public debates, this paper explores heterogeneous citizenship identifications and orientations of the young Finnish-Russian dual citizens (“realities of citizens”) in the contexts of recent politics and policies of Finland, Russian Federation and the “West” (“realities of states”).

Entangling Identities: Mapping The Different Ways Citizens Belong To Trans-, Sub-, National And Religious Identities

Maene, Charlotte (1); Stevens, Peter (1); Thijs, Jochem (2)

1: Ghent University, Belgium; 2: Utrecht University, Netherlands, The
charlotte.maene[at]ugent.be, peter.stevens[at]ugent.be,
j.t.thijs[at]uu.nl

Previous research, drawing on the legacy of Berry's integration model tried to map the different identity patterns that emerge for citizens with a migration background. Berry's model however overlooks the complexity of identity politics within nations; e.g. the identity of the host society is approached as a unique aggregate. In this way, identity struggles of both native and migrant citizens are obscured, which can lead to a false idea of inclusion. On top, there is a lack of empirical research that took up the task to map the complexity of these identity configurations, leading to theoretical speculation as a main driver in the identity politics debate in and outside of academia. To fill this gap, this paper uses a latent class analysis to cluster people based on their identity preferences for both natives and migrants on four identity categories; Belgian national identity, sub national identity, ethnic identity of people with a migration background and religious identity. The data of the SIS (school, identity and society)-survey is used; a recent, large scale survey in Belgium, containing the self-reports of 4500 high school students. In so doing, this paper advocates a stronger recognition of the complex nature of collective ethnic identity configurations within particular socio-political contexts in quantitative research, and the use of more inductive methods to map which collective identity configurations are meaningful within a particular socio-political context. In so doing, we develop a more in-depth understanding of the role of individual and contextual explanatory features in understanding the variation in multicultural attitudes, prejudice or stereotypes. Suggestions are made to elaborate the initial integration model of Berry to fit the multilayered reality of nation states.

Banal Nationalism in Cosmopolitan Contexts: An Ethnographic Study on German Societies at English Universities

Jürgensen, Cedric (1,2)

1: University of Leipzig, Germany; 2: Technical University of Chemnitz, Germany
cedric.juergensen[at]posteo.de

Universities are generally regarded as the heartlands of cosmopolitanism. Yet, national identities still play an important role in the social life of students as the numerous national societies at many universities illustrate. Based on Michael Billig's concept of 'banal nationalism' I aim to

investigate the different ways in which members of German Societies at three Russell Group universities perform, negotiate and use their national identity in everyday interactions. Based on an ethnographic study of these societies and their members, I find that students use a wide range of symbols and rhetoric strategies to perform their nationality. Among these are the ironic exaggeration of national stereotypes, humorous references to German history, distancing themselves from their English and international environment, using a national frame of reference and celebrating the German cuisine and language at their meetings. Most interestingly, however, they also strategically use their national identity as a brand to find sponsors for their events and improve their future chances on the labour market (e.g. through organising career and networking events). This indicates that the students do not only unconsciously and passively identify with the nation but are active and reflexive agents who pick positive and useful aspects of their German national identity to create their personal brand which they then aim to sell on the labour market.

RN32_04a | EU(ropean) constructions

Western Balkans and the Crisis of the European Integration

Sekulic, Tatjana

University of Milano-Bicocca, Italy
tanja.sekulic[at]unimib.it

The paper investigates the interrelation between the ongoing crisis of the European integration project and the patterns and effects of its transformative democratizing power towards accession states. In the literature on the EU enlargement process in Central and Eastern Europe and the 'Western Balkans', the basic conditionality principle of the enlargement is conceived mostly in terms of a transfer of cognitive, structural and institutional patterns and practices from West and North to East and South, from the center to its multiple peripheries. This view is problematic insofar as it construes the EU accession process as a unidirectional process of harmonization with Acquis, thus uncritically reducing the notion of Europeanization to its normative and procedural (and thus coercive) dimension, equating it with the implementation of 'best practice' packages by the aspirant countries. Contrary to this view, the translation of the policy as such (and of specific policies regarding all segments of the society) has been shown to be unpredictable and contingent, so that its adaptation requires constant re-contextualization, taking into account asymmetrical power relations. The research aims to discover how the institutional process of accession of the 'Western Balkan' countries unfolds at the local, national, and European level. The longitudinal inquiry (2008-2018) combined theoretical and empirical analysis of the European integration and enlargement process in this specific frame, in its normative and in its practical dimension. The analysis concerned (1) narratives of the actors involved in the enlargement/accession procedures in a longitudinal and multi-site perspective, collected by the means of semi-structured interviews and analyzed by CDA methodology; (2) critical discourse analysis of the EU progress reports and other EU strategic documents.

Sociology and EU integration theories. What role for Political Sociology?

Christodoulaki, Ioanna

Boston University, United States of America
iochrist[at]bu.edu

The paper reviews the literature of EU integration, and discusses the role of sociological approaches in the study of the European Union. Although dominant integration theories have over the years more or less successfully captured developments in the EU, and have reflected the scope of EU integration predominantly as a process of economic coordination, the rise of Eurosceptic voices, along with the particular expansion of populist nationalism, especially in the context of the European sovereign debt crisis, have pointed to the structural defaults of the European project, and have put into question continued popular support. The purpose of this paper is to briefly review dominant EU integration theories, and to shed some light on the contribution of political sociology as a discipline in the study of the European Union in times of crises. With its particular focus on state-society relations, political sociology may provide complementary angles and tools to suggest alternative analytical and explanatory frameworks to the study of the EU, especially with regard to the political, social and economic developments that followed the Eurozone crisis. With political sociology's further emphasis on the relationship between publics and the political elites, the social dimension of the EU, and the impact of the economic crisis on the society, the paper finally seeks to establish the missing link in the way in which political actors interact to produce particular political outcomes on the society at large.

Depoliticisation and politicisation through the discourse analysis: from Mario Draghi to the Spitzenkandidaten, how re-politicise the European Union

Zito, Elania

Department of Political Sciences, Sapienza University, Italy
elania.zito[at]uniroma1.it

The research investigates how the European Union is facing with a new way of politicisation since the arrival of Mario Draghi, president of the European Central Bank, on the European scenario. This research investigates on a first analysis on the Spitzenkandidaten in the next EP elections, comparing the two sides of politicisation and depoliticisation. The first side, made by the ECB in the first time of the European financial crisis, and by the European Commission - in this second part of the post financial crisis - with the attempt to re-politicise the EU starting from a political approach through the Spitzenkandidaten. The second side, made by the national and euroskeptical levels, engaged on a disruptive and anti-political rhetoric. Comparison of the different levels of leadership in the EU (European Commission, European Council, European Central Bank), the aim of this research is to demonstrate the assumption that we are facing with two parallel processes of politicisation and depoliticisation in the EU.

When the EU Is Appealing to the Disadvantaged: How Utilitarianism and Identity Shape Attitudes Towards a Social Europe

Göncz, Borbála

Corvinus University of Budapest, Hungary
borbala.gonc[at]uni-corvinus.hu

The member states of the European Union have been recently facing an economic and a refugee crisis that put under test one of the fundamental values of the European Union, solidarity. In this context of missing congruence between market integration and social integration many argued that further legitimacy, common identity and solidarity is needed for further integration stressing the importance of a social Europe. Going beyond the widely researched topic of public support towards the European integration process this paper examines the potential public support for a social Europe. While recent studies approach European solidarity from the perspective of the welfare state and welfare attitudes, this paper links it to support for the EU and the concept of identity. It is argued that general support for the European integration process and support for a social Europe are different phenomena. Building on the analysis of the ESS survey data collected in 2016 results confirm that, while their drivers might be similar, i.e. interests and identities, the mechanisms at work behind are different also depending on the institutional context of a country.

Low-skilled workers' political actions: from RRPP vote to protests. A comparison between Italy, France and Spain

Rocchetti, Davide; Pilati, Katia

University of Trento, Italy
davide[at]rocchetti.eu, katia.pilati[at]unitn.it

Starting from the 1980s low-skilled workers have remained long excluded from the European political sphere. This occurred partly because of declining trade union membership and industrial conflicts and partly because of increasing electoral abstention. In the last two decades however, we have witnessed a political re-incorporation of low-skilled workers fueled by two processes. On the one hand, hit by growing unemployment and temporary jobs intensified by the 2008 great recession, low-skilled workers have joined students, young people, and migrants in broad coalitions protesting on cross-cutting issues such as social exclusions, austerity measures, struggles challenging neo-liberal policies. On the other, extant research has observed the progressive increase in voting preferences by low-skilled workers for radical right populist parties (RRPP). This paper aims to understand low-skilled workers' changes in electoral and protest politics in the last two decades in three countries: Italy, France and Spain. Both France and Italy have experienced rising rates of RRPP, namely Front National (FN) now Rassemblement National (RN) in France, and Lega (once Northern Lega) in Italy which both have low-skilled workers as major constituencies. In contrast, in Spain, a left-wing populist party, Podemos, has been largely successful since 2014 European elections. We will examine these differences by analysing low-skilled workers' voting and engagement in protests in France, Italy and Spain in the last two decades (2000-2020) using the cumulative European Social Survey (ESS) dataset.

Migration: A New Cleavage In European Societies

Petrosino, Daniele

Università degli studi "Aldo Moro" Bari, Italy
daniele.petrosino[at]uniba.it

The migration issue is now one of the most conflicting issues within political forces, public opinion and is reflected in electoral attitudes. The division contained in it was analyzed through cleavage theory (Hooghe and Marks 2018). This paper will analyze the way in which immigration is treated by cleavage theory, focusing on some emerging contradictions in it. Immigration is producing profound divergences in the democratic systems of European countries. The growing push towards political expressions called sovereignism re-proposes the nation-state as the main container of representation with the aim of limiting as much as possible access to the different rights of citizenship of immigrants in European countries. The cleavage theory reflects this situation because it analyzes the relationship between the representation system and the divisions present in society. These divisions do not always correspond to their projection in the political framework. In the case of migration, this detachment is evident both in the definition of the actors who act on the political scene (the cleavage is entirely internal to the natives, although it regards another social actor present within the society) and of the claims they express (the social protection question). On this contradiction the "sovereign" parties build their consent, through the construction of closing mechanisms (Parkin 1979), producing a differentiated exclusion that increases the fragmentation within the immigrant category. The paper will try to focus on the relationship between the production of differentiated exclusion and the formation of new cleavages in European societies, exploring the possibility of integrating categories such as super-diversity (Vertovec 2007) and intersectionality into the cleavage theory (Collins 2016).

Relating Cultural Repertoires, Cleavage Structures and Discursive Opportunities to Events. A Theoretical Outline and an Application to the Case of 9/11 in the American and Dutch Public Spheres

van Dooremalen, Thijs

University of Amsterdam, Netherlands, The
t.j.a.van.dooremalen[at]fsw.leidenuniv.nl

The theoretical perspectives of cultural repertoires, cleavage structures, and discursive opportunities are fruitful and prominent approaches for scholars who do cross-national sociological or political scientific research. Yet a conceptual gap in each of these perspectives is that they do not have a satisfactory answer to the question of how change in response to events can occur. To fill in this gap, I propose a typology that explains why some happenings take on the color of existing trends, while others become motives to transform them. This

can be either because they are 'focusing events', that confirm dominant cultural or political patterns, or since they are 'shock events', which form a break from them. I illustrate this typology empirically by using a mixed methods-combination of text analysis (topic modeling and qualitative content analysis) to investigate the differing meanings that 9/11 has been accorded in the American and Dutch public spheres. This investigation shows that 9/11 has become a shock event on the issue of safety in the American case, as it broke with the self-image of the United States as a safe, militarily impenetrable nation. In contrast, it has turned into a focusing event concerning the issue of Islam in the Dutch case, because it confirmed the problematizations of Muslims which public actors in the Netherlands had already developed in the years before 2001.

Nostalgia, Societal Cleavages, And The Modernization Project: Georgians' Attitudes Towards The European Union

Shubladze, Rati; Sichinava, David

CRRC Georgia, Georgia
rati[at]crrccenters.org, david[at]sichinava.ge

This paper looks at the attitudes of Georgians towards the country's integration in the European Union. We argue that the binary opposition between pro- and anti-EU stances reflects deeper societal division along ideological cleavages, specifically, their attitudes towards different projects of societal modernization. The process of Europeanization is strongly associated with modernization (Featherstone & Kazamanias, 2000; Berezin & Díez-Medrano, 2008). In Georgian context, modernization and Europeanization were usually used interchangeably (Nodia, 2001 cited in Pelkmans, 2006). Georgia's post-Socialist modernizing reforms clearly bore neoliberal characteristics. Therefore, it definitely led to rising inequality and the emergence of "winners" and "losers" of transformation. Seemingly, this also contributed to the growing Euroscepticism and the nostalgia towards alternative model of modernization – the Soviet Union (Derluguian & Earle, 2010). Two waves of cross-sectional nationwide polls conducted in Spring of 2017 and 2018 show that Georgian society is polarized when it comes to the attitudes towards the country's European integration. Moreover, the poll numbers fluctuate significantly through ethnic and geographic lines. Differences arise among the representatives of various age, educational, and socio-economic groups. Although we show that disparities evaporate when controlling for the respondents' attitudes towards alternative modernization project such as the Soviet Union. Based on the societal cleavage theory of Lipset and Rokkan we argue that the respondents' attitudes to closer integration with the West mirror the ideological cleavages in the society, which emerged along the public attitudes towards different modernization projects. We hypothesize that the prevalence of these cleavages might be predicted by the attitudes towards "modernization" and "alternative modernization" discourses in Georgian society.

RN32_05a | EU Institutions and Populism

The Populist Radical Right, Exclusionary Political Frames and their Impact on EU-level Civil Society

Ruzza, Carlo

University of Trento, Italy
carlo.ruzza[at]unitn.it

This article focuses on the reactions of EU-level anti-racist and pro-migrant organizations to a sweeping populist turn in European politics and elsewhere. The recent political climate of organized civil society at EU level has been radically shaped by a sweeping populist turn in European politics in recent years, which has affected the funding priorities, agendas and political discourse of European institutions. This is evidenced for instance in the changing composition of the European Parliament where populist radical right parties made significant advances in the 2014 European elections. This political change has particularly affected inclusionary and anti-discrimination organizations. This article focuses on their reactions and relies on a multi-method approach. Through a set of in-depth interviews with civil society representatives and EU civil servants it documents and analyzes changes in the legitimacy, strategy, funding opportunities, and more generally political opportunities, of these civil society actors.

Religion, civil society and the European Court of Human Rights

Giorgi, Alberta

University of Bergamo, Italy
alberta.giorgi[at]unibg.it

A growing body of literature highlights the increasing role of the Courts in democracy – the ‘judicialization of politics’. On the one hand, the courts jurisprudence has the authority to clarify the status of controversial issues, offering a venue to potentially overcome political veto-players. On the other hand, the EU and its institutions played a significant role in the development and diffusion of the ‘language of rights’ for dealing with politically controversial issues. This is especially relevant for religious-related issues – and some scholars proposed the category of ‘judicialization of religion’ to underline the crucial role of the courts jurisprudence in defining the place and the boundaries of religion in contemporary societies. In this scenario of judicialization, the European Court of Human Rights is of paramount importance, due to its primacy over the national courts and its specific task of dealing with human rights and non-discrimination. GRASSROOTSMOBILISE project explores the extent to which the ECtHR religious jurisprudence defines the ‘political opportunity structures’ and the discursive frameworks within which citizens act. In this frame, this contribution focuses on both EU-level CSOs and grassroots religious actors, to investigate the indirect effects of the ECtHR. How do religious

organizations (and – especially – minority religions) assess the role of the ECtHR? What is the role of the judicial strategy among their repertoires of action? How does it change in light of the right-wing populism wave? Sources include key-witnesses interviews, document and media analysis

From Benign Neglect To Threat: The Rise Of Populism And Mobilization On Gender Equality In The European Union

Cullen, Pauline

Maynooth University, Ireland
pauline.cullen[at]mu.ie

From benign neglect to threat: The rise of populism and mobilization on gender equality in the European Union. Pauline Cullen, Maynooth University, Ireland. This paper will explore patterns of transnational mobilization on women’s interests in Europe at a time of increasing populism. Critics of radical right populist movements point to their attack on women’s rights (Emejulu,2016; Fraser,2016). Assessments of gender equality as an EU policy issue have also confirmed its decline as a priority (Elomaki, 2015). Left-wing populism, in turn, has provided little space for women’s interests (Dean, Keith and Maignushca, 2016). This research explores how transnational women’s rights organisations are responding to populist attacks on gender equality and the relevance of EU level actors, including the European Parliament and Brussels based social justice NGOs as allies in resisting such threats. Social movement analysis of populist movements and threats to civil society, feminist research on the opposition to gender equality and feminist analysis more broadly of European integration inform this analysis and add to our understanding of potential and limits of EU civil society as a site of mobilization against illiberalism and the erosion of progress on gender inequality.

Socio-Economic Changes, the European Parliament and Gender Equality Organisations

Woodward, Alison E.; Petra, Ahrens

Institute for European Studies, Vrije Universiteit Brussel, Belgium
alison.woodward[at]vub.ac.be, petrahrens[at]hotmail.com

Formally organised social equality activism in the European Union receives significant direct and indirect financial support from European institutions. The European Parliament indirectly stimulates gender equality organisations and research by commissioning reports and providing channels for input into policy making through the European Parliament's Committee on Women's Rights and Gender Equality (FEMM). The financial and economic crises and subsequent austerity measures have often targeted the soft spots of social equality organisations. The European Parliament organisation has been able to provide lifebuoys of financial support in return for vital information from grass roots organisations and professional movement activists in the last ten years. However, the financing of civil society interest organisations and the utilization of their input has come increasingly under fire. The strong turn to the right since the last EP elections, as well as the warning signals from populism in Poland and Hungary, combined with Brexit have meant that the ability of the European Parliament FEMM committee to continue to tap the knowledge of these organisations and reciprocally also support them has come under fire. This paper notes that civil society organisations are less likely to be included in official sessions and consultations in the last legislature. The paper investigates the challenges to the relationships between the FEMM committee and organized gender equality organisations. Research is based on historical documents, interviews with rapporteurs from the FEMM committee and with civil society activist groups and observers.

The Innovative State: Policy-Making Under Conditions of Uncertainty

Ylöstalo, Hanna

University of Helsinki, Finland
hanna.ylostalo[at]helsinki.fi

This presentation is concerned with knowledge-based economization of the political, that is, with the complex process of the folding of the economy into politics and policy making via 'innovative' policies that lean on scientific knowledge. Policy practitioners, such as state officials, think tanks, researchers and transnational expert organizations, are striving to solve a compelling problem: How can policy makers deal with complex problems under conditions of uncertainty? According to many of these actors, the world has become 'complex', the problems have become 'wicked', and all the

solutions involve a great deal of 'uncertainty'. New, policies, labelled as innovative, are designed to address these issues. This presentation takes as its focus two innovative and fast-traveling policy models: strategic governance and experimental policy. These policies rest on and are legitimized with scientific knowledge. They also rest on recognition that the knowledge available to support the rolling out of policy reforms under complex and uncertain conditions is thin and that innovative knowledge-production for policy making are needed to plug this gap. This presentation argues that knowledge and knowledge-production for policy making lie at the heart of contemporary policy reform. Such knowledge is often based on economic premises: management sciences and behavioral economics. Via scientific knowledge and methods (albeit contested ones), policy making is reinvented in economically rational terms. However, knowledge-based policy reform is an ambivalent one and entails both politicizing and depoliticizing as well as democratizing and de-democratizing effects.

Navigating Coercion in Political Rhetoric: Shifting Strategies to Cope with Intervention by the Troika in Portugal

Pi Ferrer, Laia; Rautajoki, Hanna

Tampere University, Finland
laia.piferrer[at]tuni.fi, hanna.rautajoki[at]tuni.fi

This paper examines how national political actors cope with coercion exerted on them by an external source in political discourse. Our empirical case is intervention by the Troika in Portugal. The coercive setting compromises national sovereignty and integrity. How do national actors manage this setting without jeopardizing their responsibility and institutional legitimacy? We approach the question by analysing two diverse political arenas: parliamentary debates and public accounts by political leaders in the media. The study evidences a variation in strategies to manage coercion: the politicians use both depoliticization and relativization. While discourses of depoliticization are frequent in media, in parliamentary debates the predominant strategy is to emphasize the aspect of agency by relativizing the power of the Troika. Both strategies serve to portray responsibility in the face of external intervention, but in different discursive environments political actors use different rhetorical tools to work on their institutional appearance and legitimacy.

A Permanent “State Of Exception”: The Condition Of Migrants Between Humanitarian Emergency And Exclusion Policies In Italy

Marchetti, Maria Cristina (1); Rossi,
Emanuele (2)

1: Sapienza University of Rome, Italy; 2: University of RomaTre,
Italy
mc.marchetti[at]uniroma1.it, emanuele.rossi[at]uniroma3.it

“The state of exception” seems to take on the characteristics of a true and proper paradigm of government, dominant in contemporary politics, which is fully applicable to all those who are collateral victims of globalization processes in action and are considered – in the words of Adorno – as “socially unnecessary”, or rather, real and true “wasted lives”. These are migrants, refugees, illegal immigrants and all those who are considered “out of place” and, as such, are being held in conditions which are more and more dramatic, within a “placeless place” indeed in a no man’s land. This refers to detention centers, now renamed Centri di permanenza e per il rimpatrio (CPR), ie structures which are used to hold all foreigners without a residence permit; we are speaking about those who are found to be the subjects of no immediate expulsion for a number of reasons established by law. It refers to territories and spaces within which individuals are destined to disappear as holders of rights and as bodies. These are real and proper “suspended spaces”. Foreigners retained are inserted in to a real “space of exception”, inside of which there is an active mechanism on the basis of which it is paradoxically possible to “include something solely through its exclusion”. Moving from this theoretical framework, the paper will focus on: - The paradigm of “state of exception” - The Italian law after the so called “Decreto Salvini” - Emergency/Exclusion Policies.

Politics and Administration: Civil Service in Poland in the New Institutional Perspective

Gadowska, Kaja G.

Jagiellonian University, Poland
kaja.gadowska[at]uj.edu.pl

The civil service is an important element of the public administration system and has a major impact on the state's manner of functioning. The civil service in Poland was created with the intention to ensure that the public administration performed its duties in a professional and impartial manner, unhindered by political interests. The aim of the paper is to analyse the process of creating the civil service in Poland after 1989, and to show how the division between the political and administrative spheres was formed from the beginning of the transformation and under the governments of succeeding political groups, and the extent to which the actual relations between politics and public administration reflect the formal regulations contained in successive civil service acts. The paper

concentrates in particular on personnel policy with regard to senior civil service positions, because these appointments are connected with assuming control of decision making processes and human resources policy in administrative offices. Various complementary qualitative and quantitative methods were used in the research. Multidimensional analysis of the data leads to the conclusion that political parties in Poland strive to limit the autonomy of the government administration and to subordinate it to their interests. The legislation in the area of civil service has been largely subjugated to the political interest of the moment, and not to the long-term interest of the state. The use of the new institutional perspective allowed to identify the reasons behind the adoption of specific legal measures and to show their actual effects.

RN32_06a | Cities and Populism (URBPOP)

The New EU Urban Agenda: Mobilising the 'Right to the City' Top Down? (URBPOP)

De Frantz, Monika

Charles University Prague, Czech Republic, University of Vienna,
Austria
monika.defrantz[at]eui.eu

To contribute to the urban objective of the global sustainable development goals, the new EU Urban Agenda was established in 2016 with the aim of fostering the urban dimensions of European governance. Focusing on the 'right to the city' as critical claim for global sustainable development, this paper enquires into the normative implications of the new urban agenda for European governance. Despite the political success for the urban movement, the global urban agenda also raised critical concerns that transnational governance may harmonise urban diversity and thus actually weaken global sustainable development. Applying the urban globalisation critique to the European context, the paper conceptualises the 'soft' nature of EU urban governance as transnational mobilisation and cooperation process. As an intergovernmental instrument with no legal or financial resources, the EU urban agenda offers a broad normative framework for mobilising transnational cooperation from the top down. The urban partnerships established then during the first implementation phase indicate various new normative and cooperative structures. By reflecting these preliminary findings through the scholarly debates on EU regional policy and on the global urban agenda, the paper develops assumptions about the potential implications for the broader processes of European governance. Thus interpreting the 'right to the city' as a critical claim to transform, evaluate and contest European governance, the paper elaborates a research agenda that aims to embed top-down transnational governance in bottom-up urban politics. Connecting the European with the global debates also contributes to reflecting the potential of knowledge exchange for politicizing the broad notion of sustainable urban development.

Populism in the City: The Case of Ford Nation URBPOP

Silver, Daniel (1); Taylor, Zack (2); Calderón Figueroa, Fernando (1)

1: University of Toronto, Canada; 2: University of Western Ontario, Canada
dsilver[at]utsc.utoronto.ca, zack.taylor[at]uwo.ca, f.calderonfigueroa[at]mail.utoronto.ca

Populism is often viewed as a national-level phenomenon that pits a declining periphery against a cosmopolitan, economically successful metropolis. Our analysis of Rob Ford's 2010 campaign and mayoralty in Toronto reveals the potential for the emergence of populist politics within the metropolis. To comprehend his appeal, principally within the city's ethnically diverse postwar peripheral areas, we apply Brubaker's conceptualization of populism as a discursive repertoire. Drawing on qualitative information and analysis of survey research, we first describe how Ford constructed electorally salient protagonists and antagonists. Second, we discuss how his emergence was enabled by institutional, economic, and demographic change. Finally, we explain Ford's appeal to a diverse electorate in terms of the sincerity and coherence of his performance as the collective representation of suburban grievance. We conclude by arguing that populism may emerge in metropolitan settings with strong, spatially manifest internal social, economic, and cultural divisions.

Spaces Of European Unease: Localism, Translocalism And Populist Reactions To Urban/Regional Shocks (URBPOP)

Gordon, Ian Richard

London School of Economics, United Kingdom
I.R.Gordon[at]lse.ac.uk

The rise of electoral support for populist parties – mostly of the right but also of the left – within the past decade has distinct geographic as well as time profiles that invite lines of explanation as to this source of disaffection with opinion-forming elites and mainstream parties. On both dimensions there are suggestions that the phenomenon is related to enlarged migrant and/or Muslim populations, to increased inequalities between individuals and communities, economic failures associated with offshoring of jobs and the fallout of the 2007-8 financial crisis – and a growing cultural separation between an increasingly cosmopolitan metropolitan culture and non-metropolitan communities retaining more traditional values. This paper builds on previous work (Gordon, 2018) that has used the European Social Survey panel to test hypotheses about the impacts of region-specific economic and cultural shocks on vulnerable groups and how reactions to the (more significant) cultural shock was mediated at individual and community level by biases toward localist/cosmopolitan types of personal capital and membership of two kinds of translocal organisation (Catholic churches and trades unions). This paper extends that analysis to look more directly at the urban

dimension, in relation to the functioning of urban politics – and the implications of the new spaces of unease for politics within and between urban communities.

Does Local Fragmentation Drive Populism? Trump and More

Clark, Terry

University of Chicago, United States of America
tnclark[at]uchicago.edu

The Brexit fragmentation in Parliament powerfully illustrates fragmentation and dissatisfaction with traditional leadership and rules of the game. After the Berlin wall fell in 1989, many European countries saw new leagues and political parties emerge (Poland had hundreds, Italy some 30). Comparing local and national patterns over time brings out the rise of fragmentation and permits analysis of new leadership patterns. An earlier example was the decline of class politics and traditional left-right party programs; these offer analytical strategies for interpreting populist leaders (Clark and Lipset 2001 summarize the debate which continues). We offer general propositions about populism, some brief case study support, and analysis of Trump 2016 election patterns across all US counties (about 3000).

Northern Exposure: Fear, Loathing and Hope in the North of England after Brexit (URBPOP)

Favell, Adrian Charles

University of Leeds, United Kingdom
a.favell[at]leeds.ac.uk

The North of England has played a central role in debates about the causes and consequences of the Brexit referendum, especially in the widespread perception of a divided Britain. There is a pervasive vision of the North outside of the bigger cities, driven by a wave of public opinion scholars and public intellectuals, that it represented a “heartland” vote: of “somewhere” people (core national, rooted, working class, “left behind”) against the “anywheres” (affluent, educated, cosmopolitan, metropolitan elites). At the same time, Brexit has raised fears about the future of a multi-racial society with high levels of immigration. The North of England is also viewed as a place of simmering racism and xenophobia: pitting White British, older British minority groups, and newer incomers such as asylum seekers or East European workers against each other in deprived and depressed post-industrial locations – particularly away from the more cosmopolitan “core cities” such as Manchester and Leeds. The paper will present initial documentary and ethnographic research from the ESRC funded ‘Northern Exposure’ project. Homing in on four archetypal northern towns, we interrogate sweeping perceptions of the North, while broaching sensitive questions of everyday nationalism, race and racism in largely understudied and marginalised places. While places such as Wakefield and Middlesbrough have struggled to come to terms with new European migrations and refugee settlement amidst widespread deprivation and political alienation, other locations such as Halifax and Preston offer examples of renewed multiculturalism and social intervention able to conceive a more hopeful future for multi-ethnic Britain.

RN32_06b | Politics of Boundaries (SOSEM)

Vertical to Horizontal to Central. Spatial Metaphors in Hungarian Politics since 1990 (SOSEM)

Kiss, Balázs

MTA Centre for Social Sciences, Hungary
kiss.balazs[at]tk.mta.hu

The presentation will sketch the rise and decline of spatial metaphors in Hungarian political communication for the past decades. Until 1990, the left – right divide was not important, or rather, it was overshadowed by the vertical structure. The political elite, consisted of either the single party or of the intellectuals of western values, or of the so called popular intellectuals, located itself above the citizens defining thereby a vertical division of space. From 1990 to about 2010, the

Hungarian political space was constructed as a left – right continuum, sometimes with several actors, sometimes with only two. Since 2010, a great discrepancy has unfolded between the government elite and the rest. The former tends to use the metaphor of central/centralized field of force (centrális erőter), with itself promoting the common national causes, and the hardly important rest. The opposition forces try to stick to the left – right division but each has difficulty to find a proper place on that continuum for itself, for the government and for the others in opposition. The presentation, based on a four year long research project on the history of political communication in Hungary, will draw the trajectory of the vertical, horizontal and central space metaphors, their advantages and disadvantages in political identification and strategy building.

Visual political communication resources in Hungary, 1990-2015 (SOSEM)

Farkas, Xénia

HAS Centre for Social Sciences, Institute for Political Science; Corvinus University of Budapest, Doctoral School of Political Science
xeni.farkas[at]gmail.com

Visuals have huge importance when political parties communicate with their audience: images may not only carry direct messages, but they can deliver all sorts of hidden contents, thus the investigation of political communication has to be broadened to the visual materials. In spite of the fact that political communication today is built on visual resources, research on visual political communication is still infrequent. As a contribution to this research area I will present some of the most important visual social semiotic resources of the Hungarian political communities between 1990 and 2015. The communities used varied visual resources, for example logos of the political parties, images of the politicians and the parties, or election posters can be considered as classic visual resources, but there are less obvious ones also: places that a community recurrently use, clothes or badges that represent fellowship or even a moustache can be a visual resource. I will concentrate only the most typical ones. The aim of the presentation is to describe how the political actors used these visual resources: what kind of signs, messages, and hidden intentions can be identified in their visual communication tools.

Changing Patterns of Negative Campaigning in Hungary (SOSEM)

Nábelek, Fruzsina

Corvinus University of Budapest, Hungary
fruzsina.nabelek[at]gmail.com

Negative campaigning as a political marketing tool has several functions during an election campaign. Its main goal is generally to make the targeted opponent seem less suitable for a position by attacking her based on policy issues, ideology, past political performance, behaviour or personal characteristics. On the other hand, negative campaign messages serve as distinction between the sponsor of the attack and the target implicitly claiming that the sponsor would be a better, in some cases even a more legitimate choice. The presentation examines these functions of negative campaigning using the case of Hungarian parliamentary election campaigns between 1990 and 2014, a period in which negative campaigning became a prevalent part of election campaigns in Hungary. It focuses on the patterns of negative campaigning examining the content and type of negative messages, their main sponsors and their choice of targets. Based on this analysis, the presentation argues that campaign negativity in Hungary did not only change in a quantitative term (i.e. usage of more negative messages during the campaigns) but shows a shift in its content as well from questioning the political stance to questioning the legitimacy of opponents.

Incivility as semiotic resource. Lessons from Hungary (SOSEM)

Szabó, Gabriella

Centre for Social Sciences, Hungary
szabo.gabriella[at]tk.mta.hu

As the acts of courtesy in politics is going out of fashion, scholarly interest in incivility has been growing. Whilst the main conceptualization of political incivility is usually centering on deliberative theory and considering rudeness as harmful malpractice, some researchers suggest that outrage discourses with their emotional appeals may stimulate the voter turnout. By moving beyond the deliberation and the strategic use of incivility, this presentation addresses this problem from the perspective of social semiotics. The longitudinal analysis (1990 – 2015) of the political communication in Hungary reveals multiple use of inappropriate vocabulary. The presentation highlights the expansion of insulting language and vulgarity in politics. First, incivility appeared as part of the desacralization of politics in blogs and online portals in the early years of 2000s. Then came the waves of character assassinations during the election campaign. In 2006, the highest peak in the uncivil mode of communication was connected to Prime Minister Ferenc Gyurcsány's infamous speech and the people's reaction to the talk in which he admitted that he lied and purposely misled the electorates during the previous legislative election campaign. Last but not least, obscenity in street protests was discovered. Having catalogued the practices of incivility in Hungary, I argue that indecency in political communication can be comprehended as semiotic resource which is characterised

by repetition, widespread and multichannel usage to express authenticity and political identity.

The Semiotic Resources of Left-wing Political Community Between 1990 and 2015. (SOSEM)

Bene, Marton

Centre for Social Sciences, Hungarian Academy of Sciences, Hungary; Corvinus University of Budapest, Hungary
bene.marton[at]tk.mta.hu

This research investigates the semiotic resources that integrated the left-wing political community in Hungary between 1990 and 2015. This study presents the main results of a 4-years long research project that has explored the history of Hungarian political communication since the regime change using social semiotics as method. The research has found that there are several semiotic resources (actor constructions, discourses, issues, channels and further modalities) that have been highly used by left-wing political actors and make them a recognizable and distinguishable political community within the larger political community of Hungary. The presentation will focus on the most durable semiotic resources, such as depoliticized actor constructions, preference for experts, the discourse of security, stillness and predictability, the discourse of the defense of democracy, the discourse of closing up to Europe, the issue of foreign policy etc. The study argues that while these semiotic resources were highly present in the communication of the members of left-wing community between 1990 and 2010/2012, they have increasingly faded after 2010 that has contributed to the disintegration of the left-wing community in Hungary.

RN32_07a | Examining Populism (I)

Islamic Populism and Popular Attitudes toward Syrian Asylum Seekers in Turkey

Morgul, Kerem (1); Savaskan, Osman (2)

1: University of Wisconsin-Madison, United States of America;
2: Marmara University, Turkey
morgul[at]wisc.edu, osman.savaskan[at]marmara.edu.tr

Turkey's ruling Justice and Development Party (JDP) has made increasing use of populism in the past decade, pitting a virtuous Sunni Muslim majority against a secular, pro-Western elite who conspire against the rightful sovereignty of the pious people. In the aftermath of the Arab Spring, JDP leaders have employed this populist frame in international affairs as well, claiming to represent all the oppressed Muslim peoples in the Middle East and beyond. In this way, they have established a "chain of equivalence" (Laclau 2005) between devout Muslims in different countries and constructed a collective identity—the "ummah"—that transcends the boundaries of the Turkish nation-state. This paper scrutinizes the robustness of this pan-Islamic populist identity by analyzing popular attitudes toward the growing population of Syrian asylum seekers in Turkey. Our rationale is as follows: If JDP's populist references to the universal brotherhood of a downtrodden ummah has genuine appeal, then the religious conservatives in Turkey should stand in solidarity with their Muslim brethren who are fleeing the repressive Assad regime. To test whether this is the case, we use data from a nationally representative survey conducted in February 2016 with 2,647 Turkish citizens. Our results show that, compared with more secular citizens, religious conservatives are indeed less prejudiced toward Syrian asylum seekers. However, the effect of religious conservatism is modest and does not moderate the positive association between Turkish nationalism and anti-Syrian attitudes. Furthermore, economic insecurity is a major source of anti-Syrian attitudes among conservative citizens. Due to these reasons, coupled with the recent rise of nationalist fervor and economic instability in Turkey, anti-Syrian attitudes are widespread among all religious and political groups.

Mapping Varieties of Populism in the United States and Europe

Arsaelsson, Kristinn Mar; Ramand, Peter

University of Wisconsin-Madison, United States of America
kristinn.mar[at]wisc.edu, ramand[at]wisc.edu

This paper is the first to systematically map and compare how populist sentiment clusters in the electorates of the US and several European societies using Latent Class Analysis. We have completed analysis of the US (ANES 2016), and have conducted preliminary analysis of Germany (EVS 2017). We will extend the comparison to the UK, France, Sweden and other European countries after the EVS data release in July.

Conventional strategies for studying populist attitudes compare voters of populist and non-populist parties. This strategy is, however, less suitable for analysis of two party systems like the US and UK. The relational methodological strategy we adopt allows comparison of populist voters within and across parties. It also allows us to study the formation of populist clusters over time. Building on recent theoretical innovations we operationalize Brubaker's (2017) two-dimensional conceptualization of populism, measuring anti-elite sentiment, and attitudes regarding national membership. In both the US and Germany, we find six analytically distinct classes, two of which are populist, comprising a third and 21% of the electorate respectively. In both cases the latent classes we identify are powerful predictors of a variety of social attitudes, and allow a series of interesting comparisons. For example, right-wing populists in the US are one of the most religious groups, however right populists in Germany are among the least religious. Additionally, there is little difference in policy preference between the populist and non-populist Republican clusters in the US. Rather the cleavage is primarily fueled by emotional rather than ideological factors.

The Impact Of Populist Attitudes On Electoral Behaviour. The Case Of The Czech Republic and Germany

Dvořák, Tomáš

Charles University, Prague, Czech Republic
dvoraktom[at]atlas.cz

The aim of the paper is to analyse the effect of populist attitudes on electoral behaviour. The existing research suggests that having populist attitude is a strong and significant predictor of electoral and voting behaviour. For example those, who hold populist attitudes are more likely to support and vote for populist parties. This finding has been demonstrated mainly in country specific studies with few analyses from comparative setting. This paper focuses on the effect of populist values on vote choice in national elections in the Czech Republic; and to provide a reasonable comparison also in Germany. The empirical analysis is based on two data nationally representative sources: German post-election cross-sectional GLES and Czech survey on populist attitudes. Analysis shows that the effect of populist attitudes on party choice is not simple. In Germany populist attitudes are associated with vote for AfD, albeit only in Eastern Germany. In addition, in the Czech republic populist attitudes are associated with vote for right-wing populist SPD, but not with centrist populist ANO. In the case of ANO it is hypothesized that the effect is not significant either due to centrist nature of the party or due to the fact the party has been more than one electoral cycle in government, part of establishment which has mitigated the effect of populist attitudes. The analysis thus demonstrates the effect of populist values on party choice, however, it also shows the effect is not universal/general and may be contingent on populist party ideological position (left, centrist, right) or whether populist party is in power. The paper contributes to the research of the effect of populism on electoral behaviour.

The Populist Radical Right in Europe: A "Populist Post-Fascism"?

Loch, Dietmar

Université de Lille, France
dietmar.loch[at]univ-lille.fr

With the rise and the establishment of political parties such as the French Front or Rassemblement national, the Austrian FPÖ or the Hungarian Jobbik, the populist radical right has moved from the margins to the center of (not only) European politics and societies. More as a single issue movement against migration, this complex phenomenon has revealed its economic, cultural and political profile. Relative deprivation, cultural difference and political alienation have tried to explain it keeping cultural identity as political core and as success filter for this movement. Globalisation and denationalisation stressed this still more, when the radical right has reflected the economic, the migration and the "crisis" of democracy. Furthermore, cleavage theory underlined the social dynamics of nativist politics and allowed to compare national differences on a similar European background. Finally and terminologically, the renaissance of the extreme right after World War II met in its "third wave" populism and has recently transformed completely into this concept neglecting the ideological differences between its left-wing and its right-wing forms. Given this larger dimension of the radical right and of populism in space and in time, historical sociology will lead this proposal in order to analyse this phenomenon between national boundaries and globalization and between historical fascism and the renaissance of globalized forms of authoritarianism. Can the populist radical right be considered as a "populist post-fascism"?

RN32_07b | Discursive Articulations of the Social

The Social Renegotiation of German Conceptions of Asylum and Human Rights in Response to the "Migrant Crises" of 1992/3 and 2015/6

Rogenhofer, Julius Maximilian

University of Cambridge, United Kingdom
jmr217[at]cam.ac.uk

This paper examines the political actors, discourses and practices underlying two sea changes in the asylum framework of the Federal Republic of Germany, namely the "Asylkompromiss" ("asylum compromise") of 1992/3 and the legislative response to the so called "refugee crisis" of 2015/6. In both periods rapid increases in the number of migrants arriving in Germany were interpreted as a social problem to be resolved by means of legislative amendment, in interconnected parliamentary and media debates. Both reconceptions of the country's response to the social problem of increased irregular migration focussed narrowly on the right of

asylum, which is originally sought to protect only politically persecuted people. The paper analyses why, in both cases, the requisite majority of parliamentarians in the Lower House of the German Parliament (Bundestag) opted to narrow German asylum law rather than addressing the transformations of society brought about by migration directly, either by enacting an immigration law (which would follow two years later, in December 2018) or through targeted laws aimed at victims of civil war, state collapse, extreme poverty and environmental catastrophes. The theoretical approach of this paper addresses the adverse implications of the capture of social bargaining processes by political actors leveraging the notions of "crisis" to problematise social phenomena and "Handlungsfähigkeit" (the government's perceived ability to act decisively) to eliminate alternative negotiation outcomes. In light of these two notions, constraints emerge on how political actors can creatively (as conceived by George Herbert Mead) respond to societal transformations.

Anti-Muslim Racism In Israeli And German Public Discourses: Manifestations On Local, National And International Levels

Schmidt-Kleinert, Anja

Philipps-University Marburg, Germany
anja.schmidtkleinert[at]staff.uni-marburg.de

The so-called "refugee crisis" of 2015, as the major influx of Syrian civil war refugees and asylum seekers from North Africa is often referred to, has added fuel to the fire of "hate parties" (Western) Europe-wide, e.g., the AfD in Germany, the FPÖ in Austria, the Front National/ Rassemblement National in France, Wilder's Partij voor de Vrijheid in the Netherlands, or the Yisra'el Beitenu in Israel. Most of these political parties put a particular emphasis on anti-immigrant, or, rather, anti-Muslim-related issues, drawing a threat scenario of "Islamisation". By doing so, they have been able to link their rhetorics to racist, or, anti-Muslim stereotypes of the majority populations, and increasingly dominate public and political discourses. In the suggested paper, I will look at the presentation of a threat of "Islamisation" in public discourse as a means of symbolic boundary-making in two exemplary case studies, Israel and Germany. Central questions here are: first, how a threat of "Islamisation" is presented on the different societal levels (local, national, international) and, second, how threat is linked to (anti-Muslim) racism in both countries. The suggested paper is based on the secondary analysis of data collected in two independent research projects. For the Israeli case, the data base are in-depth interviews with activists in the Yisra'el Beitenu party. The German case study is based on social media communication. By using a sociology of knowledge approach to discourse studies, the material of both case studies allows the examination of a perception of threat in public discourse.

Communicating Mobilisation and Resistance: The Rhetorical Dimension of Radical Movements and Protest across Periods of 'Newness'

Charalambous, Giorgos

University of Nicosia, Cyprus
giorgos.charalambous[at]gmail.com

This study is a section of an ongoing book project under contract with Pluto Press, which attempts to draw historical parallels between different periods in the twentieth and twenty-first centuries when the radical left as a political family in Europe has manifested itself in ways that have been conventionally considered as 'new'. The purpose is to bring into light continuities and discontinuities between different historical instances of radical politics. The book compares social movements and parties on the radical left space in Europe across three decades – the 'first new left' of the late 1960s to the late 1970s, the mid-1990s to the early 2000s global justice struggles (GJM), and the post-2008 anti-austerity and pro-democracy mobilisations. 'Newness' is assessed across distinct analytical levels concerning ideas and claims, rhetoric and communication, and organizational form. The study proposed here, intended as a chapter of the aforementioned book project devoted to the evolution of radical rhetoric across time, asks if and how the post-2008 social movements and protest events associated with the European radical left can be seen as distinct from those of the 1960s/70s and the GJM in Europe, in terms of communicating mobilization and resistance. The overarching theme of the study is how left radicalism has (re) casted and (re) framed its struggles. The analysis looks in particular at two elements of radical rhetoric: first, how the movements and protesters cast themselves, that is projecting the movement's image to the public at large through slogans, banners and a number of other real or virtual communication tools and performances; second, the use of discursive schemas, binaries, trichotomies or more complex language, as utilised to communicate ideological messages.

Mediated Misogyny: the communicative politics of #BoycottGillette

Pertwee, Edward James

London School of Economics, United Kingdom
e.j.pertwee[at]lse.ac.uk

One important component within the contemporary resurgence of far-right politics is antifeminist 'men's rights' activism. Linked through extensive online networks, men's rights activists (MRAs) have been implicated in notable episodes of organised misogyny, such as the 2014 'Gamergate' campaign of targeted harassment against female video games developers and journalists. Despite a growing literature on the politics of antifeminist backlash, the role of both new and traditional media in mobilising male anger and resentment remains comparatively under-researched. This paper will

explore the dynamics of antifeminist online action through a case study of one recent episode of contention: the online mobilisation against shaving company Gillette's 2019 advert 'The Best Men Can Be'. Intended by the company to promote a more positive model of masculinity, the advert was strongly criticised by MRAs and related groups for what they saw as its 'anti-male' message. Drawing on a unique dataset of 40,000 tweets collected from Twitter in the aftermath of the advert's release, the paper will examine the key actors involved in the online mobilisation against Gillette, and the ways in which they and their opponents sought to frame the advert. The paper will also explore the way in which the anti-Gillette mobilisation was covered by the traditional media. In doing so, the paper will contribute to wider debates about the respective roles of new and traditional media in fuelling support for reactionary politics.

RN32_08 | Governmentality and Society (II)

Coalition Building And Distortion: New Evidence About Legislative Networks In Ukraine, 1993-2018

Brik, Tymofii (1); Mylovanov, Tymofiy (1,2); Ostapchuk, Dmytro (3); Nadelnyuk, Oleksandr (4)

1: Kyiv School of Economics, Ukraine; 2: Pittsburgh University; 3: DataRobot; 4: VoxUkraine
tbrik[at]kse.org.ua, mylovanov[at]kse.org.ua, ostapchukvox[at]gmail.com, s.nadelnyuk[at]gmail.com

Most recent studies in political science have recognized that legislative outcomes are often influenced by social networks. Legislators are influenced by their social ties, reciprocal relationships, information flow in the networks, peer pressure, and homophily effects (i.e. preferential attachment – to behave similarly to those legislators that share relevant social traits). Most of the existing studies, however, are focused on Western democracies. Surprisingly, little is known about legislative networks in other parts of the world. We analyze a novel dataset covering co-authorship and voting of Ukrainian legislators from 1993 till present. First, our data suggest that in Ukraine, in contrast to Western democracies, co-authorship and voting are not aligned. Second, we show that homophily effects and centrality measures are more important for voting but not for co-authorship. Third, we analyze specific cases of distortions when legislators flip and do not vote for those bills which they co-authored. We argue that these cases are indicative of coalition distortions. Our contribution to the literature is twofold. While previous literature tends to analyze voting or co-sponsorship in isolation, we analyze them together. Second, we shift empirical analysis from the success of a given bill to the success of a coalition.

World Politics on Migration and Inequalities in the EU

Aksakal, Mustafa

Bielefeld University, Germany
mustafa.aksakal[at]uni-bielefeld.de

Migration has been associated on diverse societal levels with the (re)production of inequalities. This paper addresses world politics on migration as a process that might (re)produce inequalities among migrants. Although world politics emerge beyond the nation-state it reflects existing power constellations and might have next to manifest also latent functions, potential producing paradoxes and inequalities on lower societal levels linked to the following question: what are the latent functions of current world policies on migration and in which ways are these politics producing inequality-related in the EU? From international political sociology viewpoint, I focus on the Global Compact on Safe, Orderly and Regular Migration (GCM) and argue that the framework has the potential to produce global governance paradoxes' especially in the interaction with member state policies in the EU which has also unfavourable inequality-related effects on migrants. Drawing on 40 qualitative expert interviews from diverse civil society organisations in sending and receiving countries, it is contended that although the GCM represents the first comprehensive legal framework for the protection of migrant rights, it has also important limitations. This has to do with several latent functions linked to economic and security rationales of more powerful actors within the GCM community. The results indicate that these latent rationales and functions contribute to inequalities among migrants with certain characteristics in the EU. Certain migrants obtain more rights due to the GCM framework, which is occurring at the cost of many others. The findings indicate that social mechanisms such as social exclusion, exploitation, increasing discrimination, political categorisation and hierarchisation of migrants are propelled which contributes to increasing inequalities in the EU.

Theorizing Justifications in Political Rhetoric in the EU and beyond

Rautajoki, Hanna

Tampere University, Finland
hanna.rautajoki[at]tuni.fi

Epistemic Governance meets Ethnomethodology: Theorizing justifications in political rhetoric in the EU and beyond In the world of nation states with parliamentary systems and subsequent practices, political governance predominantly operates through the logic of political persuasion (Alasuutari & Qadir 2014). In decision-making, the policymakers have to gain sufficient support for their suggestions by appealing to the conceptions, aspirations and ideals of fellow policymakers, stakeholders and citizens. This persuasion acts upon three aspects of the social world: (1) ontology (2) identifications and (3) norms and ideals (ibid.). My postdoctoral research project (European solidarities in turmoil, Academy of Finland, 2018-2021) concentrates on investigating and theorizing the relevance of the latter two. The value of rationality is all but

one striving asset in political rhetoric. What matters in the world of modern imaginaries are also the identifications among actors: the questions of who we are and how we relate to each other in the course of our actions. This is what I call the relational scaffolding of epistemic work in political persuasion. Identities are multifold and they are deployed reflexively and strategically in political rhetoric. To elaborate the details of epistemic governance processes I apply the insights from ethnomethodological theory on social interaction. I mobilize the concepts of recipient design, membership categorization, positioning and reciprocal relations to explicate how discourse, agency, identification and power function in the game of political justifications. My empirical case is policymaking discourse in the EU but my claims about the constitution of modernity extend well beyond Europe theoretically.

Classification Struggles in Post-socialist Serbia: Elite Discourse on Personal Socio-economic Success

Petrović Trifunović, Tamara

University of Belgrade, Serbia
evena304[at]gmail.com

Relying on Bourdieu's concept of classification struggles (Bourdieu, 1984; 1989), in this paper I explore elite discourse on personal socio-economic success during the post-socialist transformation of Serbia. Classification struggles involve efforts by social agents to impose their own criteria of evaluation and ranking of people and practices. The stake in these struggles is the monopoly of legitimate social classifications, which are the basis of representation of social groups and ultimately of their mobilization and demobilization. Critical discourse analysis (Fairclough, 2003) is conducted on the corpus based on the weekly newspaper Vreme's 2006-2009 survey in which 324 representatives of the political and economic elite (CEOs, high-position advisers, economic experts, political officials, etc.) were asked to define "winners and losers of the Serbian transition". Analysis sheds light on the attempt of members of the higher strata to anchor their status achievement to socially legitimate values and merit principle (individual initiative, courage, ambition, etc). Many instances of the analyzed discourse exemplify how the winners were represented as young, educated, hardworking people, full of initiative, ready to take risks and adapt to new circumstances. Losers, on the other hand, were described as static, confused, impractical people who have "failed to take their fate in their own hands", coddled by the paternalism of socialism. This shows how transformation of social order in Serbia was accelerated by discursive work on translating social inequalities into the matter of personal (in)competence, taken up by members of the elite in their struggle to impose the legitimate principle of vision and division in society.

RN32_09a | Examining Populism (II)

Populist Discourse on Political Representation: Case Study of Lithuania

Ulinskaite, Jogile

Vilnius University, Lithuania
jogile.ulinskaite[at]tspm.vu.lt

If populism is understood as expressions of the peoples' will and of an antagonism between the people and the elite (Mudde, 2004), a direct unmediated link between representatives and represented is implied. Nevertheless, classical (Pitkin) as well as contemporary (Lefort, Ankersmit, Urbinati) studies of political representation claim that the distance between represented and the representatives is necessary for political representation. Moreover, populist political parties participate in the process of political representation through political elections. Therefore, it becomes especially relevant to consider how populist political parties understand and define political representation. An empirical study has been conducted on Lithuanian populist political parties' interpretation and definition of political representation. Research data consists of party election manifestos of 2016 and articles on populist parties' websites (period of April 2016-September 2017). The analysis focuses on how populist political parties interpret and define who are to be represented and who are to represent. The empirical research reveals that the populist political parties attempt to both avoid and to improve political representation. On one hand, their conception of political representation is partly in line with the principles of party representation. On the other hand, they define representation through references to common moral values, professionalism and constant communication. These three measures are aimed at creating a common political identity between and the represented and themselves. Common political identity "resolves" the distance between represented and the representatives.

How do Transnational Populist Parties and Leaders frame External and Internal EU Borders?

Lamour, Christian

Luxembourg Institute of Socio-Economic Research,
Luxembourg
christian.lamour[at]liser.lu

The construction of the EU is based on the freedom of movements. It has supposed a physical de-bordering process within the EU while a policy of bordering has been conceived for the external border of Europe. The representatives of populist parties have been at the forefront of territorial re-bordering policy aiming at protecting a "pure people" threatened by a so-called "global elite" and multiple external

flows. Yet, there has been little academic attention paid to the border as a material and discursive resource used by populist parties and leaders to shape a transnational agenda. The goal of this contribution is to address transnational populism in Europe by focusing on state borders. We might expect different discourse by populist representatives depending on the type of flows crossing the borders, the origin and destination of these flows and the scale at which the state territorial border is considered. Populist leaders such as Viktor Orbán can share the league of leagues for the defense of borders manifesto proposed by Salvini when they consider the current "Migrants crisis". They can collectively built-up a pan-European populism on a Fortress Europe agenda. They can also collectively worry about the closure of some internal borders of the EU for their fellow citizens as proved with the current Brexit situation. Furthermore, they can see potentially negatively cross-border political initiatives taken by some of them putting at stake the territorial integrity of their respective state such as for instance the decision of Viktor Orbán to give the Hungarian citizenry to the Hungarian communities living in neighboring countries. There is a need to investigate the importance of state-border in the definition of pan-European populism.

Why No Populism in Portugal?

Lessons from Lisbon

Carreira da Silva, Filipe

Universidade de Lisboa, Portugal
fcs23[at]ics.ulisboa.pt

This paper proposes a new approach to populism as a logic of social and political action - the logic of resentment. This logic is taken to help organise contents (ideology, discourse, forms of mobilisation, etc.) in a distinctive manner by pitting one part of the people against another part in the name of a future, reconstituted "people". Methodologically, Portugal is conceived of as a negative case. Our argument is that the performative articulation of the populist logic of resentment by Portuguese political agents failed to translate into electoral success between 2011-2015, the same period in which Podemos in neighbouring Spain achieved its most significant electoral results, has a lot to do with local politics in the capital, Lisbon. Long run by a broad left-wing coalition, soon to be replicated at the national level (the PM is the former Lisbon mayor), Lisbon can be seen as functioning as a political and social antidote to the politics of resentment that fuel populism.

Superordinate Intersectionality - Putting Identity Politics in the Study of Right-wing Populism

Norocel, Ov Cristian

Université Libre de Bruxelles, Belgium
cristian.norocel[at]ulb.ac.be

From the US to the northernmost corners of Europe, right-wing populism is making deep inroads into the mainstream political landscape. Despite a flourishing scholarship on the topic, to date there are few explanations concerning the intricate workings of right-wing populist paradoxes: privileged white politicians (mainly men) proclaiming themselves the true voices of white working class (men and women) against the remote and corrupt elites that open the national borders to threatening migrant Other (men) and endanger the cultural (and racial) distinctiveness of their nation in the name of globalization. With this in mind, the present contribution aims to bring identity politics in the study of right-wing populism, and argues in favor of superordinate intersectionality as an analytical perspective to address these paradoxes in examining right-wing populist discourses. Such an approach scrutinizes the interactions between several axes of difference and inequality: gender (masculinities); social class (elites); and race (whitenesses). These theoretical articulations are illustrated with examples from the US, as well as from Europe.

official ostracism, persecution, and repression. Contemporary Russian elections are stripped of any ideological orientation. At present, the Russian policymakers consider an ideology as non-essential, while dissension is still considered dangerous. Consequently, today's ideological constructs become illusory and more disproportionate to the real tasks, values, and interests of a majority of citizens. Most voters are ill-informed about party and pre-election programmes that use conservative, social and democratic and liberal slogans. However, the study shows that, on the one hand, elections in contemporary Russia remain an essential political institution. This is proved by high voter turnout and the participation of opposition parties and leaders. Nevertheless, the effective democratic component is weak and largely formal.

When There Is No Choice: Electoral Preferences of Russians In Times of Ideological Uncertainty

Trofimova, Irina (1); Morgan, W. John (2);
Kliucharev, Grigorii (1)

1: Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation; 2: Wales Institute of Social & Economic Research, Data & Methods, Cardiff University
itnmv[at]mail.ru, morganj74[at]cardiff.ac.uk,
kliucharevga[at]mail.ru

The study analyses the electoral preferences of Russians who participated in the 2016 parliamentary and 2018 presidential elections. The empirical basis is derived from the data of nationwide monitoring carried out by Federal Centre of Theoretical and Applied Sociology of the Russian Academy of Sciences over 2014-2018. The sample comprised 4,000 persons (aged 18 and over) and was representative of the adult population in terms of gender, age, education and type of settlement. As the study shows elections in modern Russia may be described as "elections without choice". This is why contemporary Russia resembles the Soviet Union. But the main difference is that the Soviet elections had Communist ideology as the basis, and those with dissenting opinions suffered

Interest Group Systems In Post-Communist Environment: Informal Relations And Inequality Of Access To Policy Making

Kanevskii, Pavel

Lomonosov Moscow State University, Russian Federation
kanevskiy[at]socio.msu.ru

Interest group systems, as introduced by Almond in 1958, describe how articulation of organized political interests take place in various societies, how are these interests transmitted to decision making and translated into public policies. Almond specified that particular difference existed between Western and non-Western interest groups systems, referring among other examples to communist countries' experience when interest groups were controlled by the state and used to mobilize citizens in order to support the government. Three decades after the fall of communist regimes, relations between decision makers and major organized groups in Central and Eastern European states are still dependent on the government and to different extent are dominated by cronyism, informal ties and nepotism. Only limited number of interest groups enjoy privileged access to policy making which provokes inequality of access and halts further development of interest group systems. These problems have been inherited by post-Soviet states as well as new member states of the European Union from Central and Eastern Europe. As a rule, despite initial progress in setting mediation institutions there have been dramatic drawback since the beginning of illiberal and populist wave. Europeanization didn't have a notable effect on integrity and openness of interest groups systems among new EU members states because informal networks used to lobby their interests do not work on supranational level. Nor have these systems been able to introduce efficient corporatist mechanisms of interest representation, which is why Ost called it "illusory corporatism". More democracy and proactive civil society, less expansive and inclusive state, anti-corruption measures, understandable rules and change of behavioural attitudes should be the core of policies aimed at changing the tenacious legacy.

The Role of Polish and Russian NGOs in Lithuanian Civic Society: State Policy Measures and Attitudes of NGOs Leaders

Frėjutė-Rakauskienė, Monika

Lithuanian Social Research Centre, Lithuania
monika[at]ces.lt

The paper addresses the questions of the role of ethnic civic organizations in the Lithuanian civic society; what are the mission of these organizations and how state institutions aim to strengthen national minorities' civil society. The paper also discusses how changing geopolitical context after the Ukrainian and Russian conflict in 2014 has been reflected in public attitudes and state policy towards ethnic minorities groups in Lithuania. Russians and Poles are the most numerous ethnic minorities groups in Lithuania and they are represented by several political parties and a number of civil society organizations. These organizations unite active members of ethnic communities, who articulate issues that are seen as important and relevant to the Polish and Russian ethnic groups. The civic society in the democratic states is seen as the platform for representation of different social perspectives and consolidation of society groups which experience structural inequality (e.g. Young 2000). In Lithuania, these minority NGOs mostly focus on organization of cultural events, they target local Poles, Russians and Russian-speakers and only in rare cases orient their activities towards the society at large. The main body of these organizations consists predominantly of individuals of middle- and older-generation; these individuals form the main audience of their activities as well. The paper is based on the analysis of qualitative data collected in NGO sector and interpretation of state policy towards national minority NGOs.

Gender Differences in Reported Relationship between Spouses' Housework Hours and Relative Income

Syrda, Joanna

University of Bath, United Kingdom
j.e.syrda[at]bath.ac.uk

Conceptions of gender may shape not just actions, but perceptions and reporting. This article takes a new approach to housework and gender by examining differences between males and females in how they respond to survey questions about both, own and spouse's housework, in the context of wife's relative income. Fixed effects regression results using 1999-2015 waves of the US Panel Study of Income Dynamics dataset (n=6,229) show a significant asymmetric effect of gender norms on the spouses' reporting behavior. When wives are earning relatively higher income, thereby deviating from the gender norm, husbands report lower own housework hours and higher housework hours on wife's behalf. This is consistent with gender deviance neutralization (and/or masculine overcompensation) theory. However, when wives report spouses' housework hours, the relationship follows the bargaining-exchange model. Identified clear gender differences in reported relationship between housework and relative income are interesting in themselves and have practical research implications, including possibly explaining conflicting empirical results found in previous research. Plausibly, the mixed findings stem from the changing composition of female and male respondents. Results presented in this study suggest that housework data is profoundly affected by gender differences in reporting and this is not a simple linear bias.

Money Management and Gender Equality: An Analysis of Dual-Earner Couples in Western Europe

Cineli, Cemile Beyda

Universitat Pompeu Fabra, Spain
beyda.cineli[at]upf.edu

Using data from ISSP "Family and Changing Gender Roles" 2012 module, we do a cross-sectional analysis in order to examine the dynamics behind the non-traditional money management systems (joint and individualized money management) used by 25-45 age group dual-earner couples. We explore whether the changing patterns of employment and changing ideologies and discourses of gender have resulted in more egalitarian ways of handling money among couples in intimate relationships. The novelty of this paper lies in taking into consideration both the joint and the individualized system which is relatively less explored and covering both married and cohabiting couples. Although gender inequalities persist in joint and individualized systems, both are more egalitarian than the traditional breadwinner system where only one partner –usually male –manages all the household income. Individualized system -which is a rather newer way of managing money for couples-is more associated with gender egalitarian values; it is preferred significantly more by respondents who express relatively more egalitarian ideologies of gender and, finally, in relationships where males are older or earn significantly more money than their partners, the likelihood of switching to non-traditional systems (joint / individualized) is lower. Keywords: Gender Inequalities, Intimate Relationships, Household Economics, Family Sociology, Gender Arrangements.

Employment Guarantee Schemes: Their Role in Marital Negotiation of Work in India and Bangladesh

Olsen, Wendy Kay

University of Manchester, United Kingdom
wendy.olsen[at]manchester.ac.uk

In north central rural India and rural Bangladesh, we find women both trapped at home and subject to the strong pattern of male circular migration. 15% of women are head of household (2015/6 field surveys). Breaking down patterns of government “100 days” employment guarantee at local level we find both village-wise and class-wise patterns. The talk explores the patterns using semi-structured interviews (2015/6) and multilevel modelling. First we found women of higher class not utilising the employment guarantee; on the other hand, those with access to cash could afford the bribe needed to enter the scheme. Applying gender-and-development theory we offer a nuanced class approach at the household level to distinguish which women in each country obtained the advantages of “100 days” or cash-for-work employment guarantee. Second we found women and men sharing in strategies of work and task management. Tragic poverty situations were associated with ill health and outmigration, as well as widowhood and the migration of the next generation on a more permanent basis to towns. Lastly, we discuss the different gender dynamics in predominantly Muslim Bangladesh and predominantly Hindu north central India. Our treatment of discourse differences allows us to gauge the role of social norms, social change, and two contradictory pressures. On the one hand: be modern. On the other: be conservative and hence trustworthy. Women deal with these pressures in many ways. We explore discourses used by both men and women for dealing with these norm conflicts over work allocation. Women’s paid work is very important both at symbolic and discursive levels, and economically.

participate less in the labour market and are less likely to socialize themselves outside their household. Using Colombian National Survey of Time Use (ENUT-2016/2017), we provide empirical support to show that the distribution of time between couples acts as a mediator between individual factors, both objective (type of union) and subjective (perception of gender roles), and the two defined outcomes for women. Our empirical strategy uses an original mediation model supported by specific logistic regressions. From the perspective of public policy, our results demonstrate that women’s social and labour participation must be analysed under the prism of individual and collective dimensions. The orientation of public policies could be adjusted since it would be evident that Colombian policies focused exclusively on women’s individual characteristics must necessarily be reinforced by actions that also take into account the distribution of time and ultimately, the household as the intervention unit.

Household Time-Use Or Individuals Characteristics To Increase Women’s Participation? Evidence From Colombia

Vernot López, Michelle Camile

University of Barcelona, Spain
michelle.vernot[at]uexternado.edu.co

This article seeks to clarify the complex relationship between the distribution of time within the home, socio-psychological individual factors and crucial outcomes for women: participation in the labour market and their construction of social bridges. The literature on the determinants of the gender gap in terms of social and labour participation is rather extended and continues to be part of the current debate on gender inequality and unpaid domestic work. Like other developing countries and in conformity with international institutions’ goals, Colombia has implemented different strategies to overcome this burden. However, women still

Understanding Migrants' Negotiations Of Masculinity Through Intersectional Lens

Wojnicka, Katarzyna (1,2); Nowicka,
Magdalena (2)

1: University of Gothenburg, Sweden; 2: German Center for
Integration and Migration Research (DeZIM)
katarzyna.wojnicka[at]gu.se, nowicka[at]dezim.de

Migration triggers significant changes in gender norms. Migrants might be faced with unfamiliar value systems and feel impelled to renegotiate their own gender identity. Often, migrants are under social pressure to 'modernize' what culturally hegemonic (white) majorities consider migrants' 'backward' stances to gender equality and/or variety of sexual identities expressions. Many scholarly works follow this path and focus on supposed cultural distance between majorities and migrants and ask if and how this gap might be closed. New evidence suggests that male migrants might be less flexible than female migrants in terms of accepting and adopting more diverse ways of performing gender roles and sexual identities. We want to extend these narrow views on migrant masculinity and take the lens of intersectionality to understand how male migrants negotiate their own gender identity and performances when confronted with diversity of lifestyles and expressions related to ethnic, religious, gender and sexual identities of population in cities where they now reside. We draw on our ongoing research with intra-European and non-European migrants in Germany in order to address how their ethnic/racial and social backgrounds intersect with their gender identities and norms of masculinity. For example, we look at how catholic Polish men in Berlin negotiate their masculinity vis-à-vis a cosmopolitan gay community and/or Turkish and Arab men, or how young refugees from Muslim countries experience German lesbian secular lifestyles and/or feminist Turkish activists. Intersectional approach paired with focus on 'negotiated (gender/sexuality) order' (Anselm Strauss) helps us to reveal dynamics of masculine identities in migration.

Egalitarian Ideologies on the Move: Changing Care Practices and Gender Norms in Norway.

Isaksen, Lise Widding; Bikova, Mariya

University of Bergen, Norway, Denmark
lise.isaksen[at]sos.uib.no, mariya.bikova[at]uib.no

This paper explores the complexities and ambiguities in Norwegian families' interaction with the public childcare system. Public childcare is a cornerstone in established social policies that equalize children's upbringing and support gender equality. The dual earner/dual carer family model interacts

with fulltime participation in the labor market, gender equality at home and universal access to childcare. This social practice has made contemporary childhood mobile and multi-local. As part of their everyday organization of care, parents have to establish connections between home, work and childcare. Here we will introduce a newly coined concept; the concept of 'care loops',- to analyze how local families 'do' combinations of welfare services, family resources, gender ideologies and migrant care workers. Drawing on empirical research on Filipino migrant care workers in Norwegian families and discussing recent studies of majority families' care practices, the paper discusses the paradox that egalitarian norms and ideals might generate extra works loads in families with small children leading to demands for migrant care workers and creating geo-political inequality.

'Good care'?: Nannies and Au Pairs Negotiating Different Views on Care Anving, Terese

Lund University, Sweden
terese.anving[at]genus.lu.se

Working as a nanny or an au pair taking care of children is often seen as an easy job suitable for young women. While this for a long time has not been a common solution to care for children in Sweden it is today a growing market, making possible for parents to employ low paid often migrant women (see e.g. Eldén & Anving, 2016; Kvist, 2012; Widding Isaksen, 2010). Taking my point of departure in a research project in which the practice of care and has been studied from the perspective of all participating actors (nannies, au pairs, parents and children) I will in this paper analyse the nannies' and au pairs' narratives on what it means to be in a care situation with children: How do they relate to and form bonds with children while at the same time try to do care in a way that corresponds with both their own views on 'good care' as well as the parents'? There is, I argue, a tension between the parents' expectations of the care practice and the nanny's/au pair's understanding of what makes a care situation 'good' (comp. Macdonald 2010). But there is also a tension between the parents' views on what the caring relationship should be like and the actual practice of care that the nanny/au pair and the child are engaged in and the specific relationship that develops through this. To negotiate and handle these different and often contradictory views on care, that are also related to different structural positionings (see e.g. Anderson, 2000), is a difficult and delicate task that here will be explored further.

Transnational Care Obligations and the Political Economy of Care Work

Gábríel, Dóra (1,2)

1: Hungarian Demographic Research Institute, Hungary; 2: University of Pécs, Hungary
gabriel[at]demografia.hu

Hungary has historically and structurally strong ties with Austria, its Western neighboring country. In the last few decades, Hungary started to emit a significant number of live-in care workers to the Austrian elderly care sector, constituting the third biggest foreign group among live-in caregivers in the receiving country. Due to population aging, the demand on migrant care workers is gradually increasing in Austria. The paper examines the supply side of the phenomenon focusing on the unequal gender roles, transnational care obligations, and the assumed cost-benefit calculation of Hungarian live-in care workers employed in Austria. The interviews indicate that the decision about migration is often made on familial basis that confirms the validity of the theory of New Economics of Labor Migration, and the Household Economics model. The research method is based on sociological fieldwork, and a combined interview technique of narrative and half-structured interview method. The fieldwork was conducted in Baranya County, Hungary, and in Styria, Austria. The analysis contains 34 interviews. Hungarian care workers apply different strategies in order to provide care for their elderly parents, or children residing in the home country. However, the interviews demonstrate that the respondents do not count the emotional burden and physical distance from their beloved ones into the costs of their migration. They rather suppress their personal interests in favor of their family. The paper studies the gendered family economy aspects due to labor migration and shows the elements of coercion, and deep-rooted structural constraints in care migration.

RN33_01c | Feminist knowledge and theorizing: Opportunities and Dialogues

Bauman and Gender

Weil, Shalva

Hebrew University of Jerusalem, Israel, UNISA, University of South Africa
shalva.weil[at]mail.huji.ac.il

In 2010, I interviewed Zygmunt Bauman at length in his home in Leeds. Published excerpts of that interview were published in *European Sociologist* (2011). In this paper, I bring for the first time unpublished material from the same interview dealing with gender. In particular, I raise the important issue that I had posed in the interview: why does Bauman ignore gender in all his writings and particularly in his writings on the Holocaust? The question is particularly pertinent in that his own wife Janina was a leading female voice documenting the horrific mass killing of six million Jews and millions of others in history's

worst and inexplicable catastrophe, the Holocaust. In his book "Modernity and the Holocaust", Bauman viewed both the Holocaust and Communism as results of order-seeking modernity in a post-Enlightenment era, while arguing that modernity is in fact 'liquid'. While dealing with "modern" syndromes, such as fleeting conjugality, computer problems and even reality shows, Bauman totally disregards gender. In his recorded interview, Bauman expressed his doubts about the feminist movement, and about women in general. When pressed about his avoidance of the subject of gender in society, he made a distinctly sexist joke, followed by a long speech on hunting and killing of animals, and the 'inhumanity' (sic) of women.

Peer Review As Issue Of Critical Gender Research

Sagebiel, Felizitas

Bergische University of Wuppertal, Germany
sagebiel[at]uni-wuppertal.de

Networking in combination with peer reviews influence the construction of scientific excellence. The paper will show how gender bias is intertwined in this process. Peer reviews or assessments are very important in scientific communities and institutions of higher education. There is a general belief in academia that publication in a peer-reviewed journal shows a higher qualification and scientific excellence than a publication in a journal without peer review or in books. What is nearly never considered is the integration of scientists and reviewers in relevant networks, questioning the principle of meritocracy. Even though mostly informal men's networks play an important and powerful role in the evaluation system of science they are not considered as biasing objectivity of results. In these networks of so-called gender-neutral journals, women participate still less in comparison to men. If female scientists would send an equal number of papers, they would have a less probability for publication. The results are that in the same field male scientists would seem more qualified in comparison to female scientists. In recruitment processes for positions of full professors to measure qualification of scientists, peer reviews are obligatory. People in academia think that this procedure is the best measure to find the best-qualified scientists for positions as professor and that this measure is objective, but it is not. The selection and outcome of reviewer are not objective, even though this has been the rationale of this procedure. Feminist sociology should focus these gender biases in global future gender research.

(Inter-)disciplinary Boundaries: (In)accessibility to Feminist Knowledge and its Production through the Educational Offer of Gender Studies at Swedish Universities

Haru, Ashley Elisabeth

Uppsala University, Sweden
ashley.har[u]@edu.uu.se

Contemporary gender research critically tackles a variety of complex topics through intersectional and interdisciplinary lenses and necessarily engenders the continuity of feminist knowledge production and discourse. However, educational accessibility to the analytical tools of the (inter-)discipline is fundamentally crucial not only to feminist knowledge production but is also, from a feminist perspective, pressing in the fight to eradicate social/ethnic/racial, etc. inequalities in society at large. Yet, how accessible is this particular type of knowledge and where, institutionally, geographically and disciplinarily, does one access it? And ultimately, who is it that is able to access it? This presentation aims to address these questions and examines the (in)accessibility of Gender Studies in Swedish higher education from 1993-2017. Sweden is often considered internationally as a bastion of gender equality and social progressiveness, yet today nearly all programs and research centers, and the majority of gender studies courses tend to be located at the older, more prestigious universities in Sweden. Using Multiple Correspondence Analysis, it is possible to investigate the (inter-)disciplinary boundaries of gender studies and the barriers of access to feminist knowledge and production in Sweden. Structural patterns and divisions are examined regarding where all programs and courses related to gender studies between 1993-2017 were located - across disciplines, institutions, and rural/urban areas - as well as the patterns and divisions regarding the gender and social background of the students who took these programs and courses. Higher education broadly is often seen as a vehicle for change and social progress, but questions of accessibility, (inter-)disciplinary organization and who has access to particular kinds of knowledge necessarily has implications for knowledge production and struggles against systemic inequalities.

RN33_02a | Economic Relations: Work, Gender Equality and Empowerment

Gender And The Professional Experience Of Women Working In IT sectors. Results Of Research In Polish Context

Tobiasiewicz, Edyta

Jagiellonian University, Poland
edytatobiasiewicz[at]gmail.com

The aim of my lecture is to present the results of a study carried out in 2019, focusing on the issue of gender as a category differentiating professional, and educational experience women connected with IT sectors. Studies to date (Glass et al., 2013) show that women give up education and STEM-related careers significantly more often than men, despite the same competencies in hard sciences (Stoet and Geary, 2018). This phenomenon occurs most often in the first years after starting education or professional work. In my presentation I will characterise the significance of gender in IT fields, outline the main barriers, obstacles and challenges faced during professional career development in corporations reported by women. I will present the scope of duties and tasks performed, access to power in organisations, as well as limitations and possibilities of vertical mobility. The analysis of respondents' experiences will take into account the context of wider organisational structures. I will pay attention to the significance of working environment and factors supporting the sense of belonging to IT sectors. Due to the exploratory nature of the study, qualitative methodology and semi-structured individual in-depth interviews (IDI) with elements of biographical survey were used. The respondents comprised 10 women representing the IT scientific community of one of the largest technical universities (students and lecturers). And also 10 interviews, with women's employed of a major IT corporation in Poland, in the positions of specialists, leaders, but also subordinate.

Challenges and Strains in Couples' Dual Career Management: The Persistent Impact of Gender at the Work Place. Empirical Evidence from Austria.

Mauerer, Gerlinde

University of Vienna, Austria
gerlinde.mauerer[at]univie.ac.at

Based on qualitative research in Austria (Mauerer 2018) I will present empirical research results on parents' challenges and strains in managing the reconciliation of their career and family life. The results indicate the persistent power of traditional, male-dominated sex-gender-relations especially at the work place. Although reformed family policies in Austria have aimed at overcoming binary gender codes in parenting and careers by including partnership-oriented childcare benefits, effects still seem to be limited at parents' workplaces. The presented results derive from the following research projects: (1) qualitative-interpretative data deriving from two research projects on men's realization of (long-term) parental leave in Austria (36 interviews with men on parental leave in Austria (2013-2014), and (2) two follow-up studies on female partner's perspectives (12 interviews with female partners of men on parental leave, 2015), and parental part-time work (14 interviews with male and female parents, 2016). Although individual couples strongly aimed at overcoming traditional gender barriers in managing their career and family life, their support at the work-place was weak in terms of going beyond traditional gender attributions in parenting. Moreover, the results revealed a higher level of gender equality in couples and families with a good financial background. This fact revealed a further, transnational gender impact, as many parents referred to informal female household help. Concluding, long-lasting effects of economic power (inheritance, education, subsequent income conditions) and gender influences were identified, indicating several flaws in consistently promoting gender equality (with a focus on parental dual career management). Images of being a loyal worker and/or a responsible parent still entail a high gender impact and the perpetuation of gender disparities in men's and women's labor force participation.

Entrepreneurship and Women Empowerment: A Case Study of Women Entrepreneurs from Urban Nepal

Gautam, Tika Ram (2); Mahat, Rojina (1)

1: Tribhuvan University, Nepal; 2: Tribhuvan University, Nepal
gautamtr[at]cidsatu.edu.np, rojinamahat2040[at]gmail.com

In recent days, women have access to small entrepreneurship, which is new phenomena, even in the urban peripheral part of capital city of Nepal. This paper aims to explore how the women from different social background have entered into

such entrepreneurs so that they have been able to enhance their socio-economic status which empowered themselves. In order to explore the role of entrepreneurship in empowering women 35 women from different social background were purposively selected and were interviewed. The data show that the women engaged in entrepreneurship were mostly married and they entered into this business after their marriage. They got both financial and moral support from their family as well as their friends. Women were working very hard spending 70% of their time for their entrepreneurship. Among them 86.02% women were spending more than 8 hours in their entrepreneurships. It is interesting to note that two third of the women entrepreneurs are from nuclear family who spend more time in their business compared to women from joint family. The findings of the study reveal that women entrepreneurship and women empowerment are complementary. The women were empowered themselves and were positive towards entrepreneurial activities after their involvement in their entrepreneurship. They expressed that their participation in entrepreneurial activities has empowered them in the social, economic and cultural fields. Power and access to decision making capability of women has increased at household and community level activities and they were more self-confident than before. Thus, involvement of women in entrepreneurship ultimately empowers women through improving socio-economic status and enhancing capability.

It's not all 'bout the Money: Making Profit on Gender Equality

Petersson McIntyre, Magdalena

University of Gothenburg, Sweden
magdalena.petersson[at]cfk.gu.se

Gender equality is increasingly related to matters of economic growth. What does it mean to think of gender equality as a market and what are the consequences of such a development? Drawing on fieldwork from a gender consultancy firm and in-depth interviews with consultants, this article examines the development and negotiations concerning concepts and standpoints of gender that are involved in the process. The last decade has witnessed a substantial growth in the gender consultancy field, especially in Sweden. Partly it is a result of the spreading of feminism. The development of a market for gender equality stems from three different processes. The first is an idea increasingly heard in public debate, namely that gender equality is 'good for business' or 'profitable'. The second process is the marketization that stems from what is often termed neoliberalism and can be observed in many areas of society and public administrations. The third process is related and involves precariousness in the labour market and an encouragement to turn passions into entrepreneurship, a call that often targets young women and detaches subjects from job securities (Scharff 2016). The paper argues, however, that the talk of gender equality in economic terms, and the growth of this consultancy industry, may also be understood as a questioning of the separation between economic and social values; of bringing the social into matters of the economy, and a refusal to accept the boundaries between bodies, gender, intimacy, and the economy.

RN33_02b | Feminist Movements: Mobilizations and limitations

Digital Feminist Activism in the Case of the Academic appeal Against Sexual Harassment #akademiuppropet

Salmonsson, Lisa

Örebro University, Sweden
lisa.salmonsson[at]oru.se

In this paper I analyze #akademiuppropet from a digital feminist perspective. Feminist activists are increasingly turning to digital technologies and social media platforms to dialogue, network and organize against sexism, misogyny, harassment and rape (Mendes et al., 2018) and #akademiuppropet is one example where women working in Swedish academic institutions got together to highlight the issue of sexual harassment. Data is gathered through qualitative interviews with 14 women that experienced sexual harassment in academia. During the interviews we talked about what #akademiuppropet and #metoo meant for them, and how they thought it might be a force for change. Results show that the use of social media, as one of many tools in organizing and mobilising the movement, has made it possible to put equal opportunity high on the agenda. This also indicates that many “small whisperings” can be turned into a powerful collective voice – as we have seen with the #metoo movement. Even so, the work is not finished, and we will have to continue to work together in our organizations and with a long-term perspective.

Construction of the Feminist Consciousness as part of the Collective Identity

Papcunová, Kristína

Charles University, Czech Republic
kristin.papcunova[at]yahoo.com

The presentation will be focused on the issue of the feminist consciousness which is central in forming a collective identity within the feminist movement. The aim of the study is to elucidate the question of how women develop their collective feminist identification and individuals commit their lives to creating social change. The development of feminist awareness is closely linked to the process of social frameworks that can be influenced by the transformation of collective identity. Women often internalize the individualistic framework; therefore, problems arising from gender inequalities are often perceived as personal problems that can be solved on an individual level rather than recognized as complex structural shortcomings. Previous research into

framework processes has contributed to the recognition that a significant component of the framework for collective action is a sense of injustice, an important motivation to overcome obstacles and achieve social change. Feminist activists often perceive gender inequalities at multiple levels of private and working life, but on the other hand they see obstacles and problems in areas where they did not have to deal with them personally. Despite the fact that these inequalities do not affect them personally, they feel a high level of empathy and solidarity with women who have to face these problems. These prepositions will be further detailed in the presentation.

Social Background and Self-confidence Among Young Girls in Norway

Skoland, Kathrine; Gjerstad, Brita

University of Stavanger, Norway
kathrine.skoland[at]uis.no, brita.gjerstad[at]uis.no

Nowadays, in the media in Norway, we hear about the “performance society” and how young people, especially young girls, are struggling to be perfect in a range of social areas. This is often considered a problem more relevant for girls than boys, making issues such as low self-esteem among girls a gender related problem, rather than a social class problem. Inspired by the cultural class analysis tradition, we investigate the everyday workings of social class among girls in Norway at the age of 15 in their final year of primary school, a stage in life where big choices about their future is about to be made. We study differences along a variety of indicators on young girls’ well-being between those with different social backgrounds and demonstrate how class (measured by indicators of parent’s income and cultural resources) is related to self-perceptions, mental health and expectations to future in ways that are not beneficial to those who are from families with less resources. We thus show how class is part of young girls’ identity and how being part of families with less resources have a negative impact on young girls self-value. We use data from the “UngData” survey on health and well-being among young people in selected regions in Norway.

Understanding Contemporary Feminist Participation: Does #metoo Constitute A Counter Public Sphere?

Bernardini, Vittoria

Sapienza Università di Roma, Italy
vittoria.bernardini[at]uniroma1.it

The aim of this paper is to contribute to a theoretical framework to understand current online feminist mobilizations. Focusing on the case of the #metoo movement, I ask whether this can be understood as a feminist “counter public sphere” in the age of digital media. In her essay “Rethinking the public sphere”, Nancy Fraser discusses some of the limits of Habermas' notion of the public sphere, arguing that it was actually exclusionary in terms of those admitted on the basis of gender, ethnicity and class, and in terms of the type of issues considered of public interest. This led other subordinated groups to form their own alternative publics that functioned as “spaces of withdrawal and regroupment [...] and training grounds for agitational activities directed towards wider publics”. These “subaltern counter-publics” contribute to the expansion of discursive space, including alternative identity-based publics and more comprehensive arenas where members of different groups interact. I therefore aim to explore whether #metoo can be understood as a contemporary form of counter-public sphere. The question is tackled by discussing theoretical contributions on public sphere theory, focusing on feminist critiques, and how they can be applied to this online movement. The application of public sphere theory to contemporary issues is complicated by the pervasiveness of digital media in current political participation. Recent theoretical contributions suggest moving on from the overestimation of the role of rationality in classical notions of the public sphere, emphasising the role of affect and the sharing highly individual and self-motivated interests.

RN33_03a | Policies and Gendered Practicies

Who Can Raise 'Good Citizens': Immigration Policies and the Disciplining of Migrant Women's Reproductive Practices

Loneragan, Gwyneth

University of Sheffield, United Kingdom
g.loneragan[at]sheffield.ac.uk

Discussing racism and reproductive justice in the US context, Ross (2006) argues that both immigration controls and policies around reproduction are deployed by the government to reinforce an association between citizenship and whiteness. This insight points to how policies around immigration, and those around reproduction, are informed by, and contribute to, discourses around belonging and citizenship. Immigration policies govern who is able to settle in a country, and on what terms. Policies around biological and social reproduction – including regulations determining access to reproductive health care, and other resources important to raising children, like housing – deal with who can, and cannot, be trusted to raise future citizens. This paper uses a reproductive justice framework to explore the overlap between immigration policies and those around reproduction in the UK context. In particular, I argue that aspects of UK immigration policies can be read as disciplining migrant women's reproductive practices. Various policies render the right to settle, and access to resources necessary to raise children, contingent on demonstrating that one can raise 'good' future citizens. Constructions of the 'good' citizen, in turn, are underpinned by mutually co-constitutive racialized, gendered, and neoliberal discourses of belonging. Women are therefore impacted differently depending on their location within these discourses. Applying a reproductive justice framework enables a more in-depth analysis of the racialized, gendered, and neoliberal dynamics underpinning these immigration policies and how they interact and inform each other; and allows us to better understand how they are materially implemented within the context of an expanding internal border regime that targets migrants in locations central to social and biological reproduction, e.g. hospitals, schools, and housing agencies.

Son Preference and Skewed Sex Ratios: Contradictory Socio-Economic Changes and Effective Policy Formulation

Vasudev, Charumita

Indian Institute of Technology, India
charumita.vasudev[at]gmail.com

The Government of India in its recent Economic Survey noted that India is progressing on fourteen out of seventeen indicators of women's agency, attitudes and outcomes. There has been an increase in literacy levels, greater female workforce participation and a decline in fertility. However, despite all these positive changes, one indicator that has only worsened over time is India's skewed child sex ratio. A preference for sons not only manifests itself through the sex selective abortion of girls but also as a meta preference through differential stopping rules (leading to a number of 'unwanted daughters') and a biased allocation of family resources in favour of male children. Numerous policies ranging from cash transfers to schemes for girl's education have failed to yield results. In this context, the paper makes an attempt to understand the cultural logic behind the devaluation of daughters and questions if the benefits of globalization and consequent changes in economic structure, have accrued only to the male members of the household. The paper makes use of data from field survey in two villages of Jammu and Kashmir, in addition to a review of the existing literature to identify how family building strategies differ according to the socio-economic relationships people are embedded in. In doing so, the paper seeks to establish what should guide better policies in order to reverse this trend of 'missing girl children' while also enhancing their capabilities. The paper also draws comparisons with some policies introduced in various countries of Europe and examines if India can learn from the experience of the west, in terms of effective policies for ensuring greater gender equality.

RN33_03b | Marriages, Rituals and Gendered Negotiations.

Patrilineal Fertility And Marital Bargaining Power In Egypt

Abouelenin, Mariam Hamada

Lancaster University, United Kingdom
m.abouelenin[at]lancaster.ac.uk

The Middle East remains one of the least gender-equal regions globally. It is predominantly characterized by patrilineal descent and male-dominated institutions. In particular, conjugal power relations are largely gender stratified and yet have not been examined with the increasing frequency of studies that mainly reference Western and South East Asian

couples. Under Egypt's patrilineal kinship and social structure, men occupy a dominant position in the domestic sphere. Recent years have seen a shift of focus from economic resources such as education to symbolic resources such as the birth of a son as a way of improving women's conjugal power. Using nationally representative Egyptian data and 35 qualitative interviews, this study explores the link between patrilineal fertility and women's conjugal power, predicted on the basis of women's say in three household decision making domains: financial, daily and children. Drawing on resource theory, we also test whether economic resources moderate this relationship. Our findings illustrate a positive association between giving birth to a son and women's power in daily decisions and children's decisions. Women's power in financial decisions, however, does not differ by patrilineal fertility status. Moreover, the associations between patrilineal fertility and decision making were moderated by economic resources, with weaker associations between patrilineal fertility and decision making being observed among economically resourceful women. This work addresses broader issues of gender inequality in the Egyptian context and underlines the sociocultural forces that shape women's bargaining power in patriarchal societies.

Happily-Ever After: Self-Married Women, The Claim of Wellness and Temporal Ownership

Lahad, Kinneret; Kravel-Tovi, Michal

Tel-Aviv University, Israel
lahadk[at]post.tau.ac.il, mkaravel[at]tauex.tau.ac.il

For the last decade, Self-Marriage is becoming an exponentially growing phenomenon worldwide. Understudied by scholars and often ridiculed by social commentators, Self-Marriage, so we argue, offers single women to formulate new powerful relationship with their self by formulating new relationship to time, constituting what we call temporal ownership. Drawing on textual analysis of Self-Marriage accounts, given by Self-Married women as well as Self-Marriage gurus and entrepreneurs, we offer a threefold temporal analysis. First, while the singlehood experience of women is often understood to be revolving around waiting - for prince charming and a happy future - Self-Marriage is recounted as an assertion of a meaningful and whole present, significant in and of itself. Secondly, while singlehood is often understood as a "raw" and orderless time, lacking structured timelines and temporal benchmarks, Self-Marriage brings with it the promise of a temporal horizon, and within it, an inclusion within adulthood. In this vein, Self-Marriage punctuates and measures time by creating visible and accumulating anniversaries and movement towards future selves. Thirdly, because Self-Marriage is idealized as a lifelong commitment to a "healthy relationship" with the self, it is not constituted as a transitory stage on the way to couplehood, or as a substitute to relations with potential partners. Instead, it creates, ideally, a lasting impact important in and of itself. This threefold temporal account enables us to intersect scholarship on wellness and self-making with critical time studies, and to foreground the centrality of temporal workings in neoliberal enterprises.

708

Crossing The Borders In A Divided Society: Mixed Marriages Among Palestinians And Jews In Israel

Sabbah karkabi, Maha (1,2)

1: University of Haifa; 2: Truman Institute, Hebrew University of Jerusalem, Israel
mahasab71[at]hotmail.com

This study explores the way intermarriage between Palestinian women and their Jewish spouses occurs in a context where historical and structural inequalities underlie the relationship between the two groups, and the way these women negotiate their crossing of ethnic, religious and social borders under these circumstances. Studying Jewish-Palestinian intermarriage enhances our understanding of intermarriages between spouses who differ in ethnicity, religion and culture, and in which one spouse belongs to an indigenous—not immigrant—minority; it also enhances our understanding of the intersectionality of ethnicity, religion and gender in the context of intermarriage where gender relations are tightly controlled by society. Using in-depth interviews with ten Palestinian women married to Jewish men, the findings reveal that social change and educational expansion were the main factors underlying the appearance of ethno-mixed marriage among Palestinian women in Israel. Nevertheless, endogamy weakened among the selected group, where several social factors facilitated intermarriage. Negotiating spousal family relations was affected mainly by the way in which Israeli society defines, constructs, and perpetuates the ethnic and religious borders and the inclusionary-exclusionary relations with the Arab minority. This explains why, despite the social change taking place among Palestinians in Israel, very few of these types of marriages take place.

Gendered (In)Equalities in Siblings Relationships Through the Life Course

Dębska, Katarzyna

University of Warsaw, Institute of Sociology, Poland
k.debska[at]is.uw.edu.pl

A very traditional approach to family, represented e.g. by Parsons, assumes that family functions in a significantly different mode than the rest of society which is permeated by relations based on universalistic values of meritocracy. However, the public discourse around upbringing more than one child emphasized the importance on equal treatment of siblings. Popular interpretation of this suggestion refers to the necessity of creating an independent successful adult. In the experience of adult siblings, the need of equality between them is usually portrayed in a more nuanced way. In my presentation, I will sketch the scope of understanding and experiencing (in)equality by brothers and sisters in their childhood and adulthood. My analysis is concentrated around gender, however, I also take into account class and generation factors. I claim that the dynamics of siblings relationships, lasting from the very beginning of younger sibling's life usually through the whole life span of individuals, reveals the ways of constructing gender division and sustaining or undermining

patriarchal domination. The presentation is based on an analysis of biographical narrative interviews and in-depth ones with adult siblings (both in the same-sex arrangement as well as brother-sister one). Studying siblings relations reveals in terms of gender and (in)equalities also reveals how class positions and generation belonging influence the construction of masculinities and femininities.

RN33_04a | Care Practices, Emotions and Markets.

Local Loops of Care in the Helsinki Region— A Time-Economy Perspective

Näre, Lena; Wide, Elisabeth

University of Helsinki, Finland
lena.nare[at]helsinki.fi, elisabeth.wide[at]helsinki.fi

Finland subsidises caring for young children at home by several cash-for-care schemes, starting in 2001 adopted a tax credit for domestic services, including care. This article adopts an everyday perspective to social policies to analyse how Finnish cash-for-care policies produce local care loops from a time-economy perspective. It examines the increase in private services alongside public ones through an analysis of the organisation of child care in time and space, paying attention to the micro-mobilities and daily choreographies of care. Drawing on interviews with Finnish employers of privately employed child carers, our results demonstrate that child care policies and tax credits are central means through which child care is increasingly being privatised. We argue that the notion of time as a scarce resource and the organisation of care loops in a way that maximises time available for wage labour and 'quality time' point towards the emergence of a classed time discipline. Time becomes a commodity with not only monetary value but also other inherent value, captured in the notion of 'quality time with children'. Significantly, this quality time does not include time used for other reproductive labour tasks, such as cleaning or cooking.

Intersection of State, Market and Family in the Fathering Experiences of Divorced Men in Turkey

Beşpınar, L. Zeynep (1); Beşpınar, Fatma Umut (2)

1: Marmara University, Turkey; 2: Middle East Technical University, Turkey
zeynep.bespinar[at]marmara.edu.tr, bespinar[at]metu.edu.tr

This paper aims to question the role of state, labor market, and family in the reshaping process of fatherhood experiences of divorced men. Men's perceptions and experiences of masculinity and fatherhood have been transformed in accordance with their work life and family experiences. In addition, the impact of the state's changing perspectives in the divorce legislation and custody in the last years have been significant in men's perception and experiences. We conducted in-depth interviews with 20 divorced fathers who are from working and middle classes. In this way, we also aim to examine the relationship between the class dynamics and the intersection of state, market and family in the fatherhood experiences. We asked men's fatherhood experiences before the divorce, the transformation of their relations, experiences and strategies after the divorce and how they use their resources to deal with this new life experience. Social policies and economic conditions influence the fatherhood and divorce experiences of men (Bergman and Hobson, 2002; Orloff and Monson, 2002; Eydal and Rostgaard, 2016). The role of legal issues is important in the personal experiences of men and their relationships with their children (Guttman, 1989; Emmer and Sommer, 2003; Bokker, 2006). The demographic and economic characteristics of divorced men determine their access to social services provided by the state (Brown, 2000). Based on our fieldwork, we argue that the intersectionality of the state's approach to the family and its care and custody policies, the rising unemployment rates and economic crisis experienced in the market and the family dynamics affect men differently based on their class positions. Fathers' economic, social and cultural resources shape their divorce and fatherhood perceptions, experiences and strategies.

Taking Care of Emotions

Guy, Deborah (1); Millepied, Anne-Charlotte (1,2)

1: EHESS, France; 2: University of Geneva, Switzerland
dbhguy[at]gmail.com, annecharlotte.millepied[at]yahoo.fr

« Relations of thinking and knowing require care and affect how we care », María Puig de la Bellacasa Following Sandra Harding's definition of method, methodology and epistemology, we wish to propose a paper on feminist methodologies and epistemologies through the lens of emotions. Our reflection emerged from our respective fieldworks on women's postpartum emotional distress and endometriosis, in which we try to adopt a feminist standpoint. Gathering our first narratives of violence, trauma and pain, we faced unexpected moral and emotional dilemmas : How should we receive such levels of emotional sharing, as well as respect

the trust placed upon us ? How should we include our own feelings and physical reactions to those stories in our findings ? Since those feelings had already been framed in various settings in women's lives, what role could we, and did we want to play in this affective economy ? This urged us to question the status of emotions in feminist inquiry and find some new practical tools. We seeked to re-value emotions' methodological and epistemological potentialities, searching for a way to include them at each level of the research process : during fieldwork and after, in the analysis and in writing. In this paper, we wish to share the results of our reflection. We found help in care and standpoint epistemologies that we tried to make operational at a methodological level, in order to generate some feminist "tips" to pursue our investigation in a more conscious and affective way : to engage our emotions at all times; to avoid reproducing the epistemological break between discursive and practical reflexivities; to take up responsibility for the irreducible asymmetry in the researcher/researched relationship.

RN33_04b | Trans/sexualities and Intimate Relations

Temporality and Transformation: Nonmonosexual Use of Language and Identity over Time

Nelson, Rosie Beth

University of Bristol, United Kingdom
rosie.nelson[at]bristol.ac.uk

Nonmonosexuals – those romantically or sexually attracted to more than one gender, including bisexuals, pansexuals, and queer people – are undertheorised and underresearched despite the significant incidences of suicidality, depression, and domestic and sexual violence amongst the population. These issues led to the development of a PhD project looking at how nonmonosexuals maintain their sexual and gender identities in a heteronormative, homonormative, and cishnormative environment. This particular paper explores the question ‘how have nonmonosexuals understood, experienced, and transformed their identities over time? Influenced by queer theory, I analyse 40 semi-structured interviews with diverse British-based nonmonosexuals. Findings demonstrate that participants changed their identity labels over time - based on relational and contextual elements - to best represent their sexualities and genders. Participants learned new terms to frame their experience which impacted on how they located themselves socially. Furthermore, participants grew used to navigating and, later, disregarding discrimination as they aged. They achieved this ability to navigate and disregard discrimination through working in isolation to validate their own identities in a hostile society, or through finding LGBT role models. This research contributes to a better understanding of how nonmonosexuals navigate a hostile, monosexist social world and emphasises the work required by sexual minorities to validate one’s identity. This research contributes to a wider understanding of sexuality and gender through using a nonmonosexual lens to explore the fluidity and temporality of identities. Driven from a nonmonosexual standpoint, this research troubles binary divisions of sexuality and gender, and questions the usage of labels in society.

Making Sense Of Gender Transgressions In Transgender And Nonbinary Lives And Discourses

Merlini, Sara

Social Sciences Institute, Lisbon University, ICS, Portugal
sara.merlini[at]ics.ulisboa.pt

The concept of gender transgression has been used to name processes of gender change and innovation. Contrary to the classical concept of «deviance», the study of transgression allows us to understand the union of opposites and the processes of redefining the dividing lines of gender systems and practices. Transgressing the gender binary opposition has not only been possible as transgressions coexist with restrictive and punitive limits that reify gender from the antagonist logic. Normative non-compliance is transversal (Pearce and Connell, 2016) but there are different costs in the transposition of the gender belongings and positions. Through a gender practices perspective we propose a definition and theorization model of gender transgressions and normative (re)productions. We demonstrate its utility through a practical application to the study of transgender and non-binary lives and discourses. Our results are based on the biographical study of 19 non-binary gender trajectories and the analysis of a digital archive Nonbinary wiki (https://nonbinary.miraheze.org/wiki/Main_Page). By identifying normative traditions of gender we open a collective dialogue about its meanings and values. The importance of gender is seen by its consequence. In the possibilities of being accepted and recognizable. The differences between «gender itself» and «gender for the self» can be understood within social processes of attribution, appropriation and interpretation which translate into variable degrees of (in)visibility in alternative gender performances and narratives. Recognizing the existence of other conventions and values in gender contributes to its inclusion and to a better understanding of the mitigating factors in (re)doing gender (West and Zimmerman, 2009).

Swiping for Intimacy: Modern Courtship and Sexual Expectations on the Dating App "Tinder"

Schnaller, Jenny Cornelia

Technical University Munich, Germany
jenny.schnaller[at]tum.de

The mobile dating application Tinder is one of the most prominent dating apps, especially regarding the mainstream heterosexual market. With an estimated 50 million users worldwide, the popularity of the app opens it up to many questions from scholars, with respect to modern courtship and sexual activity. Does, for example, the constant suggestion of available intimacy on Tinder make finding love any easier? Or does the seemingly never-ending pool of potential partners lead to uncertainty and indecision, and become a perceived threat to monogamy? Presenting results of interviews conducted with 25 Tinder users in Munich, Germany, this study examines how gender and sexuality intersects with digital culture. Specifically, this research explores the experiences of the users in order to assess the extent to which a digital transformation of intimacy might be under way. It examines whether users feel that Tinder has influenced and impacted their views on love, dating, monogamy and other romantic ideals. As Tinder is often described as a "hookup app" – especially in public discourse - one focus of the study lies on how user's sexual expectations are affecting their (potential) sexual interactions and boundaries when meeting a 'match' in so called real life. This is particularly interesting as highly gendered sexual scripts are being emphasized within and through the technologically mediated environment. The interviews highlight the different experiences of men and women when engaging in sexual activities with their Tinder match, even when they didn't actually want to sleep with that person.

Physical Transitions, Embodiments and Gender Discourses: Trans Youth in Portugal

Marques, Ana Cristina (1,2); Hilário, Ana Patrícia (1)

1: Universidade de Lisboa; 2: University of Kurdistan Hewler, Iraqi Kurdistan
anacristina.hmarques[at]gmail.com,
patriciahilario[at]gmail.com

While some materials have been written on how trans people have come to terms with their gender identity in Portugal and how they make sense of the diagnosis of Gender Dysphoria, there has been little attempt to understand the experiences of trans youth in the country. Drawing upon data from the TRANSRIGHTS project, the study intends to fill this gap by understanding how trans youth in Portugal define their identities and legitimate their bodies in their everyday lives. The findings that we present here are based on 12 in-depth interviews carried out with trans and gender diverse young adults (six assigned male at birth and 6 assigned female at

birth), aged between 18 and 29 years old, living in Portugal; mainly in urban centres. Similarly to what other research has shown, in the context of a highly gender-binary society, several Portuguese young trans and gender diverse people try to protect themselves against discrimination, harassment and abuse by using more gender-binary expressions, especially in cis-heteronormative dominated public spaces, and/or by undergoing some kind of physical transformations that is medically supervised. Thus, it is only a minority of the participants that is able to express a more non-binary, gender diverse expression. We also situate our study in the context of the increasing research on trans and gender diverse youth. We believe that by showing the diversity of the participants' discourses, practices and embodiments of gender, and their different positions in relation to gender identity we present here, we critically contribute to the Sociological and Transgender literature and the debates its generates.

RN33_05a | Labour markets, workplaces and occupational issues

'Let's Have Some Coffee First!' Drinking Coffee at Workplace in Finland

Kinnunen, Merja (1); Lempiäinen, Kirsti Maria (1); Peteri, Virve (2)

1: University of Lapland, Finland; 2: University of Tampere, Finland
merja.kinnunen[at]ulapland.fi,
kirsti.lempiainen[at]ulapland.fi, virve.peteri[at]uta.fi

In our earlier study, we have investigated gendered meanings in informal workspaces such as coffee rooms, corridors and so called chill-out areas (Kinnunen, Lempiäinen & Peteri 2017). One of the results was that organisations construct informal workspaces as platforms for innovation and aesthetic presentations. These aesthetic platforms, however, are not in agreement with the ideas how workers understand drinking coffee and meaning of the coffee-room at work in general. Here we continue the analysis by targeting our focus on drinking coffee in workplaces. Drinking coffee crystallizes sense of community, embodiment, gender relations, power hierarchies, control and resistance at workplace. The paper asks what sort of moments drinking coffee creates for people and their workplaces. What kinds of rules and ways of drinking coffee exist in work? We are also interested in the change of spaces, times and habits around coffee that we can detect from our earlier data collected in public workplaces and the memories people have constructed for this study in interviews, essays about drinking coffee and our own auto-ethnographies. We suggest that drinking coffee not just builds the social relations between people but it constructs the workplace and work as well. That what might seem informal and of little or secondary value to workplace, can become a central force of both people and the organisations they work in.

Blokes of all Genders? The Experiences of Women Journalists in UK Media

Topic, Martina; Bruegmann, Carmen

Leeds Beckett University, United Kingdom
M.Topic[at]leedsbeckett.ac.uk,
C.Bruegmann[at]leedsbeckett.ac.uk

There is a body of academic literature discussing the position of women in journalism, and the fact masculine work practice does not always suit all female journalists. For example, Mills (2014) argued that women who succeed in journalism “become so bloke-ified by the macho water in which they swim that many younger women looking up don’t see them as role models for the kind of women they might want to become” (p. 17). This is because the work culture in newsrooms is masculine and the view of what constitutes news is founded in a masculine way of thinking. However, when the so-called feminine topics came to the agenda, such as health, lifestyle and food, then a recently conducted research in the UK has shown that it is no longer women who write on these topics but rather men (Topić, 2018). We are therefore building upon the discussion in above papers, and are conducting interviews with female journalists working in UK’s newspapers and magazines asking them questions on organisational culture such as office banter and sexism, as well as questions on leadership styles, differences in experiences when working for a female editor as opposed to male editors, whether those who worked for a women can identify with their female bosses and the general working culture (working hours, networking expectations, etc). In addition, we are asking general questions on discrimination and their personal backgrounds such as the parenting style they experienced, communication style and the early socialisation process.

The Effect of Unemployment Experience to First Birth Fertility

Slabá, Jitka

Charles University, Czech Republic
jitka8slaba[at]seznam.cz

The postponement of fertility to later ages suffers nowadays-European highly educated women. In the end, the fertility postponement can lead to a lower level of completed fertility of women. Nevertheless, the women do not only postpone their plan when they wish to have their first child (for example because they spent more time in education); they also additionally delay the childbearing due to unexpected life circumstances. The submitted paper answers these questions: How are the reasons for the additional postponement of first birth affected by individual life-cycle experience of women? Is the experience of unemployment a reason to postpone first birth due to material conditions? The paper presents selected data from Czech “Women 2016” survey (completed sample size N=1257). The analysis of contingency tables, binary logistic regression and Kaplan-Meier survival function were used. The women, who experienced unemployment before their first birth, additionally postpone their fertility. They significantly

often postpone because of “material condition” circumstance than due to other reasons (i.e., “work & study”, “no suitable partner”, “health problem”). The experience of unemployment is related mostly to the lack of money. This economic deprivation can be a reason for the unplanned postponement of first-order fertility. Keywords Unplanned postponement; First birth; Unemployment; Czechia

Challenges Facing Women Entrepreneurs In Lithuania

Mazuoliene, Julija

Lithuanian Social Research Centre, Lithuania
julija.mazuoliene[at]lsc.lt

Key words: women entrepreneurship, women economic empowerment, family economy. The purpose of the presentation is to reveal social and economic challenges facing women entrepreneurs in Lithuania. The principle study areas of this issue are social and economic indicators, social gender roles in family and labour market, innovation policy, social and legal policies, and other obstacles on the way of women entrepreneurs. The presentation reflects the ongoing work on female entrepreneurship and its theoretical background within Lithuania, and provides a complex approach for enhancing women’s economic empowerment by improving entrepreneurship and leadership, and covering all factors that influence women’s business success, with a particular focus on social environment and family processes as one of the key factors of women’s choice. The main research question is: What are the main social, economic and cultural challenges facing women entrepreneurs on the way of starting and developing entrepreneurial activities in Lithuania? Female entrepreneurship plays a significant role in the improvement of the country’s social situation, economic processes, and positive changes in the field of gender equality and family welfare. Despite the popularity and significance of the subject, female entrepreneurship has not been sufficiently researched in Lithuania. This phenomenon requires active collaboration on local and international level that could lead to a comprehensive view and evaluation of the problem in question in order to characterize the picture of a successful female entrepreneur and to improve the socio-economic conditions favorable for women’s leadership and entrepreneurship.

What's Next? Athletes Reporting Opportunities In Their Sports After Their Sport Carrier

Béki, Piroska Boglárka (1); Farago, Beatrix (2)

1: Eszterházy Károly University, Hungary; 2: Széchenyi István University, Hungary
piroska.beki[at]gmail.com, beatrix.farago.b[at]gmail.com

Sport is the highlight of the male-female relationship system. We find that the concept of homogeneity is becoming more and more weakened, sport becomes unisex, which can strongly influence gender judgment in society. The "weaker sex" appearance and spread of the sport indicates that something has changed in the world, so thinking has to change also. Nowadays, there is a dual process in the field of sport: 1.) women appear in the traditionally masculine sports, and this plays an important role in the development of gender relations as mixed races arise; 2.) at the same time, men also appear in previously reserved areas for women, which they have not had opportunities so far (Béki, 2018). This phenomenon can be observed, though much slower in sports management. In other sports roles the gates for both sexes have not yet been opened in masculine and feminine sports. Our research is focusing on how a top athlete develops at the end of sport, if she wants to represent her sport in other territory of sport, mostly coaching and judging. Special attention was given to those sports which are not socially accepted by both sexes. In our survey, we examined female athletes, showing what career path they choose at the end of the athletes' past, how they are preparing themselves for life after sport, and how sport becomes an identity factor? The sample of the study was reported by hungarian female athletes. Firstly we made a semi structured in depth interview (n=123), and the survey was conducted using a questionnaire method (n=386). Keywords: feminine-masculine sport, carrier opportunities, other sports role, athletic identity.

RN33_05b | Violence, legal practices and oppositions

The Work Of Anti-Violence Organizations In Russia: Overcoming Legal Barriers By Building A Knowledge-Based Network

Davidenko, Maria

Higher School of Economics, Russian Federation
mdavidenko[at]hse.ru

The gradual restriction on foreign assistance to Russian non-profit organizations (NPOs) began in the mid-2000s and culminated in the 2012 Foreign Agents Act. However, starting in 2006 the state has also been providing increasing support to non-foreign funded, socially-oriented NPOs. This article

explores how NPOs in the field of domestic and sexual violence operate in this legal climate, given that their work has also been affected by the "decriminalization of beatings in the family" (DBF). Previous research has shown that social NPOs that cooperate with, and receive funding from, the government can still find ways to advocate on behalf of their constituencies. The findings of the present study both support and add new insights to this observation. The DBF has evidently politicized domestic violence, which turned public discussions of a federal domestic violence law into a political activity to be avoided. Despite these limitations, anti-violence NPOs seek to propose innovative practices that can benefit survivors in the absence of a national law on DV, and to conduct educational seminars for specialists from the public sector to promote a unified understanding of the problem. Through these activities, anti-violence NPOs seek to develop a knowledge-based network of non-state and state actors. In the situation where NPOs have to largely rely on personal connections with and sympathies of individual government representatives, building such a network becomes an effective way to advance the interests of survivors. The article draws on interviews with nineteen representatives of two state and twelve non-state anti-violence organizations.

Gender Stereotypes in Judicial Judgments: Analyzing Sexual Violence Cases in Croatia

Cepo, Dario; Čehulić, Mateja

University of Zagreb, Faculty of Law, Croatia
dcepo[at]pravo.hr, mcehulic[at]pravo.hr

Societal focus has been put on the issues of gender disparity, including gender-based violence and institutional response to it. Modern activities such as #metoo and those from previous decades linked to social movements for women's liberation led political actors to act and adopt both national and supranational legislature combating gender-based violence and stereotypes based on gender. There is enough research done on this question to gauge the success or failure of societies to tackle this issue. What is less known is the activities of the judicial system in fighting gender stereotypes especially in the case of gender-based violence. This paper focuses on the cases of gender-based sexual violence (where girls and women are victims) and gender stereotypes common in judicial judgments. We analyze current theoretical and empirical literature in order to build a typology of stereotypes linked with gender-based violence. This typology of gender-based stereotypes will provide a basis for research on individual rape, and other gender-based sexual violence, cases in Croatia, ie. examples of gender stereotypes used as mitigating or aggravating circumstances by judges. We use typology of stereotypes in order to show the most common types of stereotypes in Croatian judicial practice. This will indicate the link between the proclaimed public and political discourse on gender-based violence with its implementation and realization in the judicial field. Keywords: gender-based violence, sexual violence, gender stereotypes, judicial judgments, courts

Sexual Consent And Gender-Based Violence

Oliver, Esther (1); Vidu, Ana (2); Merodio, Guiomar (3)

1: University of Barcelona, Spain; 2: University of Deusto, Spain; 3: University of Barcelona, Spain
estheroliver[at]ub.edu, ana.vidu[at]deusto.es, guiomar.merodio[at]gmail.com

The gang rape case occurred in Spain during a 2016 famous festival placed the trial against its five aggressors on an unprecedented social scale in Spain. The court that ruled for sexual abuse and not for rape generated a prompt rejection from citizens against the current legislation and in favour of the victim. Under this framework, consent for sexual engagement become the issue to be raised while analysing victim's willing to consenting sex. Several North American States and some European countries already started to include consent on their gender-based violence legislation or merely started a discussion about what consent means and under which situations it cannot be provided. The Spanish government has also expressed its interest in modifying the Criminal Code to legislate consent in relation to sexual crimes. They take advantage of the current social opportunity needed to create awareness and transform laws. While there is a rather spread agreement in country laws and scientific literature that consent should be affirmative, positive, voluntary, aware and enthusiastic, the situations in which consent cannot be asked neither achieved are still understudied. Communicative acts place a crucial role to that extent. As language takes place through interactions and sexual violence may happen in interactions among people, specific communicative acts may permit or avoid such situations of violence. Language and social interactions prove to be key in approaching violence and can contribute to develop effective prevention strategies. The paper provides knowledge on the potentiality of using language to fight against gender violence.

Combating Domestic Violence Against Women in Service Providers Perception of Gender Equality in Turkey

Çabuk Kaya, Nilay

University of Ankara, Turkey
cabukkaya[at]gmail.com

Domestic violence against women remains a major problem that is waiting for a solution. Violence against women because of their gender prevents women from taking advantage of their rights and freedoms. In order to combat this important problem, policies are developed at international and national level, regulations are made and intensive efforts are being made to transform the implementation in accordance with regulations. The prevention of violence against women will be ensured through the participatory efforts of law enforcement officers, health workers, law enforcement, social workers, psychologists, shelter and media workers working in public

institutions and organizations providing services for women who are exposed to violence and at risk. The purpose of this study, the institutions offering this service in Turkey is to demonstrate the capability of an assessment in terms of the perception of gender equality. In line with this objective, the research carried out in 26 provinces conducted in-depth interviews with 111 people who were exposed to violence and provided services to women at risk. 17 different focus group interviews were conducted and quantitative data were collected from 316 institutions to determine the institution capacity. This research presents a situation analysis that demonstrates the capacities of institutions providing services from different dimensions. In this presentation, gender equality perceptions of these institutions, rather than determining accessibility and quality of services for women exposed to domestic violence, will be tried to be revealed.

RN33_06a | Religion, Feminism and Sexism

Reclaiming Muslim Female Body in Ecofeminist Theories of Embodiment

Erfani Hossein Pour, Rezvaneh

University of Alberta, Canada
erfani[at]ualberta.ca

Ecofeminists have called for adding an ecological dimension to gender research to address various forms of oppressions women experience in their daily lives and to explain how feminine repression and exploitation of the environment result from the same logic of patriarchal domination. In the past 20 years, several ecofeminists have shown that ecofeminism needs to embrace and explore the body more closely and evoke embodiment theories to make them central in feminist theories and epistemologies. Now that it appears that the flow of essentialism-phobia, as Field (2000) called it, has decreased, it seems that it is time to deal with the risky topic of the body in ecofeminist research and theory. In theorizing body from an ecofeminist point of view, feminist theory needs to avoid repeating the past mistakes and pay proper attention to the question of difference; whose body is being discussed and generalized? In this paper, I focus on the importance of inclusivity of female body in any theoretical efforts addressing embodiment in ecofeminist theory and analysis. In particular, I examine how a Muslim woman's embodiment theory should be characterized and theorized in relation to nature. In the analysis, I consider both visually identifiable and self-identified Muslim women to explore how a female Muslim body is controlled, marked, and possessed. I examine childbirth, breastfeeding, and sexuality as three main elements to suggest how ecofeminist theory should approach a covered and raced body and show why it is important for a feminist critical theory of embodiment.

Gender Role Identity: Migration, Ethnicity and Religious Affiliation

Deliu, Alexandra; Voicu, Mălina

Romanian Academy, Romania
alexandraneliu[at]yahoo.com, malina.voicu[at]iccv.ro

Gender role identity occurs at the intersection of various identity layers and is reshaped throughout one's life course. Changes in individual life circumstances provide new points of reference and require the adjustment of social roles and individual identities. International migration leads to the reconfiguration of individual circumstances, bringing changes in gender roles and the readjustment social identities within family. Migration impact on gender identity occurs at the intersection of some structural factors like ethnicity and religious denomination. Belonging to an ethnic group might tie the individual within a specific migration network, putting him/her on a migration path which influences employment opportunities in the host country and leads to the adjustment of gender roles within family. Religious belonging makes available specific repertoires of values and attitudes regarding work, family and gender which filter the impact of migration on gender identity. This paper looks at intersectionality as process, inquiring how ethnicity and religious denomination intersect and shape gender roles. We employ mixed methods, combining qualitative data collected in 2012 – 2014 in a multiethnic and multireligious village from Romania, having rich international migration history with quantitative data coming from the Roma Inclusion Barometer (2009) conducted in Romania on a representative sample of general adult population and of Roma adults, which allows for cross-ethnic and cross-denominational comparisons. Our findings suggest that, while ethnicity, religious affiliation and migration have direct effects on gender role identity, their effect is moderated also by the intersection between ethnicity and religious affiliation, leading to the reconfigurations of the social and familial spaces at the origin.

Islam and Feminism in the North Caucasus: the Possibilities of Women's Agency

Kosterina, Irina

Heinrich Boell Foundation, Russian Federation
ira.kosterina[at]gmail.com

In my paper I would like to present some findings from the research of gender relations in the North Caucasus. The methodology included in-depth problem-oriented interviews with women and men, as well as ethnographic observation. Gender relations in the North Caucasus are in many ways a litmus test demonstrating the relationship between modernization and traditional components. However, in the case of the North Caucasus, the concepts of modernization and traditions cannot be used as opposites - modern researchers working in non-European regions argue that the idea of Western European modernization cannot be universalistic and applied to the analysis of any cultures. So the manifestations of Asian modernization will significantly differ from the

Western European, and the researchers of 'Islamic modernization' convincingly argue for the specifics of this type (for example, Göle 2000; Amin 2009; Esposito and Voll 1996). Many attitudes toward women's behavior and 'women's honor' are governed mainly by customary law and Islamic norms. On the other hand, all these existing systems are often applied inconsistently, differentially and ad hoc. To analyze women's resistance strategies I use the term 'patchwork modernization' when the features of a traditional society and patriarchy organically co-exist with modernized practices. Feminism in the North Caucasus exists in practice, but not in discourse as many feminist ideas are viewed as contradictory to local standards of gender hierarchies. In my paper I discuss the ways how women deal with patriarchy, the possibilities of women's agency and the role of religion in women's empowerment.

RN33_06b | Gender Struggles, Places and Bodies

Body in Transition: leisure Sports, Gender and Place among Palestinian women citizens of Israel

Ben Dori, Suzan

Tel Aviv University, Israel
suzybendori[at]gmail.com

This study explores how Palestinian women, citizens of Israel, constitute their decision to practice sports in Jewish-Israeli sports spaces and how do they experience it. Leisure sports is mostly discussed on an individual level and in liberal terms of 'free choice', 'individualism', 'life-style' and the 'neoliberal self'. But the complexity of a minority decision, whose national belonging is constantly questioned, to practice sports among the Jewish majority raise a sociological interest Vis-a-vis: The increasing racism and 'Othering' the 'Arab' in the public discourse on one hand and Vis-a-vis what is perceived as the Arabic "hegemonic" concepts of "embodied" behavior of the Palestinian woman in general and in the public sphere in particular. Through in-depth interviews with 15 Palestinian women in Israel, I examined their decision and coping practices in the movement between the distinct material and cultural spaces. The findings reveal that the active decision of the women to practice sports in Jewish-Israeli spaces stems from a combination of structural and cultural barriers of an indigenous conservative minority as well as structural and cultural cracks that characterize society in change. The women's experience has also shown constant tension in the movement between the distinct spaces, and concern if, where and when space will become a 'place'. The tension illuminates the complexity of an ethno-national minority group's life and the Palestinian women's life in particular and enables us to observe the array of strategies and practices involved in their sports activity as a result of an active agency.

Masquerading in Modern Tehran; the Case of Female Body

Alami Fariman, Mahsa

Goldsmith, University of London, United Kingdom
malam003[at]gold.ac.uk

If Tehran's streets in the 1979 Revolution witnessed the presence of a new woman; the traditional woman, eighteen years after the Revolution, in 1997, the same streets encountered a new form of the female presence; the preformative body. After the emergence of the reform period (1997–2005) in Tehran and in Iran at large, Tehrani women fashionised hijab in order to reject and mediate, if not change, the Islamic dress codes defined by the state. They occupied and re-invented urban/virtual public realms and their bodies became a mannequin to carry and exhibit their new created codes of presence in the city. If dressing up and face disguises were the festive occasions characterised by the reversal of hierarchical societies through the tradition of masquerade in eighteenth century, then it is safe to say that facial make up and the resistant form of clothing in the streets of Tehran is a new form of masquerade in which the individual becomes bold and, therefore, she, as a public persona forms a 'false impression as the presented self'. Inspired by Efrat Tseëlon's theories on masquerade and identity, this paper suggests a new way of understanding the act of presence, visibility, and recognition of the female preformative body in the streets of Tehran. This will be followed by a chronological investigation on how Tehrani women have established a kind of nafarmani-ye madani (literally, civil disobedience) through their bodily impressions and facial masks since 1979.

"I am a Human Being, a Body and an Emotion that Cannot be Oppressed": Druze Women in Israel and their Gender Struggle Strategies

Barakat, Ebtessam Hassan

Bar-Ilan University, Israel
ebtessam1970[at]gmail.com

The lecture will discuss the strategies of resistance of Druze women, from the double marginality, against the patriarchy. The main argument despite the marginal location of Druze women on the economic, political, national and social-religious, and even though there is no established framework for women in the Druze society against the patriarchy, many Druze women perform daily gender struggles on basic rights, struggles that cause a change in social behaviors, some of the struggles done in secret and some visible. Social behaviors, according to Bourdieu, are not "natural" but have become such, as a result of social construction processes that camouflage their arbitrariness and present them as necessary and natural (Bourdieu, 1991). I will focus on two main areas in which women conduct gender struggles, the struggle for the right to exercise their personal choices, on issues such as the realization of their sexuality, as well as the right to expand their mobility in space. Semi-structured interviews with academic

educated and uneducated Druze women, in the framework of a doctoral thesis, show that Druze women who maneuver and subverting in a hidden space against patriarchy often use non-conformist strategies. Therefore, both conformist and nonconformist strategies work against the habitus of the social-religious field and produce cracks within. In summary, the intersection of the circles of oppression places Druze women in a double marginal place, being both minorities and women. Nevertheless, this intersection does not restrictive women in narrow spaces, but rather some women resist and strive for the direct oppressive force - realms of patriarchal oppression—due to expanding their 'freedom' space, to a some extent.

Crafting Weight Stigma in Slimming Classes: a Case Study in Ireland

O Toole, Jacqueline Anne Marie

Institute of Technology Sligo, Ireland
otoole.jacqueline[at]itsligo.ie

Since the 1960s, commercial group slimming classes have emerged as popular spaces where people gather to attempt to lose weight. Such classes operate from the premise that sustained weight loss is best achieved and sustained through processes of group identification. In Ireland, the first commercial organisation to endorse this approach to weight loss was established in 1972. This paper is framed by the promulgation of the 'obesity as epidemic' thesis, and the widespread pathologising and stigmatising of fat and fatness. Informed by the work of Erving Goffman and Michel Foucault and based on the findings from a one year narrative ethnography of slimming classes in Ireland, and narrative interviews with 14 women engaged in the weight loss programme, it asserts that the crafting and narrating of weight stigma is central to the dominant weight loss story-line constituted in the classes, itself underpinned by an explicit fat oppression narrative. Through the careful use of narrative devices, the slimming classes articulate weight loss as a 'quest' involving a linear, progressive temporality generated in the classes via a narrative arc of weight loss. However, I argue that this produces a set of limited narrative resources embedded in discourses of health, appearance and responsible citizenship. Concluding the paper with vignettes from the personal narratives of the women participants, I illustrate the significance of deploying narrative inquiry to reveal the profound implications of weight stigma in women's everyday lives.

Work and Family Reconciliation in Turkey: Women as a Vulnerable Group

Serim, Simla

Bogazici University, Social Policy Forum, Turkey
simlaserim[at]gmail.com

Women's labour force participation rate in Turkey is one of the lowest among the OECD countries. Turkey has made significant changes pertaining to the labour market regulations and made noteworthy efforts in increasing labour market participation of women. However, vulnerability of women's position in the labour market is still an unsettling matter as half of the working population is perceived as vulnerable which indicates a gender issue inherent in the society. The difficulties of access and continuity in the labour market could be explained by the difficulties pertaining to reconciliation of work and family life and labour market structure that creates vulnerabilities for women who are engaged in informal and precarious jobs. In order to elaborate on different aspects of women's vulnerability in the labour market, this study deals with how the work and family reconciliation policies define the vulnerable position of women in Turkey. The main aim is investigating the effects of the newly introduced labour market policies pertaining to flexibility and childcare arrangements in the society. Semi-structured interviews conducted with informants who are representatives of trade unions and women groups, social group leaders, state actors and civil society organizations. Findings suggest that although the government prioritizes the practices to raise employment rates among women, they are being considered only in terms of ensuring a quantitative increase, not on the basis of creating decent jobs. Therefore, flexible measures in the labour market will increase the vulnerability of the vulnerable groups like young women engaged in precarious jobs, women from low-socio economic status unless work and family reconciliation policies target gender and class equalities through extensive childcare facilities.

Between Opportunities And Inequalities : A Qualitative Study Of The Lived Experiences Of Extra-European "Dependent" Women With Study Projects In The Belgian Context Smit, Sarah (1,2)

1: Université Catholique de Louvain (UCLouvain); 2: Fonds de la Recherche Scientifique (F.R.S.-FNRS), Belgium
sarah.smit[at]uclouvain.be

Although formally neutral, migration policies remain gender-based and have different effects on mobile women and men, particularly in the context of family reunification schemes. Indeed, while family reunion procedures account for a significant part of migrations to Belgium, the predominance of women is striking. Moreover, women who benefit from this scheme are placed in particularly vulnerable positions : first, because their right to remain in Belgium depends on the maintenance of their relationship with the person they joined and, second, because they are often confined in their role of spouse and denied any professional ambition or activity. Many of these "dependent" women return to higher education as a way to deal with complicated situations in the host country, reflecting a desire to actively engage in their new environment and regain a certain control over their lives. However, these women can face a number of obstacles in higher education too : a limited recognition of their diplomas, a competition with their family responsibilities, a certain reluctance from their partner as well as a number of categorizations and differentiations that – whether experienced as obstacles or opportunities – tend to reduce the singularity and complexity of their situation. Based on preliminary results gathered through an ongoing sociological fieldwork, this contribution aims to give voice to Congolese, Indian and American adult women who arrived in Belgium under the family reunion program and enrolled into higher education. It aims to analyse the multiple system of inequalities affecting these women's opportunities in the host country by paying special attention to the interplay between structural constraints, lived experiences and everyday strategies.

Gender Equality Perceptions of the Turkish Second Generation in Six European Countries

Groenewold, Willem George; de Valk, Helga

Netherlands Interdisciplinary Demographic Institute (NIDI), Netherlands, The
groenewold[at]nidi.nl, valk[at]nidi.nl

Views about gender equality of the Turkish second generation are examined and compared across six European countries using a gender equality perceptions (GEP) scale. Survey data from areas where most of the Turkish community concentrate are used: main cities of Austria, France, Germany, Sweden, Switzerland and The Netherlands. Multiple Classification Analysis (MCA) is used to estimate differences between people with different person- and context characteristics. In all countries, GEP scales-scores of the Turkish second generation are lower than those of native young adults. Differences are in the range of about 1 and 2 points on the 0 to 10 point GEP-scale. Religious and low educated persons, in particular men, with few natives in the friends-pool, residing in neighborhoods with few natives and where perceived social cohesion and trust is low, maintain very low GEP scale-scores, which differ widely from those of persons with opposite characteristics. Interestingly, results also show that GEP scale-scores of the Turkish second generation with particular background characteristics in one country may be higher than those of native young adults with similar background characteristics in another country. Theory-driven expectations and empirical findings are discussed. MCA-results are easy to interpret and can readily be used for profiling target groups of gender mainstreaming policies and programs.

Mapping Attitudes Towards Gender Equality in Denmark, Sweden and Norway

Shamshiri-Petersen, Ditte

Aalborg University, Denmark
dittep[at]dps.aau.dk

Gender equality has been a sort of a trademark establishing the Scandinavian countries as progressive frontrunners. However, on closer inspection, significant differences appear. For instance, regarding progress in gender equality policies such as gender quotas and earmarked paternity leave, Denmark unfavorably stands out from both Norway and Sweden, and in the World Economic Forum's Global Gender Gap report (e.g. 2015, 2018), Denmark are ranked distinctly lower. But the question is how this reflected in gender equality attitudes among the populations? To our knowledge, a comparative Scandinavian survey on gender equality has not previously been conducted. Thus, this paper explores the attitudes of Scandinavian women and men towards gender equality and the intended contribution are twofold: First, to provide a mapping of gender equality attitudes in Scandinavia. Second, to point out significant differences between the three Scandinavian countries. In order to map attitudes and to

identify country differences, we distinguish between four main dimensions of gender equality attitudes: 1) attitudes towards gender roles, 2) attitudes towards gender equality as an ideal, 3) perception of the current state in terms of distance from the ideal, and 4) attitudes towards particular policy instruments to promote gender equality. The study is based on nationally representative surveys conducted in Denmark, Norway and Sweden in 2015 (n=4048, 1005 and 1009). Results clearly demonstrate differences between the Scandinavian populations on all four dimensions of gender equality attitudes, Sweden being the frontrunner and Denmark a sort of "laggard".

RN33_07b | Anti-Gender Strategies and Right-Wing Populism

Emancipation of Far-Right Women

Sygnowska, Aleksandra

Polish Academy of Sciences, Poland
aleksandra.sygnowska[at]gmail.com

This paper focuses on the crucial issues sparking between nationalism and gender in the current Polish political debate flooded by the populist surge. It investigates the gendered elements of national ideologies within a heterosexual framing and explores the central role that women play in the reproduction of national categories. The main assumption of this paper is that different narratives on nationalism and gender interact with, fuel and reproduce each other and, in consequence, influence the social imaginary. Given that nationalism and gender are equally powerful sites of discourse creation, this paper intends to examine the political role women themselves play in national projects. For this purpose, I analyse narrative strategies applied by Polish far-right female politicians in their anti-Muslim campaigns. First and foremost, I explore a stereotype of alien sexuality that generates associations with the threat of alien power and dominance. In this context, alleged sexual violations become a metaphor of national humiliation in which sexuality becomes a strategy for social control. Seen from this perspective, I argue, women become national vulnerability and rape on women signifies rape on the nation itself. Most importantly, however, the rhetoric of female vulnerability depicts women as passive in nationalist discourse. Therefore, I find it crucial to acknowledge that women's visibility in politics is not only a symptom of their emancipation but also a symptom of their role and importance in the reproduction of nationalism.

Retraditionalization And Militarization Of Masculinity As Practices Of Reproducing Hegemonic Masculinity: The Experience Of Polish Migrants In The Polish Catholic Mission In England

Leszczyńska, Katarzyna

AGH University Science and Technology, Poland
kaleszcz[at]agh.edu.pl

The aim of my paper is to analyze the processes of retraditionalization and militarization of masculinity in the Polish migrant community, active in the religious organizations of the Polish Catholic Mission (PCM) in England. I will present the results of research carried out as part of a project conducted in 2015-2019, especially in-depth interviews with religious Polish migrants to England as well as participant observations. In the research, I understand gender (and masculinity) as meaning a social institution constituted by recursive relations between social practices and social rules. PCM are religious and migration organizations operating in the transnational contexts of sending and receiving countries. The transnational environment influences the strategies of activities (including gender practices) within PCM organizations. One of the gender patterns that is commonly practised and reproduced within the PCMs is hegemonic masculinity. This pattern is implemented by various social practices. One of the key practices that reproduce this pattern is the retraditionalization of masculinity and militarization. Retraditionalization means invoking activities mythical, past and "lost" masculinity; militarization embraces social activities within the framework of cultural warfare, struggle and confrontation. Research shows that these practices refer to the cultural and social context of the English society in which Polish migrants live. The four dimensions of the context in which men take up confrontational practices are particularly important. One is Islam and multiculturalism; studies show that the confrontation of Polish religious men with Islam is becoming a symbolic arena of struggle of masculine forces for domination over control of the social order. The other contexts to which my interlocutors primarily refer in the practices of hegemonic masculinity are the nation, secularization, and religious pluralism.

Gender Equality as the New Scapegoat for Political Parties and Conservative Movements in search of a new Political Consensus - A Romanian Case Study

Băluță, Oana

University of Bucharest, Romania
oana.baluta[at]fjisc.ro

In many European countries, illiberal leaders, parties, and movements have promoted an anti-feminist and anti-gender agenda by making common cause with established liberal and social democratic parties (Isaac, 2018; Verloo, 2018; Korolczuk, Graff, 2018; Bustikova, Guasti, 2017; Paternotte, 2014; Kuhar, Paternotte, 2017). Specific groups (women, LGBT, immigrants and refugees) and democratic values (gender equality) have been subjected to systematic attack. In Romania, opposition to gender equality became a political project in 2018, when a referendum on "the traditional family" divided the society and fed antifeminist and anti-LGBT discourses. Liberal and social democratic political parties joined hands with the most conservative right wing coalition and the Orthodox Church to support the Constitutional referendum to define marriage as the union between a man and a woman. And new NGOs and parties organized to fight this. How can we explain this alliance between powerful liberal and social-democratic political parties and the conservative Coalition to Protect the Family? What motivated the new political parties to oppose the referendum, and how was this justified? This paper will answer these questions. By mapping national antifeminist and feminist political actors and their main framings during the boycott campaign, it will also contribute to a better understanding of the opposition to gender equality in Eastern European that now play an important role in the European Union. Bibliography - selection Korolczuk, Elżbieta; Graff, Agnieszka, 2018, Gender as "Ebola from Brussels": The Anticolonial Frame and the Rise of Illiberal Populism in Signs, pp. 797–821. Kuhar, Roman; Paternotte, David (eds.), 2017, Anti-Gender Campaigns in Europe Mobilizing against Equality, Lowman & Littlefield. Verloo, Mieke, 2018, Varieties of Opposition in Europe, Routledge, New York.

Sex and Gender Equality in the Europe of Anti-Gender Movements: What Challenges for Feminism?

Venegas, Mar (1); Villar Aguilés, Alícia (2)

1: University of Granada, Spain; 2: University of Valencia, Spain
mariter[at]ugr.es, alicia.villar[at]uv.es

Contemporary societies are transforming by opening up to emerging tendencies, among which a relevant one for feminism is the so-called 'Ideology of Gender' (IoG). This IoG is occupying a relevant social and political space worthy of serious feminist considerations in contemporary Europe. A good example of this is Spain, where recent polls in Andalusia (2nd December, 2018) gave access to the Andalusian Parliament, for the first time in the recent democratic period following Franco's dictatorship, to the extreme right. This has opened a new political period, bringing anti-gender discourses, based on the IoG, to core political debates in the country as a whole. It is remarkable to emphasise the important feminist achievements got for sex and gender equality in Spain in the last two decades. Nevertheless, the UE gender mainstreaming is now collapsing with the strong opposition of anti-gender positions that, in fact, have spread all over Europe (and beyond), making it an international phenomenon of interest for both feminism and sociology. In this historical venue against feminist attainments, this paper wonders about the impact anti-gender movements in Europe have on feminist achievements in the field of coeducation, which is defined here as the educational (Spanish) model that is willingly and strategically committed for sex and gender equality in education. In so doing, we first consider recent feminist relevant achievements in Spain. We then analyse how this ideology is permeating social and political discourses. Finally, we discuss the challenges feminism may have to face, taking education as a core field.

RN33_08 | Everyday Sexism, Abuse and Violence

Writing against Violence(s): Cultural Difference and Sexism in the Narratives of Immigrant Divorced Mothers from Turkey in Germany

Uygun, Çiçek

Justus Liebig University Giessen, Germany
Cicek.Uygun[at]jgsc.uni-giessen.de

In Germany, people with immigration stories from Turkey are affected by a set of dominant discourses which shape their public presence around religion and gender violence, represent Muslim women as victims of Muslim violence (Weber, 2013), stigmatize the masculinity of Turkish Muslim men (Ewing, 2008) and racialize Islam as tainted by Turkish traditions (Özyürek, 2014). Based on my current fieldwork, this paper tackles the daily struggles of immigrant divorced mothers from Turkey living in Germany and how they narrate their experiences as personal, structural or cultural problems. My previous research experience with middle class divorced mothers in Turkey in 2015 has shown that they often make sense of their daily struggles in terms of personal problems (as a matter of capacity, strength or worldview) and/or structural problems (such as gender inequality or the state's institutions and policies). In the context of Germany, however, such individual narratives also merge with the discourses of cultural difference, and even the structural problems that the participants experience as immigrant divorced mothers can be framed within the Turkish/Muslim patriarchal culture. Hence, this paper analyzes the narratives of immigrant divorced mothers from Turkey in Germany through the question of how to negotiate as a feminist researcher, between writing against gender inequality and challenging the existing stigma on the Turkish-German community as culturally oppressive and violent. How can feminist research enable an analysis of racism and sexism without trivializing the narratives through which some of its participants' claim to have fought against an oppressive culture all alone?

Deception And Abuse: Manifold Instances Of Proxemic Violence Against Sub-Saharan And Eastern-European Women-immigrants In Sicily

Bartholini, Ignazia; Pascoal, Rafaela Hilário

University of Palermo, Italy
ignazia.bartholini[at]unipa.it,
rafaeladaconceicao.hilariopascoal[at]unipa.it

Over the past few decades and up until 2017, Sicily has hosted increasing numbers of African fugitives (ANCI et al., 2017) as well as migrants from Eastern Europe, especially after the entry of Romania into the European Union. The aim of the research was to analyse some of the role positions found in gender dynamics among migrants, throwing light on possible processes by which mechanisms of submission to and normalisation of gender violence seem to have been internalised by these victims of proxemic violence, emphasising the viscous links existing between vulnerability, resistance and resilience. Within this markedly multicultural context in Sicily, the researchers carried out a two-part qualitative research project, the first part consisting in participant observation of a number of sub-Saharan women hosted by some of the island's migrant reception centres, victims of abuse, followed by a set of semi-structured interviews administered to them; the second part consisted in participant observation and some semi-structured interviews with Romanian women involved in outdoor prostitution. The project sought, furthermore, to highlight equivocations surrounding affective action declined in feminine terms and instrumental action in masculine terms, suggesting that proximity may be considered a more "intimate and deceptive" declension of gender violence.

Gendered War Memories: The Case of Croatia

Dremel, Anita

University of Osijek, Croatia
anitadremel[at]gmail.com

This paper analyses gendered memories of the War in Croatia 1991-1995, particularly of the armed conflict in eastern Slavonia and western Srijem, the areas figuring as symbols of suffered aggression at the time. We look into personal narratives and dominant discourses, the latter shaping (gendered) cultural memory, which influences the processes of cultural modernization during democratic and capitalist transition. The objective is to do an auto-ethnography of displacement in late 1991 and to critically analyse the discourse of transcribed interviews with victims and witnesses of the war and selected media coverage. Analyses focusing on the relationship between war and gender typically emphasize militarized masculinity in national discourses and cultural sphere, while femininity represents the space outside of war (home, normalcy, peace), to which man-soldier returns to and in defence of which he is willing to die. Both gender identities

are however constructed in a way that reproduces militarism. In this sense, analyses of gender as both a social construct and a political category keep informing the studies of not only war, but also migration, bio politics, female work exploitation, international relations etc. Leaving aside the debates on the petrification of gender characteristics that associate men with war and women with peace, the path needs to be cleared for considering mutual constitution of war and gender, especially from the perspective of social power. Maybe the most important contribution we may hope for is revealing ontological implication of gender in war: we cannot make war without doing gender and vice versa. This is no new argument (Betty Reardon, Jean Bethke Elshtain and Cynthia Enloe), but contextualized research on the topic is the task ahead of us.

RN33_09a | Generations, Identities and Subjective Experiences

Tradition or Integration? Changing Identity Patterns in Three Generation of Roma Women in Hungary

Maszlak, Fanni

University of Debrecen, Hungary
maszlak19[at]hotmail.com

The infiltration of globalization and modernization into traditional communities does not only bring change at the individual level to the life of Hungarian Roma women, but also changes the way of cultural transfer and socialization, including new contents, value sets, traditions, and integration frameworks. The role of Roma women in these processes, i.e. in the field of cultural transformation, could be a key factor for the integration of the minority group. On one hand, they ensure the continuation of traditions and, on the other, they are the initiators of change. It is particularly important to examine this change from the viewpoint of both the majority and the minority groups. I try to answer the questions, whether keeping traditions or putting them away facilitate the integration into the majority society and how these patterns changed in the past 20 years, how the 'walls of tradition' hinder the integration. In my interview research, I present the different phases of integration and levels of segregation based on the personal perceptions of three generation of Roma women.

Doing Feminist Diversity: Learning from a workshop for first generation students

Ben-Shoshan Gazit, Efrat

Tel Aviv University, Israel
efigazit[at]gmail.com

First-generation students (FGS), are students whose parents do not have academic degrees. Most FGS are low income women, from minority groups, underrepresented in research faculty. FGS women face multi barriers that create a sense of s alienation, especially in regard to their lack of academic skills, which are considered within the meritocratic discourse as 'knowledge' that defined excellence and success. Ahmed (2017) points the contradiction between institutions' declarations of diversity, and the reality. She criticizes the false diversity language of academia as an active un-transformative action. I will present a particular diversity initiative for FGS, and discuss its feminist framework. In the past four years "Academia for Equality" has been offering an academic workshops for FG women, providing academic professionalization skills and feminist tools in order to allow them to expose the politics of 'knowing', and most important, the politics of 'not knowing'. I will demonstrate how these workshops enable the creation of a feminist knowledge, by allowing the students to speak the 'not knowing', to express the emotions of alienation it produced, in a safe place. I will conclude by proposing to institutionally adopt such a model of critical workshops, that widen the possibilities to 'do diversity' and not just speak about it.

Exploring the Everyday Lived Experiences of Young Muslim Women About the Hijab: Reflections From the Inside

Golding, Berenice; Jackson, Leonie B

University of Huddersfield, United Kingdom
b.golding[at]hud.ac.uk, l.jackson2[at]hud.ac.uk

The Islamic headscarf has received a large amount of attention in the United Kingdom (UK), Europe and the broader Anglosphere in recent years, resulting in an increase in research that consults Muslim women about their views. While Islamic veiling practices have long been problematised as potential indicators of radicalisation and positioned as challenging to multicultural British identity, contentious debates in the UK have focused on face and body coverings (the niqab and burka), while scarves that cover only the hair and neck (hijab), have been largely absorbed as acceptable practice. The announcement in November 2017 that Ofsted (Office for Standards in Education, Children's Services and Skills) school inspectors would question young girls about why they wore the headscarf was therefore somewhat surprising, particularly as it was apparently based on an interpretation of the garment's potential sexualisation of children. This paper reports on an exploratory study in to the multiple meanings of the headscarf for young women in two universities in the

North of England. Using The Listening Guide, a narrative feminist approach to data analysis, we illustrate how diversity, inclusion and unconscious bias are central to young women's reflections upon the role of the hijab in their lives. Specifically, we reflect upon wider social, political and societal contexts and the factors that influenced their decision to wear or not to wear a headscarf, their thoughts and feelings about the Ofsted ruling, societal perceptions of the headscarf, and these young women's positions in wider society.

Sexting is not Sex: How Teenagers Redefine Communication and Sexuality

Zafeiridou, Genovefa

University of Cyprus, Cyprus
zafeiridou.genovefa[at]ucy.ac.cy

The phenomenon of teen sexting has become a major challenge not only for parents but also educators and policy makers. Beyond moral panics and concerns about propriety, sexting has also been identified as an instrument of intimidation and bullying. However, while research has examined the prevalence of the phenomenon mostly through surveys, few studies have engaged young people's own perceptions and understandings of sexting. This study is based on 34 interviews with 15-18 year-old students (20 girls, 14 boys) in two high schools (urban and rural) in Cyprus. All ethical rules for ensuring anonymity and confidentiality were followed, including parental and student consent as well as procedures for handling cases of abuse disclosure to the interviewer. Results are concurrent with recent literature which points to how sexting exposes sexism, double standards, 'slut shaming' and internalized misogyny. However, while the devastating consequences of sexting as a form of bullying were recognized by the participants, there was also a blasé attitude towards the significance of sexting. I argue that young people's explanations and rationalizations of this widespread practice involve a discernible shift in youth culture where sexting is viewed simply as form of communication, devoid of the gravity and 'seriousness' of sex. I conclude that this needs to be taken into account when analyzing how sexting complicates current debates on sexuality and sexual agency.

RN33_09b | Gendered Responsibilities and Family Idealizations

Female Perpetrators in Prison: Agency, Suffering and the Gendering of Responsibility

Snertingdal, Mette Irmgard (1); Neumann, Cecilie Basberg (2)

1: University College of Norwegian Correctional Service, Norway; 2: Oslo Metropolitan University
mette.snertingdal[at]krus.no, nece[at]oslomet.no

In the intersection between critical criminology and feminism, the juxtaposition of the categories prisoner and woman creates challenges, for complex gendered- and social theoretical reasons. While the critical criminologists were, and still are, engaged in problematisations of black and white thinking around people's criminality, distancing themselves from reductionist explanations of criminality and emphasising the effects of social processes of marginalisation, feminists have attempted to demonstrate how gender is a social construction impacting differently on the lives of women and men and their opportunities for self-realisation. However, where we permit different feminisms and critical criminology to meet in order to increase our understanding of the lives, conditions, and actions of women in prison, problems arise with regard to how we should relate to the concepts individual responsibility, agency and suffering. Here, discourse hold out two gendered subject positions; the woman as a victim and the man (and prisoner) as a perpetrator, also engaging the contested labelling's of women as passive and men as active. Taking female prisoner's engagement with violent crime as our point of departure, our papers ambition is to shed light on the complex and gendered reactions to these violent acts within the judiciary system.

Preparations For The Next Life? Authenticity, Ambivalence And Middle-Class Femininities

Vaadal, Kristine (1); Ravn, Signe (2)

1: Volda University College, Norway; 2: University of Melbourne, Australia
kristine.vaadal[at]hivolda.no, signe.ravn[at]unimelb.edu.au

In this paper we explore how professional women in their late twenties/early thirties construct identities as successful middle-class women and the tensions involved in this. Based on qualitative interviews with 19 Norwegian women aged 27-34, we argue that their identity-work is not only tied to their present situation, but also to their imagined future lives and identities. Drawing on cultural class analysis, we focus on the complex ways in which the participants construct specific

classed and gendered identities through their own consumption patterns and the distinctions they draw towards others' regarding alcohol, nightlife and broader lifestyles. The analysis falls into two parts: first, we consider the ways in which the participants presented themselves as progressive career-oriented women, distancing themselves from what was considered excessive, sexualized and conservative drinking cultures in (mainstream) nightlife. Second, we look at the growing centrality of the home sphere in the participants' lives, centring around private dinner parties, an interest in food and wine and cultivating close relationships with family, friends and partners. While these practices are becoming more central in the participants' present lives, they seem particularly pertinent to their imagined futures. However, these imagined futures were marked by feelings of ambivalence. We conclude the paper by discussing the implications of these findings in relation to the concept of new femininities and we relate the participants' ambivalence towards their 'next life (phase)' to the limitations in terms of gender performances that they seem to associate with this.

Ideal family. Women Idealized: The prisoner's stigma that contradict models constructed historically

Reif, Karina

Pontifícia Universidade Católica do Rio Grande do Sul. Brazil
karinareif[at]gmail.com

Analysing biographical narratives of women who were in the prison system in Brazil, it is evidenced how those people try to represent what society expect. They recover in their speeches the gender stereotypes and the role that women play in family, which was constructed historically. The interviewees showed mainly three aspects: stigma; reinforcement of gender stereotypes, used as a way to mitigate the image of ex-prisoners; and learning period. The representations of passivity and delicacy were recurrent associated with women throughout history. Therefore, when they commit a crime, they would be assuming a place reserved for the man, which is more associated with the violation of the established order. Thus, the jail would have the intention of transforming and framing the woman in traditional models, according to sexist patterns. It seeks to reestablish the social role of mother, wife and guardian of the home.

Gender and Women's Commitment in Mafia Organizations: The Family as a Greedy Institution

Panzarasa, Martina

University of Milan, Italy
martina.panzarasa[at]unimi.it

Women play a crucial role within mafia organizations as confirmed by a number of studies, especially focussing on the Italian case, that have emphasised the emergence, during the past few decades, of a growing female presence in the management of the various illegal activities carried out by these groups. Gender relations in mafia groups, however, have been mainly studied through the narratives of women who decided to turn state's witnesses and through court records. This paper suggests a different approach by focusing on the accounts given by women who are still linked to criminal organizations. It employs qualitative methods and is based on 18 semi-structured discursive interviews with mafia women belonging to the main Italian mafia groups (Camorra, 'Ndrangheta, Cosa Nostra) who were detained in a high security prison. The analysis focuses on the role played by family in constructing gender practices within mafia contexts and on the mechanisms used by criminal organizations in order to ensure women's commitment. In particular, the research shows that family acts as a greedy institution (Coser 1974) thanks to an encapsulation process (Greil and Rudy 1984) which confines women to the role of mothers and caregivers, making them experiencing segregation, especially after sexual maturity, and a coercive control over their bodies. Finally, family also regulates forms of dyadic attachment through the control of matrimonial practices. In conclusion, the paper highlights that gender roles are structured through interactions with mafia group's norms and needs, which are reproduced within the household contexts. Indeed, mafia family seems to behave as a device for the greedy membership required by mafia organizations.

RN33_10a | Languages, Identities and Masculine Dominations

The Limitations of Identity Politics in The Women's Movement in Turkey and Transversal Politics as an Alternative Approach

Dinçer, Pelin

Hacettepe University, Turkey
pelindincer[at]gmail.com

The women's movement in Turkey involves women who are diversely positioned in terms of their social locations, identifications and values, which intersect with the political

cleavages that divide Turkish society as a whole. One of the main reasons for this fragmentation, I argue, is the extant identity politics within the movement. In this study, I discuss that seeing identities as unalterable and not transitional deepens the fragmentation within the movement and stigmatises women in different groups. The increased attack on gender, as well as on feminism, under the contemporary conservative regime in Turkey, however, indicates the need for establishing alliances with differently located women. Thus, this study explores activist women's perceptions and their positions on identity issues, such as gender, religion and ethnicity, as well as their views of each other, through in-depth interviews I conducted with women activists and academics in Turkey in 2014–2015. I argue that understanding identities as fixed notions leads to disregarding intra-group differences, creates a false sense of homogeneity within groups and exacerbates activists' tendency to stay in their small groups. In order to move away from the limitations of identity politics, I offer to adopt transversal politics in understanding differences among women, whereby activists can find a realm aside from the exclusionary structures of universalism and identity politics. Adopting transversal values could potentially help activists overcome the barriers to work across differences by increasing respect and understanding of their differences without becoming trapped by them.

Language And Gender In The Labour Market

Mikić, Jasna

University of Ljubljana, Faculty of Social Sciences, Slovenia
jasna.mikic[at]fdv.uni-lj.si

First attempts to investigate the topic of gender and language date back to the 5th century but it was not until the second feminist wave in the 60s and 70s that the topic gained widespread recognition. Although the earliest studies have focused mainly on exploring differences between (what was then identified as) 'woman's language' and a deviation from the (male) language norm (Lakoff 1975, Spender 1980, Tannen 1990), the emergence of fundamental redefinitions of gender in the 90s has offered a new perspective in study of language in society. My analysis will be based on the understanding of language as an important dimension and a fundamental tool for reproduction of gender identities, power relations and inequalities in the labour market. Many studies have shown that stereotypes are automatically activated (and difficult to discharge) in word processing. The language used in job descriptions and in job titles is associated with cognitive integration and identification of women and men as members of certain occupational groups. Female job titles could be associated with less competence, male job titles with more competence and the use of gender-fair language in occupational titles may trigger a greater gender-balance in perceptions of people's professional success (however there is also some counter evidence). The aim of this presentation is demonstrating ways in which sexism in language is not only a linguistic issue, but a broader socio-political phenomena, which affects the positions of women and men in the labour market.

Working for the Government as a Convenient Job for Women in the Russian Patriarchate

Utkina, Valeriya

National Research University Higher School of Economics,
Russian Federation
valeria_utkina[at]hotmail.com

It is believed that public administration is not perceived as a gender-specific profession in modern Russia, but there are requirements that limits women compared to men (for example, glass ceiling). However, in 2017 National Action Strategy in the interests of women in the years 2017-2022 has been prepared by Ministry of Labor and Social Protection of the Russian Federation under the instruction of Russian President and the Government, where it is proclaimed to develop women participation in public administration. The strategy should be a fundamental document defining the priority directions of the state policy for women in the medium term. Our study was based on a set of 32 semi-structured interviews with young women who have an experience of working in the civil service. The results were guided by the qualitative analysis of the text in order to identify the main topics crucial for this group of women due to the nature of their work and personal life. Thus, we examined whether the civil service is "suitable" work for women, and why. We revealed, on the one hand, the continuing stereotypical division of labor in the spheres of male (power, supreme responsibility) and female (work assistant, organizer, or more creative, but rather an individual - Analyst, PR, etc.), on the other - some counter-stereotypical phenomenon and attitudes that characterize the studied group of women: a relatively high self-esteem and tends to "peer" self-realization. Indeed, women in the Russian government agencies, as a rule, do not aspire to the highest levels of power but, the pursuit of a horizontal "expert in your field" is a meaningful career for them (often in spite of the low salaries).

Language and Masculine Domination

Antić Gaber, Milica; Perger, Nina

University of Ljubljana, Slovenia
milica.antic-gaber[at]guest.arnes.si, nina.perger[at]gmail.com

While in sociology social dimensions of language and its practices, that is, its Bourdieusian character as a structuring structure and structured structure (Bourdieu 1991), is widely acknowledged (i.e. Mills 2008), such knowledge was – until recently – rarely put into practice, especially when it comes to masculine domination in language, which reflects in predominant, taken for granted use of male pronouns in generic form. In the paper, we focus on the recent successful attempt of institutionalising strategies aiming to overcome mentioned use of male pronouns in generic form (by officialising the use of female pronouns as generic) that were implemented at the level of higher education in Slovenia, more specifically, at the Faculty of arts in 2018, followed by the Faculty of Social Sciences and their internal bodies, the Senate (both University of Ljubljana). Taking into account the fact that such institutionalisation is not a product of 'now', but rather results from the whole history of practices and resistances that "chip away" (Ahmed 2016) masculine domination, the aim of the paper is to analyse the broader context and conditions on the background of which space and opportunities for such 'consecration' (Bourdieu 1988; 1991) were opened and successfully realized. In addition to giving a basic overview of similar practices abroad, the attention is also given to the backlashes that needed to be overcome and which were predominantly grounded in a conception of a) language as 'asocial', and b) institutional 'consecration' as 'authoritarian'.

Women Entrepreneurs: New Ideas, Old Practices

Shnider, Avi; Guy, Anat

College of Management, Israel
avi[at]otika.co.il, g1anat[at]colman.ac.il

This study explores the reasoning and motivation of middle and upper middle class women in Israel who chose to become entrepreneurs. Current literature perceives women's entrepreneurship mainly as a potential source of economic and social development for these women who seek mainly new opportunities that may not be available to them in the corporate western markets. By contrast, we suggest that although women's entrepreneurship serves as way to include women within the labor market it also reproduces social rules and structures, similar to those of the corporative market. By employing mixed methods of both quantitative and qualitative approaches, we analyze the motivation and reasoning of 70 entrepreneur women from Israel to choose entrepreneurship. Our findings suggest that although highly, professional, well-educated middle and upper middle class women become entrepreneur, they also limit their businesses to female-type occupation. By limiting their business operation, middle and upper-middle class women reproduce traditional gender roles, and reinforce the traditional perception that the main role of the Israeli woman is to be a mother. This study points out then, the ways whereby women entrepreneurship serves as a social practice that reinforces gender hierarchy and social order.

Gender-Based Approaches in Contemporary Iranian Art and Culture: A Critical View

Moussavi Aghdam, Combiz

Tehran University of Art, Iran, Islamic Republic of
cmaghdam[at]yahoo.com

In the last three decades, gender research and queer theory have been used to analyse socio-political-historical changes across the globe. Based on non-binary definitions of gender and sexuality, these new poststructuralist approaches have also been applied to explain the transformation of gender roles in modern non-Western societies. However, the applications of feminist and queer theories in different contexts can sometimes be challenging and disputable. In this paper, I will mainly focus on the methodological challenges that scholars of gender studies have faced within their psycho-social analyses of non-Western cultures. I intend to explore these difficulties with regard to a specific historical, geographical and cultural example and focus on the changes in gender dynamics in modern Iranian society and their visual demonstration. The fluid nature of sexuality before the manifestation of modernity in early twentieth century Iran and the tensional and transitional condition of gender roles in recent decades have led some social historians to apply gender-oriented approaches to the field. The ironic characteristic of visual material has also provided a suitable basis for rereading and analysing the changes in Iranian sexual culture. One of the key concepts in this area of research is queer sexuality which could be used for both the historical past and the contemporary post-revolutionary Iran. With special reference to art and visual culture in contemporary Iran, this paper will critically examine the ways in which feminist and queer theories have been utilised and adopted within the Iranian milieu.

Communities of Practice and Gender Equality in Academia: Challenging the Status Quo Through Knowledge Exchange

Warat, Marta; Ciaputa, Ewelina; Sekuła, Paulina; Krzaklewska, Ewa

Jagiellonian University, Poland
marta.warat[at]uj.edu.pl, ewelina.ciaputa[at]uj.edu.pl,
paulina.sekula[at]uj.edu.pl, ewa.krzaklewska[at]uj.edu.pl

The unequal status of women in the academia has been recently given an increasingly scholarly focus. Although women constitute the majority among initial academic appointments, discrimination manifests through lower pace of their career progression, their underrepresentation in senior positions and in mere presence in decision-making processes. These problems are already being addressed in institutional measures aimed at improving gender balance in academia. Yet, the lack of knowledge and expertise within research organisations calls for institutionalised ways to assure exchange of good practices. In this context, communities of practice (CoPs) are believed to have potential to improve the performance of academia by establishing and stimulating groups of practitioners who share the same concern and learn from each other to strengthen the effectiveness of their gender equality work. Our paper – focusing on the Polish case – based on the survey with gender equality practitioners, researchers and HR staff in research performing and research funding institutions conducted under the framework of the H2020 project ACT will examine to what extent CoPs can increase the engagement for institutional change and quality of outcomes. Particularly, we will map the existing collaboration between Polish research institutions, assess current needs, successes and barriers in implementing gender equality as well as analyse activities and measures developed to advance gender equality. Finally, we will analyse what internal and external factors are seen as critical to improve gender equality in research and academia. We explore these issues in the political context where the intersection of conservatism and nationalism has been found to pose challenges to gender equality policy implementation.

‘Home’, Intersectionality And Practising Arts: How Can Intersectionality Be Implemented In An Art-based Research Design?

Fathi, Mastoureh

Royal Holloway University of London, United Kingdom
mastoureh.fathi[at]rhul.ac.uk

Given the emphasis placed on education as ‘the’ way for ethnic communities to integrate in the UK, it is vital to understand migrant women’s experiences of community based pedagogical spaces and their complex dynamics. In a study with 36 women from Afghanistan, Syria, Ukraine, Somalia, Syria and Iraq in West London (2018-19), I aimed at understanding homing and pedagogy in community-based spaces. The intersectional methodological plan to which we (a group of community researchers) collectively contributed involved: 1. Ethnography notes drawing extensively on our own intersectional positioning as academics and community workers. These collaborative narratives were produced through sharing dialogues, notes written on shared folders and images of our understanding of women’s involvement in the project after each session (interpersonal experiences). 2. ‘Thematic art training’ on various aspects of women’s lives, childhood, homeland, motherhood, and home in London (migrant experiences). 3. Active participation with women in relation to caring for their children who were present in the premises where the classes were taking place (motherhood experiences) Intersectionality informed the initial design of methods to understand the various aspects of marginalised women’s experiences. Through narratives on their art pieces, it was revealed that art training enabled them to reflect on womanhood, marginalisation, being from a country ‘afar’ and living in London both visually and orally. It is suggested that pedagogical spaces can provide spaces that intersectional methods can be implemented in design and delivery stages in community-based projects rather than only at analysis stage.

The Effects of Sibling Configuration on the Religiosity among Muslim Youth in Belgium: Does the Migrant Generation Matter?

Kojima, Hiroshi

Waseda University, Japan
kojima[at]waseda.jp

This study analyzes the effects of sibling configuration on the religiosity of the Muslim male youth by migrant generation in Belgium in the mid-1990s, applying comparable binary logit models to the MHSM microdata. After controlling for demographic, socioeconomic and parental variables, having 3 or less siblings tends to have a negative effect on the experience of lamb sacrifice and having 2 or less sibling tends to have a negative effect on the daily mosque attendance among Muslim youth of each migrant generation. Similarly, having 3 siblings tends to have a positive effect on visiting relatives during Eid. However, the effects of sibling variables differ by migrant generation. Having 3 or less siblings tends to have a negative effect on the agreement with women's wearing of a scarf among the first and 1.5 generations but it has a positive effect among the second-generation possibly because of "re-islamization." Having 3 siblings has a weaker but similar effect on fasting during Ramadan by generation, but having 4 siblings exhibits even weaker effects in the opposite direction. Birth order has much less pronounced effects. Having 1 or 2 older sibling tends to have positive effects among first and 1.5 generations but it tends to have non-significant negative effects among the second generation possibly because of increasingly more restrictions in urban Belgium. The analysis has revealed larger effects of sibship size and smaller effects of birth order on the religiosity across migrant generations while there are some indications of interaction effects.

The New and the Old German Islam Conference: Conceptions of Dialogue With Islam in German Parliamentary Debates

Schlerka, Sebastian Matthias

University of Bielefeld, Germany
sebastian[at]schlerka.net

In 2006, the Deutsche Islamkonferenz, a forum of dialogue between German state officials and several Muslim actors aiming at a better integration of Muslims in Germany, was

initiated by the Minister of the Interior. It soon became a well-established institution. However, it is nowadays almost forgotten that already in 1995 the then Minister of Foreign Affairs (Klaus Kinkel) planned a large conference aiming at establishing a dialogue with Islam (Islam-Konferenz). However, after the assassination of Israeli Prime Minister Rabin and its approval by the Iranian president, the Bundestag forced Kinkel to cancel the invitation of his Iranian colleague to said conference. As a reaction, Kinkel cancelled not only the invitation but the entire conference. The paper explores the differences as well as the commonalities between both conferences by analyzing the parliamentary debates surrounding them. This way, it can be seen that back in the 90s Islam and even the Muslim population in Germany was considered an object of foreign affairs, while in 2006 it was seen as a domestic issue. Furthermore, while the debates about both conferences pivot around a concept of "critical dialogue," there are differences in the question of whom to talk to: while in 1995, a number of deputies emphasized a need to establish dialogue especially with fundamentalists, in 2006 the invitation policy aimed at excluding fundamentalist actors. This way, the paper provides insights on how the Bundestag conceived of a dialogue between the German state and Muslim actors in two different efforts to initiate dialogue that are separated by 11 years - and by the september 11 attacks.

Media coverage of Islam: Commonalities and Specificities of the Portuguese case

Santos Silva, Francisco

CIES ISCTE-IUL, Portugal
francisco.silva[at]gmail.com

Portugal is an interesting case when it comes to how the media cover Islam and stories related to Muslims and Islamic issues. Firstly, it is a European country which has not experienced Islamic fundamentalist terrorism first-hand, it has also had a comparatively low rate of Muslim immigrants in the last few years. Another interesting factor is the absence of a strong far-right political force or far-right discourse in the public sphere. This is compounded with a historical and romanticised memory of an Islamic past in the country, from which derives a not-necessarily negative view of Islam, but what might be considered a more Orientalist view of an exotic past. Portugal is also a very homogeneously Catholic country, with little experience or tradition in studying other religions or even being concerned about them, unlike much of Europe. This paper, focusing on the years between 2014 and 2016, seeks to examine how these factors change the discourse on Islam present in the media landscape in Portugal and particularly how stories generated in Portugal, about the Portuguese Islamic community or events in the country, differ from news imported from elsewhere in Europe and North America. This search for common aspects in media coverage and the specificities of the Portuguese case aims to examine how the cultural, political and historical specificity of Portugal has an effect on media coverage and if this is translated into public opinion.

'I Used To Be Muslim/I Am Not Muslim': (De)Activation, Identity Salience and Life-Course

Kazi, Uzma

Lund University, Sweden
uzma.kazi[at]soc.lu.se

In an unprecedented Muslim migration context in Sweden, with changing demographics as well as pressures on the welfare state against the backdrop of heightened securitization, terrorist attacks, and Islamic extremism, for second-generation Pakistanis, inheriting a Muslim identity from their parents can barely be considered a windfall gain. On the contrary, as they forge both roots and routes to integrate into the country in which they were born and raised, second-generation Muslims acknowledge/react to the pressures associated with holding a Muslim identity. Moreover, in constructing and maintaining this identity, they are also actively making choices between competing and seemingly opposing identity scripts i.e. religious/ethnic (parental transmission within the Pakistani diasporic context) and secular (Swedish societal context). Drawing on data from 42 qualitative interviews in three major cities of Sweden, in this paper, the cases selected will focus on personal life-story accounts of informants who I call 'ex-Muslim' hybrids on account of their disidentification with and exit from the salient familial Muslim identity as a situated negotiation within the continuum of the 'third space' to forge alternate ways of belonging as a minority within the Swedish society. Using the concepts of 'strong evaluations', 'neo-tribes', and 'interpretive repertoires', the idea is to explore through narratives, (de)-activation mechanisms that constrain and liberate 'expressive individualism'. Subsequently this paper will discuss identity strategies adopted as means to balance the cognitive load and emotional investments to various relationships of commitments in the maintenance and reproduction of social bonds during the life-course.

Social Remittances And Religiosity: How Migratory Movements Affect Religion And Religious Practices In A Trans-National Social Space

Coppola, Nicolamaria

Sapienza - Università di Roma, Italy
nicolamaria.coppola[at]uniroma1.it

Transnationalism refers to the existence of a dynamic flow of human, cultural and economic capital across national borders that connects people and institutions in a trans-national social space. This connectedness also affects religious communities and practices, both in migrants sending and receiving countries. Contemporary studies have mainly analysed the economic consequences and impact of remittances in the countries of origin of migrants, but the role and the influence of the so-called 'social remittances' have not been explored so far. Social remittances are ideas, practices, identities and social capital that flow from host country to receiving country.

Scholars have not dedicated much of their studies on examining how migratory movements and remittances affect religion and religious practices. It has been documented a correlation between religiosity and various social and political attitudes of migrants in a social space. Nevertheless, there is no empirical evidence on the relationship between religiosity and (social) remittances. The A. intends to address the impact that migration is having in terms of religious patterns in the Euro-Mediterranean region. The A. seeks to examine the transformations – if any – in the religious practices of migrants in the receiving countries and if they affect the countries of origin as well. If religiosity and religious practices facilitate the adaptation of immigrants into a new society and what are the consequences of religious influences between the countries of origin and those of destination.

Can Atheists be Good Citizens?

Bechert, Insa

GESIS - Leibniz-Institute for the Social Sciences, Germany
insa.bechert[at]gesis.org

The U.S. American Pledge of Allegiance refers to the country as "one nation under God". Previous research has shown that many Americans feel that atheists, who do not believe in any kind of God, inevitably also do not believe in the set of values perceived as fundamental for being "good citizens", let alone patriots and, consequently, should not be considered as such. Relationships of churches and states, however, differ cross-nationally. In many European countries, the two spheres are clearly separated. This article examines cross-nationally first, how atheists actually feel about their countries. Second, it examines whether the perceived relevance of belief in God for being a "good citizen" is an American phenomenon, or whether similar exclusionary attitudes towards atheists can be observed in European countries as well. Finally, it explores how relationships of church and state may shape individual attitudes towards atheists. The results confirm American "prejudices". Not only in America, but also in the majority of European countries, feelings of national identity appear weaker amongst atheists than among those, who believe in any kind of God. Individual attitudes towards atheists, however, highly depend on the countries' current and former state-church relationships and the general level of secularization. For the analyses, this article uses the ONBound database (<https://www.onbound.international/>) which comprises data from almost 280 survey waves with focus on religious and national identities as well as macro-indicators for analyzing relationships of state and church cross-nationally.

Abuse as a Barrier to Belonging: Pope Francis' 2018 Visit to Ireland

Ganiel, Gladys

Queen's University Belfast, United Kingdom
G.Ganiel[at]qub.ac.uk

This paper explores how Pope Francis' historic August 2018 visit to Ireland exposed the role of the clerical sexual abuse scandals in the decline of the Catholic Church in what was once a stronghold of the faith. The paper includes narrative analysis of how Ireland's "newspaper of record", the Irish Times, covered the build-up and the events of Francis' visit; and a nationally-representative poll commissioned by the author after the visit. In the month of August, 46 percent of articles in the Irish Times about the pope engaged with the clerical sexual abuse crisis in some way, reflecting public indignation about how the Catholic Church and Francis himself had handled abuse. The survey revealed that the most popular view among Irish people was that Francis had not done enough to address abuse, and that the visit had not been a healing time for victims and survivors. While recognising that the reasons for the decline of Catholicism in Ireland are multiple and complex, it argues that the failure of the Church to adequately address the abuse crisis has helped create a barrier to religious belonging that is unprecedented in the history of the Irish state.

Paradise Lost? Discrimination Claims Against Religious Organizations in Switzerland, Germany and ECtHR

Preisner, Michalina Zofia

University of Bern, Switzerland
michalina.preisner[at]soz.unibe.ch

Freedom of religion enjoys special, i.e. stronger than other freedoms, legal protection in national and international regulations. Whereas the scope of this special treatment (e.g. protection of belief, practice or religious organizations), restrictions attached to it (e.g. public order, freedoms of others) and religions that it applies vary across regulations and jurisdictions, the right to religious freedom often yields conflict with antidiscrimination laws. Legal protection of religious freedom allows individuals and groups to claim exemption from equality-oriented antidiscrimination laws. A well-known example of such conflicts of rights is ministerial exemption, the practice of selecting employees for spiritual functions according to the candidates' religion – while clearly discrimination of other candidates on religious grounds, it guarantees the autonomy of religious organizations vis-à-vis the state. Religious ethos and bond of loyalty refer to the autonomy of employees accepted by religious organizations. For faith-based employees, sexual orientation, seemingly private free-time activities and life decisions as common as divorce may result in termination of the contract. In Germany, where welfare providers related to the two officially recognized churches hire over 1.5m people, discrimination cases against religious employers reach courts increasingly often. Switzerland, lacking an anti discriminatory law, seems to be a different example. An analysis of court rulings and

interviews with employees shed new light on the special treatment of religion.

Between Dark and Green Religion: The Spirituality of the Progressive Ecological Milieu in Switzerland

Becci, Irene (1); Monnot, Christophe (2,1); Wernli, Boris (1)

1: University of Lausanne, Switzerland; 2: University of Strasbourg, France
irene.becci[at]unil.ch, cmonnot[at]unistra.fr, boris.wernli[at]unil.ch

Why do people in a highly secularized society have no hesitation to speak about spirituality when they talk about the environment or climate change? Are we witnessing a "return of the religious" or, more specifically, a spiritualization of ecology? Are we witnessing a turning point in ecological activism where spiritual claims are more and more common? In this presentation, we shall present a quantitative analysis of data collected in the Swiss Household Panel survey and discuss the results, also in the light of insights gained from qualitative data (interviews, participant observation and documentary analysis) gathered by engaging with ecological militants in Switzerland. Our findings show that, instead of a return of the religious or a spiritualization of ecology, we are witnessing the emergence of a milieu that shares some progressive, ecological and spiritual values. This milieu shares values which are about the protection of the environment with stakeholders who do not self-identify as religious, but practise meditation and are politically on the left.

The Religious Stranger: a comparative approach between Spinello and Foncebadón

Gasparo, Costanza (1); Venturella, Mario (1); Sirleto, Niccolò (1); Sacchetti, Francesco (2)

1: Piccolo Opificio Sociologico, Italy; 2: Università di Urbino Carlo Bo, Italy
costanza.gasparo[at]hotmail.com,
mario.venturella[at]yahoo.it, n.sirleto[at]libero.it,
francescosacchetti[at]uniurb.it

In this work we intend to compare two different religious phenomena: the annual meeting of an NRM (Ramtha lighting school) and one of the most famous itineraries in the world, the Camino de Santiago de Compostela. In particular, Spinello and Foncebadón were taken into consideration because they have undergone a strong economic redevelopment linked to a religious phenomenon. Spinello is a small village in the Tuscan-Romagnolo Apennines that has become a spiritual destination for the School and has been characterized by two distinct and connected phenomena: the stable arrival of about twenty families belonging to the School (who bought and readjusted the houses of the place) and the moment in which the international meeting of the School is organized, here thousands of people come from all over Europe for a week. Foncebadón is a small "ghost" country of 25 residents in the Spanish province of León, which, thanks to the Way, has begun to attract millions of modern pilgrims and has come into contact with a "European reality" hitherto unknown. This continuous flow has created a series "religious stranger" figures, who are perceived differently in the two countries. In the first case the integration is complete; in the other there is always a line of identity and religious demarcation between the inhabitant and the foreigner / tourist. We therefore intend to highlight this demarcation between social groups, that derives from the different interpretations of the Stranger.

New Patterns of Membership? Participation Theory in the Study of Modern Faith Communities in Finland

Hannikainen, Pietari

University of Helsinki, Finland
pietari.hannikainen[at]helsinki.fi

There has arisen a new movement within the Evangelical-Lutheran Church of Finland during last few decades that is often referred as the "community movement". It has drawn much of its influences from the renewal movements of Church of England, like the Fresh Expressions of Church. My study focuses on their new patterns of membership in the context of the the collapse of the traditional Nordic patterns of Church-membership and "belonging". The study builds on the paradigm of religious democratization and utilizes the theoretical framework of Participation theory in developing

new measuring equipment for the study of these patterns. In my paper I shall present some of the findings that confirm the pattern of participatory membership as a vital part of the emerging movement. In my paper I shall also address some of the issues that need to be addressed when studying religious movements through Participation theory.

Writing Justice/ Performing Injustice: Reflections on Research, Publicity and the Birmingham Trojan Horse Affair

Holmwood, John (1); Monks, Helen (2); Woodhead, Matt (2)

1: University of Nottingham, United Kingdom; 2: LUNG Theatre Company, United Kingdom
john.holmwood[at]nottingham.ac.uk,
helen[at]lungtheatre.co.uk, matt[at]lungtheatre.co.uk

The paper discusses issues of public communication in the context of the rise of populism and the critique of experts. It does so in terms of three kinds of 'reporting' and their associated research methodologies and ethics, namely journalism, public sociology and verbatim theatre. The issues it raises are exemplified through the Birmingham Trojan Horse affair (about the claimed 'Islamification' of schools) which has been subject to extensive media reporting, public inquiries of various kinds as well as legal processes. In that sense, there have been various courts of public opinion where the affair has been staged. In the paper the affair is understood as an injustice visited upon a community of British Muslims and the teachers and governors responsible for their schools, an injustice that derived largely as a consequence of provocative media reporting and peremptory Government action. The article addresses the role of public sociology as a project of writing for justice in the context of widespread Islamophobia and secular criticism of religion, including in the self-understanding of sociologists. It also reflects on the role of verbatim theatre in staging the injustice for public reflection through a play by LUNG theatre group which was first performed at the Edinburgh Festival Fringe in August 2018 (where it won the Amnesty International freedom of Expression award) and will be on tour in British theatres from October 2019.. John Holmwood was an expert witness for the defence in court cases arising from the affair, Helen Monks and Matt Woodhead are script writers and directors of the play.

RN34_04 | Managing religious rights in multicultural societies I

Religion on the borders. Polish Tartars and Lemko case

Warمیńska, Katarzyna (1); Michna, Ewa (2)

1: Cracow University of Economics, Poland; 2: Jagiellonian University, Poland
kwarminska[at]o2.pl, ewamichna[at]gmail.com

The relationship between religion and ethnicity could have multidimensional character. On the one hand, religion could be used as the main marker of ethnicity and be located strongly and permanently on symbolic boundaries of a community. On the other hand, religion can be situationally used in social interactions to communicate differences or similarities between social actors, which underlines the contextuality and the dynamic of identity processes. In both cases, the ethnicization of religion as well as religiousization of ethnicity could be observed. In this paper, we would like to analyse the identity strategies undertaken by the members of two groups - the Lemkos and the Polish Tartars living in Poland nowadays, and we will focus the attention on two issues. First, both communities are minorities in an ethnic and religious aspects. Consequently, to understand the way how they construct symbolic boundaries with dominant group e.g. the Polish Catholics means to take into consideration the structural aspects, especially in the present times of the dominance of religious nationalism in the country. Second issue important in this matter is the scope and character of differences. The Lemkos being East Christians and the Polish Tartars being Muslim in a Catholic country face different challenges. The comparison of these two communities helps to demonstrate some general problems or trends concerning the employment of religion by minority groups in the process of identity construction and the specificity of each of them arising from different history and cultural resources as well as ethnic strategies undertaken in the “we” – “they” relations.

Knives, Religion and Communities: An Ethnographic Study of Knife Crime and its Cultures in Croydon, London

Konechni, Bartholomew Alexander

L'Institut d'Études Politiques de Paris, France
bartholomew.konechni[at]sciencespo.fr

Following the rise of knife crime in London a series of speculative arguments as to its social causes have followed in its wake. Everything from drill music to social media has been accused of playing a role. This paper, based on three months of ethnographic fieldwork in Croydon, seeks to move beyond this speculation and argue that religious organisation has played a pivotal role in creating the conditions for the rise of

knife crime. Croydon was at the centre of the 2016/2017 rise in knife crime; with London as a whole experiencing a 24 percent increase in the total number of knife crimes reported while Croydon experienced a 103 percent increase (Allen and Lukas, 2018). This article attempts to show that this concentrated rise is a problematic one which does not conform to arguments put forward in the public arena. Instead, this paper attempts to reconceptualise the problem of London knife crime as one of a lack of “collective efficacy” (Sampson, 2018) within and between certain ethno-religious groups leading to a redefinition of the norms of public spaces. Differentiated levels of community organisations and beliefs systems built around the concept of an unseen cosmic battle have left the Croydon community vulnerable to publicly violent responses to increasingly difficult social and economic conditions. While some religions have successfully managed to prevent this degeneration of governing norms through the daily regulation of their members lives, looser organisations have allowed their congregations to be subsumed in violence.

Religion and International Politics in Second Modernity: Reassessing the role of religious factor in EU policy-making

Almpani, Chrysa K.

Aristotle University of Thessaloniki, Greece
chrysa.almpani[at]outlook.com

In the fragile times of Second Modernity, religion arises as a prominent issue of sociological analysis that could allow a better understanding of the modern world and its ambiguities. In drawing upon the theoretical background of reflexive modernization (Ul. Beck), this paper will focus on the intersection between religion and politics, in attempt to approach the role that the religious factor can play as a ‘soft power’ agent in foreign policy-making, diplomacy and conflict resolution at international level. Special attention is paid to the dialectical relationship between religion and human rights in the context of the increasing interdependence that characterizes the modern world and underlines the importance of religion in the study of international politics. The analysis is based on a qualitative research through in-depth interviews that has been conducted in 2018-2019 and was addressed to political representatives at EU level (politicians, MEPs, foreign-policy practitioners, policy advisors) and representatives of religious institutions which work in close cooperation with policy makers, providing expertise and advocacy on EU policies. Either considering religion as a political trend, a fundamental human right, a driver of reconciliation or a potential source of conflict, the results show that most of the interviewees recognize the need of ‘inclusivity’ of religious actors to the political dialogue. The present research is coordinated with the international discourse on the reawakening interest of political science to the religious factor and it aims to enhance an interdisciplinary, long-term and thorough research on the field.

The Involvement in Religious Associations: What Role in the Upward Mobility of Second Generations Migrants?

Marroccoli, Giulia

University of Turin, Italy; University Lumière Lyon 2, France
giulia.marroccoli[at]unito.it

This paper is focused on the role played by the engagement in religious associations in the upward social mobility among second generations migrants. Does the involvement in this kind of associations sustain and contribute to the creation of a middle class among people of foreign origin? When we compare first and second generations, does this present different effects on social mobility? Overall, does this kind of engagement sustain upward mobility? Moreover, as several studies point out, it is noteworthy that participation in religious associations partly overlaps the commitment within the ethnic ones. Therefore, the impact and relevance of the wider relationship with the co-ethnic community will be considered as well. Research on young generations of foreign origin has focused mostly on school insertion, while the successive phase of entering the labour market appears to be less investigated. Moreover, studies based in Southern Europe focus mainly on disadvantaged and/or marginal situations, whereas a lack of analysis is observed in the migrants' upward social trajectories – of both first and second generations. This proposal is based on data from a current PhD research, carried out in the cities of Turin and Lyon, and based on in-depth interviews with a snowball sampling technique. The study investigates second generations upward pathways along five main analysis dimensions: family background and migration history, housing situation, networks and relationships, work pathways, social status. Furthermore, the aim is to focus on the structures of constraints and opportunities shown by the two different contexts, thus are taken into consideration people of different origins.

RN34_05 | Muslims and social cohesion II

"Abogida" - Social-Religious Encounters of Eritrean Asylum Seekers in Israel

Eliyahu-Levi, Dolly; Ganz-Meishar, Michal

Levinsky College of Education, Israel
dolylevi[at]gmail.com, michalmeishar15[at]gmail.com

The lecture is based on a qualitative study in which 12 members of the Eritrean community participated in "Abogida". As part of the study, we observed the meetings held at "Abogida" and interviewed 2 principals, 6 teachers and 4 volunteers. The purpose of the study is to examine the perceptions of the leaders of the Eritrean community and the actions that strengthen community cohesion. The Eritrean

minority is pushed into the poorest areas and living in poor conditions, yet they manage to create social-religious meeting places in new areas of belonging. Their description of their situation, as is frequently heard in the media and in other studies, shows that their status as foreigners, temporary and stateless, preserves their cultural distinctiveness even more than other minority groups. They also face a hostile attitude on the part of large parts of Israeli society, with verbal and physical violence, racism and exclusion, and the danger of deportation (Mirsky, 2005). Members of the Eritrean community in Israel have established an informal religious educational framework in Israel - "Abogida", which aims to preserve among children and adults the religious tradition, ceremonies and prayers, the language of origin and heritage stories. By these activities they strengthen their communal cohesion and collective identity as a minority group distinct from the dominant majority (Obrist, Pfeiffer & Henley, 2010). "Abogida" is operated daily from afternoon by members of the community, volunteers and teachers in several places in central Israel. Mirsky, Y. (2005). Israelis - migration stories. Mevaseret Zion: Tulips Publishing. Obrist, B., Pfeiffer, C., & Henley, R. (2010). Multi-layered social resilience: a new approach in mitigation research. *Progress in Development Studies*, 10, 283–293.

Religiosity and Support for the Welfare State in 18 European Countries, 2008-2016

Ervasti, Heikki

University of Turku, Finland
heikki.ervasti[at]utu.fi

Do religious people like or dislike the welfare state more than other individuals in Europe? Prior studies report highly contradictory findings on this question. Some studies have found a positive association between religious thinking and support for welfare policies. This is intuitive since all Christian teachings stress pro-social values and the importance of caring for one another. However, proponents of the so-called economics of religion hypothesis suggest that religiosity is associated with a negative view of the welfare state, because religious individuals prefer religious communities and Churches to government institutions as providers of both monetary and psychological support for deprived persons. As the empirical source, this paper employs data from the European Social Survey (ESS) Rounds 4 (2008) and 8 (2016) covering 18 European countries, which allows the use of more detailed indicators of welfare policy than what most prior studies have used. In contrast to the economics of religion hypothesis, a small positive association between religiosity and support for welfare policies is found. As welfare policy attitudes are operationalised by indicators measuring support for egalitarian policies and views about the width of government responsibility in taking care of vulnerable groups, I find either a zero correlation or a small but statistically significant positive effect. Moreover, the results suggest that the effect of religiosity on support for welfare policies differs notably between European countries and that this effect has declined over time. In the most secularised countries, support for the welfare state is practically independent of publics' religious orientations.

Boundaries of Solidarity

Schnabel, Annette

University Duesseldorf, Germany
schnabel[at]hhu.de

The presentation focuses on the old and new forms of solidarity. Solidarity connects individual interests and common welfare by solving the four most basic problems of societies: problems of collective goods concern the joint production and preservation of common goods; re-distribution problems address the unjust allocation of resources; social protection problems pertain problems raising from unjust distribution of social risks, and loyalty problems tackle the continuance in a social collective. Religion is one of the most important systems of social norms addressing these problems by prescribing how interrelationships should be organised. These norms comprise iter alia of regimentation about who should be considered and who is to be excluded. During the development of the modern nation-state in Europe, religious norm systems lost integrative powers and were partly be substituted by welfare state policies. It is however, an open and mostly empirical question of how comprehensive this change was. Current discussions about the return of the religious in public debates and in individual stereotyping raise the question of how religion, welfare state policies and solidarity are connected nowadays. The presentation comprises of a theoretical part expousing of the connection between solidarity, religion and welfare policies and of an according quantitative analysis based on data of the most recent European Value Survey (EVS 2017/18). Aim of the presentation is to shed light on how different forms of solidarity (religious and welfare stated related ones) are intertwined and whom they address and - thereby – exclude.

Religious Conversion and Cultural Transgression. Roma Pentecostals Integration (?) in Polish Carpathians

Witkowski, Maciej (1); Nowicka, Ewa (2)

1: WSB University, Poland; 2: Collegium Civitas, Poland
szeroka53[at]gmail.com, ewanowickarusek[at]gmail.com

This presentation is based on multiple ethnographic observation in local Roma community in Southern Poland. Conversion to Pentecostalism in Roma mountainous settlement in Poland can be analyzed as the factor of profound social changes in relations between minority and majority. The most significant cultural and ethnic identity shift seems to be the greatest transformation in individuals and a group on a whole. In case of Roma Pentecostal way of life leads to transgression of traditional Roma norms and values, built around the idea of sharp division between we-group and they-group (Roma and gadzio). This evokes following crucial questions we intend to concentrate on: 1. Why local Roma decide to convert to Pentecostalism? What is the emic and etic

understanding of this conversion? 2. How the transformation of lifestyle effect the general axiological transformation of traditional Roma value system? 3. How the conversion effects entire Roma local community integration constructing new division? 4. Does conversion to Pentecostalism give chance for general integration of Roma community to majority society?

Occasional Religiosity: The Case of Participation in Anglican Religious Practices in Toronto, Canada

Johnson, Sarah Kathleen

University of Notre Dame, United States of America
sjohns35[at]nd.edu

Occasional religiosity is a way of being religious that is defined by occasional participation in religious practices—attending religious services occasionally rather than routinely, usually in association with specific occasions, such as holidays, life-course transitions, or crises. I develop the concept of occasional religiosity through the examination of participation in Anglican religious practices in Toronto, Canada, a “majority minority” metropolis. This interdisciplinary mixed-methods study draws on interviews with clergy about baptisms and funerals involving families with a range of relationships to religion, analysis of diocesan statistical records with attention to Christmas and Easter attendance, and participant observation of occasional liturgies. It is the foundation for a larger study engaging occasional religious practitioners in Canada, a comparison case for Europe. Anchored in sociological definitions of religion as practice (Riesebrodt 2009, Smith 2017), occasional religiosity attends to the content and experience as well as the frequency of religious practices. Unlike contemporary spiritualities practiced independently or in loose networks (Ammerman 2013, Drescher 2016, Lee 2015), occasional religiosity relies on congregations and clergy. Although the concept is related to approaches that rely on self-identification with traditions or beliefs such as vicarious religion (Davie 2007), fuzzy fidelity (Voas 2009), and collectivistic religion (Jakelić 2010), occasional religiosity is grounded in observable practices. While their practices may appear remarkably uniform, occasional practitioners understand themselves in diverse ways including identifying as deeply religious, nonreligious, somewhere in between, or even affiliating with other religious traditions. As a dominant expression of religion in Canada today, occasional religiosity is central to understanding how people engage in religious practices together across difference in ways that produce both cohesion and conflict in increasingly nonreligious and religiously diverse social contexts.

Middle Generation Religious Values and Patterns of their (Non)Transmission in Contemporary Lithuania

Ališauskienė, Milda

Vytautas Magnus University, Lithuania
milda.alisauskiene[at]vdu.lt

This paper aims to analyze religious values and patterns of their transmission among representatives of middle generation, born from 1970 to 1985 in Lithuania. The paper is based on the analysis of semi structured interviews (n=80) with representatives of middle generation – women and men, married and non-married, living in partnership or single who have children, that were conducted in 2018-2019. Following the classical insights about generations provided by sociologist Mannheim (1952), these social units are transmitting change, expressing discontinuity, at the same time they are influenced by historical-social processes. Contemporary middle generation was socialized during Soviet period and throughout the period of socio-political transformations, its religious socialization included both underground and public religious education. As this generation is reaching its midlife, patterns of religiosity might be discovered. What are religious values of the middle generation in contemporary Lithuania and how are they reflected in their everyday life? What is religious habitus of the middle generation? What are (if there are any) patterns of transmission of religious values among representatives of middle generation to other generation? How do these patterns differ according to gender, social status of the informants? These questions will be approached during the presentation followed by the discussion about empirical data.

Conversion to Tibetan Buddhism in Communist Poland, Exploration of Individual and Social Memory

Krajewska, Malwina

Nicolaus Copernicus University, Poland
malwina.krajewska[at]gmail.com

The presentation explore life stories of Polish Buddhists, who during the 1970s and 1980s decided to renounce Christianity in order to practice dharma. It explains how their religious identity changed over the last 40 years and how Tibetan Buddhism started to develop in communist Poland. Presented narrations refer to individual and social memory of practitioners. Exploration of reminiscences helped to identify and characterise the circumstances standing behind the first Buddhist conversions. What is more, it helped to trace the further growth of first Karma Kagyu sangha. Data used in the presentation originates from a 5-year qualitative research project (which included in-depth interviews, participant observation and content analysis) conducted among contemporary Buddhists.

Does Being Russian Means Being Orthodox? Representations of The State Identity Discourse In The Russian Orthodox Believer's Narratives About Their Religiosity

Novikova, Galina

International Graduate Centre for the Study of Culture (GCSC),
University of Giessen, Germany
Galina.Novikova[at]gcsc.uni-giessen.de

Since 1991 there has been a considerable increase in the self-identification with the Russian Orthodox Church (ROC) in Russia as well as a growing number of references to ROC in political discourse. Immediately after the collapse of the Soviet Union some researchers noted the simultaneous growth of the importance of the ROC as a social force and the decline of the social trust in the main political institutions (Tymkova 2007). In the post-soviet Russia the ROC is actively used in the political discourse not only as a core of the cultural identity, but also as the key element of the collective or rather national identity (Bremer 2009; Zorka 2009). Some evidence also suggests the ROC to be an important element of historical, national and cultural identity of Russian citizens, even for those who do not believe in God (Bremer 2003: 166). This paper aims to present an ongoing PhD research that deals with different ways of becoming and being Orthodox in the post-soviet Russia. Drawing on the narrative interviews conducted with Orthodox believers in Moscow, Saint Petersburg, Kursk and Smolensk in 2014, 2017 and 2018, this paper explores the understandings of the religious identity in the post-soviet Russia as well as the subjective meanings of the relationship between being Russian and being Orthodox among Russian Orthodox believers. More specifically, the goal here is to explore whether and how the Russian state discourses that depict the Orthodoxy as the core of the Russian identity are reflected in the individual narratives.

Identity Constructions and Religious Boundary Making among Muslim, Christian and Non-believing Urban Youngsters in Belgium

Driezen, Ariadne

University of Antwerp, Belgium
ariadne.driezen[at]uantwerpen.be

This paper investigates the role of religion in identity constructions and symbolic boundary making among Muslim, Christian and Non-believing youngsters in the super-diverse city of Antwerp, Belgium. In Europe, Islam is portrayed as the negative 'other' in public and political discourse, whereas for European Muslims religion remains a highly valued identity dimension. Drawing on in-depth interviews with 30 Muslims, 10 Christian and 10 Non-believing youngsters in the 5th and 6th year of two high schools in Antwerp, our research focuses on the salience of the religious boundary. More precisely, we examine: (1) How Muslim, Christian and Non-believing urban youngsters construct their multiple identities within social interactions and (2) How religious boundaries are made and unmade, and under which conditions they emerge as blurred or bright. Our results, first, indicate that Muslim, Christian and Non-believing urban youngsters tend to blur the religious boundaries by emphasizing cosmopolitan beliefs and identities and by prioritizing individualized and intrinsic humanistic and/or religious values. Second, contrastingly, Christian and Non-believing youngsters tend to brighten religious boundaries by emphasizing (sub)-national identities and culturalizing Western-European Christianity in contrast to Islam as the cultural 'other'. In addition, Muslims emphasize their religious identity as a way of revalorizing a stigmatized identity. Lastly, our results suggest bright symbolic boundaries between students from an academic/technical educational track and a vocational track. The intersection between the religious marker and social status creates greater challenges for Muslim students within vocational tracks.

Religious and social capitals as tools for developing an European Islam. New challenges for Muslim Second Generations in Southern European countries

Ricucci, Roberta

University of Turin, Italy
roberta.ricucci[at]unito.it

Despite there being a rich body of literature on migrations, studies investigating religion within immigrant communities, including its role and impact on the second generation, have been less extensive. However, evidence from some contemporary ethnic groups suggests that religion may play a strong role in the lives of second-generation members. Even though several studies have been focussed on Muslims with a migratory background in Europe, this paper intends to address the lack of studies on Muslim second generation and their religious transnational links and to explore how this specific youth group develop its religiousness in several European countries (i.e. Spain, Italy and Portugal), where the socio-economic and political contexts are stressing difficulties in managing the religious diversity expressed by Muslims and especially its juvenile component. Indeed, the growing presence of Muslims in various Southern European countries stresses relations with "diversity": the issues of control and safety have been on the agenda for many years and are coming back recently. On the other hand, according to Muslim organizations there is a common interest in presenting a "moderate Islam". There is a specific will and interest of the youngest Muslim generations to demonstrate their propensity to promote integration, using both old (debates, meetings..) and new (websites, blog...) policy tools. I will examine to what extent Muslim second generations in Europe are using both their religious and social capitals in promoting an European Islam, by using an interdisciplinary approach which combines migration and religious studies' perspectives integrating qualitative (90 interviews with young Muslim people, aged 24-29, gender balanced) with quantitative (on-line survey) research data collected within a transnational project on "Religions among second generations".

The Influence Of The Denominational Background On the Intentions Of Those Involved in Higher Education And International Mobility In Hungary And Transylvania (Romania)

Csanády, Márton Tamás

Károli Gáspár University, Hungary
marton[at]csanady.hu

Of the social processes of the decades since the change of regime in Hungary and Romania, the high growth in the number of students in tertiary education is of great importance as well as the migration of Hungarian and Romanian labour to abroad in the last ten years. The effect of the denominational background on education is emphasized both by international (Lehrer 1999, Sikkink and Fischer 2004, Murphy 2016) and Hungarian research (Karády 1997, Nagy 2012). This is generally true of international migration literature, but in a first and foremost way, comparing the great world religions. The situation in Hungary is unique with regard to the two mobility dimensions. The reformed (Calvinist) people regarding the participation of higher education, until the change of the regime, unlike the international tendencies and Weberian theory (Weber 1982), were under-represented among the higher education graduates (Nagy 2012). With regard to international mobility, in recent decades there was not much evidence that a country with a significant protestant minority and a catholic majority has a significant labour emigration. The Research of Religious Sociology of the KRE provides an opportunity to understand such components of denominational cultures. Four large-sample surveys (of 1000 persons each) at Hungary and Transylvania (Romania) have been conducted using and complementing the questionnaire of the European Value Survey. The questions asked during the research also allow us to examine the two types of willingness to move to different levels of denominations activity (baptismal, denominational identity, active denominational membership). We will try to reconstruct whether the value and ethical background variables can be explored. The lecture tries to clarify the relationship between the two types of mobility with the denominational background.

Religion As An Explanatory Variable? Religion, National Identity, And Politics

Zrinscak, Sinisa

University of Zagreb, Faculty of Law, Croatia
sinisa.zrinscak[at]pravo.hr

Crucial role of religion in maintaining the specific ethnic identity has become the common place in explaining the social role of religion in Central and Eastern European countries. However, this was mainly not explained further an in particular in terms of how this social role depends on different levels of religiosity and on specific majority-minority compositions in various countries. Also, my recent analysis based on the European Value Survey data gathered in Croatia revealed that the link between different religious indicators and of the national proud has been strengthening only in recent years, which is line with other analyses arguing that the religiously backed nationalism has been, in the case of the former Yugoslavia, mainly a post-war phenomenon, and not the main cause of the breakdown of Yugoslavia. In light of these observations and emerging debates of how religion represents an important cultural and emotional resource for rising of populism throughout Europe, the aim of the paper is to rethink the religion-ethnicity-politics link. Based on the literature review the paper argues that religion is just one among social variables in explaining the politics dynamics and that its role in supporting nationalism and rising distance toward minority groups depends very much on who is perceived as "Others", and how "Others" are defined. Thus, the role of religion varies whether, e.g., "Others" are "liberal and decadent Westerns", or "militant Muslims", or "seculars", or "dangerous sects". In the end, the paper discusses briefly some theoretical and empirical implications.

“We Are A Family”: Boundary-making Behavior Of Muslim Converts In Switzerland

Sheikhzadegan, Amir

University of Fribourg, Switzerland
amir.sheikhzadegan[at]unifr.ch

Religious conversion is a specific form of “spiritual transformation” (Paloutzian 2005) and implicates, as such, a transformation of identity (Travisano 1970; Paloutzian 2005; Gooren 2010). It therefore impacts the boundary-making behavior of the convert (Barth 1969; Dahinden & Zittoun 2013; Sheikhzadegan 2017; Wimmer 2008). Building upon this argumentation, the study analyzes the boundary-making behavior of Muslim converts in Switzerland. As for the methodology, a combination of observant participation, narrative interviews - with a focus on “reconstruction of narrative identity” (Lucius-Hoene and Deppermann 2004) - and qualitative network analysis are applied. Still a work-in-progress, the findings of the study so far show the contours of two distinct types of Muslim converts. While the “multiculturalists” – in the tradition of Kukathas (2003) – strive for an internal autonomy of the community of practicing Muslims, the “integrationists” encourage their co-believers to concentrate on their citizenship duties (Nollert & Sheikhzadegan 2016; see also Bartoszewicz 2014). As for the boundary-making behavior, both groups demarcate against each other accusing the other group of advocating the “wrong” approach to Islam by either being too rigid or too permissive, depending on the perspective. Moreover, the integrationists fight for a bridging between Muslims and non-Muslims, while the multiculturalists strive for a bonding of practicing Muslims and a community formation (Vroon 2014). Besides these differences, the two groups share a demarcation against the far-right, assimilationist forces, whom they accuse of being intolerant and islamophobic, and the ethnic/cultural Muslims (Özyürek 2015), who in their eyes “contaminate” Islam with superstition and reactionary cultural practices (Galonnier 2018).

Once a Lutheran, Always a Lutheran? Religion and Civic Life in the Age of the “Nones”

Lim, Chaeyoon (1); Wiertz, Dingeman (2)

1: University of Wisconsin-Madison, United States of America;
2: University College London, United Kingdom
chaeyoon.lim[at]wisc.edu, d.wiertz[at]ucl.ac.uk

Religiosity has long been linked to various prosocial attitudes and behaviors. In particular, many studies have observed a strong connection between religious involvement and civic participation. Religious involvement, however, has been in decline in most Western nations. Even in the US – traditionally considered an exception to this trend – recent studies show that religiosity is in decline. This study explores the civic consequences of declining religiosity in the UK and the US. More specifically, we ask what happens to civic participation

when people who grew up religiously leave organized religion later in their life. Given the well-established link between religiosity and civic participation, one may expect that people become less civically involved as they leave religion. However, such causal symmetry cannot be taken for granted. Civic skills and values instilled by religion may be stickier than religiosity itself and people may hang on to civic norms they grew up with even after they turn their back on organized religion. This may particularly apply if they remain embedded in social networks where civic norms and values rooted in religion are still prevalent. Consequently, someone who is no longer a Lutheran religiously may still be a Lutheran culturally and civically. We investigate such patterns of civic and cultural persistence using survey data from the UK and the US, including the British Household Panel Survey, Understanding Society, and the Panel Study of Income Dynamics. Our findings will illuminate the role of religion in civic and public life in the age of the “Nones.”

A Case of Polish Immigrants in Vienna/Austria: The Role of Religiosity for Feelings of Belonging to the New Society and for Immigrants’ Well-being

Wilczewska, Ina Teresa

University of Vienna, Austria
a1309745[at]univie.ac.at

The paper investigate the role of religiosity for integration and well-being of Polish immigrants living in Vienna. Previous research suggested that religiosity is one of the factors considered to be beneficiary for subjective well-being of people in general and of that of immigrants. The predominant religious confession in Poland and Austria is the same (roman-catholic) and from this point of view it should not constitute a barrier for integration into the mainstream society. However, religiosity has a special relation to patriotism and national identity in the Polish society due to the strong involvement of the Catholic Church in Poland in opposition to the communist regime in the second half of the 20th century. It is therefore hypothesized that greater religiosity of Polish immigrants will preserve the sense of belonging to the country of origin and impede the development of feelings of belonging to the new society which furthermore can diminish immigrants’ well-being. 290 first generation Polish immigrants participated in the study. Structural equation models revealed that religiosity has an indirect negative effect on the sense of belonging to Vienna/Austria by negatively affecting the amount of contact with the autochthonous population in the free time. Feelings of belonging to Vienna are furthermore directly positively related to the satisfaction with life. The results also showed a direct positive effect of religiosity on the feelings of belonging to Poland. It is concluded that religiosity, when connoted historically with national identity and preservation of tradition, can significantly affect the acculturation process of immigrants. Moreover, the positive relation between religiosity and well-being can be reversed in this specific context.

RN34_09a | Identities, values and religious attitudes II

Becoming A Good Muslim. Women/Female Mevlid Ceremonies In Turkey And Religious Socialization

Crescenti, Martina; Crespi, Isabella

University of Macerata, Italy
m.crescenti[at]studenti.unimc.it, isabella.crespi[at]unimc.it

The research focuses on Islamic religious socialization in twenty-five mevlid ceremonies officiated by Muslim women in Bursa and Gemlik (Turkey). Largely widespread across the country, female mevlid ceremonies celebrate rites of passage of a person from birth to death and the birth of the prophet Muhammad on his anniversary. The mevlid revolves around the recitation of Islamic texts by a female singer/preacher (mevlithanlar), particularly an Ottoman panegyric in praise of Muhammad and God. If formerly women brought together in the domestic sphere, since the rise of Islamic political parties in the 1980's they have been officiating mevlid in public spaces, as tea gardens, wedding salons, cultural centers. We participated in birth, puerperium, circumcision and death mevlid that occurred in some private houses, two cultural centers and a wedding salon. By using qualitative research methods, such as participant observation and interviews (five), we focused on the dynamics of religious socialization in the relation between singers/preachers and mothers. Mothers' trust in mevlithanlar as pious and erudite believers ("upper Islamic social status") establishes a meaningful relational exchange. By choosing significant texts and preaching, singers pass down to all participants moral values of a "good mother and housewife" ideal and encourage women to raise a "perfect and judicious Muslim child". Those figures are the cornerstone of a perfect ümmet (Islamic community) based on the Muhammad's life and teachings, the "Model of Excellent Conduct, Merit and Virtue".

Niqabi women in Spain: An approach to their reality

Ainz-Galende, Alexandra; Rodríguez-Puertas, Ruben; Fernández-Prados, Juan Sebastián

Universidad De Almería, Spain
aag486[at]ual.es, rubenrp[at]ual.es, jsprados[at]ual.es

In this paper we present the results obtained after a research carried out in Spain on niqabi women. Specifically, in the first place, what was sought was to know what meaning niqabi women give to the niqab. In the second place it was intended to know the motivations that these women have to be niqabi. Finally, we sought to know if the discourses of these women were fundamentalist or not. It must be said that with this research we did not seek representativeness since the women who focused our study were few and necessarily had to use a "snowball" type sampling, what was intended was to make sense and explain the variables that They give meaning to the discourse of these women

Faith Narratives on Un/belonging: A Sociological Exploration Based On Experiences Of Ex-Muslims And Muslim Converts

Serroukh, Iqram

Middlesex University, United Kingdom
is429[at]live.mdx.ac.uk

The notion of un/belonging in relation to religion has revealed itself to be significant for women who have decided to leave or join Islam. Through the innovative use of audio diaries to complement semi-structured interviews with ex-Muslims and (white British) converts to Islam, data gathered demonstrates the ways in which religion can become a means of defining identity in various ways. Identities are formed from categorisations, which in turn create boundaries (Wray, 2006). The role of wider society in establishing religious boundaries revealed itself to be significant in terms of creating either a sense of belonging, or exclusion, for the female participants in my research. The impact of this became salient when considering the conflation of religion and ethnicity, with the assumption from some members of society that these two aspects of identity are inextricably linked. For ex-Muslims, this translated to feeling as though they were no longer able to be part of their ethnic community, due to no longer being Muslim. For converts to Islam, being white illuminated the complex relationship between ethnicity and religion, with the underlying assumption projected that Muslims must 'look' a certain way. Thus, the construction of being white and Muslim as 'mutually exclusive' automatically marked converts as either not Muslim, or 'foreign' (Moosavi, 2015). This paper engages with religion, ethnicity and gender, to contribute to an increased understanding on how these factors manifest in lived experiences of identity.

Ethnic Churches As Partners Of Welfare Organisations To Improve Elderly Care For Immigrants

Breuer, Marc; Herrlein, Jannah

Catholic University of Applied Sciences, Paderborn, Germany
m.breuer[at]katho-nrw.de, j.herrlein[at]katho-nrw.de

This paper analyses opportunities and constraints of cooperation between welfare organisations and ethnic churches. Within the next years, the number of immigrants in Germany who need elderly care will steadily increase. Compared to the native population, their utilisation of professional care is significantly below-average, mostly due to language, cultural, social and religious barriers. Therefore, we ask how migrants' access to care facilities could be improved. Our hypothesis is that ethnic churches, who act as bridges between their members and the majority (e.g. Hirschman 2004; Baumann 2015), could be important partners of welfare organisations. To analyse this issue, we have conducted semi-structured interviews and group discussions with representatives of both sides. The results indicate that many ethnic churches consider elderly care as an important issue. Not least on the basis of their religious ethics, they aim to support their elderly members by offering assistance within their organisations. On the other hand, welfare organisations regard elderly migrants as a promising and so far underrepresented group of customers. Notwithstanding many of the established caring organisations in Germany are run by the Catholic or Protestant church, they are open-minded to address the specific needs of other religious traditions. Overall, ethnic churches as well as established welfare organisations highlight not least self-interests as motives to engage in elderly care of migrants. Cooperative relations between them seem to be limited not primarily by religious or confessional barriers, but the organisations' aim to develop services within their own spheres of influence.

RN34_09b | Comparing and contrasting the religious landscape in the European context

Religious Life In A Post-Socialist Urban Context: The Case Of Potsdam

Becci, Irene (1); Hafner, Johann (2); Völkening, Helga (2)

1: University of Lausanne, Switzerland; 2: University of Potsdam, Germany
irenebecci[at]graffiti.net, hafner[at]uni-potsdam.de, hvoelk[at]uni-potsdam.de

The city of Potsdam, the capital of the state of Brandenburg, hosts a very peculiar religious diversity. While its position as a neighbor of Berlin in an East German context would induce to consider it an exemplary illustration of urban secularity, it hosts a vibrant religious life which common statistics do not show. This is what a study published in September 2018 ("Glaube in Potsdam", 850 p.) shows on the basis of a descriptive presentation and in-depth analysis of 78 religious, humanistic and spiritual congregations (such as Freemasons, freethinkers, the Johannine Church, the Jugendweihe association, yoga-studios), 10 interreligious initiatives, and 11 religious endowments. The study took place between 2015 and 2018 and involved interviewing, participant observation, as well as document analysis. The presentation focuses on the six-fold categorization that has been developed in the process (history, buildings, rituals, community life, organisational structures, public outreach) and which allowed to go beyond the mapping of a diversity and highlight the impact of the historical transformations of the Prussian, Nazi, socialist and post-socialist era. The negotiations for the construction of a new synagogue, a new mosque, and the reconstruction of a garrison-church have been dominating the public space for years. In some cases the (idea of a) building unfolds such a social impact, that we considered it as an actor, too. In our presentation we will touch also upon methodological problems and focus on the historical and the spatial aspects.

Demarcating Moral Territories: Flexible Alignment Of Religious Organizations In The Face Of Secular Pressures In Belgium

Yesil, Ilay Zehra

University of Bern, Switzerland
ilay.yesil[at]soz.unibe.ch

A fundamental feature of modern imaginary is the binary opposition between the secular and the religious, which involves essentialist definitions based on timeless characteristics. Yet, secularization is more fruitfully understood not as the triumph of the secular over the religious, but as the mutual transformation of these phenomena in relation to emergence of the modern state and concomitant socio-political changes. While a secular rationale informs statecraft, law, economy and knowledge production, simultaneously re-interpretation and re-articulation of practices, symbols, beliefs, and institutions of religion occur in a manner that is commensurate with modernity. Agents of religious organizations, in this sense, are both transmitting and transforming religion in its institutional form mainly through supplying moral guidance to society. In Belgium, the institutional changes in religion unfold in a multi-faith context, which is predominated by liberal politics marginalizing religious teachings. Religious actors' strategic positioning for drawing moral boundaries of their organizations becomes particularly evident when they negotiate being a public institution as well as representing a certain tradition. This article, drawing on in-depth interviews with agents of religious organizations, Catholic, Protestant and Muslim, finds that two factors underlie their strategies; the first is the emphasis on respect for diversity as a cherished notion of democracy in a plural context, and the second one concerns an interpretation of social dynamics created by this diversity. Islam, as the very visible minority religion that majority have to confront or react to, in a way, revitalizes the long-abated Catholic tradition as a part of majority's identity in a comparable fashion to the religiously assertive one of the newcomers.

Young Muslims in Spain: Religion, Culture and Citizenship

Jiménez-Delgado, María (1); Jareño Ruiz,
Diana (1); De-Gracia-Soriano, Pablo (1,2)

1: University of Alicante, Spain; 2: Universidad Complutense
de Madrid, Spain
maria.jimenez[at]ua.es, diana.jareno[at]ua.es,
pablo.dgsoriano[at]ua.es

This paper is part of a wider research, development and innovation project titled Islamic Youth Identities: Gender, Education and Citizenship, funded by the Valencian Generalitat (the regional government of Valencia, Spain). Its objective is to investigate how young Muslims in Spain build their identities and how they narrate their experiences as Muslims and citizens. To this end we analysed their life stories, their cultural affiliations, their processes of identity construction and their

participation in civic life, in the light of the fact that, although the Islamic youth population has Spanish nationality or they can have got it early, Muslims are seen as "other" by the rest of Spanish society. The study's universe of analysis is young Muslim residents of the city of Alicante. Using a qualitative method including in-depth interviews and focus groups, we analyse participants' discourses. Results vary according to factors such as age, social class, gender and education, and show both a wide diversity of ways of being Muslim and the difficulties this group experiences in freely constructing their identities and in gaining full access to citizenship.

From Invisibility to Voice. Minority Places of Worship and the City as a Urban Religious Field

Bossi, Luca

University of Turin, Italy
luca.bossi[at]unito.it

Contemporary city represents a composite scenario: the coexistence of different cultures, religions and spiritualities testifies to the many forms of expression, belonging and participation of its citizens. Urban space can be seen as the social field in which the religious diversification of European societies emerges and assumes visibility. Instead of representing inert scenarios, cities contribute in shaping contemporary forms of religious life: they are the arena in which private and public actors negotiate the rules of coexistence, experiment otherness, cooperate or compete for material and symbolic resources. From this point of view, local public institutions increasingly stand at the forefront in the management of religion-driven needs. On the other side, cultural, social, economic capitals play a pivotal role in the definition of religious visibility, voice and agency. In a context dominated by political discretion, the different distribution of these resources can determine the unequal access to public funds and legal recognition, exacerbating inequalities between established and outsiders. This contribution presents the results of a research conducted in the city of Turin, Italy: based on a comparative case-study, applying archival research and interviews to privileged witnesses and stakeholders, it focus different processes of religious place-making through the lens of minority places of worship. Analysing the interplay among local politics, policies, and religious organizations in the last thirty years, the research highlight the role of capital configurations in determining minority presence in the urban religious field.

RN34_10a | Theoretical and methodological challenges in studying sociology of religion

Social Network Analysis Of The Satanic Milieu In The Russian Social Network “Vkontakte”

Mikhaylova, Oxana

National Research University Higher School of Economics, Russian Federation
oxanamikhailova[at]gmail.com

In May of 2018 representative of the Russian Security Council argued that now destructive satanic cults spread their ideology in Russian social networks. He claimed that these destructive organizations affected young people attitude and behavior. In this research we investigated satanism in the Russian social contest using the definition of satanism provided by Petersen. This sociologist argued that satanism was constituted by three discourses: reactive, esoteric and rationalistic. Among these three ideal types only reactive satanism represents the explicit intentional sometimes aggressive rebellion against Christianity. Currently, there are many satanic communities in “Vkontakte”, some of these groups spread reactive type of satanism, which is not connected with violent activities and should not be controlled. Therefore, this study is aimed at elaborating criteria which could help to make difference between reactive, esoteric and rationalistic types of satanism on the level of the network structure of the texts which are produced by Russian satanic groups in social network “Vkontakte”. For this purpose, satanism was conceptualized, taking into account peculiarities of the Russian juridical discourse. After that, the exploratory analysis of semantic structures of the satanic texts was performed and differences between discourses were outlined. In the future it is planned to check whether the communities which carry these discourses intersect in terms of the subscribers.

Actor-Network Theory as a Way to Research Religion

Tlčimukova, Petra

University of Hradec Kralove, Czech Republic
petra.tlčimukova[at]uhk.cz

Actor-Network Theory has gained quite a lot of interest in the world of social sciences in last couple of decades. Not always perceived as uncontroversial, it has been widely discussed as both theoretical and methodological approach to study social phenomena. In this presentation, I intend to look at the ways it offers to grasp the social reality of what is understood under the term “religion”. Based on the work of Bruno Latour I will debate how he understands “religion”, how can it be possible useful and innovative and, on the other hand, what are the drawbacks of his approach, for the study of religion as a social

phenomenon. I will debate the classic sociological boarder line between religious and secular (religion and science) and put it in contrast with the approach of Actor-Network Theory. In the presentation I will use examples and reflections from my own field research.

RN34_10b | Identities, values and religious attitudes III

Religion Pluralism and Symbolic Boundaries in Urban Spaces. The Case of Goutte d’Or (Paris) and Raval (Barcelona)

Albert Blanco, Víctor

Université Paris 8 - Saint Denis, France & Universitat Autònoma de Barcelona ISOR-UAB , Spain
valbert.blanco[at]gmail.com

This paper examines how religion draws symbolic boundaries among population in two different neighborhoods: Goutte d’Or (Paris) and Raval (Barcelona). Throughout the last decades, the arrival and settlement of migrant people from Africa, Middle East or Asia, transformed these neighborhoods to a superdiversity enclaves in which new religion expressions became common. Mosques, Sikh temples or Evangelical churches emerged in these urban landscapes near to new ethnic commercial establishments. These markers of cultural and religious diversity are perceived by the local population, French or Spanish, in different ways. From a performative appreciation of these multicultural flavours to an implicit or explicit rejection, religion plays an important role, as well as other factors such ethnicity or class, which draws boundaries between “us” and “them”.Based on the fieldwork that have been carried out between 2016 and 2018 in these two neighborhoods, combining different research methods as interviews, ethnographic observation and archival analysis, I suggest that religion is one of the factors that constructs the othering makes it act in the community life. In this presentation I show how the differences in a national level, while comparing France and Spain, are shaped by a common international context and by a very similar urban transformation ongoing process in the two neighborhoods.

Inter-faith And Intercultural Dialogue As A Way Of Preventing Radicalization. Moving Away From The Attraction And Fascination Towards Violence To Creating Cohesive Community

De Botton, Lena (1); Puigvert, Lidia (2);
Aiello, Emilia (3); Campdepadrós, Roger (4)

1: University of Barcelona, Spain; 2: University of Barcelona,
Spain; 3: University of Barcelona, Spain; 4: University of
Girona, Spain

lenadebotton[at]ub.edu, lidia.puigvert[at]ub.edu,
emilia.aiello[at]ub.edu, roger.campdepadros[at]judg.edu

Terrorism, organized crime and cybercrime are the three core priorities highlighted by the European Agenda on Security (2015), as 'interlinked areas with a strong cross-border dimension threats, where the EU actions can make a real difference'. More specifically, in tackling terrorism the Strategy calls for addressing the root causes of extremism through preventive measures, focusing on the potential of education, youth participation, interfaith and inter-cultural dialogue, and employment and social inclusion. Framed in this contest, the H2020 PROTON (2016-2019) project is being developed, aimed at improving existing knowledge on the processes of recruitment to organized crime and terrorist networks. Within a consortium involving 21 international partners from leading research institutions and relevant policymakers, including enforcement agencies, our team at the University of Barcelona was in charge of studying the social and ethical impact of policies against terrorism and organized crime in the EU. This was done by conducting a literature review and qualitative fieldwork in six EU countries. In this paper, we present some of the findings related to the impacts of counter-terrorism policies. Specifically, it was identified that inter-faith and inter-cultural dialogue and the collaboration of religious leaders from different religions can serve as protective factors for violent radicalization when developed under specific conditions. This type of initiatives based on egalitarian dialogue promote a positive understanding of religion, enacting counter-narratives that do not glamorize violence and thus contest violent radicalization. Successful actions of inter-faith and inter-cultural dialogue are being developed within the educational field thus accompanying youth in their process of identity creation and search for meaning while moving away from the attraction and fascination towards violence.

RN35 | Sociology of Migration

RN35_01a | Forced Migration and Global Social Inequalities

The Vicious Circle of Organized Violence and Forced Migration

Pries, Ludger

Ruhr-Universität Bochum, Germany
ludger.pries[at]rub.de

The vicious circle of organized violence and forced migration Especially since the refugee movement of 2015 forced migration is of increasing importance in science and for societies at national, European and global level. Meanwhile the nexus between migration and development has been studied extensively since the 1990s, the relation between organized violence and migration dynamics is less examined. Sometimes organized violence is the fueling factor for mixed migration processes in general (e.g., civil wars in Central America and the Middle East or organized criminal violence), sometimes organized violence is the result of (mixed) migration. A central question is: Under which conditions organized violence and forced migration become a mutually reinforcing vicious circle? The paper will address this question based on empirical evidence from the two macro-regions of Central and North America and of Africa, the Middle East, and Europe. Therein, state violence and non-state organized violence will be compared, and factors slowing down the vicious circle will be identified.

Caporalato. An authentic agromafia

Omizzolo, Marco (1); Fanizza, Fiammetta (2)

1: Tempi Moderni - net, Italy; 2: University of Foggia
fanizza.unifg[at]gmail.com, fiammetta.fanizza[at]unifg.it

Focused on the analysis of caporalato, this paper argues about the enslavement of immigrant agricultural labourers and territorial segregation practices. Moreover it deals with the topic of the agromafias' role and discuss some matters related to the deregulation of the agricultural market as well as the general crisis of the agroindustries. Because caporalato has become a methodological instrument in the frame called globalization of the farmlands, the authors try to evaluate the complex relationship between the agromafias' power and the operational conditions of Italy's local economies. So they explore elements of the extremely pervasive criminal network that determines productive trends of entire agricultural departments with the intention to denounce the dangerous

socio-cultural drifting that mafia-like criminal organizations are creating in Europe

Economic Need, Religion, and Liberal Values. The Diversity of Mechanisms that shape Migration Aspirations among Syrian Refugees in Jordan

Tyldum, Guri; Zhang, Huafeng

Fafo, Norway
gty[at]fafo.no, huafeng.zhang[at]fafo.no

The increase in refugee arrivals in Europe in 2015 (the "refugee crisis") was in part an outcome of a sudden upsurge of secondary mobility in refugee populations from safe first countries of refuge like Iran, Turkey, Lebanon and Russia. This raise in secondary mobility created a demand for knowledge about migration decisions in refugee populations, and there is now an increasing body of literature developing to describe the mechanisms that shape such migration decisions. In this paper, we analyze migration aspiration among Syrian refugees who live in and outside camps in Jordan. We discuss the role of ideology, religion and personal resources for how refugees reflect on moving to Europe, and illustrate how the mechanism that shape migration aspiration differ depending on the economic situation of the household. The analysis is based on survey-data from a representative sample of 7632 Syrian households in Jordan, produced late fall and winter 2017/18.

Chain Migration, an Endless Project of Crossing Boundaries: North Korean Defector Family Cases in South Korea

Son, Myung-ah

Seoul National University, Korea, Republic of (South Korea)
sma87[at]snu.ac.kr

This study examines family migration of North Korean defectors to South Korea from the perspective of the sociology of migration. The contexts of such escapes have been dynamic due to the long stays in transit countries, the institutionalization of defection routes, utilization of networks, and an increase in female migrants. I conducted interviews with 10 North Korean defectors to figure out the details of migration decision-making, the migration process, and aspects of settlement and assimilation in South Korea. Family migration can be classified into two types: family member accompaniment and family invitation with a time difference. The immigration network formed between immigrants and family members remaining in North Korea has a great influence on chain migration and settle in South Korea. Through a family network, it is possible to obtain detailed information on South Korean society and the actual method to escape North Korea, such as meeting brokers and paying fees. After settling, North Korean migrants preserve their bonds by regularly sending money to their families. Chain migration does not end until all of the family members are living together; it is an ongoing project. Generally, the formation of a transnational family network reduces the costs and risks of migration and increases the likelihood of chain migration. However, what makes the North Korean case unique is that chain migration has potentially dire consequences because the risks for remaining family members in North Korea steadily increase from the moment one escapes. Their chain migration has the universality of international migration and the dual characteristic of operating as a mechanism that intensifies the structural closeness of migration.

RN35_01b | The Many Faces of Return Migration: From Life Project to Deportability

Brexodus, Breturn, Brexmobility: Return and Onward Migration in the Brexit Context

Sredanovic, Djordje

University of Manchester, United Kingdom
djordje.sredanovic[at]manchester.ac.uk

Brexit menaces to introduce important barriers to the intra-EU freedom of movement by depriving Britons of EU citizenship and EU27 citizens in the UK of at least part of the rights deriving from EU norms. In this presentation, based on in-depth interviews with EU27 citizens in the UK and Britons in Belgium,

I show how the Brexit process simultaneously pushes the two groups to consider a return or onward migration, and introduces barriers that make such migration more difficult. Both groups of interviewees fear a loss of rights in their country of residence, and EU27 citizens further fear that the UK might see an economic crisis and a rise of xenophobia. For some of the EU27 interviewees a return or onward migration is a last option, for others it is something they have always considered, and in both cases there is worry that they might not have the right to settle back in the UK after a few years. Britons in Belgium see return migration as an always possible but not unproblematic option, and fear to lose the right to migrate to other EU countries. Both groups of interviewees further fear that Brexit will make short-term mobility more difficult. Both groups have relied on EU freedom of movement in order to have access to an EU-wide job market, maintain transnational family relations, or plan a retirement migration, and naturalisation is the most common tactic among the interviewees to safeguard at least in part their freedom of movement.

The Deportation of Foreigners on Social Assistance from Switzerland: Be Useful or Go Away

Soysüren, Ibrahim

University of Neuchâtel, Switzerland
ibrahim.soysuren[at]unine.ch

In public debates, migrants' access to aids and rights related to welfare State is much discussed and they have been accused of taking advantage of social benefits. However, the deportation of foreigners on social assistance has not been analysed in detail yet. Some authors, such as Walters (2002) and Ceastecker (1998), relate the deportation of foreigners to the development of welfare States. Measures strengthening the social protection of nationals have pushed European states to exclude foreigners and deport them. On the other hand, scholars have argued that the possibility of being deported, called deportability, has been instrumental in the creation of a disposable labour force which would not have easy access to social protection or social benefits. This paper is based on three qualitative research; two of which were funded by the Swiss National Science Foundation. I will firstly explore the relationship between welfare, social assistance and the deportation of foreigners. Secondly, I will detail my theoretical framework based on governmentality (Foucault, 2004), utility, deportability (De Genova, 2002) as well as "duty of politeness" (Sayad, 1998). Then, I will show how foreigners are deported from Switzerland because of being on social assistance. Foreigners can be deported when they are considered as "useless" for the host society. They break their "duty of politeness" as they did not behave well in "someone else's house". Therefore, (mis)use of welfare or social assistance shows that a foreigner does not deserve to be tolerated in the country. This State government of poor foreigners aims to push them to become economically active again or leave Switzerland. In its conclusion, the paper will point out the limits of this governmentally.

Bridging Overseas Filipino Workers Through The Reintegration Program

So, Karen Frando

De La Salle University – Manila, Philippines
karenfrando.so[at]gmail.com

Filipinos are widely known as global workers. They provide knowledge, skills and manpower to different countries. Working abroad has become very popular among Filipinos as a way to attain economic stability. Some prefer to migrate permanently while some prefer temporary migration and perceive working abroad as a step towards brighter future which promises economic security to the family. However, this economic security is slowly becoming a myth to a growing number of Overseas Filipino Worker (OFW) due to lack of financial literacy and other factors. Thus, interventions from various organizations are put in place to address this. This led me to examine the role of government organization (GO) and non-government organization (NGO) in the reintegration of OFW to their home country and/or abroad. It focused on the reintegration program and processes, as well as their impact to the lives of OFW who wish to start a new life after working several years abroad. It examined the different forms and impacts of reintegration programs offered to OFW such as capacity training, skills development and capital assistance offered to OFW who wants to start a sustainable life in the Philippines and to OFW who desires to stay abroad. The paper found out the following: 1) program offered by the government are still in infancy thus limiting the positive impacts of the program, 2) collaboration between NGOs and GO is highly important in the success of the reintegration program, and 3) revisiting policy on OFW is necessary to ensure proper implementation.

Youth Return Migration in Latvia: (Be)Longing and Challenges of Adapting Back

Bela, Baiba

University of Latvia, Latvia
baiba.bela[at]lu.lv

"When I lived abroad, I always had a feeling that I live for myself and from my work there is only personal gains. But here I have the feeling that it would be something more." Since the financial crisis in 2008, more than 250,000 inhabitants have left Latvia. In recent years, emigration rates still exceed return migration rates, although the latter are rising. Analysis of return migration carried out so far has mostly provided general information. Therefore, the Centre for Diaspora and Migration Studies at the University of Latvia carried out a study on the return migration of young people, to identify the current situation and potential problems for integration of return migrants. This paper explores the experiences of mobility. At first, attention is paid to the search of opportunities for self-development abroad and the feeling that "you are a stranger and you are not accepted as one of your own kind". Secondly, attention is paid to the factors facilitating the decision to return, especially to the embeddedness in the home cultural

environment, attachment to friends and family. In the same time, all young people needed time to adapt back, regardless of how long they lived abroad.

RN35_01c | The Local Production of Borders

The Obligation to Learn as a Disadvantage for (Some) Family Migrants in Germany? Differential Integration Requirements as Symbolic Boundaries

Hsu, Chieh

Heidelberg University, Germany
vchieh[at]gmail.com

The German Residence Act requires third-country family migrants to prove basic German proficiency before entry and stipulates their attendance in integration courses after arrival. Previous comparative research on European integration policies, focusing primarily on pre-entry tests, suggest that these mechanisms, though framed as measures to assist family migrant's integration in the host country, were envisioned and implemented to stem the flow of migration through self-selection. A problem less identified, nevertheless, is how the eligibility, entitlement, or obligation to participate in these practices differs along family migrants' nationality lines and their partner's citizenship status. Inspired by the versatility of Althusser's concept of "interpellation" in understanding the broad relationship between the state and its "subjects," this paper further incorporates theories of symbolic boundaries and offers a critical reflection of Germany's integration measures targeting family migrants and their unintended boundary-drawing effects. As the state has the authority to impose differential integration requirements based on arbitrary criteria, it simultaneously demarcates groups of family migrants and subjugates some groups more than others to integration schemes. I argue that the obligation to learn German in order to "integrate" becomes a disadvantage that stratifies third-country family migrants, since the same category of migrants are confronted with disparate pre-entry and post-arrival integration policies. Beyond the obvious result of these explicit, artificially and institutionally induced boundaries, such discrepancies in integration policies could also greatly impact family migrants' long term trajectory of integration.

Deciding To Detain: Border Practices Of Cantonal Street-Level Bureaucrats

Achermann, Christin; Miaz, Jonathan

University of Neuchâtel, Switzerland
christin.achermann[at]unine.ch, jonathan.miaz[at]unine.ch

State borders are enacted, performed and reproduced at a variety of levels and sites. Contrary to control and enforcement at the territorial borders of states or supra-state entities such as the EU, this paper is interested in the barriers that are built within nation-states in order to make unwanted migrants leave their territories. We analyse the way cantonal immigration bureaucrats in Switzerland decide when and for whom administrative detention shall be used in order to “facilitate” the enforcement of a removal order. Thereby, we are interested in understanding the very different uses of this coercive measures by the cantons and, more specifically, by the individual street-level bureaucrats in charge of taking the respective decisions. Our paper contributes to the analysis of the specific practices of creating barriers and spatially excluding unwanted migrants. Focusing on the differentiated uses of this extremely invasive legal measure by immigration bureaucrats, we analyze their collective and individual room for maneuver and the different rationales and hierarchies of criteria that structure the decision-making and the implementation of the federal legal grounds. Our analysis relies on qualitative in-depth interviews conducted in 2017 and 2018 with immigration bureaucrats in several Swiss cantons who decide whether or not to deprive of their liberty foreign nationals who are not or no longer allowed to stay in the country. These data are completed by quantitative data on the detention of foreign nationals in Switzerland, illustrating the cantonal differences.

Repercussions of Borders and Boundaries in the Everyday Lives of Afghan Refugees in Switzerland

Fischer, Carolin ; Wyss, Anna

Université de Neuchâtel, Switzerland
carolin.fischer[at]unine.ch, anna.wyss[at]unine.ch

This presentation explores how and with what effects global social inequalities and dynamics of marginalisation and exclusion manifest themselves in the everyday lives of Afghan refugees in Switzerland. We combine theories of boundary work with insights from border studies to examine experiences, practices and politics of inclusion and exclusion in different settings of refugee arrival and settlement. A focus on gender and its intersection with other categories of difference lends itself to illuminating the links and discontinuities between territorial borders and social boundaries and their everyday manifestations and effects. We draw on qualitative empirical research on the experiences of recently arrived Afghan refugees in Switzerland. Based on our emerging findings, we will make three points. First, the everyday lives of Afghan refugees in Switzerland are marked by tensions between exclusion and dependency. These are, for example, reflected in the pressure to ‘integrate’ and participants’

feelings of responsibility towards their families in Afghanistan or elsewhere. Second, a focus on gender helps illuminate how borders and boundaries contribute to shaping the specific situations of our research participants. Precariousness combined with the effects of hostile public representations evoke gender-specific vulnerabilities. In addition, negative representations provide fertile ground for more restrictive policies and more precarious living conditions. Third and more generally, our findings underline the importance of situating very concrete experiences of inclusion and exclusion in a broader context of global inequalities.

Building Boundaries at the Border. Neighborhood Practices, Inhabitants' Mobilizations and Ethno-racial Categorization in the Border-town of Ventimiglia

Trucco, Daniela

University of Nice Sophia Antipolis, France
daniela.trucco[at]gmail.com

Borders and boundaries are witnessing a regain of interest within the sociology of migration and ethno-racial relations, both in terms of field research and efforts of conceptualization (Lamon & Molnar 2002, Mezzadra 2004, Fassin 2011, Tassin 2013, Fauser 2017). In this paper, drawn on an ongoing (started 2015) ethnographic research in the border-town of Ventimiglia (Italy) mixing observation and in-deep interviews, I investigate on the two distinguished dimensions of borders and boundaries, as well as on their interrelation. After French authorities strengthened border control and rejections practices in 2015, the presence of migrants in transit on the urban territory of Ventimiglia became longer, more visible and more precarious as well. As a consequence, informal shelters, squats and camps multiplied at the same time as local authorities, on the one hand, and activists on the other hand, tried to organize migrants’ stay in town and supply at their fundamental needs (see Trucco 2016 and 2018). In this context, the paper will focus on: (1) the use and the construction of ethno-racial categories by different kind of actors and within different milieu (shelters’ neighbors, volunteers, NGOs operators, inhabitants’ spokespersons, town councilors, local media) and (2) on the practices (changes in commuting habits, avoiding of particular places or times in one’s displacements in town) and objects (barriers, protections, fences) introduced to ‘put distance in the proximity’, in order to enlighten (3) the bonds and articulations between the two (how categorization justify or reinforce separation claims or practices and the other way round).

RN35_02a | Migration Between Natural Disasters and Cultural Heritage

Migration as an Adaptation Strategy for Climate Change: A Qualitative Study on the Perspectives of Moroccan Migrants Living in Belgium Ou-Salah, Loubna

University of Antwerp, Belgium
Loubna.Ou-Salah[at]uantwerpen.be

The impact of climate change on human migration is one of the most hotly debated aspects of climate impacts. As migration can be a way to reduce the population pressure in places that are sensitive to climate risks, there is growing consensus among researchers that migration is a potential adaptation strategy for environmental and climate change. The decision to migrate is influenced by individuals' or families' socioeconomic factors, social networks and the political, socioeconomic context. Because climate shocks and stressors are affecting households by aggravating current problems, it is difficult to isolate environmental pressure from other factors. Environmental factors therefore put all other migration reasons under pressure, but little empirical research has been done into the ways in which they respond to each other. Most previous studies were mainly driven by policy and legal issues and none of them focuses on the migration trajectories of existing migrant groups living in Belgium. In this qualitative study, I will focus on the migration trajectories of Moroccan migrants (both oldcomers and newcomers) living in Belgium. Based on in-depth interviews and focus group discussions, I will explore to what extent migration trajectories to Belgium are used and seen as an adaptation strategy to deal with changes in the natural environment in Morocco and to what degree these factors are related to other migration reasons, the migration context and prevailing cultures of migration in Morocco.

The Influence Of Cultural Heritage On The Awareness Of Population Regarding Natural Disasters And Ways Of Facing Them

Vuksanovic, Gordana Dragomir (1); Nagy,
Imre (2)

1: Novi Sad Business School, Serbia; 2: University of Novi Sad,
Faculty of Science, Hungary
gordanavuk[at]uns.ac.rs, nagy[i]r[at]rkk.hu

With the increased number of natural disasters also rises the recognition of their social, economic and ecological consequences. They are reflected not only in direct material

and human casualties, but also in indirect consequences such as leaving a certain area. Whether people will continue living in an area endangered by a natural disaster depends on its previous preparation. The ability to spot dangers and face them is developed through informal and formal activities. The inherited patterns of behaviour determine the scope and quality of these activities. In order to check the influence of cultural heritage on the awareness of the population regarding natural disasters, as well as the ways of facing them, the paper investigates the relationship of the population of the settlement Jaša Tomić towards floods. The research was conducted in 2018 with the use of the biographical method and the method of contents analysis. Four informants participated in the biographical interview, two of whom relocated from Jaša Tomić after the flood of 2005, while the other two stayed in this settlement. Contents analysis was applied to the texts published in newspapers in 2005 and 2018. The issues from March, April and May were singled out, which were the months when the danger from the flood is the greatest. In addition to the empirical research, relevant statistical data were used in the paper. According to the research results, the awareness of natural disasters as well as the ways of facing them originate in the relationship towards disasters that are found in the family, as well as the closer and wider social setting. Keywords: flood, migration, cultural heritage, natural disaster, Jaša Tomić.

Climate Change, Subsistence Farming And Outmigration In Rural Zacatecas, Mexico

Schmidt, Kerstin

Bielefeld University, Germany
kerstin.schmidt1[at]uni-bielefeld.de

Drawing on empirical research in the Mexican state of Zacatecas in 2008 and 2018, this paper offers an analysis of the relationship between climatic changes in the form of more frequent and more severe droughts, changes to the importance of subsistence farming for rural dwellers, and outmigration to the USA. It challenges the prevalent understanding that climate change leads to decreases in agricultural productivity, which in turn is negatively related to the volume of international migration. The decline of the volume of Mexico-US migration in the past decade – following stricter enforcement of border controls by the USA – coincides with periods of droughts and crop failures in Zacatecas. This development suggests that unfavourable yield output cannot necessarily be expected to entail higher rates of international migration. My qualitative data also show that the cultural meaning of subsistence farming can be more important than its function as a livelihood strategy. This is expressed in two ways. First, subsistence farming has different meanings during different stages of people's lives. Many young people, particularly men, intend to migrate to the USA for work and have little interest in farming, while older people keep up the tradition of farming the land they inherited from their ancestors. Second, only households who rely on external sources of income for their basic needs – including remittances – can afford subsistence farming and take the risk of crop failures. Poorer households, in contrast, tend to stop farming when revenues cannot be guaranteed, and they might also be unable to afford international migration.

RN35_02b | Methodological Frontiers: Mapping Migration Realities

Mapping Situations – Situational Analysis: Qualitative Inquiry on Post-migration-society

Tietje, Olaf; Tuidler, Elisabeth

University of Kassel, Germany
olaf.tietje[at]uni-kassel.de, tuidler[at]uni-kassel.de

Since the so called summer of migration in 2015 the German state as well as society were temporary overstrained by the rising numbers of immigrating people. In answer to this structural deficit and related racist violence came a widespread welcoming culture into being (Rother 2016). This welcoming culture was shaped by civil society who filled a hole in the 'universal' understanding of democracy and its goods for

the people (Eilert et al 2017; Hamann et al. 2016). At the same time the image of violent Muslim men became discursive and influenced the debates on supporting migrants in Germany (Dietze 2016). Against this background we take a deeper look on the governmental aspects of this 'welcoming culture' and, following this, the link between the contemporary discursive developments in Germany and the practices of the voluntary and professional supporters of refugees. Referring to postcolonial studies (Mignolo 2005, Quijano 2010) our lecture will focus on methodological challenges for qualitative research. By highlighting the linked situations, positionalities and social worlds where the 'welcoming culture' is negotiated we are developing a methodological understanding with Situational Analysis (Clarke 2005) on migration research and governmentality. Or, in other word, we like to show how using the Situational Analysis can be fruitful for analysing governmental implications on voluntary refugee support in Germany. Our conclusions are based on preliminary results of our research within the BMBF (German Ministry of Education and Science) financed project 'Welcoming Culture and Democracy in Germany' and will be illustrated by some examples of our qualitative research.

Mission Impossible - Conducting Research in a Centre for Refugees. Belonging and Barriers

Wagner, Izabela

University of Warsaw, Poland
wagneri[at]is.uw.edu.pl

The aim of this presentation is to analyse tensions faced by the field researcher in a sensitive setting - between 'belonging' (to the University world as a sociologist) and 'barriers' (imposed by the challenging or even hostile fieldwork environment). The ethnographical research was conducted in a European centre for refugees (the 1st level of reception – displaced persons waiting for the Refugee Status Determination). The ethic code and methodological rules applicable to sensitive populations should be employed. However, the actual employment thereof might be complex or even impossible, if the field is infested with corruption. In his/her daily work, the researcher carries out the study on the refugees, but also deals with tangles of administrative issues concerning the authorities of the centre, some higher authorities as well as his/her own academic authorities (the University, the funding institution, etc.). The ethnographer's work is animated by the following questions: How to conduct the fieldwork in the situation of the groups' conflict of interests? How to pursue the research project in the climate of hostility? How to protect the 'fragile group' under study? How to maintain one's integrity when doing research in the general climate of political hostility towards the researched group? In other words, is it possible to do field research in the situation of corruption and political hostility? If it is, what kind of limits does such a situation impose to the scientific communication? Finally, what kind of protection should the researcher obtain (and from whom/from which institution) in such circumstances? What could be the application of the findings of such a study?

750

Continuous Displacement. Physical space(s) as a Methodological Instrument for a wider understanding of the Identity of Palestinian refugees from Syrian

Habib, Filip Elias

Otto-von-Guericke- Universität Magdeburg, Germany
filip.habib[at]ovgu.de

"I am aware of the whole discussion and issue of the right of return. We all are. But honestly, I don't know if I am ever going to return (. . .) If it will be possible to return, where should I return to? Neukölln? Actually, if you ask me; I would take the Yarmook to Tireh. This would be my right of return." The influence of communication and information-flows on contemporary societies belongs meanwhile to one of the central categories and fundamental questions in social sciences (Appadurei 1990, Castells, Hannerz, i.a.). Yet space seems to gain less attention and consideration particularly within social methodology or as a social theory.(cf. Herbert Knoblauch and Martina Loew 2017) And that despite the fact that social sciences witnessed the so-called "spatial turn" only twenty-five years ago (Low 2001 et seq. or/and Arjun Appadurai on scapes 1990). This paper builds on the assumption that flows of information and communication influences have changed and are continuously changing the physical space and vice versa (cf. Loew). Innovative methods with an ethnographical character such "multisided ethnography" or "global ethnography" (Marcus 1998, Hannerz 2000, Gupta and Ferguson 1997) have enriched the qualitative method of research and attempted to follow the flows of information in their physical space(s). In this paper, I will point out a few proposed methods that were used during the work on my doctorate on the cultural identity of Palestinians in different geographical contexts. The suggestions focus on the conclusion of the physical space as an inseparable part of a multimethod construction that includes different data resources that were collected since 2015.

The Familiar And The Strange: Socio-Spatial Boundaries And Internal Migration

Donnelly, Michael

University of Bath, United Kingdom
m.p.donnelly[at]bath.ac.uk

The paper is based on a 3-year project that aimed to bring a geographic perspective to understanding youth transitions and social mobility, accounting for the specificity of place, including place-based identities, segregation, and importantly, the unequal spatial structuring of resources and capitals. The project involved a unique means of collecting qualitative data, drawing on a new 'mapping tool' developed as part of the project, which involved asking participants to express their spatial imaginaries through colouring in a map. The fieldwork (which spanned 20 different geographic localities, and included interviews with a total of 200 young people and 40 teachers), along with the maps, contain a vivid and granular level of detail, and are both drawn on here. The concept of 'familiarity' is used here to explain how those occupying diverse social and spatial positions rationalise their spatial (non-)movements. The privileged students, attending elite private schools and occupying the most advantaged social positions, sought familiarity by choosing geographic and institutional locations which they perceived reflected important aspects of their identity and future selves. Place mattered in their transitions as much as the institution they were attending. Also seeking 'familiarity', but in a qualitatively different way, were working class youth living in marginal geographic localities. Their sense of familiarity was evident in seeking out places they had connections, bringing an important sense of 'knowing' a place. These two examples illustrate how a sense of familiarity, a feeling of security and safety, crosses structural lines, albeit in qualitatively distinctive ways. The ways in which groups continue to seek out and maintain what is 'familiar' has implications for the continuation of social and spatial borders in contemporary British society.

Understanding Migrants' Responses To Unsettling Events: Interrogating 'Brexodus' Through A Time-Place-Relational Lens

Kilkey, Majella; Ryan, Louise

1: University of Sheffield, United Kingdom
M.Kilkey[at]sheffield.ac.uk, louise.ryan[at]sheffield.ac.uk

The 'mobility turn' foregrounds the ongoing movement of people through space. In the particular context of EU Freedom of Movement, this has been taken by some scholars to imply that migrants will respond to changing circumstances by simply moving on. Such a perspective is reflected in popular and academic commentary predicting a mass exodus of EU citizens from the UK in the unfolding context of Brexit – a so-called 'Brexodus'. Yet, these predictions seem somewhat exaggerated when examined against responses to date. In seeking to account for this, we argue that the 'mobility turn' has overlooked the importance of time, place and relationality in understanding migrants' lived experiences. Taking the case of Polish migration to the UK, we draw on cross-sectional data and data collected longitudinally over time, and in the context of three points of significant change, which we term 'unsettling events' – EU Accession in 2004, the 2008-09 economic recession and Brexit. Analysing our data through a life course lens, our findings provide insights into the complexity of migrants' reactions to these unsettling events, highlighting how mobility and immobility are interconnected in migrants' lives. We argue for the need for more nuanced understandings of migrant experiences as lived in particular times (both personal and historical), places and relationships.

Socialization And Competition: Mechanisms Of Changes In Attitudes Towards Immigrants In Germany And The UK From 2002 To 2016

Schmidt, Katja (1,2)

1: German Institute for Economic Research (DIW Berlin), Germany; 2: Berlin Graduate School for Social Sciences at Humboldt University, Germany
Kschmidt[at]diw.de

The overall opinion climate towards immigrants in Germany and the United Kingdom (UK) has varied considerably between 2002 and 2016. In a comparative approach, I aim at answering the research question: Which structural and cultural aspects of social change are responsible for changing attitudes towards immigrants in Germany and the UK? Theory suggests that on one hand social change is triggered by differing societal conditions, social practices or shifting value priorities.

Research shows, that the continuous process of 'cohort replacement' (Mannheim, 1928) can lead to a long-term change in attitudes and values within society. On the other hand, group conflict approaches explain changes in attitudes towards immigrants with changes in economic conditions and immigration rates, both considered to trigger feelings of competition about scarce resources. Data from the European Social Survey (ESS) and country-level data for Germany and the UK from 2002 to 2016 allow depicting the theoretical assumptions. Even though the ESS is based on cross-sectional data, the advantages of panel econometric analysis are exploited in the present study. For this, Deaton's (1985) method of pseudo-panel analysis is applied. This methodological approach enables the observation of the factors responsible for a change in attitudes on the level of birth-cohorts, gender and country of origin. The main contribution of this paper therefore lies in identifying the effects in a longitudinal comparative approach. Thereby, the method is superior to OLS regressions and multi-level analysis which are mostly applied when analysing cross-sectional data. Results reveal that the opinion climate towards immigrants is not driven by immigration rates but rather by changes in value priorities and economic developments in the respective country.

Marriage and Social Integration – Results From a Longitudinal Survey Among Immigrants in Germany

Fleischer, Stephanie

Criminological Research Institute of Lower Saxony, Germany
stephanie.fleischer[at]kfn.de

Research on the social integration of immigrants mostly deals with the contributing factors of individual characteristics, such as age, education, and social mobility. The effects of family structure, especially marriage, are rarely integrated into these analyses. This presentation addresses this gap. The present study analyses the social integration of immigrants who came to Lower Saxony in 2015. Acculturation was measured using language skills, employment, attitudes and inter-group relations in the host country. A special emphasis is placed on the possible relationship between marriage and social integration. In particular, the presentation examines whether any differences exist between married immigrants and immigrants without an intimate partner concerning social integration. Furthermore, this paper differentiates between marriage in which both spouses live in Germany and marriages in which one spouse still lives abroad. The degree of social integration was measured at several time points, at the time of immigration, six months later and 14 months later. Results show that immigrants' language proficiency improved over time. Additionally, inter-group relations in the host country increased between the first and third survey along with the number of immigrants in employment. Furthermore, results indicate that unmarried immigrant scored marginally higher on acculturation than married immigrants.

New Polish Organizations in France: Change or Continuity?

Kubera, Jacek

Institute for Western Affairs, Poland
kubera[at]iz.poznan.pl

The migration of Polish citizens to France after 2004 contributed to the creation of new Polish immigrant organizations and the evolution of some of the old ones. Currently, there are approximately 200 cultural, educational, social etc. NGOs run by Poles or Frenchmen of Polish origin living in France. The history of the Polish diaspora in this country dates back to the 1830s and was shaped by several migration waves (so-called "Great Emigration" in the 19th century, mass workers' emigration in the 1920s and 1930s, war and anti-communist emigration until 1989, emigration in the 1990s). The aim of the paper is to explain the specificity of associations created by immigrants who came to France in a new political context (Poland's accession to the EU) and new economic and technological conditions. In particular, the paper will answer the following questions: What immigrant organisations are attractive for the newcomers? How the new organizations are different from those continuing the traditions of previous migration waves? What is the attitude of the leaders of the new associations towards the existing older organizational structures? Which institutions and NGOs in France cooperate with them? The paper will present the results of qualitative and quantitative research carried out among Polish immigrant organizations in France in 2016-2018, which included analysis of existing data, institutional survey, case studies and forty-eight individual in-depth interviews with representatives of various types of associations from different regions of France.

RN35_03a | Migration, Education, and Inequality I

Discrimination, Recognition, and Belonging. A Sociological Approach to the Situation of Refugees in Germany

Scherr, Albert Jakob

University of Education Freiburg, Germany
scherr[at]ph-freiburg.de

In our current research we try to understand how youth and younger adults who are regarded as people with African descent deal with discrimination. We conducted biographical interviews with black Germans and refugees from Africa, focused on their experiences with discrimination, their different ways of coping with discrimination, and the social conditions of agency and social resilience. A central finding of our research is that the relevance of discrimination for identities and social practices cannot be understood adequately if only experiences with discrimination are taken into consideration. Our research reveals that identities and practices of people who are confronted with discrimination are articulated with experiences of discrimination as well as of recognition, and the way both sides are set in relation and evaluated. Therefore, a complex and dialectic approach is necessary. Based on our research we propose that experiences with discrimination and recognition lead to a sense of one's position, which influences the coping with discrimination in schools, at the workplace or in the context of police controls. A further finding of our research is that young refugees have to deal with a situation, which is characterized by a fundamental insecurity of their future prospects, and that they are not able to understand the legal and political conditions which are decisive for their future. Before this background any explanation of success and failure in the case of young refugees has to take into account the importance of professional and informal social support, and especially the enormous capacities and affords ("Eigenleistungen") of young refugees to accomplish the process of their social integration.

Declinations of the Inclusion of Foreign Students in Formal Educational Contexts: from the Tactics of Emergency Management to Preventive Strategies

Siino, Marianna; Muscarà, Marinella

University of Enna "Kore", Italy
marianna.siino[at]unikore.it, marinella.muscara[at]unikore.it

The increasingly structural presence of foreign students in Italy has required a reshaping of school intercultural practices in order to reduce inequalities and deconstruct the boundaries between cultures in the micro-context of the classroom. This reshaping should start from the assumption that the presence of diversity is a precious asset to be valued as it creates a context of experimentation that reproduces on a smaller scale the characteristics of the multicultural society in which we live today. This paper presents some results of a content analysis of Sicilian schools' official documents (PTOF, RAV), carried out under the international research project "Hostis-Hospes. Connecting people for a Europe of diversities", project funded by the European Commission*. This paper aimed at identifying the different shades of the concept of inclusion of foreign minors in formal educational contexts, both from a point of view of the values (that is the objectives, vision and mission declared by the schools) and the initiatives (that is the effective presence and content of the projects carried out in the schools). In particular, we examined the different meanings associated with the concept of inclusion and its variations, in terms of specific vocabularies, related specifically to the foreign students' incidence rate in the schools involved, starting from the following research questions: on which contents do the documents focus their "attention structure" and how does it change according to the more or less significant presence of foreign students in the classroom? How much do the inclusive strategies of the Sicilian schools move from a preventive point of view rather than from a simple "emergency" management?

Struggle for Recognition: Educational Strategies of Syrian Kurdish refugees in Turkey

Ciziri, Nubin

Uppsala University, Sweden
nubin.ciziri[at]edu.uu.se

This study examines Kurdish families who have migrated from North Syria to a city in the South-East of Turkey called Diyarbakir due to the Syrian civil war that began in 2011. The aim is to explore the trajectories, experiences, sense of belonging and educational strategies of this ethnic group after they have crossed borders, yet still remain within the unrecognized borders of Kurdistan. Mainly deriving from Sayad's sociological theories and Bourdieu's concepts of capital, habitus and strategies, this study analyses Kurdish families' educational strategies in the light of Kurdistan inter-migration. Drawing from ten qualitative interviews conducted in November 2017 of Syrian Kurdish families residing in Turkey, the socio-economic background of the families is analysed in relation to their economic resources, social networks, educational and linguistic assets. This way, the study provides an insight and understanding on how education is perceived by Kurdish families from Syria, and what kind of educational strategies they use depending on their different types of resources or lack of them. The study concludes that educational strategies do not specifically differ based on the economic resources the families possess, however it differs based on factors such as the families' educational background, language, stigmatisation and the possibility of a return to Syria. Furthermore, findings show that immigrant children's education in Turkey acts as an impediment for their parents' return to Syria by also interpreting the reflections of double absence on this particular ethnic group.

Discrimination or just Attribution? Scrutinizing the Effects behind Perceived Discrimination among Migrant Students

de Paiva Lareiro, Cristina

University of Education, Freiburg, Germany
cristina.paiva[at]gmx.de

In the context of growing social heterogeneity, the integration of immigrants is more and more becoming the focus of political efforts and social science. Experiences of ethnic discrimination are a possible explanatory factor for different dimensions of ethnic inequality like the persistent severe ethnic inequalities in education. For reasons of research pragmatism, data from quantitative surveys, which measure perceived discrimination, is mostly used. These statements are often used as a proxy for actual discrimination, although they can – in addition to actual experiences of discrimination – also reflect the results of other processes like attribution. The generally presumed positive correlation between perceived and actual discrimination has not yet been empirically proven. There's therefore a great need for reliable quantitative data on experiences of discrimination. We need to know what factors influence respondents' statements about discrimination and understand the underlying processes behind quantitative data of perceived ethnic discrimination. Hence, the aim of my paper is to identify and empirically validate the determinants of perceived discrimination among students with migration background. After the theory-based genesis of an explanation model, the effects of potential influencing factors will be examined stepwise with data from the Socio-Economic Panel (SOEP) and the National Educational Panel Study (NEPS). Through the systematic identification and control of potential influencing factors, it is possible to assess the connection between subjective measurement and objective facts: If the students' statements prove to be robust against ethnic and psychological processes, this would suggest a strong correlation between perceived and actual discrimination. However, if other factors prove to be the key to explaining the statements about perceived discrimination, these should be taken into account in future analyses.

RN35_03b | Methodological Frontiers: Researching Migration in the Digital Era

Studying The Transnationalism Of Polish Migrants Through Facebook - Whom May We Survey And How Transnational Are They?

Pöttschke, Steffen

GESIS - Leibniz Institute for the Social Sciences, Germany
steffen.poetschke[at]gesis.org

During the last decades, migration scholars became increasingly interested in aspects of transnationalism. At the same time, some traditional sampling frames and methods have become less reliable, especially in cross-national settings. Therefore, researchers are increasingly investigating new methods and strategies to amend established approaches. The sampling of survey participants via social networking sites (SNS) is one such possibility. It stands to reason that this method should be particularly helpful in research on migrant transnationalism since it should facilitate the recruitment of individuals who mainly communicate using internet-based technologies (allowing for frequent and cheap transnational communication) and/or who are highly mobile. Hence, subpopulations who might not be reached with more established methods (e.g. register based sampling). This paper uses data from an online survey of more than 1.100 Polish migrants in five European destination countries. All participants were recruited through Facebook. Rather than describing the sampling method as such, the contribution examines selected features of the realised sample. The focus is first on general sociodemographic aspects before the level of transnationalism amongst the interviewed migrants will be examined. The analysis of the latter employs a multidimensional understanding of the phenomenon which differentiates, for example, between participants' embeddedness in transnational social networks, their transnational mobility and communication behaviour. Besides the discussion of the respective results, the paper aims to provide researchers with information which will help them to decide whether (additional) recruitment via SNS could improve the overall sample quality in their future studies examining either transnationalism or more general migration-related topics.

Algorithmic Racism and Data-Driven Politics: Why Migration Research Needs to Take the Challenges of New Data Worlds Seriously

Horvath, Kenneth

University of Lucerne, Switzerland
kenneth.horvath[at]unilu.ch

Migration research has so far neglected the crucial methodological challenges linked to the emergence of big data, artificial intelligence, and digitization. Based on recent neopragmatist studies of emerging data technologies and infrastructures, this talk offers a tentative reading of the implications of these new data worlds for migration research. The argument is developed in three steps. First, current debates on "big data and the social sciences" are briefly reviewed, focusing on their quintessential claim: the social sciences are about to lose authority and voice in the interpretation of societal developments. Second, recent collaborations by supra-national organisations (such as the IOM) and NGOs with new data sciences are critically examined regarding their theoretical and political underpinnings. The focus is on (i) "algorithmic racism", i.e. discriminatory classifications that are due to atheoretic and politically unreflective analytical procedures and (ii) over-simplified notions of "migration" entailed in these initiatives. While algorithmic racism is already noticeable as a very real threat to minority and migrant populations all over the world, over-simplified notions of migration point to the key challenge for migration researchers: they need to become critically engaged in ongoing debates if decades of empirical research and theory building shall not be lost for making sense of migration realities. Third, I argue that the current critical moment is also a window of opportunity. Getting involved with new data worlds may open new perspectives (i) for moving beyond methodological nationalism (so deeply ingrained in more traditional data sources), (ii) for advancing alternative and more exploratory styles of doing quantitative research on migration issues, and, perhaps surprisingly, (iii) for combining qualitative and quantitative research approaches in novel and promising ways.

Belonging in the Times of Brexit. Combining Synchronous and Asynchronous Interviews in a Longitudinal Perspective

Trąbka, Agnieszka

SWPS University, Jagiellonian University, Poland
a.trabka[at]gmail.com

Despite the fact that the Brexit referendum took place almost three years ago, its impact on the situation of the EU migrants living in the UK remains unknown. Unsurprisingly, research conducted so far in this domain reports their uncertainty regarding the actual conditions and consequences of Brexit and their questioned sense of belonging to the host country (Lulle et al. 2017, Tyrrell et al. 2017). This paper, based on the preliminary results of the project "CEEYouth: The comparative study of young migrants from Poland and Lithuania in the context of Brexit" has two main objectives. First, it aims at portraying how young CEE migrants living in the UK cope with the above mentioned uncertainty, how they negotiate their sense of belonging and how they make important life decisions in the context of 'undeliberate [in]determinacy' (McGhee et al. 2017). Secondly, and more importantly, it aims at presenting the methodological scenario of combining synchronous and asynchronous interviews in a longitudinal perspective in order to dynamically analyse how the unfolding consequences of Brexit affect life trajectories of young migrants. We argue that asynchronous interviews allow for more flexibility in terms of timeline and logistics and thus they give the opportunity to quickly react on the unravelling consequences of Brexit and capture spontaneous reactions participants. Moreover, they are particularly fitting for researching young, mobile and geographically dispersed populations. Combining this method with traditional, face-to face interviews is a way to overcome some of the challenges of on-line interviewing.

Tracing Human Mobilities Beyond State Borders: Big Data to Reveal Bordering People, Their Transnational Mobilities and Belonging

Järv, Olle; Müürisepp, Kerli; Massinen, Samuli

University of Helsinki, Finland
olle.jarv[at]helsinki.fi, kerli.muurisepp[at]helsinki.fi,
samuli.massinen[at]helsinki.fi

Research on borders, bordering people and transnational living has gained particular importance in line with globalization and unprecedentedly fast increase in mobilities of everything (people, objects, and information) that are transcending the borders of states and societies. Besides migration flows, we witness the fast emergence of multi-local living and transnational mobilities – people regularly cross state borders to conduct daily activities related to work, socializing, shopping, services and leisure. This shapes societies, but also people's feeling of belonging and identity, especially in the borderless European Union. With the growing complexity of bordering processes, scholars are challenged by gaining more thorough understanding about spatial practices and social interactions of people crossing borders – knowledge crucial for ensuring cross-border cooperation and governance, and fostering integration and social cohesion. However, not much is known due to lack of suitable data (collection methods). We argue that an intriguing Big Data approach could provide additional insights for understanding transnational mobilities and multi-local living as it is vastly being applied in the broad field of social sciences. We propose a conceptual framework for implementing social media data to reveal, examine and reason: 1) transnational mobility flows and individuals' spatial practices; 2) individuals' experiences and perceptions on multi-local living; 3) individuals' social engagement and their feeling of belonging; and 4) new emerging transnational spaces. We demonstrate the initial findings on how openly available Twitter data reveal transnational mobilities in the Greater Region of Luxembourg. We critically assess our workflow and highlight avenues for further research.

RN35_03c | Family and Gender Relations in Current Migration Contexts

Doing Family and Education in Migration Contexts

Reisenauer, Eveline

Deutsches Jugendinstitut, Germany
reisenauer[at]dji.de

Even if different ways of life and lifestyles are currently observable in the context of family and migration, there is a noticeable knowledge deficit in terms of family relationships

and education in migrant families. This contribution is aimed at this obvious gap in research by focusing on migration-specific ideas and practices of education. The relationship between family, education and migration will be carried out on the basis of the research project "Diversität und Wandel der Erziehung in Migrantenfamilien aus der Perspektive von Eltern und Fachpraxis" (Diversity and change of education in migrant families from the perspective of parents and professional experience; DIWAN). In particular, a view to migration contexts promotes the awareness that a restriction of the family to the model of the unilocal nuclear family possess considerable shortcomings. Firstly, migrant families – as families in general – can be differentiated in terms of their partnership and family arrangements, such as non-marital family situations, single-parent families, patchwork families and homosexual parenting partners. Secondly, different migration characteristics can be identified, including diverse countries of origin, migrant biographies, residence statuses and educational backgrounds. Thirdly, it is to be distinguished whether the entire family migrates together or rather only a part of the family, whereby in the second case transnational family constellations emerge. However, neither this increasing diversity of the (migratory) family life, nor the culturally transmitted ideas and practices of education involved are sufficiently considered in scientific research. This contribution examines how ideas and practices related to parental education are affected by migration experiences of families.

They Put Me In A Freezer And They Closed The Door": The Lived Experiences Of Syrian Refugee Families Resettled In The UK

Haycox, Hannah

The University of Manchester, United Kingdom
hhaycox[at]gmail.com

This paper will explore the lived experiences of Syrian refugee families resettled as part of the UK's Vulnerable Persons Resettlement Programme. Distinct from various EU member state policies and the UK's mainstream asylum dispersal model, the VPRP constitutes the UK government's unilateral response to forced migration as a result of the Syrian civil war. The immediate granting of recourse to public funds, temporary protection and permission to work is accompanied by feminised and depoliticised representations which position Syrian families as the inherently 'deserving' victims of the Syrian war. However, the continual cultivation of Islamophobia in a post-Brexit UK, the replication of explicitly racialised paradigms of 'integration' and the exacerbation of existing inequalities due to continuing austerity measures fail to actualise the proposed panacea to Syrian families' struggles. Drawing on two geographical locations in the North West, this paper explores the impact and experiences of two different local approaches to refugee resettlement. Existing inequalities which interact and intersect across refugee families' experiences in both locations are identified and evaluated. Enforced destitution, racialised social policy and historically entrenched policy responses to forced migrants are suggested as reifying socio-cultural and economic boundaries within which refugee families are forced to navigate and negotiate.

Conceptualising Sexual and Gender-based Violence Against Refugees: policy makers, non-government and international organisations and service providers in Turkey and Sweden

Bradby, Hannah (1); Ozcurumez, Saime (2); Akyuz, Selin (2)

1: Uppsala University, Sweden; 2: Bilkent University, Turkey
hannah.bradby[at]soc.uu.se, saime[at]bilkent.edu.tr,
selinakyuz[at]gmail.com

This paper draws on an investigation of how sexual and gender-based violence has been conceptualized and experienced by refugees fleeing conflict in the Levant and by the agencies involved in migrants' protection, support and governance (Sereda <https://www.birmingham.ac.uk/research/activity/superdiversity-institute/research/projects/sereda.aspx>). Interviews with policy makers, non-government and international organisations and service providers in Turkey and Sweden are examined for constructions of sexual and gender based violence and how such violence is understood to articulate with the different stages of forced migration: displacement, exile, arrival and settlement. Earlier assumptions that violence was associated primarily with displacement and exile, but mitigated once refugee status was granted, are giving way to recognition of the entangled nature of structural, militarized and interpersonal violence. Different constructions of sexual and gender-based violence are available for actors to draw upon, depending on whether or not intimate and stranger violence are categorized as criminal and on the popular understandings of the forms of violence that are acceptable or unavoidable. Gender-based violence has uncertain status in claiming refugee status with the reception of forced migrants implicated in compounding the harm of violence: migration governance, the process of applying for asylum, gaining documented residency and settlement can be experienced as a form of violence. Statutory and NGO actors are making meaning around refugees' protection from gender based violence in a highly complex, contested and constrained legal, policy, political and moral landscape. We navigate these complexities using a social constructivist approach, to inform models of protection and prevention that accommodate refugees' own priorities.

From French Mothers To Migrant Mothers: Narratives Of Transformations, Lost Privileges And The 'Quieter' Everyday In Brexit Britain

Brahic, Benedicte

Manchester Metropolitan University, United Kingdom
b.brahic[at]mmu.ac.uk

Based on data collected via participant observations and a series of semi-structured interviews with French migrant mothers living in Manchester, this paper focuses on a key dimension of transnational family relations and brings to the fore questions central to the field of transnational family justice, namely the impact of uncertain migratory contexts on migrant mothering and family relations. Through a focus on the affective journeys of French migrant mothers in the changing context of Brexit Britain, this paper explores how the decision of Britain to leave the European Union impacts on their identities as mothers and their mothering practices. Beyond the exploration of the impact of a localised event, this paper points to the affective dimension of citizenship statuses and its susceptibility to political contexts. It also highlights the need for the terminology used among researchers in migration and ethnic studies to reflect the affective dimension attached to different migrant statuses to reveal some of their more subtle dynamics.

RN35_04a | Migration, Education, and Inequality II

Social Justice and/or Intercultural Education? An Italian Case Study

Pica-Smith, Cinzia (1); Contini, Rina Manuela (2); Veloria, Carmen (3); Di Francesco, Gabriele (4)

1: Assumption College, Worcester, United States of America;
2: University of Chieti-Pescara, Italy; 3: Suffolk University, Boston, United States of America; 4: University of Chieti-Pescara, Italy
cpicasmith[at]assumption.edu, rm.contini[at]unich.it, cveloria[at]suffolk.edu, gabrieledifrancesco[at]gmail.com

The European discourse on intercultural education (Council of Europe, 2008; 2014; Unesco, 2008) is fully inscribed into Italian educational regulations (Miur, 2007; 2014), which places an intercultural perspective at its center and consider schools. In order to address the current debate regarding the gap between the theoretical conceptualization and policies and implementation of interculturalism (Kimlicka, 2016; Modood, 2016; 2017; Barret, 2012; 2013) this paper connects bodies of literature often separated by discipline or context - interculturalism and civic integration in Europe, critical theory and pedagogy, social justice education in the United States - and offers new conceptual tools to critically analyze intercultural education as per the European documents and strengthen intercultural education. We present a qualitative case study of Italian educators' understanding and practice of intercultural education and whether and in what measure they conceptualize intercultural education as a transformational framework informed in social justice education that aims to promote more equity in schools. Drawing on data collected over the period of one academic year (2014-2015), we apply a critical lens and social justice framework to analyze how educators take up, or not, intercultural education in the classroom. We use a case study to offer an opportunity to understand how Intercultural Education is being interpreted and implemented "on the ground". We found that the abstract nature and the tensions within the framework, its connotations and socio-political intercultural matrix were reflected in the teachers' reported practice of intercultural education. This, in turn, impacted their pedagogical practice.

Forging and Paving a Future: Immigrant Status and Academic Achievement in Luxembourg

Rivas, Salvador; Reichel, Yanica; Krämer, Charlotte; Pit-Ten Cate, Ineke; Fischbach, Antoine

University of Luxembourg, Luxembourg
salvador.rivas[at]uni.lu, yanica.reichel[at]uni.lu,
charlotte.kraemer[at]uni.lu, ineke.pit[at]uni.lu,
antoine.fischbach[at]uni.lu

In the United States, much has been written about the upward or downward social mobility of the so-called, "New Second Generation". In Europe, this topic has only recently begun to take shape; mostly in regard to the Netherlands, Germany, France and the UK. In the context of Luxembourg, however, there is very little literature on this topic even though nearly 50% of its population is now of immigrant status. Though small in geography and population, Luxembourg is a founding member of the E.U. and quite literally in the heart of continental Europe. It hosts a diverse set of immigrant groups, continuously attracting economic and some political immigrants, most notably from Italy, the former Yugoslavia and Portugal. Each of these groups arriving at a specific sociohistorical moment: Italians at the height of the steel industry, former Yugoslavians fleeing war, and Portuguese to meet construction and service industry needs. Consequently, Luxembourg is truly a multilingual and multicultural country that makes for a fascinating microcosm to test and explore existing theories of immigrant integration. Its context presents a unique opportunity to study and extrapolate from to anticipate the needs of immigrants elsewhere. Using 2016 data from Luxembourg's school monitoring programme (ÉpStan), we investigate existing and emerging differences in academic achievement among 1st, 2nd, and later generation immigrant groups in Luxembourg. We analyse math and language proficiencies (German and French) among a cohort of secondary school students (9th grade, N=6286). Preliminary results indicate clear generational differences. These are interpreted in relation to immigrant group characteristics and acculturation in Luxembourg. Implications for the new second generation in the European context will be discussed.

(Re-)Erecting Boundaries Along Religion, Nationality and Ethnicity: An Empirical Focus on High School Classes in Germany and the Students Migration Biography

Kahle, Lena

Stiftung Universität Hildesheim, Germany
kahle[at]uni-hildesheim.de

The research project “Histories in motion – historical learning in the German migration society” by the University of Hildesheim, the University of Paderborn, the Free University Berlin and the Georg-Eckert-Institute in Braunschweig, empirically analysis history learning in different educational institutions in Germany: schools, museums, school-books and non-formal political education. Main focus of this paper is not specifically educational inequalities because of migration experiences or the teaching of history in schools but the question how teachers re-erect boundaries along religion, nationality and ethnicity in their classrooms. The Analysis of narrative expert interviews with history teachers reconstructs an image of clearly overwhelmed teaching personnel when it comes to “divers classrooms”: Not only are gendered and social differences a challenge but especially the student’s migration biography seemed difficult to cope with. The classical binarity of we and them is still present and negates the student’s orientation and knowledge as relevant whereas the teacher sees his or her task in deconstructing national identity and historical references of the identified other – the student with migration biography. Hence, belonging is not negotiated between student and teacher but is still an ascribed origin. Methodologically interesting is the analysis of conflict and demarcation lines by knowledge structures in the classrooms: at what point statements or knowledges are considered not worthy and not relevant to the dominant society? How to reconstruct implicit process of creating boundaries, that are explicitly named as religious, ethnic or national differences? By presenting empirical examples of the re-erection of boundaries in classrooms, I want to discuss ideas of future perspectives on creating shared knowledge and the valorisations of the other’s perspective.

Perception of Educational Inequality among the Children of Immigrants in Three Systems

Abdelhady, Dalia (2); Lutz, Amy (1)

1: Syracuse University, USA; 2: Lund University, Sweden
dalia.abdelhady[at]cme.lu.se, aclutz[at]maxwell.syr.edu

Utilising a phenomenological approach, our paper aims to compare the educational experiences and perceptions of children of immigrants in Germany, France and the US in order to understand the educational inequalities and opportunities for social mobility for the three groups. We focus on children from the largest immigrant groups in each setting: Turks, North Africans and Mexicans respectively. The three groups share low socio-economic resources and a difficult, albeit different, situation in the labour market. Moreover, the three groups (parents and their children) may suffer from discrimination, which could lead parents to invest more in their children’s education or, on the contrary, make young people frustrated and drop out. Our comparison pays close attention to the differences in the educational systems in the three countries and the way these differences prompt experiences that are considerably distinct. In the absence of formal educational tracking in the US, Mexican Americans are found to reflect positively on their educational experiences and the influence their teachers had on their career choices. Tracking in France in Germany, however, yields different results in the two contexts. In France, French North Africans face higher levels of unemployment and stress the restrictions imposed on them by the school system. Children of immigrants from Turkey, on the other hand, put faith in the tracking system as a conduit to good, stable jobs despite encountering discrimination in the labour market. We conclude by stressing the role of teachers and school councils in promoting the role of the educational system in the perceptions of trust and success among the children of immigrants.

Immigration and the Contested Boundaries of Citizenship: A Comparative Analysis of Greece and Turkey

Serdar, Ayşe

Istanbul Technical University, Mid Sweden University, Turkey
ayseserdar15[at]gmail.com

Nation-state formations in Turkey and Greece shaped each other in complex ways. Both states pursued similar mechanisms of assimilation towards ethnic diversity, and sought to assimilate non-dominant ethnic groups who share the same religion with the dominant majority by denying their minority status and promising full-fledged citizenship rights if they assimilate. Their immigration and naturalization policies also remained relatively open only to the immigrants deemed to have “the same descent”. In both cases, the legitimate membership in the nation-state is maintained by strong ethnic tones. In the last decades, both Turkey and Greece experienced a massive flow of refugees and irregular migrants, which challenged the boundary-making mechanisms of citizenship. By examining the historical background and current official data, political discourse and recent legal changes, I analyze the divergence and convergence patterns of citizenship and naturalization policies between two cases. Greece is challenged by the large numbers of non-co-ethnic immigrants who cannot be incorporated by the former restrictive policies of naturalization. The result is reforming the laws to a relatively more inclusive and territorial principle in a highly contested climate. In Turkey, the dominant political discourse is characterized by the “religious brotherhood” with displaced Syrian Muslims. The selective application of the recent laws of naturalization tends to include mostly Sunni Muslim Syrians with economic and cultural capital and falls short of developing a pluralist and civic understanding of national boundaries towards other immigrants and refugees. This study comparatively explores the extent to which the recent laws and practices of citizenship and naturalization triggered by the “refugee crisis” are capable of democratizing and transforming the ethnicist and assimilationist legacies of nation-making in Turkey and Greece.

Contested Categorization of Target Populations and Indicators of Territorial Justice. Institutionalisation of a Formalised Intergovernmental Transfer Scheme for Asylum Seekers in Germany

Bartl, Walter

Martin Luther University Halle-Wittenberg, Germany
walter.bartl[at]soziologie.uni-halle.de

Crisis-induced refugee migration raises questions of just responsibility sharing among political territories. While there have been several initiatives in the EU to establish intergovernmental transfer schemes, the distribution of refugees within the EU remains highly uneven. In spite of this, it should be noted, that a variety of spatial distribution schemes are currently in place in several EU members states. In Germany, for example, asylum applicants are distributed among the states (Länder) in accordance with the “Königstein key” which is based on a state’s shares in total population and total tax revenue. How can we explain the institutionalisation of this key indicator for federal burden-sharing in German asylum policy? Theoretical accounts of burden sharing in asylum policy typically conceptualise this problem in the framework of collective action theory. However, these accounts leave the formation of actor’s preferences (i.e. state governments) unquestioned. Diverging from this view, the basic assumption of this paper is that indicators can acquire the quasi-objective quality of embodying a particular guiding idea (Hauriou) through investments in form (Thévenot) and pragmatic tests of reality, and thereby help to overcome problems of collective action. Based on the quantitative and qualitative content analysis of official documents and newspaper articles (1949-2018), I show first, that territorial dispersal schemes were applied to contested categories of addressees before asylum seekers became subject to spatial distribution among the German states. Second, the German states had to cope with significant non-cooperation despite having negotiated formal agreements on reception quotas before. Third, the Königstein key was institutionalised in Germany’s federal asylum policy only after it had been used successfully as an indicator of a state’s “fair share” in other policy fields.

Civil Society Organisations and the Changing Politics of Inclusion and Belonging in German and French Cities

Lang, Christine

Max-Planck-Institute for the Study of Religious and Ethnic Diversity, Germany
lang[at]mmg.mpg.de

Migration and migration-induced diversity have become increasingly contested issues in European countries. Actors mobilizing against immigrants and diversity are becoming more powerful; at the same time, immigrants and minorities have become more vocal in questioning exclusionary practices and ideas of belonging. In addition, the influx of new migrants contributes to a continuously growing socio-cultural heterogeneity, which demands new ways of conceiving national belonging. Against this background, this paper looks at dynamics in the politics of inclusion and belonging in cities in Germany and France. Cities are important sites of struggles around inclusion and belonging. The paper studies the changing politics by focusing on civil society organisations that advocate for migrants and diversity. Taking a field level approach, the paper investigates how the changing political and societal context shapes and possibly transforms the local fields of civil society organisations and their forms of political action. Focusing on cities in Germany and France, the paper includes countries with different political traditions of dealing with immigration, identity and difference, which also affect the ways, in which non-governmental and immigrant actors organize around such issues. Drawing on a survey with urban actors in 40 German and French cities and on qualitative case studies in two cities in each of the two countries, the paper will show differences between the local fields and their dynamics but also some similarities. It will identify both local and national factors that shape how civil society organisations mobilize around issues of inclusion and belonging in the changing societal contexts.

Situating Others And Situating Oneself: The Rejection Of Immigration And The (Mis)Uses Of A Post-Colonial Rhetoric In Today's Poland

Skowronska, Kaja

Université de Nantes, France
kaja.skowronska[at]sciencespo.fr

In the aftermath of the debates around the European Union relocation scheme for refugees in 2015, a virulent anti-immigration discourse has entered the Polish public sphere. Largely present among right-wing parties and in the media, it has shifted public attitudes and redefined the terms of the debate around immigration in Poland. However, in addition to defining immigration as a threat, this discourse also contains a harsh criticism of the European Union and of Western European countries. European migration policies are presented as not only unrealistic, but also as ideologically motivated dogma imposed on Poland by outside forces. This criticism is grounded in a specific understanding of Poland's geopolitical positioning. Moreover, it is often formulated using categories characteristic of post-colonial analysis. Poland is thus posited as a semi-periphery emancipating itself from the influence of both Russian imperialism and Western hegemony. The discourse on immigration also appears to be a discourse on Poland's identity and on the country's place in the world. This use of terms and concepts rises the question of the role of non-European Others in this particular construction of Polish identity and conception of the country's geopolitical position. How does immigration factor into the right-wing discourses on Poland and the West, and what does this reveal about their inner logic? This paper draws mainly on document analysis, including statements by government officials, ruling party members, and other politicians, as well as media reports on immigration, in particular coming from the right side of the political spectrum. We also draw on existing literature concerning the recent anti-immigration turn, and put it into perspective with earlier works, dating from before the politicization of the topic.

RN35_04c | Borders and Boundaries

Postmodern borders. The European externalization policy to stop migration

Tusini, Stefania

University for Foreigners of Perugia, Italy
stefania.tusini[at]unistrapg.it

The global governance of migration is driven by a main idea: externalizing borders; namely a significant transition from a country's direct control on borders, to their virtual displacement in a third country, entrusting their control to it. This process involves both to define the borders in a postmodern perspective and a profound reflection on state sovereignty. Borders have become more "liquid", but they have not disappeared or become more permeable. Until now, the main steps in the process of externalizing borders have been: the Khartoum Process, the Spain-Morocco agreement, the EU-UA Summit on migration held in Valletta, the EU-Turkey agreement, the Italian Migration Compact, the Italy-Libya agreement and, outside Europe, the Pacific Solution. The general underlying logic is always the same: to use European cooperation funds for the dual objective of "helping them at home" and forcing African states to collaborate in closing their borders. According to the agreements, African States must repress their citizens or refugees in transit on their countries, and readmit their nationals unwelcome by the EU. In return they receive money and political recognition. The latter is really important especially for authoritarian or dictatorial governments. All without a real concern for the protection of fundamental human rights, defended only on paper. My aim is to illustrate each agreement to show their similar underlying pattern. It will be interesting to dwell on the Pacific Solution Act adopted by Australia. Here, the logic of externalization has gone beyond imagination: Australia has externalized its entire national territory from itself.

The Concomitant Construction Of Boundaries And Borders As Means Of In/Exclusion: The Example Of Europe's Tightening Legislation Against Cross-Border Marriages

Dahinden, Janine

University of Neuchâtel, Switzerland
janine.dahinden[at]unine.ch

In this paper we bring together the two concepts of 'bordering' and 'boundary making' with the aim of addressing questions of migrant exclusion. We argue that there is a two-way relationship between bordering practices and boundary making. Articulating these two fields of study, allows to

understand how European nation states and the EU are continuously re-made in a globalised world by producing particular 'outsiders'. We illustrate these ideas using the example of cross-border marriages. Most European countries restricted this kind of family reunification by simultaneously internalizing and externalizing their borders and by mobilizing a particular symbolic boundary constructed upon "gender (in)equality". Combining border and boundary perspectives reveals new forms of differentiated processes of ex/inclusion which reinforce global inequalities and postcolonial governmentalities.

Bordering and Debordering the Alpine Chain: Local Responses to Policies of Migrants "Push-Back" at the Northern Italian Frontiers

Vergnano, Cecilia

University of Amsterdam, Netherlands, The
vergnanocecilia[at]gmail.com

The erection of barriers against migrants increasingly characterizes not only external boundaries of Europe, but also internal relations between EU states. Indeed, critical scholars highlighted that European "migration crisis" can be better defined as an internal European governance crisis. This is especially visible at the internal borders of the Schengen area, where countries of destination of asylum seekers' secondary movements (such as France, Germany, Austria, among others) have recently re-established border controls and systematic push-backs of undocumented migrants. In particular, push-backs and rejections at northern Italian borders by French, Swiss and Austrian police are making border-crossings of asylum seekers more deadly on the whole Alpine chain. Which impacts does the "push-back regime" produce on the local dimension of these border areas, and how local actors, in turn, shape the border and try to prevent its deadly effects? By focusing on three strategic internal border areas (Ventimiglia and Col du Montgenèvre, at the French/Italian border, and the Brenner Pass, at the Austrian/Italian border), the proposed paper comparatively addresses the aforementioned questions through ethnographic methods (a seven-month fieldwork in selected border areas and in-depth interviews to different categories of social actors: migrants, themselves, local residents, border workers, local administrators, police officers). It shows that the effectiveness of border enforcement depends on several factors, such as different kind of political responses at the national and local level, pre-existence of local networks of supportive citizens or smuggling organizations, greater or lesser cooperation between police forces.

In the Need of Borders? A Sociological Case against Open Borders

Immerfall, Stefan

University of Education at Schwaebisch Gmuend, Germany
Stefan.Immerfall[at]ph-gmuend.de

The nation-states of Europe have been constructed around borders. Until most recently, the relevance of borders seemed in decline: European integration has bridged the nations to the European space, globalization undermined the premise of a national closure of cultures, and the universalization of social rights did render national citizenship less valuable. With the massive influx of refugees, however, the borders of Europe have dramatically reasserted their relevance as barriers against migration. National borders usually do not have a good name within the sociological discourse. Rightly so, since restricting rights of access undeservedly privileges the native population at the expense of others. Borders contribute to upholding blatant injustice. Still, this presentation argues there is a lot to be said in favour of borders. The first section discusses well known topics. Both liberal democracies and welfare societies are said to need border restrictions because of the collective good and the moral hazard-problem. This argument can be extended to the European integration with regard to the Hayek-Keynes-controversy. The presentation concludes that these arguments may hold in principle but need to be qualified. A second, rather new string of arguments, concern the historical embeddedness of institutions. The degree to which they are effective is subject to varying circumstances. Contrary to historical tendency for political systems to evolve in a way that does not support prosperity for many, many European institutions evolved in a way to perpetuate order and safety within a market. The question then is, whether massive and rapid immigration impinges on the balance of beliefs and institutions that promote sustainable growth. In a nutshell: while borders are unjust, they may be justifiable.

RN35_05a | Migration, Education, and Inequality III

Education as a Lifebuoy: Newly Arrived Academics and Establishment Programmes

Lidegran, Ida (1); Hultqvist, Elisabeth (2)

1: Uppsala University, Sweden; 2: Stockholm University, Sweden

Ida.lidegran[at]edu.uu.se, Elisabeth.hultqvist[at]edu.su.se

This article investigates newly arrived academics and their efforts to establish themselves on the Swedish labour market with special attention given to the role of establishment programmes. The theoretical starting points are derived from the sociology of Pierre Bourdieu (Bourdieu 1989; 1993) and Abdelmalek Sayad (Sayad 1999). Our aim in this paper is to understand the outcome of the encounter between newly arrived graduates and one of the rapidly emerging measures, namely the programme The fast track, which was created to enable establishment on the labor market for newly arrived graduates. The content and reach of cultural capital in its institutional form is at the forefront of the analysis of the 50 interviews with newly arrived academics. The results show that there is a strong confidence in the role of education for facilitating their establishment on the Swedish labor market. When other assets have been lost, education becomes the lifebuoy. However, the part of the labor market that this group is oriented towards is probably the most difficult one to enter, characterised by hard competition and possession of specific educational credentials. Our results indicate that this group of well-educated and qualified immigrants, who lack many crucial resources, especially social and linguistic capital necessary for successful career paths in Sweden, in the short perspective will undergo a process of strengthening the immigrant identity rather than quickly entering the labor market.

The Role Of Extra-curricular Youth Work For Integration

Zentner, Manfred

Danube-University Krems, Austria
manfred.zentner[at]donau-uni.ac.at

Integration of migrants in the host society take place in various ways. For the group of young migrants (aged between 10 and 25) access to education and the labour market is essential. Participation in organizations, clubs or youth work offer opportunities for migrants to develop both their own personality as well as to get in contact with other young people. However, the importance of youth work for integration has not been sufficiently investigated. An EU Presidency discussion paper on the role of youth policy and youth work with regards to migration started a reflection on the possible role of youth work . Subsequently, an EU expert group was established in 2017 to highlight models of good practice and prepare further steps regarding youth work for young migrants and refugees. This development culminated in an EU Council Conclusion regarding youth work for young refugees and third country nationals stating the importance of youth work for integration. But it remains vague which concept of integration is reflected in youth work policy as well as in youth work on the ground. Is youth work pursuing an approach to help youth with migrant background to adapt to the host community or is youth work per se integration work? In this research project for the first time the role of extra-curricular youth work for integration processes is analysed on the level of policy makers, youth workers and young people. Differences in and between the groups regarding understanding of guiding terms and principles, both of youth work and of integration, are in the focus of qualitative research.

Devalued Education and the Health of Migrants in Germany

Carstensen, Johann

German Center for Higher Education Research and Science Studies (DZHW), Germany
carstensen[at]dzhw.eu

Education is one important determinant of one's health. However, it is still unclear if this is due to the effects of educational certificates and their effect on resources such as the socioeconomic position or if higher education leads to better health behavior through competencies and knowledge. Earlier research for Germany shows that migrants have problems to fully capitalize their education on the labor market. Foreign certificates of education and academic degrees are often not acknowledged, leading to a discrepancy between competencies and employment. In this paper the question is addressed, whether migrant's morbidity differs from those of the population of the host country, and especially if there is a different effect of education on health status. The focus lies on the question whether devalued education from the country of origin can be transferred into better health, or if the devaluation affects the usability of education for health purposes. The analyses using data from the German Socioeconomic Panel show that migrants'

education health gradients do not differ from those of non-migrants in general, but non-acknowledged certificates do not yield the same health-advantages as acknowledged ones. Examined aspects of labor-market integration cannot account for this difference.

RN35_05b | Contested Politics of Migration II

Asylum Reforms, Discrimination of Refugees with Special Needs and Practices of Resistance in Local Contexts of Europe

Bartholini, Ignazia

University of Palermo, Italy
ignazia.bartholini[at]unipa.it

The standardization of the asylum system demonstrated a gap in providing specific assistance to asylum seekers with specific vulnerabilities as required in the Art. 17 of the 2013/33/EU Directive. The aim of this proposal is to describe the results of the research "Provide", founded by the EU (Rights, Equality and Citizenship Program 2014-2020), conducted in the last two years . The reasearch, based on mixed methods, highlights a problem of legislative discomfort between the EU and the different States; a gap in the assistance of migrants with specific needs; a problem of lack of understanding of phenomenon of proximity violence. In France, it is highlighted a lack of porosity between the Common Law and the asylum Law, especially regarding the granting of protection to vulnerable categories. Similarly, in Spain, violence suffered by migrants after leaving the origin country is not considered as a motive for International and national protection. In Italy there was a disparity in approaches in the assistance of migrants with specific needs. In the different regions and municipalities of three Countries involved there is no formalized coordinated system between asylum law and common law, between the asylum seekers' reception system and the system of protection of victims of violence. Furthermore, asylum reforms currently underway risk of increasing the vulnerabilities related to the perpetuation of proximity violence among migrants. This is due to some of the measures envisaged by legislative reforms relating to asylum, including those concerning shorter waiting times for asylum applications and longer periods of administrative detention. The effect could be to make the victims of proximity violence even more invisible. Few are the practices of resistance in local contexts.

Screening the Refugee: Freedom Stories and the Performance of Empathy in an “Emotional Community”

Khorana, Sukhmani

University of Wollongong, Australia
skhorana[at]uow.edu.au

In Australia, the policy of deterrence with regards to asylum seekers is occasionally questioned when the courts insist that it must not violate Australian law, or when the public sporadically shows compassion for individual asylum seekers, especially children. This paper takes the preoccupation with empathy in documentaries advocating for asylum seekers as a point of departure to understand how the mediation of emotions in late modernity may impact the formation of publics, and possibly facilitate social change. Through a focus on the Australian documentary *Freedom Stories* (Steve Thomas 2015), I unpack the performance of empathy in a Q&A session after a community screening.

Media Discourse Rebordering The Post-Brexit UK

Radziwinowiczówna, Agnieszka (1,2);
Galasińska, Aleksandra (1)

1: University of Wolverhampton, United Kingdom; 2: University of Warsaw, Poland
radziwinowicz[at]gmail.com, A.Galasińska[at]wlv.ac.uk

Exiting the European Union by the UK will involve the cease of the freedom of movement, the rebordering, and the new regulations concerning the mobility of the EU citizens. Therefore, Brexit makes possible the observation of the inception of a new immigration regime targeting the EU nationals, whose freedom of movement in the EU Member States can be circumscribed only under very specific conditions. The writings in political philosophy and political anthropology discuss immigration enforcement as a means to fund or reproduce state sovereignty. The debate preceding Brexit provided empirical examples of this process, with the ‘leave’ voters and Brexiters mentioning the ‘recuperation of UK sovereignty’ as one of the most crucial arguments and the EU migrant workers presented as a competition to the natives. This paper demonstrates how the future of the freedom of movement and immigration regulations targeting the EU citizens following Brexit are depicted in the British and Polish media. The paper, methodologically anchored in the Critical Discourse Analysis, examines samples of texts (including readers’ comments) from online issues of four daily newspapers, representing the spectrum of political opinions in the UK (The Guardian, The Times, Daily Mail, The Sun). That will be compared with matching samples of daily newspapers in Poland, the country of origin of the biggest migrant group in the UK. It is important to grasp and critically evaluate how the media discourse before and after the EU Exit create the reality that shapes and becomes a part of the life worlds of EU migrants.

The European Borders Pressed to the Global South: Notes on the Externalization of Borders through the Politics of Agreements for Refugees and Migrants between the European Union and ‘Safe Third Countries’

Pavezi, Ingrid Berns

Albert-Ludwigs-Universität Freiburg, Germany
ingrid.pavezi[at]soziologie.uni-freiburg.de

The departure point of this paper is the current politics between the European Union and the so-called ‘Safe Third Countries’, as i.e. Turkey and Libya, for the management of migrants and refugees towards the European continent. This politics will be analyzed through the following developments: (1) the contextualization of the politics between the European Union and third countries in a broader context, from a sociological-historical background and world-system analysis perspective; (2) the policies and developments of the political relations and agreements between European Union and third countries on the topic of migration, asylum and visa policies and (3) the dynamics in the world-system that the actors involved have been assuming, related to the topic in its plural aspects. One can also ask which are the current political and epistemological borders of the European Union, beyond its geographical well-known delimitations. Moreover, the world-system analysis provides a comprehension of the world, understanding the unequal regions of the globe as core, semi-periphery and periphery. Moreover, the postcolonial sociological perspectives comprehend those inequalities in relation to the political and economic negotiations between state actors from these unequal and diverse regions of the globe. This paper aims to contribute to the theoretical and methodological developments of the critical borders and migration studies. Especially, through questioning the socio-historical and postcolonial inequalities between the political actors involved in those politics that are setting and constraining the mobility of refugees and migrants.

RN35_05c | Migration and Integration Reconsidered I

On The Importance Of Playing House. The Paradox Of The Domestic Attachment Mode In Finnish Immigrant Integration Policies

Haapajarvi, Linda

Centre Maurice Halbwachs, France

[linda.haapajarvi\[at\]ehess.fr](mailto:linda.haapajarvi[at]ehess.fr)

Migration scholars are increasingly interested in the interactional processes in which agents of public policies shape “good” citizens out of newcomers. Pioneering research into the ordinary practice of immigrant integration policies has mobilized various conceptual frameworks looking for instance at the practices of everyday bordering that control the boundaries of the nation-state (Tervonen, Pellander, Yuval-Davis, 2018), at the situated interactions in which migrants engage with the welfare state and the process of “citizenisation” (Nordberg & Wrede, 2015) and yet at the (moral) subjectivities state agents forge in different national contexts (Fassin, 2013). This article tackles the making of “good” female citizens in the Finnish context. Drawing to a four-year ethnographic study at a Helsinki “neighbourhood house”, it analyses the concrete institutional context and interactions in which integration policies targeting immigrant women are put in practice. It introduces a novel conceptual perspective to the study of integration, one based on theorizing the social bond forged between migrant women and Finnish society (Paugam, 2016), the concrete mode of which surprises by its distinctly domestic nature. In order to understand the dynamics of this bond, two further lines of inquiry are pursued. Firstly, drawing to Mary Douglas’s (1991) conceptual analysis of the “tyrannies of home”, it problematizes the effect on immigrant women’s membership in Finnish society of the group boundaries and collective norms these policies are based on. Secondly, it picks up where Douglas’s analysis ends, i.e. the needs of immigrant women that these policies serve, and does this by examining the effective uses immigrant women make of the policies targeting them.

Contact Theory and Integration Policy: Intergroup Peer Interaction between Young Children in two Danish Desegregated Schools

Jensen, Sidsel Vive

Vive - The Danish Center for Social Science Research, Denmark
[sije\[at\]vive.dk](mailto:sije[at]vive.dk)

In order to accommodate increasing concerns about ‘integration’ in European societies and the concentration of

immigrant populations in specific locations, European politicians have implemented various versions of ‘desegregation policies’. Desegregation policies may be defined as policies resting on a basic version of the contact hypothesis: That intergroup contact reduces prejudice and increases tolerance between groups. Thorough tests of the contact hypothesis have demonstrated that contact alone does not reduce prejudice and the field of contact theory has sought to identify the ‘optimal conditions’ under which contact improves intergroup relations. In this paper, I investigate the consequences of a current Danish school desegregation policy that resembles the policies employed in the US since the 1950es and 60es, where immigrant children are bussed to schools outside of their residential areas. Particularly, I investigate how children resegregate into ethnic groups and how interethnic interaction correlates with the differences in children’s statuses and interactional resources structured by the institutional (school) setting. The analysis is based on mixed methods analysis of fieldwork data collected over 16 months in two classes in two schools in 2014 and 15.

Integration through Blood Donation: Post-Secular Implications of British Shia Immigrants’ Civic Engagement

Hashemi, Morteza

University of Edinburgh, United Kingdom

[morteza.hashemi\[at\]jed.ac.uk](mailto:morteza.hashemi[at]jed.ac.uk)

The Imam Hussain Blood Donation Campaign is the largest cross-ethnic charity of British Shia immigrants which has worked in collaboration with NHS Blood and Transplant in the past ten years. This paper investigates the British Shia Muslim immigrants’ strategies of integration into the larger society. It will explain how Shias in London and Birmingham have tried to integrate through civic engagements and how their engagements resulted in theological adjustments. If we understand post-secularism as a form of consciousness about the shortcomings of the secularization theory, is the Blood Donation Campaign constitute a post-secular sense of belonging? To what extent they expect to see donation as a way of being accepted in the larger society not despite their religion but because of their religiously supported ritual of blood donation? In other words, this paper tries to explore British Shias’ lived theological understanding of displacement.

Multi-focal Integration. A Theoretical Synthesis On Immigrant Integration With An Empirical Application

Kemppainen, Laura; Kemppainen, Teemu

University of Helsinki, Finland
laura.kemppainen[at]helsinki.fi,
teemu.kemppainen[at]helsinki.fi

Immigrants' integration to their new host society is one of the oldest research areas in sociology and today it remains an important topic in the interdisciplinary field of migration studies. In the 1990s, the theories of transnationalism started to gain increasing attention and brought diversity to the research field on immigration. However, immigrants' integration to the host society and their transnational practices have remained separate research topics and the theoretical work on the relationships of transnationalism and integration under-developed. In this study we propose a theoretical model that allows for the investigation of different dimensions of integration (structural, social, cultural and identificational) and, more importantly, considers integration in terms of various sites, places or directions: we propose a multifocal conception of integration, which includes the transnational sphere of life as a possible focus of integration along with host society and local ethnic minority communities. With this theoretical solution we can better examine the diverse and multifocal patterns of social engagements of immigrants in the contemporary globalised world. Empirically, we use our theoretical model to examine three immigrant groups – the Russian, Somali and Kurdish – in Finland, using high-quality face-to-face survey data from a stratified random sample drawn from the population register. In the presentation we present our theoretical synthesis and selected empirical results. For example, is transnational or local ethnic integration in conflict with integration to the host society? What is the role of Internet skills in maintaining transnational ties or accessing the institutions and networks of host society?

RN35_06a | Re-thinking Migration: Conceptual Challenges and Innovative Perspectives I

Borders, Migration and Class in an Age of Crisis: Producing Immigrants and Workers

Vickers, Tom

Nottingham Trent University, United Kingdom
tom.vickers[at]ntu.ac.uk

This paper examines how categories of 'workers', 'migrants', and associated subcategories have been structured and mobilised in recent years within populist representations of 'migrant crisis' and 'welfare crisis', to facilitate capitalist exploitation. The paper situates mobility in relation to class formation and exploitation through the concept of labour process, which highlights the importance of capitalist control over movement, at a micro and macro scale, in order to extract surplus value from living human subjects. This analysis is tested and further developed by drawing on a programme of empirical and theoretical research between 2012 and 2017, concerning patterns of migration and settlement, labour markets, state policy and implementation, the media, and activism. The paper focuses on Britain in particular. This goes against the grain of the general turn toward a transnational frame in many studies of migration and bordering practices, but has value given the persistent national organisation of capital, and the continuing significance of national divisions and connected racial boundaries in governing migration and migrants' rights. This has added importance in the context of Brexit, and the wider international turn toward protectionism and unilateralism supported by populist movements. Yet the British economy remains heavily reliant on international investments and service export of services, and key sectors are structurally dependant on migrant labour. Through an analysis of this case, theoretical insights are developed that have international relevance. The paper concludes by proposing alternative, counter-hegemonic understandings of the relationship between borders, migration and class that are informed by grassroots movements and foreground solidarity.

768

Protecting Non-Resident Citizens: The Changing Role of Church and State

Gray, Breda

University of Limerick, Ireland
breda.gray[at]ul.ie

Scholarly work on diaspora engagement and transnational social protection, while increasingly common, generally treats these as emergent forms of secular statecraft. The historical and continued imbrication of secular statecraft with religious discourses, practices and knowledges has not been part of the conversation. In this paper I address this oversight by calling attention to the historical and contemporary interweavings of church and state ideas, authorities, and techniques of government in simultaneously forging transnational conceptions of social citizenship, extending social protection and fostering ethnically and religiously-identified subject-citizens. I demonstrate the need to move beyond framing origin-state diaspora engagement as solely a project of secular statecraft by bringing to light some of the ways in which the Catholic church (an example of only one religious institution) in the case study contexts of Italy, the Philippines and Mexico have pioneered migrant social protection in partnership with, in parallel, and in contestation with origin states. While church rationalities of protecting human dignity and preserving family life put it in conflict with origin and receiving state migration policies, church techniques of migration government through social protection also support sending state diaspora relations and social protection policies. Alongside the scholarly attention currently being paid to the extensification and intensification of origin state protection measures, I point in this paper to the continued significance of church actors in the social protection of non-resident citizens.

“Vulnerability” as Limitation for Political Citizenship

Leppäkorpi, Mervi

University of Helsinki, Finland
mervi.leppakorpi[at]helsinki.fi

Migrants in irregular status have to negotiate their place within the society through “acts of citizenship” (Isin 2002). Those acts break the silence around the people. Political citizenship is negotiated through challenging the exclusion. In northern Europe these negotiations are framed through the failed international protection and/or workers' rights. Civil society provides support for these migrants through services and by demanding their rights. The understanding of the irregularity is constructed in encounters between those who seek and those who offer help. Consequently, vulnerability of these migrants dominate in representations. It is used as an argument and political tool in advocacy work. There have been intentions to redefine the vulnerability as a concept, that would take a step from victimizing, descriptive categories towards a shared human condition. This should promote more inclusive practices (Fineman 2008), but fails to target the marginalization as a consequence of juridical-administrative processes. I argue, that the use of “vulnerability” as an apolitical concept in advocacy limits the possibilities of

migrants in irregular situations for being political. Vulnerability argument construct a “genuine undocumented migrant” - the deserving victim - as an opposite to the undeserving (economic) migrant. This difficult those in irregular situation to defend demands without positioning themselves within the vulnerability discourse. This paper is based on my empirical PhD research in Hamburg, Stockholm and Helsinki between 2014 and 2016. Albertson Fineman, Martha (2008). The vulnerable subject: Anchoring equality in the human condition. *Yale Journal of Law and Feminism* 20(1), 1-24. Isin, Engin F. (2002). *Being political: Genealogies of citizenship*. Constructing “Groupness” among Highly-Skilled International Migrants. An Analysis of Symbolic Boundary-Making in a Berlin City Magazine

Carlson, Sören

Europa-Universität Flensburg, Germany
soeren.carlson[at]uni-flensburg.de

As a result of general globalization and transnationalization processes, but also in reaction to specifically European conditions (e.g. freedom of movement), we can observe new forms of labour migration and transnational mobility within Europe. These movements increasingly stem from relatively young and highly-skilled people and are often of a less permanent and, supposedly, more individualized character compared to more traditional forms of migration in Europe. This raises the question of how far these migrants can actually be considered as a social group with shared forms of belonging and identification. Furthermore, it begs the question of whether their belonging is still based on national or ethnic criteria or whether it is possibly related to different ways of constructing “groupness”. The paper addresses these questions by drawing theoretically on the concept of symbolic boundaries, as elaborated by Michèle Lamont and others, since such boundaries are a necessary “ingredient” for group formation. The empirical base of the analysis is a qualitative content analysis of editorial columns in a monthly, English-speaking Berlin city magazine, covering the years 2017 and 2018, which is predominantly geared towards an audience of highly-skilled people from abroad who moved, temporarily or permanently, to Berlin. By examining the ways in which symbolic boundaries are constructed within these columns when relating to as well as interpreting the migrants' experiences of living within this city (e.g. by distancing oneself from the “local” population), the paper can show that there are indeed indications for an emerging form of group identity and belonging which supersedes traditional national affiliations.

Asylum Seekers and the Context of Their Housing: Different Places, Different Integration Outcomes?

Sandström, Lina Elisabeth

Örebro University, Sweden
lina.sandstrom[at]oru.se

In Sweden, asylum seekers can either live in accommodation offered by the Migration Agency (ABO) or they can find their own accommodation (EBO). Ever since the option to choose was introduced in 1994, EBO has been a contentious topic. One common criticism is that it is detrimental to refugee integration as it often entails staying with relatives living in ethnically segregated urban areas. Two crucial aspects are usually missing from these discussions. The first is a clear definition of what is meant by integration and the second is a closer examination of the integration prospects of the alternative: ABO is typically found in isolated rural areas with integration issues of their own. Based on material from a qualitative interview study with Syrian asylum seekers and other key informants, this paper attempts to rectify some of these shortcomings. The interviews were conducted in two locations where either EBO or ABO is the dominant form of housing. Using Ager and Strang's (2008) integration model as an analytical tool, it reveals some noteworthy differences between the two locations. Amongst other things, the participants view and value social connections with both other Syrians and Swedish people differently. It is less clear, however, whether these differences should be understood in terms of integration in the classical, Durkheimian, sense of the word. In fact, the paper concludes that there is a danger in doing so as it may divert attention away from structural inequalities and result in blaming refugees for choosing not to 'fit in'.

Personal Networks, Social Support and Upward Mobility among Roma Migrants in France

Cañarte, David (1); Vacca, Raffaele (1); Vitale, Tommaso (2)

1: University of Florida, United States of America; 2: Sciences Po, France
dcanarte[at]ufl.edu, r.vacca[at]ufl.edu,
tommaso.vitale[at]sciencespo.fr

Social support has long been studied as an important aspect of social inclusion, sense of belonging, and integration in primary and secondary groups, as well as a social determinant of individual health and well-being. However, scholars in the social and health sciences have typically examined structures and mechanisms of social support in the general population, while research on the topic has been more limited in immigrant communities, particularly in hard-to-reach and marginalized populations like Roma migrants in Europe. This study analyzes uniquely rich survey data on personal networks and migration trajectories to examine determinants and patterns of social support among Romanian Roma migrants experiencing upward social mobility in France. Using hierarchical logistic and negative binomial regression for personal network data, we investigate the characteristics of migrants (i.e., the potential support recipients), their social contacts (i.e., the potential support providers), and personal networks (i.e., social contexts) that are associated with the provision, variety and intensity of social support. We consider different dimensions of social support, including instrumental aid, emotional support, companionship, financial help, and informational support. Furthermore, we distinguish between specialized support (limited to one of these dimensions) and multiplex support (spanning multiple dimensions). Findings suggest that Roma migrants who experience upward social mobility in France are more likely to receive support from contacts who are female, geographically close, older, non-coethnic, and part of their family. We discuss the policy implications of these results and their significance for the study of social support, immigrant incorporation, and transnational practices in immigrant communities.

Ageing Immigrancy as a Category of Residual Inclusion –The Finnish Third Sector Organizations Standing in for the Public Welfare Services

Buchert, Ulla

University of Helsinki, Finland
ulla.buchert[at]helsinki.fi

Diversity of the ageing population is increasing also in Finland. Older people have increasingly diverse language skills, cultural, religious and educational backgrounds, family situations, pensions etc. However, the public health and social services have not been developed accordingly so far. Instead, the state funds the third sector organizations to develop separate support services for people called ageing immigrants. Theoretical background of the research is based on theories regarding incorporation of people to the public welfare service systems as well as institutional categories and classification. The research questions are: How the institutional category of ageing immigrancy is used by the third sector organisations to promote incorporation of people to the public welfare services? How use of the category affects incorporation in the short- and long-term? Data of the research consists of thematic interviews of employees of the Finnish third sector organizations organizing support services for people called ageing immigrants. The data is analysed by using theory-oriented content analysis. The research demonstrates that the institutional category of ageing immigrancy is used to promote incorporation both by supporting people in service use and by reminding the services about equal treatment. However, the research points out that use of the category, which enables recognition of people in need presently, generates in the long-term construction of both a group called ageing immigrants and separate service use procedures. This in turn enables the public welfare services to reject more thorough reformations, in other words to settle for residual inclusion.

Migrant Advocacy Under Austerity: Transforming Solidarity in The Greek Refugee

Pendakis, Katherine Laura

King's College University, Canada
klpendak[at]gmail.com

This paper explores the structural convergence of economic austerity and the 2015 influx of refugees into the Northern Greek city of Thessaloniki. It is based on interviews with young Greek activists who came of age and were politicized during the early years of the economic crisis, established relations with migrant populations in the process, and have —since 2015—been employed in the emerging refugee regime. I examine the implications of moving from activist networks to formal employment in local NGOs for (i) the kinds of solidaristic relations formed between local Greeks and foreign migrants, (ii) the moral and political identities and projects of those who become absorbed in the regime as paid employees and (iii) the solidarity networks that activists leave behind. My argument is

twofold: First, that the conversion of non-hierarchical solidarity networks into cultural capital results in the depoliticization of relations between young Greeks and foreign migrants; Second, that the newly employed engage in identifiable forms of 'boundary work' and justification to establish a compelling line of continuity with their left-wing identity and their politicized commitment to migrants. This research contributes to our understanding of the difficult and necessary labour involved in social justice advocacy during a period of rising xenophobia and radical nationalism in Europe. It also offers important ethnographic and theoretical insights into the local impacts of emerging refugee regimes in contexts of protracted economic crisis and austerity. Keywords: Greece, migrants, refugees, solidarity, austerity, cultural sociology.

Acculturation of Slavic Migrants in Poland. Socio-Legal Study

Klakla, Jan Bazyli

Jagiellonian University, Poland
jan.bazyli.klakla[at]doctoral.uj.edu.pl

Polish law provides specific legal and institutional framework shaping the reality of foreigners. In my paper I will present findings from my PhD project, which aims to investigate the factors determining the process of Slavic migrants' acculturation in Poland. Special emphasis is placed on legal and institutional factors. The project is based on a theoretical acculturation model called Relative Acculturation Extended Model. The research group in this project consists of migrants originating from Slavic countries who arrived in Poland in the period of 1989-2003. Project combines the formal-dogmatic method and the critical analysis of the legal texts with qualitative sociological method in the form of biographical interviews with migrants and in-depth interviews with experts. At ESA I will present the initial findings from empirical research and legal analysis carried out so far. The empirical part of the project is scheduled to be completed in July 2019, so I will be able to use most of the data for my presentation. The results will identify the underlying biographical processes associated with the migration process and determine how institutional factors affect the experience of migrants in the migration process, the strategies desired and implemented by them, and the nature of the relationship between these choices, their effect and beforementioned factors.

Value Consensus and Feelings of Welcome Amongst Refugees: Evidence from a Prospective Panel Study

Fuchs, Lukas Marian

Freie Universität Berlin, Germany
lukas.marian.fuchs[at]fu-berlin.de

The integration of refugees who recently arrived in the European Union is a matter of ongoing public debate. The sociology of migration has continuously emphasized the positive long-term effects of employment, social networks, residential location, and legal status on the integration of immigrants. Regarding integration of refugees, however, these indicators are of limited value because of their prolonged legal liminality. Existing studies have therefore emphasized the importance of social and cultural factors (e.g., language, norms, values) for refugee integration and well-being, in particular shortly after arrival. In this respect, values are widely discussed as prerequisites for successful integration. Two lines of argument are related to this conjecture: First, value consensus, i.e., shared values between refugees and members of the host society, are considered hallmarks of individual well-being and social integration. In acculturation theory this is reflected in concepts of cultural distance, where values are part of a person's cognitive social capital that promotes the formations of social bonds and feelings of community. In this view, value consensus rather than value distance should be associated with well-being and feelings of welcome amongst refugees (consensus hypothesis). Second, one might argue that, in particular, liberal and cosmopolitan values promote social integration and feelings of welcome in culturally distinct societies, irrespective of whether these values are widely shared with members of the host society (independence hypothesis). The present contribution investigates both hypotheses using data from the World Values Survey and the IAB-BAMF-SOEP, a prospective panel of refugees in Germany, comprising 4817 adult respondents in 2016. Initial analysis lends support to the independence hypothesis, rather than the popular consensus hypothesis, indicating that absolute liberal values positively influence feelings of welcome.

Exploring Migrants' Legal Consciousness: a Case of African Migrants in Lithuania

Miežanskienė, Ramunė

Kaunas University of Technology, Lithuania
ramune.miezanskiene[at]ktu.lt

Standing on the pillars of the theoretical framework in the field of research of legal consciousness (Ewick, P., Silbey, S., Hertogh M.) the conducted research seeks to address the features of migrants' legal consciousness. It provides insights into the distinctive features of African migrants' legal consciousness in a different legal system and legal culture setting of a host country as well as the factors which influence the genesis of those features. The research is based on twelve semi-structured interviews, conducted in Lithuania in 2019. Interviewees were sampled using criteria and snowball sampling. Preliminary results of semi-structured interviews reveals a vacuum of legal socialization, the features of undetectable legalities of host country, instances of socio-legal remittance and voluntary and semi-voluntary isolation towards the host country's legal system. The given data also corresponds/comes in line to the patterns of legal consciousness referring the spectrum of legal alienation ("legal meaninglessness", "legal powerlessness", "legal cynicism" and "legal value isolation" (M. Hertogh, 2018)). The value of this research lies in (1) filling the shortage of particular research concerning the topic of migrants' legal consciousness, (2) identifying the distinctiveness of legal consciousness which is externalized mostly by legal alienation and (3) noticing those triggers, which come to play as key factors in the development of the patterns of legal consciousness, e.g.: remittance of legal knowledge and experience, diversification of experiences regarding public vs social institutions, etc.

Assimilation Theory As A Theory Of South-To-North Migrant Incorporation: Analyzing The Contrasting Characteristics Of North-To-South Migration And Laying The Groundwork For A General Theory Of Migrant Incorporation

Schöpf, Caroline Maria (1,2); Chew, Matthew M. (1)

1: Hong Kong Baptist University, Hong Kong; 2: Max Weber Foundation, Germany
caroline.schoepf[at]gmail.com, mmtchew[at]hkbu.edu.hk

Assimilation theory is often regarded as a general theory of immigrant incorporation, but its empirical basis is constituted almost entirely of cases of South-to-North migration. This study compares the central tenets of classical, segmented and new assimilation theory with studies on instances of South-to-North, North-to-South, North-to-North and South-to-South migration. While assimilation theory's predictions fit well for South-to-North migration, outcomes are more neutral for 'lateral' forms of migration, and often reversed for North-to-South migration. Specifically, assimilation theory predicts that migrants enter the receiving society in a disadvantaged position vis-a-vis the 'societal mainstream': Migrants are assumed to often have less, or less convertible, human capital, and tend to face unfavorable modes of incorporation, with often hostile immigration policies, prejudiced societal reception, and weak co-ethnic communities. The 'societal mainstream' is viewed to often offer better opportunities, encouraging assimilation. However, analyzing empirical studies of instances of North-to-South migration reveals that in these cases, migrants tend to enter the receiving society in an advantaged position, typically having human capital that is valued higher than that of receiving society members and encountering receptive immigration policies, positive societal reception and strong, powerful co-ethnic communities. Outcomes of North-to-North and South-to-South range in between. It thus appears that assimilation theory's status as a general immigrant incorporation theory is based on a mistaken generalization of a specific set of cases. We proceed to outline a general theory of migrant incorporation that includes all four trajectories.

RN35_07a | Re-thinking Migration: Conceptual Challenges and Innovative Perspectives II

Senses of Time and Processes of Citizenisation in Institutional Encounters Between Social Service Workers and Migrant Service-Users in the Immigrant Services of Helsinki Metropolitan Area

Kara, Hanna

University of Helsinki, Finland
hanna.kara[at]helsinki.fi

Migration brings to the fore social time and dominant ideas of time in society, and being outside of and in negotiation with these times (Frederiksen & Dalsgård, 2014; Kara, 2016), yet time has only recently seen a significant rise in interest in migration research (e.g. Griffiths et al., 2013; Mavroudi et al., 2017). Time is also centrally about control and power (Bailey et al., 2002), as states control time and through time (Griffiths, 2017), through for example institutional schedules and routines, censuses and classifications, and bureaucratic procedures and requisites. In this presentation I will explore the ways time and temporal experiences reflect the positions of social service workers and migrant service-users in the institutional encounters taking place in the integration services in the capital region of Helsinki, Finland. I will analyse different time aspects in the experiences of service-users and professionals in reference to the work done at the integration services as well as to the experiences of the welfare bureaucracy more generally, and discuss them inside the conceptual rubric of citizenisation (Nordberg & Wrede, 2015). More specifically, I will look at the temporal experiences of time shortage, waiting, time suspension (e.g. Cwerner, 2001; Griffiths, 2014) and different temporal paradoxes, and consider the inherent dynamics of losing, gaining, resisting and negotiating power. The analysis presented is based on a four-year research project (2017-2021) which draws on collective and collaborative ethnographic approaches to examine how migrant citizenisation is linked to power asymmetries in the Nordic restructuring welfare bureaucracies.

How border deaths challenge belonging: A case study from Southern Italy

Stauffacher, Daniela (1,2)

1: University of Zurich Switzerland; 2: EHESS, Paris, France
daniela.stauffacher[at]rws.uzh.ch

The dead are usually a challenge for any social order. People dying at the borders of Europe are no exception to the rule as they rise a number of political, legal, logistical and ethical uncertainties. For the management of the dead whose identity in most cases remains unknown, the question of belonging is of particular interest since habitual concepts such as nationality or religious affiliation do not suffice as guidelines for the procedure with them. A case study in Southern Italy shows how practices of belonging are being implemented both on a local and national level: As certain actors claim that the dead belong to the sea, others devote all the necessary means to recover them from the grounds. When it comes to the accommodation of the dead on land, belonging is translated into a variety of spatial regimes on cemeteries i.e. special sectors, grave fields, ornaments etc. The study of the border deaths shows on an empirical level how group-boundaries are at times annihilated, re-distributed or reinforced. These empirical insights lead to reconsiderations on a theoretical level since belonging is not easily stipulated with concepts such as nationality or religious affiliation and needs to be rediscussed in order to better understand the phenomena.

Xenophobia as a Social Order Catch-22

Lopez-Narbona, Ana Maria (1); Davenport, Christian (2)

1: University of Malaga, Spain; 2: University of Michigan, United States of America
alopeznarbona[at]uma.es, christiandavenport[at]me.com

Xenophobia is conceptualized, in this work, as a Catch-22 where immigrants remain imprisoned. The process is triggered by nationals' reaction against those who "challenge" a mythological order. Corinthians 14:40 "But all things should be done decently and in order". Social order is based on asymmetric power relations where nationals impose social order or, alternatively, (if immigrants do not obey) social control (in the form of prison, social exclusion, discrimination, death penalty, unemployment...). Immigrants may challenge (unintentionally and inadvertently) the social order in, at least, the following instances, (i) labour market order, immigrants are lazy and/or distortion the labour market, (ii) cultural and value system order, the purest culture and values are those of the nationals, (iii) religious order, immigrants are not real or pure Christians, or, worst, they are muslims, (iv) patriarchal order, immigrants have the aspiration of being treated like free adults, with authority and power, (v) capitalistic order, poor immigrants cannot consume enough, (vi) legal order, immigrants are in essence violent and more prone to crime than nationals, and, (vii) racial order, endogamy must be respected by immigrants. This work reflects critically on the

"social order/social control dynamic" in which topics (i) to (vii) conform part of the inescapable vicious circle. For example, regarding the labour market order, if immigrants are working, they are stealing jobs from nationals; if unemployed, they are lazy and enjoying public benefits without contributing to society; if unemployed, but not enjoying public benefits, they are making society unsafe and poor, for all of which they are to blame. Immigrants are irremediably condemned to the margins of society.

RN35_07b | Intersectional Migration Orders

"Commodity-Refugees" of the Global Age: A Comparative Analysis of Iranian and Afghan Refugees in Turkey

Topates, Hakan; Kalfa-Topates, Aslican

Pamukkale University-Faculty of Economics and Administrative Sciences, Turkey
hakantopates[at]gmail.com, aslicankalfa[at]gmail.com

As an intersectional context, the practices of migration sways between the core, semi-periphery and periphery countries in a sociological route combining globalization and the fact of migration. In Turkey-Denizli city being the part of these geographical areas, diversifying reflections of migration practices of Iranian and Afghan refugees in socio-economic levels have been analyzed using qualitative semi-structured interviews. Within the scope of field research in-depth interviews were made by the researchers. The narratives of the sample comprising 30 Iranian and 20 Afghan migrants have been comparatively analyzed as hermeneutic and phenomenological. According to the research findings, refugees in the city usually work at labour-intensive manufacture and service sectors. That the city's economy conjoins to the global division of labour through commodity chains has turned migrant labour to a mechanism of surplus-value production. At this point, we conceptualize refugees having lost between universality and partiality as "commodity-refugees." We hypothesize that Afghan refugees are ontologically and epistemically more likely to commodify and alienate, compared to Iranians. As a result of the absence of compulsory education and social conflicts combining with war, Afghans lose the condition of being subjects in "postmodern conditions." While Iranians try to experience freedom conditions in public and private sphere, conversely Afghans do not have this tendency. Since Iranians have sought asylum in order to have a public sphere experience, they are closer to the communicative action process in Habermas's sense. Regarding Tönnies's categorization, Iranians are in seek of modernism and society, as Afghans are in the level of community. That Iranians consist of various categories such as Christians, Zarathustra, Atheists, Baha'is, and political opponents has created subcultural groups.

‘Losers of neoliberalism’: Everyday racism against Syrian refugees in Turkey

Simsek, Dogus

Koc University, Turkey
dogus.simsek[at]gmail.com

This paper focuses on the intersections between race and class in exploring Syrian refugees’ experiences of everyday racism in Turkey and aims to examine whether class is linked with race in the construction of everyday racism against Syrians. Drawing on in-depth interviews with 100 Syrian refugees and 75 local people most of whom have low- and high-income profiles in Ankara, Gaziantep, Kilis, Hatay and Şanlıurfa, I aim to explore the processes of ‘everyday racism’ against Syrian refugees. I argue that neo-liberal migration policies and class background of refugees play a crucial role in the reconstruction of racialised hierarchies between Syrian refugees and the local people; which then turn into displays of ‘everyday racism’ as a form of political outcome in which the local people either actively or passively maintain a distinction between ‘them’ and ‘Syrian refugees’ based on class; and that these kinds of structural inequalities are reinforced through everyday practices and interactions. The findings support the argument that everyday racism against Syrian refugees in Turkey is highly related with class and an outcome of neo-liberal migration policies.

Masculinity on a spectrum: The Meaning Of Success And International Migration Among Punjabi Sikh Men

Mitra, Diditi

Brookdale Community College, United States of America
diditimitra[at]gmail.com

Research examining the intersection of masculinity and international migration shows that desire for material prosperity strongly influences men’s decision to settle overseas. But, what is the strength of this consensus on material success, masculinity and international migration? That is, do all men desire financial success and see international migration as a pathway to it? And, do the men who have migrated abroad continue to view their move to have been successful and hold favorable perceptions of international migration? In this paper, I argue that although patriarchy is a binding force, there are gaps in the dominant socialization that manifest in varieties of masculinity as it relates to the topic of international migration. That means, I maintain that it would be erroneous to present masculine identities, success and subsequently, men’s views of international migration as monolithic. I develop this argument with the case of rural Jat Sikh men who live in Punjab, India and/or have immigrated to the United States. The data is a combination of semi-structured interviews and ethnographic observations conducted both in the Punjab and the United States. The findings advance knowledge in the areas of Sikh studies, South Asian studies as well as international migration.

Doing Equality and Migration in Finnish Parliament Plenary Sessions, 2008-2016

Menard, Rusten

University of Portsmouth, United Kingdom
rusten.menard[at]port.ac.uk

Critical feminist researchers have demonstrated some of the ways in which ‘Europeanness’, ‘Nordicness’ and ‘Finnishness’ are built as exemplary of gender and sexuality equality, as well as nationalistic and exclusionary (Bredström 2003; El-Tayeb 2012; Gross 2014; Haritaworn 2010; Jungar & Peltonen 2015, 2016; Lähdesmäki & Saresma 2014; Vuori 2009). Equality is established as inherent to the nation, while ‘our’ identities are constructed as distinct from, in contrast to and threatened by the cultures and values of migrants and asylum seekers. As Nordic and Finnish identities are also embedded in concepts of ‘whiteness’ and cultural homogeneity (Keskinen 2012; Häkkinen & Tervonen 2004), the separation of ‘us and our values’ from ‘immigrants and theirs’ is often racially marked. Discourses on equality are seemingly readily available tools for building and justifying anti-immigration standpoints. In this paper, I present preliminary findings of a study on how equality is given meaning in different textual contexts of political discourse, in Finnish parliament plenary sessions during the years 2008-2016, and how those meanings are used to take up positions on migration. As parliament members are in central positions for accessing, using and transforming discourses that may act as sociocultural technologies, my aims include specifying how specific discursive practices as regards equality may be culturally homogenising, socially exclusionary and subjugating. Methodologically, I conduct critical discourse analyses of representation, evaluation and stance (e.g. Martin & White, 2005) at different levels of analysis (see Wodak, 2001).

RN35_07c | Migration and the Labour Market

Migration Trajectories, Social Networks and Employment Rates

Eve, Michael

University of Eastern Piedmont, Italy
michael.eve[at]uniupo.it

Much research has documented the "refugee gap", the lower employment rates of refugees and asylum seekers compared with "other migrants". This disadvantage cannot be explained by individual characteristics like age, gender and education, nor by economic conditions at time of arrival or by the region of origin (and hence the "race") of migrants. Research has provided interesting results regarding health of refugees, the effect of dispersal policies, and of waiting times as factors which may lower employment rates. However, these explanations, too, leave much data unexplained, and it is argued that other factors need to be considered. Little systematic attention has been given to the social networks of asylum seekers, even though a large literature has shown the importance of networks in finding jobs. Drawing on information on recent asylum seekers in Italy, compared with migrants arriving via the work channel, I show there are important differences which probably have consequences for the ability to find jobs, and also for the ability to be functional in the workplace, and so maintain employment. I argue that this difference in the social networks of asylum seekers and "other migrants" is one explanation for the "refugee gap" found in many countries. We know that most labour migrants arrive migrate via a consolidated migration chain. This is not usually the case for asylum seekers, who cannot usually choose which place to go to. More in general I argue that migrants' "migration trajectories" have systematic effects on networks in the place of immigration. I argue that quantitative data on employment rates of migrants arriving via different channels (international protection/work/study/family reunification), and qualitative data, support this hypothesis.

Identity, Belonging and Economic Outcomes in England and Wales

Hristova, Ivelina

London School of Economics and Political Science, United Kingdom
i.hristova[at]lse.ac.uk

The United Kingdom's 2016 vote to leave the European Union exposed the need to look at economic equality through an identity lens. However, academia has not agreed on the impact of national identity on labour market outcomes, and the impacts of national identity on progression at work have not been studied yet. To fill these gaps, this paper explores whether having British identity impacts progression at work for sub-state national and migrant-origin groups in England and Wales. Logit models are run on the ONS Quarterly Labour

Force Survey to compare the impacts on career progression chances of each of the eight identity combinations between the three dimensions – British, sub-state national and migrant-origin, themselves influenced by social class. Having one dimension fixed, the models compare how the interplay between the other two affects progression at work. The results suggest that identity-related power relations, in-group preferences and bias at work create disadvantage to career progression. This disadvantage is particularly strong and highly significant for migrant-origin groups who do not feel British, compared to their sub-state national counterparts. This paper also shows a quantitative evidence for differences in what British identity means for sub-state national and migrant-origin groups in the first place. The novel approach sheds more light into the differential labour market behaviours of migrant-origin and sub-state national groups, and adds to the better understanding of the feeling of belonging to Britain. The results provide a basis for innovative policy recommendations at the work place and beyond.

Transient Wishes: Labour Market Aspirations of Highly Educated Refugees in Malmö and Munich

Mozetič, Katarina

University of Oslo, Norway
katarina.mozetic[at]sosgeo.uio.no

The paper engages with the topic of labour market participation of highly educated refugees. More precisely, it looks at highly educated refugees' aspirations in the destination country labour markets, the factors determining these aspirations and how labour market objectives change over time. To tackle this topic, the paper draws on 31 semi-structured interviews with highly educated refugees who live in Malmö and Munich, and their surroundings. The preliminary analysis of the interview material shows that – although not all – the predominant majority of research participants wishes to continue working or studying within their occupational field. This wish is connected to a number of reasons such as the sense of identity and the possession of specific occupational cultural capital. However, highly educated refugees' labour market aspirations are not set in stone, but are subjected to an array of dynamics over time. Dreams are re-examined in light of actual possibilities, objectives are altered in face of obstacles and newly arisen opportunities. Drawing on highly educated refugees' narratives concerning their labour market aspirations, the paper offers a dynamic, bottom-up perspective on labour market integration processes of highly educated refugees. To grasp highly educated refugees' labour market aspirations, the changes these wishes are subjected to over time and the factors affecting these, the paper proposes the application of amended aspirations-capabilities framework (de Haas, 2014).

Female Agency in Semi-Legality – Life Strategies of Serbian Women in France and Germany

Poleti Cosic, Dunja

University of Belgrade, Serbia
dunja.poleti[at]gmail.com

The main focus of the paper will be on the life strategies of economically active Serbian women living in semi-legality across two European destination countries, France and Germany. We start from Kubal's definition of semi-legality, that calls into question the binary categories describing migrants' interactions with law, such as regular/irregular or documented/undocumented, and in which semi-legality is conceptualized as "multi-dimensional space where migrants' formal immigration status interacts with various forms of agency towards the law" (Kubal, 2013:566-567). This broader notion implies that the status of semi-legality could be obtained not only when immigrants fail to obey the migration laws and regulations, but also when their employment and residential statuses mismatch. Therefore, the aim of this paper is twofold. Firstly, we want to explore the interplay between illegality of immigration and informality of labour statuses in order to map the variety of the existing forms. Secondly, we want to examine what life strategies women chose in the given circumstances, reconciling not only migration and labour statuses but also imposed gender roles. The findings presented in this paper have been obtained in a study aiming to enlighten the intersection of migration practices and gender regimes, using biographical-narrative approach. The data were collected through 60 semi-structured in-depth interviews, with the reconstruction of the life trajectory of interviewees. In contrast to the most common way of defining migrants through their formal status, the study included economically active women, regardless of how the legal system classifies them.

RN35_08 | Migration in Public Perception and Discourse

Gender Differences in Stereotypical Attitudes and Social Distance Toward Migrant Workers

Ziv, Riva

Ashkelon Academic College, Israel
rivaz[at]ariel.ac.il

One of the consequences of globalization is the migration of workers to developed economies where they find low-paid, low-prestige employment. The issue of migrant workers in Israel has recently risen to prominence in its public discourse, where it is generally seen as a threat to Israeli society. This view is a consequence of the inevitable encounter between

heterogeneous groups within Israeli society and the resultant cultural tensions. The purpose of the present study was to examine whether there exist gender differences in stereotypical attitudes and in social-distance among Israelis towards migrant workers. We checked the hypothesis that employment of migrant workers reduces stereotypical attitudes and social-distance. The Bugardus social distance scale questionnaire and a stereotypes assessment questionnaire were distributed to 150 men (75 employers and 75 non employers) and 150 women (75 employers and 75 non employers). Unsurprisingly, we found that both women and men who employed migrant workers held more positive stereotypes of migrant workers compared to non-employers. Women tended to hold more positive stereotypes than men. As for social-distance, employers reported less social-distance compared to non-employers. No gender differences were detected, thus women's more positive stereotypes of migrant workers did not result in lower social-distance.

Social Trust and Fear of Refugees

Zagraban, Jozef

Institute for Sociology of the Slovak Academy of Sciences, Slovak Republic
jozef.zagraban[at]savba.sk

There is a number of theoretical approaches that explain the determinants of the attitudes towards foreigners/immigrant/refugees, however, only a limited number of them focused on a relationship between these attitudes and social trust. Those that did, claim that people with higher levels of social trust are more likely go with the risk of trusting people with different cultural background. Also, people with higher social capital are more likely to exhibit positive attitudes towards immigration. This study tests the hypothesized relationship between social trust and position on immigration on Slovak data from 2018 module of the International Social Survey Programme (N = 1470). Results show that respondents claiming that "People can almost always be trusted" are less likely to be worried about refugees than others. The same conclusion applies to people with more liberal views comparing to those with more conservative views. On the other hand, factors previously connected to attitudes towards immigration in other countries, such as gender, age, education, employment status or income, do not seem to play a role in Slovakia and are not statistically significant.

Global Social Inequalities Localised: Refugees Between Civic Engagement and Populism

Shinozaki, Kyoko (1); Abramowski, Ruth (1,2); Karabegović, Dženeta (1); Stöllinger, Lena (1); Winkler, Anna (1)

1: University of Salzburg, Austria; 2: University of Bremen, Germany

kyoko.shinozaki[at]sbg.ac.at, ruth.abramowski[at]uni-bremen.de, dzeneta.karabegovic[at]sbg.ac.at, lena.stoellinger[at]stud.sbg.ac.at, Anna.Winkler[at]stud.sbg.ac.at

Debates on refugee movements are shifting from 'arrival', to that of '(forced) return' for some, and that of 'integration' in the 'receiving' context for those who stay. It is this latter shift which has paved the way for the emergence of populism on the one hand, and that of civil engagement, on the other. It compels us to analyse the stayers through a lens of social inequalities. Social inequalities denote a systematic lack of access among individuals and social groups to both material and immaterial valued resources due to their societal positions. Meanwhile, however, inequality scholarship has been critiqued by migration scholars for neglecting the spatial dimension, taking for granted nation-state-based society as a unit of reference. Taking these debates as a point of departure, this paper first examines the extent of inequalities in terms of education, employment and housing that have begun to be formed among refugees' lives, compared to non-migrant and migrant groups, using the "IAB-BAMF-SOEP Survey of Refugees" in Germany and the "Displaced Persons in Austria Survey". Second, we map the networks of civil society actors providing refugees with support in Salzburg and explore the ways in which, despite the ever-present populist rhetoric, these may help refugees to unfold their own capabilities to integrate in the local society while simultaneously staying connected with their hometowns. By doing so, this paper also sheds light on some of the ways in which civil society actors themselves are undergoing changes through refugee migration.

Does Migration Affect Notions About Justice?

Grosse, Ingrid

Dalarna University, Sweden
igr[at]du.se

Migration has many effects on individuals and countries. Among other things, it is supposed to change preferences for welfare spending and redistribution politics. Some researchers hypothesize that preferences decrease due to lower levels of solidarity between differing ethnic groups and due to higher costs related to immigrants' social needs. Others hypothesize that preferences increase due to higher general levels of inequality, poverty and unemployment. This paper will focus on the issue from a cultural view, instead: the question is if differing cultural and religious backgrounds of the established population on one hand and immigrants on the other hand

come with differing views on what is supposed to be just. Justice relates to questions of redistribution and welfare spending, but relates even to wider issues about what is due to a person or an institution. Religions, for example, differ in conceptions about rightful claims concerning various situations. In addition, historical legacies of countries have informed the experiences of equality and justice, which in turn have created different cultures related to notions of justice according to several researchers. Thus, immigrants and established populations may differ concerning what they regard as just, if notions of justice are preformed and relatively stable. Alternatively, notions could be rather similar, if the new social environment forms them. I will take a closer look into these issues. For this purpose, I apply multilevel analysis. I will use World Values Survey data, which comprise a range of countries from all world regions, and, in addition, the Quality of Government dataset.

RN35_09a | The Long Summer of Migration and Its Aftermath

Home Accommodation of Asylum Seekers in Finland. Hospitality as Resistance

Merikoski, Paula

University of Helsinki, Finland
paula.merikoski[at]helsinki.fi

The autumn of 2015 and the arrival of unprecedented number of asylum seekers mobilised the Finnish civil society. As elsewhere in Europe, new forms of pro-asylum action emerged in addition to the solidarity movements that were already in place. In Finland, a network for home accommodation of asylum seekers was set up by local activists to respond to the growing need for housing and assistance, and in order to show support to the newcomers. Although hospitality is an old practice and pro-migrant solidarity groups have been active for years, the scale of the movement has been unprecedented since the 'long summer of migration'. This empirical paper is based on a qualitative research project where the main data consists of in-depth interviews with local hosts who have opened their homes to asylum seekers. Home accommodation is considered here as a grassroots movement and as a form of hospitality that aims to challenge tightening asylum policies and anti-migration atmosphere. I argue that hosts aim to surpass binary divisions often related to migration, such as guest/host and victim/agent, by renouncing the idea of home accommodation as one-way assistance. However, power inequalities may affect how well equality and reciprocity are achieved in everyday life. Home accommodation of asylum seekers turns the private home into a site of resistance where the right to asylum is being claimed and immigration categories lived and contested. Thus, I understand home accommodation as an activity that blurs the public/private divide.

“Staying Despite Everything”: Syrian Refugees’ Legal, Political and Social Struggles in Turkey

Terzioglu, Aysecan

Sabancı University, Turkey
aysecan[at]sabanciuniv.edu

In this talk, I will focus on the problems Syrian women experience in their efforts to seek medical treatment for their problems in the health institutions in Istanbul, through the interviews I conducted with them and participant observations I had in the hospital settings. I would relate these problems to the biopolitical strategies of the state, general discriminatory discourses in the society, and inadequacy of NGOs in addressing the Syrians’ needs. I would also inquire why the Syrians prefer to stay in Turkey despite all these problems, claiming a common culture and religion. There are about 3.5 million Syrians in Turkey, and they are often subjected to discriminatory discourses and practices by the people and state, and there are ambiguities in terms of how they would benefit from their basic human rights, such as the access to health and educational services. They cannot be legally called as refugees, since Turkey grants this title to the migrants from the West, as the Turkish state had that geographical condition in signing the Geneva Convention in 1951. They are under “temporary protection”, a term which is legally ambiguous. Most Syrians suffer from disadvantageous living and working conditions, as well as economic exploitation. In Turkish academia, there are several studies which focus on the political, legal and social problems of Syrians, but very few of them reflect their own perspective and voice through research with qualitative methods, which I aim to do with my research.

“You are in Czech Office, so you have to be able to speak Czech”: Discourses and Practices of Czech Migration Policy

Cada, Karel; Horeni, Karina

Charles University, Czech Republic
kcada1[at]gmail.com, karina.horeni[at]fsv.cuni.cz

In summer 2017, criticism and contention encompassed Prague City Hall after employees put up a sign demanding that clients speak in Czech, or else come with a translator. The sign reads: ‘You are in Czech office, so you have to be able to speak Czech.’ According to our research, this sign represents public authorities’ practice which migrants face in everyday life in the Czech Republic. In the last few years, European newspaper headlines have repeatedly highlighted xenophobia and intolerance in Europe. In our paper, we intend to look at everyday demonstrations of such discourses in institutional practice. We have deployed tools of cultural and interpretative sociology to explore discursive strategies and social practices in relation to the institutional experience of migrants. Based upon the analysis of migration law and policies and interviews with migrants, social workers, and public officers, we mapped barriers and enablers of migrants into the Czech society and

describe their experiences in relation to the Czech institutions. We conclude that the hostility toward migrants is inscribed both in bureaucratic rules and their interpretation in practice. The Czech migration policy remains locked in the circle of the hermeneutic of suspicion which is inscribed in the legislative rules and their interpretation of street-level bureaucrats.

Negotiations of Borders and Uncertainty: Social Work with Unaccompanied Minors in Times of Restrictive Migration Policy

Wernesjö, Ulrika

Linköping University, Sweden
ulrika.wernesjo[at]liu.se

In November 2015, in the midst of the so called ‘refugee crisis’, the Swedish prime minister declared a need of ‘breathing space’ in the reception of asylum seekers. In addition to enforcement of stricter border controls and medical age assessment of unaccompanied minors, a provisional legislation has been passed by the parliament which restricts asylum-seekers possibilities to obtain permanent residence permits and for family reunification. These changes have raised enormous critique, especially for the consequences they have for unaccompanied children and youth seeking asylum, and for their situation. Moreover, the current migration policy has ramifications for social work with this particular group. In this paper I investigate social workers talk about their work with unaccompanied minors, discretion and the current policy. The paper is based on a qualitative interview study with social workers at the Social services and at residential care homes. In the analysis, particular attention is paid to both how the social workers negotiate the uncertainty that characterises not only the children’s and youth’s situation but also the provisional legislation, and how borders are manifested, negotiated and resisted in their accounts. State borders not only become manifested in accounts of the minors’ legal status, but also in how the social workers talk about both minors’ trajectories towards independence and adulthood. Inclusion, in this regard, is intimately connected to certain ideas of integration, education, work and values such as equality.

RN35_09b | New Politics of Identity

The Construction of Identity through Consumption from Zygmunt Bauman's Perspective: Experiences of Iranian Refugees in Turkey

Kalfa-Topates, Aslican; Topates, Hakan

Pamukkale University-Faculty of Economics and Administrative Sciences, Turkey
aslicankalfa[at]gmail.com, hakantopates[at]gmail.com

This research aims to discuss consumption's function in Iranian refugees' identity construction process in Turkey, from Bauman's perspective. Bauman argues that consumption constitutes different social realities including identity in the modern liquid era. As the work ethic constitutes identity in the "producer society," consumption takes this function over in today's postmodern era. Bauman's argument is valid for several social classes in Turkey being a semi-periphery country. Hence, despite the increase of poverty with the recent economic crisis, there is a strong tendency for indebted consumption. This research focusing on Iranian refugees' daily life practices discusses the intersection of migration with the fact that consumption society practices play an essential role in the identity formation process. In the context of the study, the researchers used qualitative field research and conducted in-depth interviews with 30 Iranian refugees living in the city of Denizli. Turkey has been hosting many asylum seekers/refugees from the Middle East and Africa since the 1980s. Composing of LGBTIs, Christians, Zarathustra, Baha'is, and political prisoners, Iranian refugees mainly live in Denizli and participate in the labour market as cheap labour source in order to earn their livings. However, they construct their identities through consumption. In this context, the main finding of the research is that Iranians adopt consumption patterns consistent with Bauman's argument on the relation between identity and consumption. Iranians push the limits of consumption opportunities in Turkey as a result of Iran's authoritarian regime's restriction on consumption freedom. They use a considerable amount of their income they earned through jobs under their skills for hedonist consumption. Thus, the design of the refugee identity combines with the design of the consumer identity.

The Representation of Englishmen among Baltic Migrants in the UK

Kaprans, Martins

University of Latvia, Latvia
martins.kaprans[at]lu.lv

Great Britain has become the main destination for new labor migrants from Latvia and Lithuania. The majority of these migrants have come to the UK within the last 15 years. This paper looks at how Baltic migrants define their relations with

the British society. In particular, the paper focuses on how the perception of British people conditionally shapes the migrants' adaptation narratives, revealing their integration as well as separation intentions. The paper draws on the ideas of social representation theory (Moscovici 2008) that explains how people create a shared understanding of social objects, such as genuine Englishmen, and how they position themselves through such representations. In order to understand the migrants' discursive practices as regards British people, the paper explores interviews with Latvian and Lithuanian migrants that were conducted in terms of my postdoc project in 2018. Interviewees were recruited from East Midlands and West Midlands. Taking into account the Brexit vote in 2016, these interviews provide context-sensitive data, i.e. they show whether and how the Brexit discourse has framed particular themes in the representation of British people. The paper argues that the social representations of British people reveal different acculturation strategies (Berry 1997) that Latvian migrants use in order to legitimize their stay in the UK as well as to de-problematize uncertainties and anxieties related to Brexit. Likewise, the qualitative data suggest that the portrayal of Englishmen is discursively used as a basis for social comparison that helps to maintain a positive migrant's identity. Thus the paper illuminates the hegemonic and emancipatory dimensions within the representation of Englishmen.

Ethnic Cultural Associations and Identity Formation of Immigrants: The Case Study of Russian and Italian Associations in Germany

Havlin, Tetiana

University of Siegen, Germany
havlin[at]soziologie.uni-siegen.de

Around 600000 voluntary associations are registered in Germany. Activities of associations cover a wide range of civil and public life – from political to leisure oriented. 17000 associations are organized by immigrants. Ethnic cultural associations can be seen as a form of collective agency of immigrants joint in common actions such as: public representation of a particular ethnic group, preservation of unique ethnic culture, organization of public events, passing ethnic/cultural knowledge to locals or younger generation from the same ethnic group, collective participation in the life of German civil society or bridging to organizations from a country of origin. The talk aims at answering the following questions: what is the role of ethnic cultural associations in Germany and how do they contribute to the identity formation of immigrants? Based on the case studies of two ethnic cultural associations – Russian and Italian – I attempt to answer these questions. The study took place in one ordinary mid-sized German city which does not have a great variety of ethnic cultural representation as, for instance, larger cities have. Therefore, these selected cultural associations are the main official points of reference or channels of communication between ethnic community and local population/ institutions. The findings demonstrate the formation of ‘Russianness’ and ‘Italianness’ which are constructed in the German context and which overlap but at the same time differ from the national/ethnic construction in Russia and Italy. These special German ‘Russianness’ and ‘Italianness’ serve as a frame for as well as a result of identity formations in the host country.

Bosnian Diaspora(s) between Nationalism and Cosmopolitanism? A Social Constructivist Approach to Diasporic Postwar Identities

Mijic, Ana

University of Vienna, Austria
ana.mijic[at]univie.ac.at

Within an ongoing sociological research project at the University of Vienna, I am focusing on the analysis of identity-formations of the Bosnian diaspora(s) living in Vienna. The theoretical foundation of the project is Berger and Luckmann’s sociology of knowledge. By the means of a hermeneutical analysis of narrative interviews conducted with Bosnian immigrants with different ethnic and social backgrounds as well as various migration histories, I aim to decipher the dynamics of their identity-constructions and their senses of belonging. So far, the analysis suggests that the experience of war as well as migration and life in minority settings, have a

strong impact on the self-perceptions of my interviewees. Against the backdrop of the previous analysis, it is reasonable to assume that these identities are characterized by a combination of two apparently antithetic qualities: by ethnic boundary maintenance and ethnic boundary erosion, or to put it in prominent terms, by nationalism and cosmopolitanism. Depending on the social backgrounds as well as the biographical trajectories, the interplay between nationalism and cosmopolitanism, however, vary in manifestation. In my presentation, I will outline the interim results of the analysis and discuss them in the light of Berger and Luckmann’s social constructivist approach, since, to date, there has been hardly any interexchange between their sociology of knowledge and research on migration. I aim to use my research to make a substantial contribution to bridge this gap, theoretically and empirically, and to offer a sociology of migration, which is deeply anchored in the sociology of knowledge.

RN35_09c | Concepts of Belonging in Migration Contexts

Concepts of Belonging in the Narratives of ‘Multiple’ Migrants

Winiarska, Aleksandra (1); Salamonska, Justyna (1); Kluszczyńska, Marta (1,2)

1: University of Warsaw, Poland; 2: Adam Mickiewicz University, Poznań, Poland
aa.winiarska[at]uw.edu.pl, jj.salamonska[at]uw.edu.pl, marta.kluszczyńska[at]amu.edu.pl

The aim of our paper is to explore different concepts of belonging through the perspective of multiple migration. Taking into account the increasing international movement of people and expanding transnational practices, researchers pose significant questions concerning identity-building, integrative and ‘anchoring’ practices, attachment to place and feeling at home. These questions prove valid when it comes to the experience of ‘multiple’ migrants – individuals who repeatedly engage in transnational mobility, to different destinations and for varying periods of stay. We will analyse their narratives in the search for constructs of belonging as well as emotional, social and practical attachment to various places and spaces. Our focus will be especially on how the idea of home and place of belonging is constructed. The presented analysis will be based on mixed-methods data coming from the on-going research project ‘In search of a theory of multiple migration. A quantitative and qualitative study of Polish migrants after 1989’ at the Centre of Migration Research, University of Warsaw, where we are attempting to research multiple migration of Poles all over the world through an online survey and a qualitative longitudinal study. Survey data will shed light on where the migrants identify their sense of home. Qualitative interviews (from the first wave of the study) will provide a more in-depth understanding on how belonging is constructed over the course of mobile lives.

781

Mono-, Bi- or Transcultural? Reflection of Identity Constructions of International Mobiles

Décieux, Jean Philippe

University of Duisburg-Essen, Germany
jean.decieux[at]uni-due.de

International mobile persons usually live in multicultural contexts and have frequent opportunities for cultural contact. They live for example in mixed-national households or interact with different cultures in their everyday live. An interesting question is how they organize and experience their nationalities, identities and feelings of belongings and how these develop over time. Based on data from the first two waves of the new and unique German Emigration and Remigration Panel Study (GERPS) the paper tries to answer the following questions: How are the identities and belongings experienced? Do they self-identify in a mono- or bi or transcultural way, and what factors (sociodemographic, personality) contribute to either identification? GERPS will provide information on approximately 11.000 international mobile individuals which have recently emigrated from Germany to any other country in the world or recently re-migrated to Germany. As GERPS is a panel study, I will be able to present first results concerning developments and changes over time, which is important as modern theories reflect identity and cultural construction as dynamic negotiation processes.

Passing, Being Liminal, and Belonging in Longitudinal and Current Migration Perspectives

Cox, Pat

University of Central Lancashire, United Kingdom
pcox2[at]uclan.ac.uk

In this paper the author examines some multiple forms of belonging, in both longitudinal migration perspective, and currently. For ESA conference, 'belonging' is a 'contested idea ... created and re-created in communities of necessity and choice'. The author asserts that belonging is also multiple, hybrid, 'lived experiences'. She notes that there is little acknowledgement that existing societies were transformed by, and are comprised of, descendants of earlier-arriving migrant peoples. She questions why, despite the near-universality of migration, there is (apparently) limited recognition that we sociological researchers also are migrant peoples or are their descendants. Issues of intersectionality (including 'race', ethnicity, gender, religious belief, sexuality, age and class background) impact upon our forebears' and our own experiences of belonging. It thus becomes possible to challenge the received wisdom of research as disembodied and disengaged. Much research into migration and belonging elides the experiences of second, third and later generations. Examining belonging in longitudinal perspective requires addressing this lacuna, and exploring how 'private lives and public knowledge' intersect. Individual and family biographies

(private lives) illustrate theoretical (public) knowledge. Theories improve understandings of experiences of belonging within private lives, linking global and local sociological knowledges. Drawing from work by Gilroy and by Hall on identities; by Mergner on ambivalence; accounts from first and second generation writers who are migrant peoples and from inter-generational family experiences, the author explores and examines some ongoing processes and experiences of belonging in migration contexts.

Who Belongs to Us? 'Politics of Belonging' Before, During and After the 'Refugee Crisis' in Germany and Their Interplay With Anti-Immigrant- Attitudes

Preuß, Madlen (1,2); Zick, Andreas (2)

1: University of Applied Science Bielefeld, Germany; 2: Institute for Interdisciplinary Research on Conflict and Violence, Bielefeld University, Germany
madlen.preuss[at]fh-bielefeld.de, andreas.zick[at]uni-bielefeld.de

The public discourse on migration in Germany is significantly influenced by concepts of belonging, i.e. the question who is part of society and which criteria so-called newcomers have to meet. Since summer 2015, when Germany 'opened' its borders, old concepts of national identity seem to dominate the discourse anew. The politicization of corresponding parameters of belonging like religion, economic status or loyalties as (il-)legitimate markers for the community of belonging has been highly contested ever since (Yuval-Davis 2006; Wimmer 2008). By data of a cross-sectional surveys from 2014 (n = 2.009), 2016 (n = 1.300) and 2018 (n = 2.008) we try to understand the link between different politics of belonging and their varying influences for anti-immigrant attitudes. The study focuses the German population's criteria which have to be fulfilled in order to belong to the German society. With the help of latent class analyses the dominant politics of belonging were calculated to show the shifts and varying class sizes over the years - and thus for the time before, during and after the strong refugee movements to Germany. Secondly, we test a SEM of these politics toward the rejection of four migrant groups. First results have shown three dominant politics of belonging - (1) strict-exclusive, (2) liberal and achievement-related, and (3) open-inclusive - are given but differ enormously in their size over the years. Furthermore, the interplay with the anti-immigrant-attitudes shows that the salience of the different migrant groups for the different politics also varies greatly across the years.

RN35_10a | Migration, Integration, and the Role of Language

The Effects of Psychological Stress and Trauma of recent Refugees on Teaching and Language Acquisition: The Case of the German Integration Course

Baier, Andreea (2); Wieczorek, Anna X. (1)

1: Federal Office for Migration and Refugees, Germany; 2: Julius-Maximilians-Universität Würzburg, Germany
andreea.baier[at]uni-wuerzburg.de,
anna.wieczorek[at]bamf.bund.de

Since many refugees entered Germany in recent years, their successful and rapid integration poses a pressing issue to the German society. The German government established a world-wide unique system of integration courses, which focuses on the acquisition of the German language and the transmission of German values, its history and political system. Many of the recent refugees attend these courses. While studies on the German integration course show its positive effect on the attendees' language acquisition and orientation within the German society, less research has been done that focuses on the effects of the integration course on the recent immigrant group of refugees. This paper aims to take a step in closing this gap by dealing with refugees' psychological stress and, potentially, trauma and their effects on the teaching situation as well as their impact on language acquisition within the integration course. Following a mixed-methods approach, analyses are based on the dataset of the IAB-BAMF-SOEP refugee survey in Germany, comprising of around 2.700 refugees, as well as on analyses of 22 semi-structured qualitative interviews with representatives of the institutions that provide the courses, the teachers as well as the refugee participants to the courses. The paper thus seeks to extend knowledge about the refugees' state of health, about the factors that may (have) cause(d) psychological stress or trauma, and about how it effects the teaching situation and language acquisition. Lastly, it deals with the policy measures that have been implemented to relieve the situation for all persons involved.

Early Childhood Intervention For Migrant Families In Germany: Constraints And Opportunities When There Is No Shared Language

Jentsch, Birgit Elke

German Youth Institute, Germany
jentsch[at]dji.de

Background Communication and language barriers often constitute an important focus of the literature covering the provision of health services for migrants (with fewer references to social services) (Hanft-Robert et al., 2017; Gehri et al. 2016). Recommendations tend to centre on the need for professionals providing these services to have timely access to trained/certified/cultural interpreters. While such a standard is certainly desirable in many contexts, in reality in Germany, especially social services cannot reliably draw on qualified interpreters at short notice and low cost. This study explores the experiences of early childhood intervention (ECI) providers in Germany, who aim to support primarily those families who face socio-psychological challenges. Many migrant families (and here especially refugees) experience precarious living conditions, insecurity regarding their legal status, and possibly trauma. They particularly stand to benefit from these services, but frequently do not share a language with the service providers. Research Aims • How do professionals working with migrant families in ECI address language barriers? Do (unforeseen) opportunities arise? • What impact do the professionals' approaches to communication have on the accessibility, availability and quality of ECI services for migrant families? What implications arise for social in-/exclusion? Methods One focus group (12 professionals) and 13 in-depth interviews with professionals were conducted in 2018 and 2019 across four German Länder. Findings Strategic decisions and criteria are presented, which professionals in ECI used to decide how to approach language barriers, often stressing the need for flexible solutions as appropriate for their job context. Implications for social inclusion are discussed.

Titular Finns and Finnish Somali – Imitation Game research exploring boundary making and assimilation

Segersven, Otto

University of Helsinki, Finland
otto.segersven[at]helsinki.fi

According to Robert E. Park's assimilation theory, the immigrant and her antecedents slowly adopt the language, manners, social ritual and outward forms of her adopted nation. It is a process in which smaller merge into larger and more inclusive social groups. It usually entails shedding a group's own culture in the process of adopting a new one and, given enough time, the immigrant is no longer distinguishable among natives. I test and elaborate Parks theory by investigating the relationship between titular Finns and 2nd generation Finnish Somali. I ask whether the Finnish Somali know more about the culture of the majority than the other way around and if they have lost part of their culture in doing so. I use a novel method called the Imitation Game in which participants from two different groups attempt by means of computer-mediated, typed questions and answers to imitate membership in one another's social group and identify imitating non-group members from genuine group members. According to theory, and previous empirical research, we can expect members of minorities living immersed in the culture of a majority to be better at pretending the majority than the other way around. The quantitative results (correct over incorrect membership-identifications) of the Games indicate the contrary: The Finnish Somali were less successful at pretending the titular Finns than the other way around. I elaborate these results by analyzing titular Finns' and Finnish Somalis' strategies for telling group members from non-group members using group-bound knowledge, experiences, values and linguistic style.

Applying The Symbolic Interaction Theory To The Case Of Older Refugees' Language Learning Difficulties In Germany

AL Ajlan, Ahmad

Bielefeld University, Germany
ahmad.ajlan[at]uni-bielefeld.de

There is little sociological literature on forced migration and one certainly cannot find a developed body of empirical work and theory. Moreover, there has been little research done concerning the language learning difficulties that older refugees face, even though the inability to learn the language of the new country can leave negative effects on the lives of older refugees or immigrants. In this paper, I apply the symbolic interaction theory to a better theoretical understanding of the integration problems of older refugees in the case of learning the German language. The symbolic interaction theory acknowledges the principle of meaning as the centre of human behaviour. This theory claims that facts are based on and directed by symbols. Moreover, the meaning

of symbols provides individuals with a kind of expectation, and in any social situation, individuals are influenced by the expectations. Based on qualitative interviews with five low educated older refugees, five highly educated older refugees, and five language teachers conducted in 2018, I show the contradictions of meanings that older refugees and their teachers ascribe to old age. Additionally, the meaning that policymakers ascribe to refugees is that of a homogeneous group, and the meaning that they apply to the need to teach refugees the German language is that of a temporary phenomenon.

RN35_10b | Lived Citizenship and Humanitarianism in Practice

Second-generation Youths: Experiences of Political Participation in Italy

Riniolo, Veronica

Università Cattolica del Sacro Cuore, Italy
veronica.riniolo[at]unicatt.it

In Italy the political participation of second-generation youths is still an unexplored subject. In the light of this, my research explores the dynamics and the ways second generation young adults (18-35 year olds) participate actively in Italian politics. In the specific, I address the following questions: how do second generations in Italy manage to have their voice heard in the public sphere? What kind of relationship and collaboration is there between young activists, the institutions and the other players of the civil society (such as third-sector organizations)? And, finally, are there differences between the activism of first and second generations? My research draws from extensive fieldwork conducted in different Italian cities between January 2017 and January 2019. It is based on 55 in-depth and semi-structures interviews to young second generation activists and various representatives from the institutions and civil society involved in the activities of mobilisation of young activists and on participant observation carried out on the occasion of key events. Despite it is not possible to talk of a common collective identity, the research highlights some new dynamics of activism and paths of empowerment of the young activists involved. However, the investigation shows a structural weakness of the movements of the young adults. Indeed the role of other players, both institutional and from civil society, in supporting their activism remains preponderant and essential. Finally, the research highlights differences between first generations and second generations activism.

A Mexican Approach to a Humanitarian Crisis: Migrant Caravans in Tijuana

Ruiz, Olivia Teresa

El Colegio de la Frontera Norte, Mexico
oruiz[at]colef.mx

The arrival of migrant caravans from Central America to Tijuana, Baja California, Mexico in November of 2018 has given rise to a wide range of reactions – from sympathy and solidarity to hostility and calls to expel the migrants by force. As such, they seem to mirror what is happening across the border in San Diego, California, in the United States. Focusing on discourses and actions of civil society (neighborhood organizations, media) and local government (statements by municipal authorities, municipal immigration measures) in Tijuana, this paper aims for a more general comparison of Mexican and US reactions to the immigrant caravans. It argues that while some of the responses in Tijuana reflect those across the border, there are also differences. Thus, it cautions against seeing Mexican reactions through a United States (or, more generally, first world) lens and addresses some of the particular contextual issues shaping responses to the caravans in the city and Mexico at large.

An accompaniment model – experiences from a Humanitarian Corridor

Schnyder von Wartensee, Ilaria; Sedmak, Clemens

University of Notre Dame, United States of America
ischnyde[at]nd.edu, csedmak1[at]nd.edu

In January 2017 prominent religious organizations in Italy partnered with the government to establish a “humanitarian corridor,” a legal and safe pathways towards citizenship, for a selected group of refugees. The program is committed to resettle 500 Eritreans, South Sudanese and Somalis from Ethiopian refugee camps to communities and families in Italy within the course of a year; the refugees are distributed all over Italy and the program follows a personalized method of accompaniment whereby faith-based host families and host communities welcome and support small groups of migrants. We organize a research project around the question: does this accompaniment model work? Many migrants are welcomed in Temporary Reception Centres (CAS), implemented by Prefectures, which are often overcrowded and where a system of accompaniment is not implemented. Accompaniment has been suggested as an alternative approach to integration since large scale “administration” of migrants has led to significant problems; accompaniment has also been promoted because of the suspicion that “integration” is a term that more often than not involves invisible violence, forcing migrants to reorient themselves. Nonetheless, there are major challenges with this contested concept and the approach. We want to present findings on the challenges of this accompaniment- approach . We will provide a) an overview over the Humanitarian

Corridor, b) a discussion of the relevant literature on accompaniment with special reference to integration, c) a discussion on the role of the religious factor and spirituality as behavior-shaping and bridge-building of refugees families and hosting families. d) summary of our research in Italy, e) some recommendations for policy-making.

Volunteer Work as Moral and Emotional Labour among Newcomer Mothers in Canada

Nordberg, Camilla C

University of Helsinki, Finland
camilla.nordberg[at]helsinki.fi

Previous research has identified a range of individual level motives for getting involved in voluntary work. However, this article draws attention to state structures and institutional arrangements for producing volunteering regimes that govern people and activities within a context of unpaid work. The paper is using data from an ethnographic study among 15 newcomer mothers in a medium-sized Canadian city, asking, firstly, what the rationales are for newcomer mothers to engage in volunteering and, secondly, how volunteering enable or constrain citizenisation for newcomer women with small children. Volunteering is arguably not targeting all residents in the same way. Newcomers are typically encouraged to volunteer in order to gain ‘Canadian experience’ despite the strains this form of precarious, unpaid work puts on their everyday life. The paper draws on participatory observations of volunteer work in refugee reception, a socio-political landscape that highly depends on the moral and emotional labor of volunteering.

RN36_03 | Political Changes: Providing explanations

Individual Agency or Context. Determinants of Change in Polish Contemporary Society

Kolasa-Nowak, Agnieszka

Marie Curie-Sklodowska University, Poland
ag-kol[at]wp.pl

The focus of the paper is the changing sources of dynamics in Polish society. I am especially interested in the role of individual action in explaining social processes in a post-communist society. Taking into account the fall of the socialism and decades of economic, political and social transformations it is important to evaluate the problem of agency in broad perspective. In explanations of social reality in Poland is there a space for individual actions or is it a global context of historically defined regions that gives the basic explanatory frame? The underlying question is whether Eastern Europe can be perceived as having its own agency in the process of transformation. There is a shift in explanations from optimistic visions of autonomous decisions made by individual actors in 1989 towards the growing awareness of systemic external determinants (coming from global market, geopolitics or historical determinism). In this context the problem of barriers and durable differences is of special interest for sociologists and is also meaningful in public discourse. Moreover, boundaries, which seemed to cease in the times of EU-integration, are now gaining in importance in Poland. Are they the effect of human actions or the result of factors that they have no influence on? I will base my arguments on the analysis of Polish sociological discourse and on the results of recent social research.

Explaining Poland's Illiberal Revolution

Mueller, Klaus

AGH University of Science & Technology, Poland
mueller[at]agh.edu.pl

The recent populist wave that swept Eastern Europe put an end to the illusionary victory of liberal democracy across the region. This applies especially to Poland, the country with the most impressive civil society movement, Solidarnosz, and the frontrunner of radical market reforms. Despite the best economic performance of all post-communist countries, the party Law and Justice (PiS) came to power for a second time in

2015, only to impose its retrograde national-catholic model on the media, the law system, and the public sector. The surprising turn of Polish politics is usually subsumed under "populism": the global revolt against subordination to international institutions, foreign capital, cosmopolitan values and large-scale immigration. The party in power heavily uses populist rhetoric (anti-immigration, anti-Brussels, 'good' vs. 'bad Poles', sovereign nation etc.). However, referring to "populism" hardly explains if/why its voters took the message at face value. The paper will use the Polish case to contrast the diagnostic value of current concepts of populism with socio-structural and contextual explanations. The success of PiS, as argued, cannot be explained by the immanent strength of its populist rhetoric. Rather it points to the programmatic neglect of its liberal predecessors: of regional heterogeneity, precarious working conditions, and sharpened inequalities. While the electorate supports some valid points of PiS's socio-economic programme, it is not inclined to follow its internally divisive and externally confrontational anti-EU ideology. However, present EU policies are not the solution but part of a constellation, on which populist propagandists capitalise.

In search for the roots of recent Czech Euroscepticism

Kostelecký, Tomáš

Institute of Sociology of the Czech Academy of Sciences, Czech Republic
tomas.kostecky[at]soc.cas.cz

The recent public opinion surveys shows that Czechs are one of the most euro-sceptical nations within the European Union. Referendum in Czechia about whether to remain or to leave the EU (if any) could lead to Czexit, despite generally positive macro-economic indicators (GDP growth, low unemployment, low inflation). The paper seeks to examine potential reasons for scepticism of Czechs towards the European Union. Several potential underlying factors of euro-scepticism are examined: 1) the discrepancy between the optimistic expectations of early 1990's and reality of the convergence process, 2) the specific reactions of Czech politicians, media and general public to the Great Recession, the European debt crisis, the Eurozone sovereign debt crisis, and the European refugee crisis, 3) the long-term specific features of public opinion of Czechs on their position in the international arena. The basic (macro)economic indicators and the data from public opinion surveys are used as the main source of information.

The Turn From Morphogenesis To Morphostasis And The Rise Of Neoconservative Agency In Estonia

Lauristin, Marju; Vihalemm, Peeter

University of Tartu, Estonia
marju.lauristin[at]ut.ee, peeter.vihalemm[at]ut.ee

The theory of morphogenesis/morphostasis (Archer 2013, 2014, 2015, 2016, 2017) could provide useful analytic tools for explanation of divergent trajectories of the post-communist transformations, when looking at the emergence of the new agencies and structures in societies as a result of concrete loops of the positive feedback in the case when positive changes leading to morphogenesis are taking place, and the negative feedback loops which are hindering changes and producing counter-effects, leading to stagnation or morphostasis (Archer, 2014: 95-96). Applying this theory to the different periods of Estonian transformation (Lauristin & Vihalemm 2017), we can divide the whole process of societal changes into three morphogenetic cycles: restoration of the nation state and neoliberal reforms (1990-2003), joining EU and adaptation to transnational environment (2004-2015) and search for the new strategy of sustainable national development (2016 -). Our presentation will focus on the last cycle, analysing contest between old and new social agencies and political visions, particularly considering morphostatic mechanisms related to the rise of conservative nationalism.

RN36_04 | Perception of Equality and Boundaries – Class, work, life

Secular Trends in the Human Wellbeing across Europe: a Comparison of Economic and Biological Standard of Life Viewpoints
Norkus, Zenonas

Vilnius University, Faculty of Philosophy, Lithuania
zenonas.norkus[at]fsf.vu.lt

The East-West divide or gradient across Europe is usually conceived in terms of economic divergence between rich Western and Nordic regions and less affluent parts of continent, going back to differences in timing of first industrial and subsequent technological revolutions, entailing lags in demographic, social, political and cultural development. Standard measure of cross-country economic disparities are differences in the gross domestic product per capita (GDPpc), which is now under hardening criticisms as the measure of human wellbeing. Alternative measures (like Human Development Index; HDI) is difficult to apply for detecting long run trends because of data gaps and methodological problems. This paper discusses contribution of anthropometric history to

our knowledge of divergences and convergences in human wellbeing across Europe since early 20th century. It focuses on the secular changes in the biological standard of life, measured by human body stature and life expectancy. We do not disregard complications, related to impact of both genomic (biological) and environmental (social) factors on cross-country and cross-time variation on values of these indicators. Although economic output and biological standard of life are related, this relation is non-linear, attenuating at the higher levels of GDPpc. Otherwise, humans would become giants and life expectancy would increase unlimitedly, as GDPpc grows. We close with actual patterns of relation between indicators of biological standard of life and economic output: how much does East-West divide or gradient transpire in the cross-country variation in the biological standard of life. This research was funded by the European Social Fund according to the activity 'Improvement of researchers' qualification by implementing world class R&D projects' of Measure No. 09.3.3-LMT-K-712.

Structural and Semiotic Contexts of Work Integration Social Enterprises in East-Central Europe (Based on CE 1223 INNO WISEs Interreg project)

Golob, Tea; Makarovič, Matej

School of Advanced Social Studies, Slovenia
tea.golob[at]fuds.si, matej.makarovic[at]fuds.si

The paper addresses the structural and semiotic contexts of the selected post-communist societies of East-Central Europe (Croatia, Czech Republic, Slovenia, and Poland) affecting the historical development and contemporary situation of work integration social enterprises (WISEs), as an aspect of social economy focused on the integration of disadvantaged social groups. It is based on secondary data, surveys, semi-structured interviews and focus groups with the stakeholders obtained within the activities of the Interreg Central Europe project CE 1223 INNO WISEs. The authors apply the cultural political economy perspective, observing social transformations as a co-evolution of structures and semiosis based on variation, selection, retention, material reinforcement and selective recruitment. In that regard, the research identifies both the communist and post-communist transformations as mostly unfavourable for WISE, while the crucial factor contributing to their selection as a viable option after 2004 has been the external impact of the European Union-related structures and discourses.

Gender Equality Attitudes Revisited: Men and Women in Croatia After the Post-socialist Transition

Zdravković, Željka (1); Tomić-Koludrović,
Inga (2)

1: University of Zadar, Croatia; 2: Institute of Social Sciences
Ivo Pilar, Split, Croatia
zzdravko[at]unizd.hr, inga.tomic-koludrovic[at]pilar.hr

This paper presents and discusses the results of a two-step cluster analysis of data on gender equality attitudes from a 2018 nationally representative survey of Croatian adults, conducted within the Croatian Science Foundation funded project on gender modernisation (GENMOD – HRZZ 6010). The results were analysed separately for women and men and then compared, in accordance with the postulates of “gender and development” (GAD) approaches, as well as of the relational gender analyses carried out in the German-speaking context by Zulehner and his associates. The analysis included attitudes on partnership, work egalitarianism, educational and professional emancipation, and the independence of women. The discussion of the resulting typologies of men and women reveals that men’s attitudes on gender equality modernise slower than those of women. However, a wider discussion – taking into account the results of comparable previous surveys – seems to confirm the findings and claims according to which – contrary to expectations – “gender conservatism” has on the whole decreased in the period of post-socialist transition. On the other hand, the constituents of the types of men and women resulting from the analysis also suggest a clear connection with the legacy of the socialist period, especially in the distribution of gender roles in the work sphere

Strengthening of the Class Boundaries in the Eastern and Central Europe?

Djoric, Gorana

University of Nis, Serbia
gorana.djoric[at]gmail.com

The paper addresses the issue of class formation in the region of Eastern and Central Europe. On the one hand, there is an expectation that class boundaries are weakening, due to the processes of postmodern social fragmentation and the increasing influence of non-class related social divides. On the other hand, one may also plausibly expect the opposite - that in the region of East and Central Europe, the class boundaries would strengthen with the full establishment of the functional market economy. Which of the two expectations is better supported by the empirical evidence? We attempt to answer this question using the WVS/EVS data for a number of selected countries in the period which covers a span of transformation from socialist to market economy. By assumption, strong class boundaries are associated with homogeneous value systems, which, in turn may translate into collective action promoting class' interests. Thus, in this paper the class formation is measured by looking at the extent of in-class value

consistency, and its change. In-class value consistency is high if: class members share common values, if the extent of acceptance of these values differs among social classes, and if the various values simultaneously accepted by the class members are compatible with each other within a unique value system. Class boundaries are strengthening relative to other lines of social divide in the region if in-class value consistency is higher than the value consistency within other groups with which individuals may be affiliated (such as ethnic, gender, religious or political).

Co-creating Stories About the Transformation of the Unpaid Work in Romania

Badea, Marian (1,2)

1: University of Bucharest, Romania; 2: Romanian National
Directorate of Probation
marianbadea.ro[at]gmail.com

I believe it goes on to say, the story of the unpaid work for community, as a penal sanction, exclusively for adults, it starts in 2014 in Romania, when the new criminal code and criminal procedure code came into force. Unpaid work for community takes the form of serving the penalty by fine by performing community service, could be an obligation included in the penal decision for postponement of penalty enforcement, or an obligation always associated to suspension of service of a sentence under supervision. These are the three types of unpaid work for community, as a penal sanction coordinated by the Romanian probation service. In 2018, 60,000 Romanian probationers were obliged to perform unpaid work for community. As an oblique way of introduce and understand the topic of unpaid work for community, in the frame of ‘Sociology of the Intermediary Institutions, in the Penal Area’ course of study, every student is invited to present two complementary stories: a story of her/his personal experience as a volunteer and a story of her/his parents involved in voluntary-patriotic work in communism. The theoretic ground of the research focused on the transformation of the unpaid work is provided by the distinction between civility and patriotism as a form of piety (Ph. Selznick), in conjunction with the distinction between organic and mechanical solidarities (E. Durkheim). There are important distinctions, taking into consideration the painful experience of the voluntary-patriotic work in communism and the actual endeavor to develop authentic voluntary involvement in communities, in Romania.

RN36_05 | Modernity and urban context

Urban regimes in small Russian towns

Ledyaev, Valeri

National Research University Higher School of Economics, Russian Federation
valeri_ledyaev[at]mail.ru

The paper presents the outcomes of a research project conducted in five small Russian towns. The theoretical framework of the research was urban regime analysis. The basic material was obtained in the course of 76 in-depth face to face interviews with local politicians, public officials, businessmen, local and regional experts. Different coalitions between local actors take place in all communities. However, coalitions that meet the criteria of the urban regime (in classical Stone's interpretation) have been discovered, with certain reservations, only in two towns. For a number of characteristics these coalitions differed from regimes in American and European towns (often not quite voluntary nature of coalitions, prevalence of egoistic motives in the coalition-building, strong dependence of the regimes on the personal factor, absence of formal organizations able to coordinate the interests of coalition members, etc.). In the three other local communities urban regimes have not been built due to personal factor, frequent changes in the local government leadership, or the role of external factor. In the public agenda of the regimes (quasi-regimes) the elements of the status quo and, to a lesser extent, growth, prevail. The outcomes of study allow us to conclude that despite the authoritarian nature of the Russian politics and the differences between Russian and American contexts, urban regimes analysis is quite applicable for the study of power in the Russian local communities.

Modernity, First or Second? Individualisation and Youth culture among Gurjar's (Caste) in an Urban Village of Delhi

Gurjar, Vishesh Pratap

IIT Delhi, India
visheshgurjar[at]gmail.com

Contributions of Ulrich Beck about the changes in the understanding of modernity provided important reflections about the change that the European society has undergone in the wake of Second Modernity. As much as these changes are relevant about the European society, the reflections on rising individualisation have also proved useful in understanding the changes in other societies. However, as much as the world is unified by globalisation, multitude of hierarchies within societies diversify its experiences. Further, the global power structure and historical advantages have also placed the Euro American societies in a position to diffuse a modular modernity to other societies. Even though the post-colonial

scholars have raised serious doubts against the possibility of a universal modernity and have explored the possibilities of alternative modernity in the non-western societies. The present paper seeks to intervene in this debate by arguing that universalisation of modernity remains a possibility, however its experiences remain varied due to internal hierarchies within societies. The paper based on fieldwork in an urban village of Delhi seeks to explore the youth culture within a caste group. It takes individualisation as a framework to capture the presence of youth culture as a response to modernity and urbanisation. It lay down the experiences of individuals to argue that the First and Second division of modernity remains unimportant when it comes to formation of youth culture in an Urban Village, as they respond to modernity and urbanisation. It also argues that even among a homogeneous caste group differences of Class, Social Capital and Gender matters when it comes to their associations with the culture of individualisation diffused through modernity.

Man In The New Reality: Does Informatization Lead To The Transformation Of The Individual And Society?

Kushnir, Dariya

Financial University under the Government of the Russian Federation, Russian Federation
dariyakushnir7[at]gmail.com

The main tendency in the 21st century is the process of informatization, which has a key impact on all spheres of life in modern society, in which information is the main resource. In Russia, according to the Pew Research Center, the total number of Internet users is steadily growing: in 2013 66% of the respondents used the Internet, in 2015 - 72%, and in 2017 - 78%. The rapid expansion of Internet communications over the past decades have had a significant impact on the emergence of a new environment, the "infosphere", in which a person ceases to be an isolated entity and becomes informational, which interacts as with biological objects, and with virtual objects. Man becomes freer from the limitations of his physical location and biological body. In this sense, if earlier our perspective was fundamentally materialistic, now it becomes just informational: it means to interact, to communicate. Hyper-reality is rapidly developing, in which the real and the imaginary transform into each other, into a world in which daily life moves from the daily routine to the network. A person ceases to understand: when he is online, and when - no. Modern human is constantly surrounded by all kinds of gadgets, balancing between reality and the virtual world. The difference between being online or offline is erased. A thorny question is raised, whether a person will be able to cope with the growing influence of the Internet, the impact of information technologies and preserve himself as an individual, or will technological changes lead to its complete transformation and, as a result, the transformation of society as a whole?

Sociocultural Modernization and a Civilizational Complex of a Local Urban Territory

Kozlovskii, Vladimir

Sociological Institute of Russian Academy of Sciences, Russian Federation
vvk_soc[at]mail.ru

In modern sociological explanations of the dynamics of Russian society, there is a widespread desire to combine linearly-modernization and local-civilizational paradigms in the framework of the "sociocultural" modernization model. It was designed to take into account the variability of ways and methods of modernization in different countries. This concept is an attempt to combine the progressive dynamics of the structural and institutional differentiation of the social system with the continuity of the cultural and civilizational identity of society. The concept of sociocultural modernization asserts the multiplicity of modernization' ways. For an alone taken society it, like the classical theories of modernization, sets an invariant trajectory of movement towards modernity. The variability of modernization paths correlates not only with the multiplicity of modernizing countries, each of which draws its own trajectory of movement towards modernity and within modernity, but also is associated with the multiplicity of projects and models of modernity that arise within each particular society. It makes sense to talk about the multiplicity of modernization in relation to different societies, also in relation to the same society, not only in the diachronic, but also in the synchronous dimension. The proposed civilizational complex of a local urban territory or small city makes it possible to explain a complex mechanism that ensures the overcoming of the crisis of the Soviet model of single-industry towns, the diversification of their traditional economic and production structure, the formation and reproduction of multidirectional socio-structural effects of a dynamically changing culture. Thus, a civilizational complex of a local territory is one of the case of a contemporary sociocultural multiple modernization. (Abstracts were prepared with the support of the RFBR, project No.18-011-01254.)

RN36_06 | Political field: Politicians, institutions and masses

Constituting a Political Field in Russia: An Empirical Analysis

Philippova, Liudmila; Patrushev, Sergey; Pavlova, Tamara

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation
ludmila_filippova[at]hotmail.com,
servpatrushev[at]gmail.com, tamarapavlova[at]mail.ru

The concept of political field – a public space of dialogue and conflict over existing and alternative projects of common goals and strategic decisions for society – is used as a methodological tool in studying the institutional environment of politics. Political field is constituted through interrelated processes of institutionalization – elaboration of rules and organizational structures, and politicization – manifestation of social contradictions and realization of actors' political subjectness. Forming of political field is indicated by the following: emergence and ideological expression of political identities (cleavages); increase in individual and collective participation; institutionalization of conflict and dialogue between citizens, as well as between citizens and the state; legal universalization of norms and procedures of interaction within political community. Shaping of modern politics' institutional environment is facilitated by the deliberative practices in which civic orientations and values, as well as norms, rules and strategies, are produced. In the paper the conditions for constitution of political field in contemporary Russia are analyzed. According to the data of state-wide survey (FCTAS RAS, 2018), in the majority of respondents' view, politics is replaced by activity within the non-political and essentially deformed "zone of power". A minority demonstrates a normative understanding of politics, corresponding to the ideal-typical construct of political field. The survey results also helped to assess the prospects for the implementation of deliberative practices, which can potentially overcome limitations of the zone of power and facilitate the formation of political field. The research is supported by the Russian Foundation for Basic Research (project No. 17-03-00446).

The Polish Space of Opinion on Russia: Origins and Structures

Turkowski, Andrzej Marek

University of Warsaw, Poland
andrzej.turkowski[at]student.uw.edu.pl

In my paper I investigate the influence of the 1989 transformation on the community of experts on Russia and the Polish-Russian relations. I ask, how the post-communist Poland organized its infrastructure for a production of expertise on this issue. I also attempt to analyze how the post-1989 "balance of power" between major intellectual traditions in Polish thinking about Polish-Russian relations was settled. Focusing on a small and specialized part of the Polish elite, I gain an insight into a wider process of transformation of different social fields, including media, academia or think tanks. My paper is located within the tradition of Bourdieu's field analysis, with its emphasis on relationality, reconstruction of structures and historical developments. Given, that the social space I study does not possess enough autonomy to be seen as a "field", I use the concept of a "space of opinion", developed by Townsley and Jacobs. I'm also inspired by works of Zarycki concerning adaptation of Bourdieu's research to Polish, (semi)peripheral conditions. My research makes several contributions to the field of East European studies as well as more general to sociology of politics. Firstly, it provides detailed, and empirically based, insight into the process of elites' struggles related to the 1989 transformation. Secondly, it explains foundations of the Polish policy towards Russia (from the point of view of expertise and debates). Finally, it provides a model for an analysis of social space, which does not form an autonomous field. The model can be used in various studies concerning public opinion sphere.

The Rise of Illiberal Democracy in Poland: A Neo-Polanyian Interpretation

Kassner, Maciej

Nicolaus Copernicus University in Toruń, Poland
maciej.kassner[at]gmail.com

According to many observers' elections results of 2015 mark an important reversal in Polish politics amounting to nothing less than a regime change. While it remains contested what kind of political system is being constructed by the new authorities, the name "illiberal democracy" is frequently applied to describe recent changes in Poland, Hungary and beyond. In my presentation, I want to examine the political dynamics that brought these troublesome changes into being. My contention is that the present illiberal turn in Poland cannot be properly understood without taking into account the previous phase of neoliberal transformation. In order to demonstrate how neoliberal policies made room for an authoritarian reaction, I would draw upon the theory of double movement put forward by Karl Polanyi in his 1944 classic *The Great Transformation. Political and Economic Origins of Our Time*. On the empirical side, I would discuss recent research findings regarding the consequences of the rise of inequality and the

labour market deregulation for the delegitimization of the political system prior to the 2015 election.

Patriotisms of the Polish Politicians – Continuity and Change. A Qualitative Study

Binder, Piotr

Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland
piotr.binder.pb[at]gmail.com

Patriotism remained, though with varying intensity, an important element of the Polish public debate's dictionary of the last quarter of a century. This does not mean that throughout this period it was fashionable or desirable. Often it functioned rather as a negative reference point. Nevertheless, this category can be treated as an example of a certain continuity of political life. At the same time, the sphere of politics has undergone a radical rebuilding. Almost everything has changed from social conditions to cultural, economic or geopolitical ones. Can politics (political life) be conceptualized and researched today in the same way as it was 25 years ago? Or does the political life of the "Twitter era" require a kind of new opening, both theoretical and empirical? In the proposed paper, I set the goal of reflecting on these issues on the basis of two sets of qualitative data collected at the Institute of Philosophy and Sociology of the Polish Academy of Sciences. The first of these are in-depth interviews with Polish politicians gathered in the mid-1990s (42 IDs) within a research project 'Patriotism of the Polish Politicians'. The second set of qualitative data (including 31 IDs) was collected in 2018-2019 within an ongoing follow-up study, which is a continuation of the research from the 1990s, and partly also refers to the same participants. Keywords: sociology of politics, social media, qualitative methods, CAQDA.

RN36_07 | (Dis)Trust and cultural and political changes

You Can't Be Too Careful - The Origins of Generalized (Dis)trust in Slovakia

Mrva, Marianna

Slovak Academy of Sciences, Slovak Republic
mrva.marianna[at]gmail.com

Generalized trust is considered to be a glue, which holds relationships together, makes social contacts more effective and acts like a building block of overall positive atmosphere in society. However, beyond the boundaries of a narrow circle of family and friends, trust in other people is a rare commodity, especially in Post-communist countries. These countries belong to the ones with the lowest degree of generalized trust in Europe, according to international surveys, such as the International Social Survey Program. Is it the lack of success in life, the underdevelopment of the civil society, the lack of weak ties, which is responsible for this, or a combination of factors? The goal of this presentation is to present an empirical analysis, based on the data from the ISSP: Social Networks survey, which examines the most significant theories on generalized trust and the extent to which they are able to explain its low degree in Slovakia. The findings suggest that none of the main theories can fully explain the lack of trust in these countries, but we have to look for a combination of different factors on individual level such as on societal level.

Civic, Artistic, Activist, Militant and Military Reactions to Neo-liberal Transformations

von Weichs, Raphaela; Salzbrunn, Monika; Moretti, Federica

University of Lausanne, Switzerland
raphaela.vonweichs[at]unil.ch, monika.salzbrunn[at]unil.ch,
federica.moretti[at]unil.ch

As a general effect of neo-liberal economy and accompanying reforms, there is a growing concern over economic redistribution, access to resources, the disregard of human rights and the legitimacy of political power. Multi-party voting systems are increasingly questioned and challenged as a mode of political representation (Rancière 2017). Though exported from the North to the South and from the West to the East, they often lack credibility and support, not least because they are corrupted by the regimes in power. As a corollary, citizens boycott elections, get on strikes, squat public places, organize alternative innovative political events and even face civil war. Within our ERC funded project "ARTIVISM. Art and Activism. Creativity and Performance as Political Means of Expression in Super-Diverse Cities" (www.erc-activism.ch) we have come across several collapses that express the dark side of neo-liberal transformations of local and global society: the collapse of the Morandi bridge in Genova (Italy), the collapse of the

residential buildings in rue d'Aubagne, Marseille (France) and the collapse of city life in Buea and Douala, (Cameroon). As a résumé of these divers collapses, we propose to discuss them in regard to the civic, artistic, activist, militant and military reactions they triggered, and to ask in which way these reactions respond to the frustrations and transformations (gentrification, material and symbolic invisibilisation and expulsion of non-desired people) in the name of dignity and right to the city (Pisanello 2017) in question.

Willingness To Pay For Superpower

Karacharovskiy, Vladimir V.

National Research University Higher School of Economics,
Russian Federation
vvk[at]hse.ru

The issue of investing in 'superpower' status is deeply rooted in the Russian – West socio-political discourse. This paper develops an approach to measuring the shadow price of superpower as a specific type of public good. It is based on an experimental solution to the classical budgetary dilemma for Russia, in which the additional cost of maintaining superpower status is weighted against two alternatives – 'economic' (i.e. investment in public well-being) and 'humanitarian' (e.g. investment in health provisions). Two types of experimental situations are tested: 1) a short-term program with a 'soft' model of a superpower (a moderate program maintaining national sovereignty in international relations) and 2) a long-term program with a 'hard' model of a superpower (an enforced program of total military parity with the West). The findings suggest that society has a bipolar world outlook with a large share of the public supporting an understanding of the state's power either as 'external' (centered on gaining an international force) or 'internal' (centered on economic and humanitarian wellbeing of citizens). The upper limit of the acceptable alternative cost of additional strengthening of the superpower was estimated at 1 million rubles per capita (for economic programs), and 1000 saved lives (for humanitarian programs). For the economic alternative this translates into a cost of 3–10% of GDP (depending on the type of experimental situation). For the humanitarian alternative, approval can be granted by investing in medical centers with an efficiency of about 1000 saved lives per year. The research is based on data of the representative survey in Russia in 2016 and 2017. This work was supported by the Russian Science Foundation under Grant number 16-18-10270.

The Drop in the Level of Trust in Society: the Trend of Globalization or Increased Cultural Degradation?

Orekhovskaya, Natalia

Financial University under the Government of the Russian Federation, Russian Federation
orehovskaya[at]yandex.ru

In the era of globalization and rapid modernization is the destruction of traditional axiological systems, breaks the value system of human coordinates, excluding from it the category of "trust". The World Values Survey, which studies the dynamics of social values and their impact on social and political life, measures the level of social trust in society. Answering the question: "Generally speaking, would you say that most people can be trusted or that you can't be too careful in dealing with people?" Respondents from different countries were not unanimous. Thus, in Russia 66 % of respondents believe that you should be careful in dealing with people, and in the Netherlands 66% of citizens believe that the majority of residents of their country can be trusted. The study, conducted in January 2017 by sociologists from the Financial University under the leadership of O. Borovinsky, was aimed at studying the level of trust in Russian cities. The highest level of trust was recorded in Novosibirsk (63 %), Yekaterinburg (58%) and St. Petersburg (51%). The lowest confidence rate was recorded in Moscow (35 %). To live better, according to respondents, Russians need: to get a better education (16 %), to adhere to high moral values (12 %), to develop trust and tolerance towards neighbors (10 %). Trust is a product of moral values and norms that have developed and functioned in a particular society due to its cultural specificity, that is, it can be considered a culturally conditioned phenomenon.

RN36_08 | Integration and country borders

Concepts of Social-Spatial transformation: Practices of Debordering and Debordering in German-Polish Border Regions

Sommer, Vivien (1); Frąckowiak, Maciej (2)

1: Leibniz Institute for Research on Society and Space, Germany; 2: Adam Mickiewicz University in Poznań, Poland
vivien.sommer[at]leibniz-irs.de, adv[at]3made.eu

In 2007, Poland joined the Schengen area. The material border separating Poland and Germany disappeared and transformed the regions on both sides into "direct" neighbors. These transformational processes create new practices of debordering as well as rebordering practices. Our project DE-RE-BORD is conducted jointly by the Polish AMU Institute of Sociology and German Leibniz Institute for Research on Society and Space and its aim is to investigate socio-spatial

transformation. Such transformation processes involve the creation and dissemination of new knowledge through public discourse, participation in long-term cross-border interactions, spatial appropriation, and cooperative projects, where actors from both sides of the border construct a gap and ultimately a unique cultural space. In order to grasp these socio-spatial processes of transformation, we are investigating the knowledge and practices of the actors in the border regions. The main aim of our research project is the question how the concepts of debordering and rebordering can be conceptualized in a systemized way. In our presentation our focus will lay on these conceptualizations: First we will reflect on our definition of debordering and rebordering based on our empirical study. Therefore, we will discuss questions of what kind of knowledge and practices are typical for the people living in the border regions. In how far do they changes over time with respect to this? Second, we will discuss how these concepts can be used in the analysis of wider changes in the contemporary world. Based on our empirical results we will illustrate how these transformation processes in general can be analyzed through the lenses of debordering and rebordering.

Countries of the Commonwealth of Independent States: Striving Together or Falling Apart?

Maltseva, Daria; Kamalov, Rustam

National Research University Higher School of Economics, Russian Federation
d_malceva[at]mail.ru, kamalov.r201[at]gmail.com

The relations between countries can be considered as a network, where the countries are nodes and the thickness of links is the indicator of their attraction or repulsion. In our project, we consider the relations between countries-members of the Commonwealth of Independent States (CIS). The data is taken from the project "Integration Barometer", implemented by the Eurasian Development Bank Centre for Integration Studies in partnership with the International Research Agency Eurasian Monitor. Since 2012, six waves of measurements of the public mood in the post-Soviet space were conducted. The amount of countries varies from 12 (2013) to 7 (2017). Each year in each country at least 1,000 people were included into representative national samples. The questionnaire contains questions about people's integration preferences in different spheres of life – social, economic and political. Respondents were asked about the countries from the CIS where they have close contacts (relatives, friends), would like to travel, send their children to study, or migrate; which country they think their country should have trade relations with, which one would support their country in political sense, etc. Using methodology of social network analysis, we construct set of networks out of these data, and compute various metrics for individual nodes (countries) and whole network structures. Identifying the most central nodes and most connected subgroups of networks, we make conclusions on whether the countries of the CIS are currently striving together or falling apart. The data of different waves help us to trace the dynamics of attraction and repulsion changing.

The Role of Community-Oriented Policing Implementation in Integrating Post-Conflict Societies: Experiences from Serbia and Bosnia and Herzegovina

Strużińska, Katarzyna; Czapska, Janina

Jagiellonian University, Poland
katarzyna.struzinska[at]gmail.com, janina.czapska[at]uj.edu.pl

Post-conflict countries have to deal with such conflict-related problems as a disintegration of social ties and an emergence of new barriers (e.g. social distrust) that impede social relations. A significant role in restoring peace and bringing stability to these societies is played by the international community and its efforts to foster changes, in particular, within the security sector. One of the tools that are proposed and advocated by the international community in the peace process is community-oriented policing (COP), a strategy of the police work which is focused on building closer, based-on-trust relations between police officers and citizens to solve local problems, and, consequently, to make local communities safer. Even though COP is often presented as having considerable positive influence on transformation of communities, it should not be treated as a one-size-fits-all solution. The simple transplantation of COP in its forms established in the US and Western European countries to varying contexts of countries in transition faces many obstacles. The main purpose of this paper is to reflect on the usefulness and effectiveness of COP implementation in the post-conflict context. In search for an answer to a question if COP can play an integrating role in the conditions of dismantled social and political structures, we analyse processes of COP implementation in post-war Bosnia and Herzegovina and Serbia. Presented case studies are based on research results which were conducted in both of these countries in 2016 and 2019 within the international project 'Community-Based Policing and Post-Conflict Police Reform' (ICT4COP) funded by EU Framework Programme for Research and Innovation Horizon 2020.

Visual Representations of Polish-German Border After 2007

Rura, Przemysław; Rogowski, Łukasz

Adam Mickiewicz University, Poland
przemyslaw.rura[at]amu.edu.pl,
lukasz.rogowski[at]amu.edu.pl

In project "De-Re-Bord. Socio-spatial transformations in German-Polish interstices. Practices of debordering and rebordering" (implemented in the framework of the Polish-German NCN-DFG Beethoven 2 programme), we aim to research Polish-German border and to reconstruct spatial discourses and the knowledge systems they imply, as well as actual practices of residents. Particular attention is paid to material and visual manifestations of the border. We implement in the project multidimensional research design, which is based mainly on qualitative research techniques. However in our presentation we will refer to quantitative analysis— visual content analysis method— of visual representations of the border. This is a part of wider analysis of public discourses, which research how different media discursively construct border regions over time. In our presentation we will refer to three issues: 1) Sampling strategy, including data from social media, local archives and newspapers. We will show what are the advantages and disadvantages of using different data types to analyze border representations; 2) Code list, where we will discuss which features can be defined as a core of border analysis; 3) Results of the analysis, especially relationship between the ways of depicting, the date of depicting or dissemination as well as the distribution medium. Basing on these, will show how basic visual and distribution patterns of border representations changed over time. This will lead us to more general questions on symbolic and mental status of the Polish-German border. We will discuss what aspects of barriers between East and West disappeared and what new have been created in the discourse.

RN37_01a | The role of culture and creativity in urban transformation

The Impact of "Big" and "Small" Art on Urban Change & Community Building: Voice from Katowice (Poland)

Klekotko, Marta

Jagiellonian University, Poland
marta.klekotko[at]uj.edu.pl

The paper discusses various perspectives on arts and culture in urban change and community building. It provides case study of Katowice, (post)industrial city in Upper Silesia Region in Poland and analyses uses and misuses of arts and culture in urban development and community integration. Answering the question why some cultural interventions and investments favour urban change, while others seem to have no significant impact, the paper points to the problem of participation and empowerment on the one hand and city branding on the other. It analyses interactions between uses and misuses of "big" and "small", mainstream and alternative arts, top-down cultural policies and bottom-up art initiatives and attempts to identify mechanisms that underlie urban change and community building.

Right to the City in the Urban Peripheries: Street Art at Quinta do Mocho

Raposo, Otávio Ribeiro

Centre for Research and Studies in Sociology, University Institute of Lisbon (CIES-IUL), Portugal
otavio_raposo[at]iscte-iul.pt

Quinta do Mocho, social housing neighborhood on the outskirts of Lisbon, has usually been addressed by the media as one of the major "problematic neighborhoods" in Portugal, a label based on the supposed relationship between its young residents and crime. But the reason why Quinta do Mocho is currently a popular news is actually art. Indeed, the area has recently been transformed into one of the most important street art hotspots in Europe, with more than 100 large-scale works decorating the social housing buildings where roughly 3,000 people live. This project has been organized by Loures Municipal Council since 2014 and involves the participation of some young residents. They are the ones leading the guided tours, in which they present a perspective on their neighborhood, which is different from traditional stereotypes. It can be very fruitful to analyse the effects of this project on

the political and cultural citizenship of Quinta do Mocho's inhabitants through the prism of Henri Lefebvre's theory of the right to the city. From this perspective and based on ethnographic observation of the guided tours, I intend to debate how the residents of the neighborhood, most of them coming from the former African colonies, are facing such changes. Will the population get involved in the artistic intervention that is being developed in the neighborhood? To what extent will the valorization of the neighborhood through art be capable of reconfiguring the place of its residents in the hierarchy of the city? While artistic expressions are excellent ways to overcome segregation and stigmatization processes among subaltern groups, it is important to debate their limits and the political exploitation of art when approaching social issues.

The Destruction of Monuments: An Analysis Urban Morphology of Diyarbakir/Suriçi

Bekiroğlu, Sibel

Middle East Technical University, Turkey
sibelbekiroglu[at]gmail.com

Within the electoral period of 2015, the armistice between PKK (Kurdistan Workers' Party) and Turkish state ended. Like many other regions of Kurdish provinces, Suriçi, a historical province of Diyarbakir located at the center of the city, became the venue of security operations and armed conflict by the Turkish army. Named as "ditches war" (hendek savaşları) Suriçi became the main area of the conflict which was, to a great extent, resulted many deaths and the ruinization of the province. Many times through the conflict period, curfew declared by the Turkish government and the state of emergency became the ordinary situation in the region. Resembling an urban war, the space became one of the main agents of the conflict with its own morphology and historicity. As Lefebvre put into words, each society has its own spatiality and also centrality which reveals both possibilities and contradictions of the given situation. This centrality (or the spatial architectonics) asserts itself in the architecture or more accurately in the monument in which memory leaves its mark on the space. In that sense, this study, by using photos, reports, maps news and interviews about Suriçi, will be an effort to examine the destruction of the rhetoric topoi (in another words, monumentalization of the mediocrity) of Suriçi with reference to Lefebvre's concept of monument and to the urbicide literature.

The Values of Live Music in Urban Development: The Case of Rotterdam

van der Hoeven, Arno; Hitters, Erik

Erasmus University Rotterdam, the Netherlands
vanderhoeven[at]eshcc.eur.nl, hitters[at]eshcc.eur.nl

This paper examines the role of live music ecologies in urban development. Live music ecologies can be defined as the networks of music organisations (e.g. venues, festivals and talent competitions) that together support local live music performances and scenes. The paper seeks to contribute to the existing research on the sociology of music by conceptualising the impact of live music on urban places. To understand the role of live music ecologies in urban development, this paper distinguishes four different values. The social value of live music concerns its contribution to social capital, community engagement and identity building in cities. Cultural value, which could also be described as the intrinsic value of music, encompasses the dimensions of musical creativity, cultural vibrancy and talent development. The economic value of live music includes its role in job creation, increased tourism and consumer spending. Finally, spatial value concerns the impact that live music has on the ways in which the physical environment of cities is experienced by citizens and managed by policy makers and urban planners. These four values will be explained by discussing the case of live music in Rotterdam. Rotterdam is the second city in the Netherlands in terms of population size. After the bombings in the Second World War, festivals have played an important role in redeveloping the cultural infrastructure of this post-industrial port city. As this paper discusses, public and private organisations in Rotterdam have used live music in various ways to achieve social, cultural, economic and spatial objectives.

RN37_01b | Local elections: Agenda, policies and risks

The social and spatial structure of the vote for the Northern League and 5 Stars Movement in Italy. A research on the Metropolitan urban area of Milan data

Morelli, Niccolò (1); Cousin, Bruno (2); Del Fabbro, Matteo (2); Piolatto, Matteo (3); Pratschke, Jonathan (4); Vitale, Tommaso (2)

1: Università di Bologna, Italy; 2: SciencesPo, France; 3: Università di Milano, Italy; 4: Università di Napoli Federico II, Italy
niccolo.morelli[at]unibo.it,
bruno.cousin[at]sciencespo.fr,
matteo.delfabbro[at]sciencespo.fr,
matteo.piolatto[at]unimi.it, jonathan.pratschke[at]unina.it,
tommaso.vitale[at]sciencespo.fr

This contribution investigates the performances obtained by the 5 Stars Movement (5SM) and the Northern League (NL) in the metropolitan urban area of Milan at the last elections on 2018. Despite the media vote in Milan (city) has been described as an exception to the national trend, widening the view to the periphery the situation is radically different. Through a geo-referenced analysis of the vote, it is intended to show that in peripheral areas the yellow-green majority was already present long before it turned into a government alliance. These areas are characterized by the presence of people who occupy marginal positions of the social hierarchies (Biorcio & Vitale, 2016) and which occupy not only a geographical periphery but also social, following the lexicon of the theory of social centrality proposed by Milbrath (1965). Urban sociology has strongly insisted on pushing political and social studies to dismantle a city scale and adopt a metropolitan scale for its own analysis. The metropolitan dimension would be essential for a full understanding of citizens' relations with politics, given the strong social and economic interdependence between the territories of an area of high integration and daily mobility of the population. In this presentation the metropolitan boundaries defined by the OECD for the Functional Urban Areas will be used (OECD, 2013; Del Fabbro, 2018). The results obtained by the 5SM and the NL regrouped at the school level (the finest one) to get a geo-referencing of the vote. These data will be combined with the 2011 census data using the finer level, that of the sections, regrouped on a basis of about 5000 inhabitants, to show the socio-economic characterization of the vote.

Decreasing Voter Turnout As A Threat To Democracy In Metropolitan Areas

Warsewa, Günter

University of Bremen, Germany
gwarsewa[at]iaw.uni-bremen.de

In Germany, like in other European countries, shrinking voter turnout is seen as an indicator for social disintegration and as serious threat to democracy. This tendency seems to be particularly dramatic in big cities and metropolitan areas where the quote of non-voters raised since the end of the 1970s and reached about 50% in the current decade. Although there are different reasons and explanations for abstinence in elections on local, regional and national level, this does not give an explanation for the higher rates of voter turnout in big cities. The paper will argue, that in big cities the complexity of requirements and interests in urban allays live and postfordistic social structures overstrains the capabilities of traditional political institutions and procedures. Therefore, the difference between steering and problem-solving capacity of policy on one hand and the demand for problem solutions on the other is higher than in other types of regions. Citizens do perceive this in their daily routines and environments but, this is also the place where the conditions for their identification with the community and the commitment to democratic participation are created. The paper will analyse the social conditions for identification, civil engagement and democratic participation more in detail and conclude, that by far not only deprived and subproletarian milieus have good reasons for refusing to vote. There is also an increasing number of average and well-situated middle-class people which from several reasons lose more and more their commitment for democratic elections. The contribution will also discuss approaches to solution, especially deliberative forms of citizens' participation.

How Have You Learned To Be Neoliberal?: Ljubljana's Entrepreneurial Strategies And Urban Policy Transfer

Ploštajner, Klemen

Faculty of Social Science, University of Ljubljana, Slovenia
klemen.plostajner[at]fdv.uni-lj.si

The starting point of the contribution is the analysis of "actually existing neoliberalism" that does not see neoliberal social transformation as a universal and homogeneous process, but as a variegated, path-dependent and contextual local articulation of general neoliberal tropes of deepening and spreading market forces. Neoliberalization is thus always locally molded and reworked according to the local power relations, institutional arrangements and especially subordinate or relative autonomous position in the world. Contribution on neoliberal transformation of Ljubljana's local state will try to map this local process and local articulation of neoliberal policies. However, its main goal is not to describe particularities of Ljubljana's "actually existing neoliberalism",

but to try to understand what influences its dissemination, application and development. Three main sources can be detected: structural political and economic reorganization (shifts in the regimes of accumulation and rescaling of the state), reorganization of local elite and urban policy transfer. The paper will focus especially on urban policy transfer, but contextualize it by also briefly addressing other sources, by analyzing where do ideas for local development come from and how are they reworked by local officials. To understand the process of policy transfers three methods will be used: tracking the policy connections and networks of city officials (urban policy tourism); analyzing strategic documents; interviews with local officials.

'Taking Back Control'? Energy Democracy, Municipalism And The Crisis Of Liberal markets

Reynolds, Larry

UCLan University of Central Lancashire, United Kingdom
lreynolds3[at]uclan.ac.uk

The apparent unravelling of the spatio-temporal fix of neoliberal globalisation is accompanied by contestations over the scale of future social, economic and political life. From the national to the municipal, different imagined communities are invoked in calls to 'take back control'. This is also the case with the sociotechnical imaginaries of energy transition, which imagine communities at a divergent range of scales. In the UK and many EU member states, new imaginaries, practices and infrastructures of energy localisation and re-municipalisation are taking shape. This paper is based on research that examines the recent experience of local authorities in the UK who have begun to establish locally owned or locally branded municipal energy supply companies. These are the first municipal energy companies in the UK since nationalisation centralised the industry in 1948, and also the first forms of public ownership since privatisation in 1989. UK energy re-municipalisation gains its support through public distrust of the 'big six' energy corporations. But it is also enabled by market liberalisation which has allowed space for local authorities to become energy suppliers and technological changes around 'distributed energy' and small-scale generation. However, operating within the framework of liberal market competition, these new companies face strategic dilemmas around economic geographies of scale versus local democracy and local identity, as well as trade-offs between imperatives of low carbon and low-cost energy. This paper develops theories of materiality, democracy and infrastructural commons in relation to these developments, to interrogate electrical and political power.

RN37_02a | Consequences of digitalization on urban life and urban spaces

Digital Platform and Cities: The cases of Bologna city of food and Lisbon TVDE service

Pirina, Giorgio

University of Bologna, Italy
giorgio.pirina2[at]unibo.it

This paper deals with the relation between cities and digital platforms, in the frameworks of Global Value Chains (GVCs) and platform capitalism. After a brief introduction of literature concerning these approaches, the analysis will focus on the contexts of research: Bologna and Lisbon. In both these cities, the shifting toward a touristic economy has been a strategy to boost the urban economy and to improve their competitive position in the global hierarchy and in the spatial division of consumption and labour. The emergence of sharing/gig economy is contributing to shape the social and urban space and, furthermore, to extract value from it. However, globally exist several practices included in what is known as platform cooperativism, whose purpose is reframe concepts like innovation and efficiency and facilitate the active participation of people in the decisional process. The questions are: in which manner digital platforms, such as for example those of food delivery, Airbnb and Uber contribute to transform the urban structure and labour process of i) Bologna, within the framework of the so-called city of food and ii) Lisbon, given the recent “Lei da Uber” (Uber Law)? The former is an interesting case study because of the so-called “Carta dei diritti dei lavoratori digitali in ambito urbano”, which represents a bottom-up (from social movement and Municipal scale) attempt to regulate the food delivery sector. The latter represents a top-down regulation (from the national scale) of TVDE service, that is “Transporte individual e remunerado de passageiros em veículos descaracterizados” (individual and remunerated transport of passengers in uncharacterized vehicles). For both cases some empirical evidence will be used, assisted by current literature on touristification and platform capitalism. The non-standard methodology will be useful to seize the processual dimension of cases study and emphasize ground’s features. Keywords: digital platform, gig economy, city of food, platform cooperativism, Uber.

Do Locative Media Change Urban Public Space?

Lettkemann, Eric; Schulz-Schaeffer, Ingo

TU Berlin, Germany
eric.lettkemann[at]tu-berlin.de, schulz-schaeffer[at]tu-berlin.de

In our talk, we present an analytical concept for distinguishing manifestations of public places and discuss how locative media might reinforce or change the fabric of public space. Locative media is an umbrella term for mobile apps, providing users with digital information about their social and material surroundings. Some apps, like Ingress, are mobile games adding virtual objects to perceptible space in order to turn urban places into playgrounds. Others, such as Foursquare, are recommendation services enabling users to annotate urban places with digital photos, ratings or comments. By means of locative media, users share and create information about places and presumably contribute to the (re-)production of spatial structures. We propose to describe the public space of modern cities along two structural dimensions. On the one hand, we distinguish urban public places according to their degree of accessibility. On the other hand, we distinguish urban places based on how basic or elaborate and how homogeneous or diverse the symbolic meanings attached to them are. We argue that these meanings and the associated social practices influence the de facto accessibility of public places. Consequently, while some areas of a city are actually open to all residents, other places are restricted de facto to members of specific social worlds. Based on preliminary empirical observations, we examine how locative media either reflect and reinforce the given social fabric of public space or evoke changes in the accessibility and meaning of public places. In doing so, we want to compare the respective effects of locative games and recommendation services.

Bright Spots in the Sold City? Libraries in the Age of Digitalization

Wandelt, Alina

Universität Leipzig, Germany
alina.wandelt[at]uni-leipzig.de

The commodification of urban life and privatization of public spaces has increased sharply in recent years. Spaces that are accessible to all and free of charge have become scarce, especially in major cities, where rents are steadily increasing, and gentrification has become a major concern. Berlin is a particularly succinct example: Formerly endowed with an abundance of open spaces, the city's privatisation policies in the 90s have left a majority of places in the hands of large investment firms, while seemingly public spaces are run by a state management imposing thresholds by means of admissions prices (e.g. museums) or specific codes of conducts (e.g. train stations). Against the backdrop of such developments, libraries present themselves as bright spots: Inheriting the ideal of universal access to knowledge at their core, they promise to cater for the general public's needs. And while their traditional function as supertemporal archives for knowledge may have ceased in the course of digitization, libraries appear to gain momentum as physical spaces that allow people to meet and assemble across boundaries. Drawing upon ethnographic research in libraries in Berlin, this paper asks in how far libraries can live up to this ideal of common spaces. The methodology employed follows the approach of Latour-student Yaneva (2011) who opts for a perspective on architecture that overcomes the artificial bifurcation of 'architecture' and 'society'. Instead of explaining a supposedly static and fixed building with 'society' or 'culture', controversies related to libraries are traced in order to grasp their complexity as assemblages in the city.

Un/safe City. The Gendered Representation Of Safety Technologies

Dambrosio Clementelli, Alina

Independent researcher, Italy
alina.dambrosio[at]studio.unibo.it

My proposal is to analyse through an intersectional perspective what is the representation that emerged by the use of urban security technologies, stressing the relationship between urban space dynamics and subjects' positions within it. The analysis will focus on safety apps for women that are characterized by mapping of the city, from which emerged some unsafe neighbourhoods. Previous researcher showed gender bias and power hierarchies in urban space (Rose, 1983; Massey, 1994; Borghi & Rondinone, 2004), and highlighted the link between fear, gender and security (Valentine, 1989; Pitch2& Ventimiglia, 2001; Koskela, 2002). According to Foucauldian analysis of power (1971, 1975), the urban space may become a dispositive of control leading to "normalization", and how the body may become a "bio-politic boundary" (Minca & Bialasewic, 2004) that can be included or excluded [in the space] according to the norms. Indeed

security dispositive, like the militarization of streets, the video-surveillance, etc., are security dispositive that do not contest power hierarchies, rather raise material and symbolical boundaries to normalize habits (Petrillo, 2015). In this sense, safety apps for women could be considered an individualized security dispositive? How these apps and their application is changing the urban social relationship and environment? These are the issues that emerge in order to outline the gendered representation of security.

RN37_02b | Neighbourhoods and neighbouring as a conceptual and empirical challenge 1

Unfamiliar Eyes and Fragile Trust. An Ethnographic Research into Boundary Practices in 'Unsafe Neighborhoods'

Knibbe, Mare Else (1); Cratsborn, Sjoerd (2); Horstman, Klasien (1)

1: Maastricht University, Netherlands, The; 2: Independent
m.knibbe[at]maastrichtUniversity.nl,
s.cratsborn[at]gmail.com,
k.horstman[at]maastrichtUniversity.nl

This paper aims to contribute to insight in residents' practices for promoting safety in a city-area that was considered 'unsafe' in municipal reports. Engaging with the work of Jacobs and Lofland, we ask how residents' efforts at improving safety, established boundaries between public, private and parochial realms. The analysis is based on participatory ethnographic research lasting one year, day and night in a city area of Maastricht. Residents in two neighborhoods engaged in different boundary-practices. In Greenspace, residents saw many signals of unsafety: drugs, deterioration, racism, loitering youth. While Jane Jacobs wrote about eyes on the street for safety, residents were seeing with 'unfamiliar eyes on the street'. At loss about how to interpret these signals, it was difficult for them to take action in the street and instead residents sought safety with a fortification of private realms by abstaining from interference with others and adding locks and fences to their houses. By contrast, the stories in Stonevillage show the unfeasibility of protecting private space against intruders, violence, noise and smells, and residents invested in a parochial realm by familiarizing themselves with their streets and making distinctions between insiders 'knowing their ways' and outsiders, 'unknowing strangers'. As the neighborhood was also hosting powerful criminal networks and unpredictable institutions for welfare, housing and police, trust in this parochial realm was fragile. While citizen efforts at improving safety were compromised by the lack of parochial space in Greenspace and lack of private space in Stonevillage, scarcity of public space was reported in both neighborhoods. This limited resources for residents to open new perspectives and improve living conditions.

Moving for the Kids – Does the Perception of Spatial Educational Opportunities and Neighbourhood Quality Influences Relocation Decisions?

Oeltjen, Mareike

University of Bremen, Germany
moeltjen[at]uni-bremen.de

There is an ongoing debate about middle class parents actively shaping the educational trajectories of their children, driven by an uncertainty regarding the intergenerational status reproduction. This debate motivates our investigation of how perceived local educational opportunities and neighbourhood quality are related to residential relocations. We suppose that during family formation and extension the evaluation of place utilities depends on the perception of local contexts and their assumed impact on child development. Parents might be particularly sensitive to the educational infrastructure and neighbourhood. In case of dissatisfaction with the spatial living conditions, middle class parents with high educational aspirations might tend to adjust their housing situation and move towards a more appropriate residential environment. Based on existing research on residential and school segregation, we expect the social composition in schools and neighbourhoods to play an important role in middle class parents' residential decisions. In our research project "Moving for the Kids", we collected data in three German federal states and asked parents of primary-school aged children about the timing and direction of past residential moves, future relocation plans and the perceived local school and neighbourhood quality. In my contribution I would like to present first empirical findings based on event history analysis: Controlling for important life course events and the individual social class, we find that the perception of schools and neighbourhoods is significantly related to a higher tendency to relocate. Moreover, the relocation rate of academics and non-migrants to neighbourhoods subjectively described as non-divers are significantly increased, which indicates occurring segregation processes.

Urban Experiments in Times of Crisis: From Cultural Production to Neighbourhood Commoning

Chatzinakos, George

Manchester Metropolitan University, United Kingdom
g.chatzinakos[at]gmail.com

This paper presents a longitudinal action research, concerned with the development of a bottom-up neighbourhood initiative in Thessaloniki, Greece. This activist project was launched in order to stimulate the creation of a new neighbourhood identity, whilst promoting place-framed urban experiments that aim at the gradual appropriation of public space on various levels. The project attempts to link research to action and demonstrate how various commoning practices

can foster a neighbourhood-scale economy and consolidate a more participatory culture. This chapter contributes to the discussion on the repositioning of urban neighbourhoods in relation to the broader organisational challenges currently faced by Greek cities. Thus, it makes a case for the emergent and critical alternatives to urban management. The importance of this empirical work lies in an identifiable tension between the neoliberal image-making agenda of a city that seemingly attempts to managerialise and depoliticise eventfulness within the parallel absence of a regulatory framework that focuses on the quality of life and allows cultural participation at a neighbourhood level. It is argued that the 'revival of the neighbourhood', seen as an intersectional representation of place, can be developed as a locally organised response to the crisis in Greece. In the longer term, this project aims to identify the extent to which neighbourhood initiatives can present an alternative means of urban management and the participation of citizens in the midst of a crisis that has more than a financial aspect. The paper concludes by considering how realistic such an aim might be.

Practices of Neighbouring and Social Order(s)

Bukowski, Andrzej Wojciech (1); Smagacz-Poziemska, Marta (2)

1: Jagiellonian University in Kraków, Poland; 2: Jagiellonian University in Kraków, Poland
contraAB[at]wp.pl, marta.smagacz-poziemska[at]uj.edu.pl

Increasing of social mobility and proliferation the scales of people activity as well as their ways of life make the explanatory potential of the traditional approaches to the neighbourhood run down. The conceptual categories such as neighbourly bonds, local identities and local social capital have also proved to be analytically useless in relation to the complexity and dynamics of everyday life in urban housing estate and beyond. How then can we explore the processes of social ordering and structuralisation of urban communities? To answer these question we test the practice approach, developed in works of Schatzki, Reckwitz, Shove, Nicolini and others. Generally speaking, the practice is "a collection of activities that are linked through an array of understandings, rules, and teleoaffectivities" (T. Schatzki, *The Site of the Social: A Philosophical Account of the Constitution of Social Life and Change*, The Pennsylvania State University Press, University Park 2002: XXI). From this theoretical angle neighbourhood is seen not as territorial community, but as being a set of dynamic arrangements of socio-spatial practices, embedded in wider institutional (normative), class, emancipatory and political settings. Based on our field research carried out in 6 housing estates of three Polish cities we would like to detail such practices as car parking, space marking, fence making and some others, and to indicate their potential for creating the contours of social order(s).

RN37_03a | Segregation and spatial forms of inequality

Living Alone in Urban Context - the Case Study of the Historic Center of Santarem

Lucas, Catarina Pimpao

Universidade Nova de Lisboa, Faculdade de Ciências Sociais e Humanas, Portugal
catarinapimpao[at]gmail.com

Considering that being / living alone is an increasingly complex phenomena in urban environment, which can have origin in a personal, professional, economic and even emotional loss, or which may only be a personal choice. There for and considering the above, it is sought in this work to characterize the community,(Santarem Historic Center) considering the demographics and population, housing, built heritage and existing facilities, in a way to understand the meaning of living alone in this social reality and particular urban context. While it is also sought to elaborate a typological analysis of those who live alone, considering the causes and effects of this experience to one, and always considering the personal, social, cultural, professional and other antecedents that are the origin of this living, as well as the results, emotions, feelings, interventions and social dynamics that exist daily or that arise due to this experience. Within this work, I also considered necessary to discuss the specific interventions needed and the process through which interventions may be implemented among the population identified and analyzed, in order to combat and minimize the potentially harmful effects of these phenomena. This particular territory was chosen in the scope of the professional duties of the doctorate in the Office of the Historic Center of the Santarém City Hall, in order to deepen the knowledge about a particular theme and reality, increasingly common and still little studied, in particular in this territory, to foster the development of interventions and activities in the community and urban space.

Strategies Of Coping With The Unequal Access To Public Services In Urban Space

Koscinska, Justyna Anna

University of Warsaw, Poland
j.koscinska[at]is.uw.edu.pl

Due to the transformations of urban areas and urban sprawl phenomena, both in new and in old districts within the city access to public services may be very uneven. This division of living conditions constitutes one of the boundaries in the modern cities. An important question presents itself in the following: how does the situation mentioned above affect the quality of life and the individuals' strategies of coping with the deficit in public services? The primary objective of my study was to identify and explain main strategies adopted by

inhabitants to sustain their livelihoods in these territories. Many papers exist which undertake this issue on a macro scale. There is a lack of a micro perspective, including the point of view of individuals. To fill the existing gap, I conduct the qualitative study through the use of two qualitative methods: data analysis and the individual in-depth interviews. I analysed availability of public services (healthcare and education) in three chosen districts of Warsaw. The other method used in the study involved in-depth individual interviews. Around ninety interviews were conducted. Results show, that very often decision to live in some district is dictated by different reasons than accessibility of public services. It may be proximity to the family, greenery, desire to live in a single-family house rather than in flat. However, people always underline importance of accessibility of public services. To sum up, the results obtained in the study may be of an applicative nature. Conclusions may provide the basis for shaping urban policies, which should carry the weight of the strategies of individuals.

Network-based Survival Strategies of Transgender Sex Workers

Guler, Ezgi

European University Institute, Italy
ezgi.guler[at]eui.eu

Violence, discrimination, and financial insecurity are the problems sex workers struggle with globally. Particularly, the least protected members of our societies, such as transgender sex workers, are targeted with these threats disproportionately. Research has consistently revealed that relying on others for support is a survival imperative in marginalized, high-violence, or low-income communities. However, while coping with common external threats, the challenges internal to a community might affect supportive relationships. In urban Turkey, the site of this research, transgender sex workers also have restricted access to formal protection mechanisms, for the criminalized street-based sex work creates barriers between workers and state authorities. Furthermore, the informal sex industry entails competition for income and clients. Sex workers experience physical and psychological violence and financial insecurity in their day-to-day lives. In this study, I explore the patterns of support networks among workers to cope with these threats. In addition, I examine whether the co-existence of threats and competition creates a dilemma between solidarity and conflict and hence undermines the creation of support networks. The study is based on ethnography and semi-structured interviews (August 2017 - February 2019). The findings suggest that workers collectively cope with threats. However, the scope of support networks depends on the form of threats. Informal support networks have complex patterns because support exchanges are domain specific. Solidarity and conflict can co-exist. The separation between finance and safety-related matters helped them to form strong solidarity to protect themselves from violence and kept competition under control. I discuss the implications in relation to their constant struggle for space and the precarious conditions the criminalized sex industry entails.

The Banality of Evil: Discrimination within Everyday Life

Serin, Bilge

University of Glasgow, United Kingdom
Bilge.Serin[at]glasgow.ac.uk

Arendt (2006) stuns the reader with the idea that how human beings can take part in atrocities and their actions can result in something vicious, or bluntly evil, while being just a normal human being. Arendt (2006) also argues that “this normality was much more terrifying than all the atrocities put together for it implied”. This research questions the normality of discriminative practices in urban space via private neighbourhoods while investigating the dynamics behind creating boundaries and borders within urban space. It focuses on the case of branded housing projects in Istanbul. The branded housing projects are private neighbourhoods which provide urban services and facilities within their confines privately and exclusively for their residents. The projects have been expanded within the last two decades and their number in Istanbul only exceeded 800 (Saricayir 2014). As a particular means of provision of social services, this practice inherently excludes various groups of society reaching key urban infrastructure. The research traces this normality of discriminative practices in urban space by interviewing the residents of these private neighbourhoods. It questions how a very normalised practice - living in a private neighbourhood - can result in creating commodified and exclusionary social services and how this means of provision may be detrimental for the future of cities.

RN37_03b | The right to housing 1

Between Needs and Deeds: The Role of Housing Narratives In (Not) Considering Housing Adjustment Behavior Among Flemish Families

Put, Bart; Pasteels, Inge

PXL University of Applied Sciences and Arts, Belgium
bart.put[at]pxl.be, inge.pasteels[at]pxl.be

Recent statistics by Eurostat show that Belgium has one of the highest undercrowding rates in the European Union (Eurostat, 2018). At the same time, continued trends in specific family and population dynamics (rising separation and repartnering rates, increase in single household families, ageing society, etc.) put extra stress on the (mis)match between actual housing needs of families on the one hand and the existing housing stock on the other hand. In this paper, we explore the motivational drivers and barriers for present or future housing adjustment behavior among Flemish families, both in the light of existing alternatives on the supply side of the housing market and of concrete Flemish policy plans to reduce further loss of open green space. To that end, individual in-depth

interviews were carried out with 70 people between 18 and 80 years old, representing a broad range of family and tenure types, as well as various degrees of urbanisation. We will argue that a number of more or less ingrained ‘housing narratives’ or ‘mental road maps’ play an important role in shaping specific experiences and expectations with regard to one’s own housing futures. More in particular, talking about the prospect of smaller and (partially) shared living spaces not only triggers considerations on the level of the functionality of new ways of housing, but also on the deeper level of what it actually means to be ‘at home’ somewhere.

Spatial Exclusion and Informalization: Housing at Allotment Gardens in Hungary

Vigvári, András

Hungarian Academy of Science, Hungary
vigvariandras[at]gmail.com

In my presentation I give a brief overview of the most important theoretical points of my anthropological investigation that was based on my field work experience at an eastern suburban neighbourhood in Budapest. The focus of my research was to understand how allotment gardens have been transformed during the financial crises in Hungary and what kind of new (sub)urban functions appeared since the regime change. In this last two decades former socialist allotments have transformed into permanent residential neighbourhoods providing an informal way of housing, which is one of the most crucial spatial consequences of the housing crisis hitting after the 1990s. My research question is in correspondence with the broader theoretical framework of how residential areas in post-socialist urban centres have been shaped in and around the city. In my presentation I will concentrate on housing aspects (such as housing financialization, informal housing and marginalization) because I find issues related to that an appropriate level of analysis in which larger macro structural changes can be linked to the local experience. One of the most important questions from an anthropological point of view is how personalized this experience of informal housing has become. I will emphasize this aspect by showing from the perspective of the people with whom I made my interviews and who were forced to choose informal solutions to cope with the unfavourable conditions. Key words: informal housing, spatial exclusion, suburbanization of poverty.

Dwelling Among Diversity. Boundaries and Boundary Work in the Mixed Housing Companies

Juvenius, Jutta Elisabet

University of Helsinki, Finland
jutta.juvenius[at]helsinki.fi

This paper examines the neighborhood relations among the residents of the mixed housing companies. Mixed housing company means that there are both social housing rental apartments and owner-occupied apartments. Helsinki has dealt with the questions of spatial segregation since the post-war re-building era, and mixed housing companies are one link in the series of interventions. There is a strong consensus that scattering social housing all over the city is one of the most efficient tools for tackling spatial segregation. However, in the public debate there is varying opinions how these apartments should be placed. Finland has a strong cultural hegemony towards owner-occupied housing and municipal rental housing is means-tested. Together these notes have raised a question how different tenure groups would perceive living among each other, and especially how owners tolerate the renters living next door. To observe these questions, I have collected 20 semi-structured interviews from the residents living in the mixed housing companies. In the analysis I am looking what kind of social boundaries the residents draw in their daily lives. I am especially interested in what kind of cultural repertoires residents utilize to justify their arguments. As a surprising result, the biggest conflicts are not between different tenures but there are some other notable front lines like ethnicity and willingness to take care of shared matters of the housing company. To find an explanation for these unexpected results I also look what kind of boundary work residents make to level down these differences between residential groups.

Constructing Community in Multi- Generational Co-Housing Projects – Who and What belongs to Whom and When?

Ehmann, Tanja; Scheller, David; Thomas, Stefan

University of Applied Sciences Potsdam, Germany
ehmann[at]fh-potsdam.de, d.scheller[at]fh-potsdam.de,
stefan.thomas[at]fh-potsdam.de

In our qualitative study on multi-generational cohousing – in self-organized and municipal owned houses – we developed and established the Research Forum as a participatory method of Citizen Social Science, which is dedicated to identifying the discursive modes of residents' community-building processes. In regular meetings and workshops, communicative spaces have been provided and explored in these different settings by organizing mutual negotiations on important topics concerning individualized and collective needs and conflicts. In the specific context of cohousing projects, belonging could be defined as coming together on a regular basis to have

discussions grounded in common ideas and projects and with the goal of strengthening solidarity and support of each other. This kind of belonging gives shape to what we call “communities of solidarity” and is developed in relation to how multi-generationality is perceived and processed. As a result of our analysis we point out that intergenerational conflicts are often negotiated between older singles or couples without children and families or between people who have a history of engagement and living at those places and those who have not lived there before. At the same time, identity politics and the desire for law and order appear as strong claims in the communities. But such positions are challenged when solidaric subjectivities and sociabilities get support from within those communities. Crucial for all those cohousing projects are common meeting spaces, the motivation to participate and the recognition of this participation.

RN37_04a | Gentrification and displacement

New Inequalities in A Context of Urban Regeneration. How Tourism and Gentrification Can Change the Trade Sector at The City of Bilbao

Campelo, Patricia; Ispizua, Marian

University of the Basque Country, Spain
patricia.campelo[at]ehu.eus, marian.ispizua[at]ehu.eus

The urban transformation of neighborhoods located near city centers, as well as the widespread phenomenon of tourism, usually involve gentrification processes that ultimately cause the displacement of part of the original population. A variant of these gentrification processes are the transformations of some traditional markets of supplies. The specialized literature has baptized and analyzed these processes as market gourmetization, elitist consumption (Sorando y Andura, 2016; Rodriguez Sebastian, 2017; Gonzalez y Waley, 2013; Smith, Mayi e livery, 2014). In the case of the markets of supply, the displacement takes place in two levels. On the one hand, the type of shops and the original and new merchants of the stalls of the market itself, as well as the traditional customers and the new profiles and, on the other hand, the transformations in the most immediate environment. This is the case of “Mercado de la Ribera” located in the Casco Viejo, next to the Bilbao's river. This paper analyzes the processes of socio-spatial change that have taken place in recent years in La Ribera supply market (Bilbao) and how could be framed in the line of turistification and gentrification processes that have occurred in other places (San Miguel and San Antón Markets in Madrid or Santa Caterina or La Boquería in Barcelona). On the one hand, the socio-spatial transformations that occurred in the La Ribera Market and its immediate surroundings have been studied through secondary data and, on the other hand, the opinions of the intervening social actors are taking into account using qualitative methodology.

The Political Consequences of Gentrification

Ueblacker, Jan (1); Lukas, Tim (2)

1: FGW, Germany; 2: University of Wuppertal, Germany
jan.ueblacker[at]fgw-nrw.de, lukas[at]uni-wuppertal.de

Considerable debate and controversy continue regarding the effects of gentrification on cities, neighborhoods and residents. While there is a significant amount of research describing the residents' perceptions of neighborhood change and their strategies to cope with it before eventually being displaced, only few is known about the extent to which a city's population is concerned with displacement pressure. Ethnographic accounts understand gentrification and displacement as a form of neighborhood inequality associated with a loss of identity, boundary making processes and feelings of economic marginalization. Seen in the light of the current debates on populism and political participation, our study asks for the political consequences of gentrification on the individual level. We draw on survey data from three German cities (Düsseldorf, Leipzig, Munich) to examine the relationship between displacement pressure and political attitudes. Following the basic assumption, that people act upon their individual perceptions instead of "objective" information ("Thomas Theorem"), we conceptualize displacement pressure as a combination of (1) perceived changes in social structure, built environment, retail landscape and (2) a strong dislike towards these changes. The resulting cognitive dissonance between the image of the neighborhood "as it used to be" and the ongoing structural changes can be understood as displacement pressure (Marcuse 1985). In consistency with current explanations for extreme political orientations (Inglehart/Norris 2016) we further assume that residents experiencing displacement pressure have a higher tendency to either non-vote or vote for extreme parties. Initial analysis indicates both that displacement pressure is primarily perceived through structural improvements and rental increases, and that high perceptions of gentrification and a negative evaluation go along with voting for political parties on the fringes of the spectrum.

Newcomers in a Traditional Neighborhood: Middle Class Values and Gentrification

Santos Veloso, Clarissa dos; Teixeira de Andrade, Luciana

Pontifícia Universidade Católica de Minas Gerais, Brazil
clarissaveloso25[at]gmail.com,
lucianatandrade1[at]gmail.com

This paper aims at analyzing the "construction of belonging" narratives and the motivation to reside by dwellers of a central and old neighborhood in Belo Horizonte, Brazil. Empirical data analyzed consists of interviews with newcomers of Floresta, a neighborhood listed by the Deliberative Council of the Municipal Cultural Heritage of Belo Horizonte. Interviewees address their motivations for living in Floresta and their sense of belonging in three interlinked spheres: the neighborhood's

centrality, its heritage status and its lifestyles. Heritage is revealed in its material and intangible dimensions, which are based on the residents own experience but also on external representations and stereotypes about Floresta. In addition, newcomers refer to Floresta's characteristics, focusing on its central location as one of the greater attributes, and also on its ways of life, which mixes references to the individualized and intense life in big cities with the appreciation for aspects that allude to the countryside. Newcomers weave a nostalgic and apparently contradictory, although complementary, narrative of enjoyment of the metropolis in its plurality of beings and possibilities, while simultaneously longing for personal and close social interactions in the neighborhood and also for a sense of community and belonging. We examine the relation between the taste and motivation of this middle-class group that moved to Floresta and the values of gentrifiers and urban spaces going through gentrification, a field that until now has been little studied in Brazil if considered the residential form of the phenomenon.

RN37_04b | Explaining urban structuration and urban class

The Formation of Marginal Urban Spaces in Cities in Globalization

Villalon Ogayar, Juan Jose

Universidad Nacional de Educación a Distancia, Spain
jvillalon[at]poli.uned.es

In this paper, the author analyzes the historical processes that have strengthened or originated areas in which problems of marginalization, exclusion, poverty and delinquency are concentrated in six urban regions of the world: Nairobi, Santiago de Chile, Cancun, Chicago, Paris and Malaga. Each of these cities represents a different city model because of: the position in the World Economic System that it tends to occupy, the model of state government that has prevailed in its recent history, the system of social stratification that was forged within it in the twentieth century, and, the geographical place it occupies in the World. And, they resemble, among other things, in that: 1- all of them have globalized their economy; 2- And, in that, they contain urban areas with a population that experiences, as a whole, a social situation of social vulnerability greater than the rest of the city of reference. The defended hypothesis is that: regardless of the position in the world economic system, the state model developed in the 20th century and the system of stratification forged in the 20th century, the globalization of the economy of these cities has originated or strengthened the segregation of minorities and most disadvantaged classes to certain urban areas. That is, the globalization of the urban economy tends to generate urban territorial segregation because urban segregation is a successful strategy followed by the dominant groups to globalize the economy of a city and, not only an unintended consequence derived from other strategies of urban development and globalization of the economy, or of a previous local history.

ZuNaMi Dortmund - Narratives of Cohesion as an Answer to Disintegration and Radicalization in Urban Spaces

Tiefenthal, Gerrit (1); Brandt, Kevin (2)

1: Auslandsgesellschaft.de, Dortmund, Germany; 2: Hochschule Rhein-Waal, Kleve, Germany
gerrit.tiefenthal[at]tu-dortmund.de, kevin.brandt[at]tu-dortmund.de

Contemporary crises, socio-economic and cultural divides within the EU and Germany are inevitably connected to intergroup conflicts and segregated identity building. The heterogeneous urban area of the old industrial town of Dortmund is well-known as a locus of social disintegration and socio-spatial segregation. Simultaneously, the region is widely known for its long history of immigration and integration. Together with citizens of Dortmund, the action-research based project ZuNaMi (“Developing cohesions narratives together”) strives to find narratives of cohesion and separation as well as the mechanisms of their creation. Therefore, several group workshops that function as deliberative communication spaces were held, with some workshops reflecting on the results of the first project phase to follow. Heterogeneous participants from different parts of the town, forming artificially composed groups, were invited to explicate and debate on these narratives at a performative level. The workshops’ design attempts to both stimulate transformative actions and produce insights into designing deliberative spaces in disintegrated urban settings. In this way, ZuNaMi reacts to the perceived gap between processes of disintegration and othering and approaches concerning citizenship (in Germany) which seem to be inadequate to catch up with these forms of radicalisation. The presented paper reports on the workshop analysis’ first results and discusses how deliberative spaces for boundaries transitions can be created.

A New Urban Class Structure

Custers, Gijs; Engbersen, Godfried

Erasmus University Rotterdam, Netherlands, The
custers[at]jessb.eur.nl, engbersen[at]jessb.eur.nl

The social class model by Savage et al. (2013) has received critical reception by many sociologists. In this study we analyse the academic debate that followed Savage et al. (2013) and we scrutinize the research approach underlying their social class model, which we refer to as Bourdieusian latent class analysis (BLCA). We argue that BLCA has certain specific benefits for documenting contemporary urban classes, and especially for conducting neighbourhood comparative research. We apply BLCA to develop a social class model for Rotterdam, the second most populous city of the Netherlands that is known for its marked inequalities and majority of ethnic minorities. A large dataset (N = 14,040) including measures of economic, social and cultural capital is used to identify eight classes. Similar to Savage et al. (2013), these eight classes sort into a high-middle-low structure. Considering multiple academic studies on Rotterdam neighbourhoods, we demonstrate how our class

typology complements such studies on neighbourhood issues. In addition, we study how the neighbourhood class compositions relate to ‘traditional’ socio-economic measures such as income. Our findings show that neighbourhoods with a similar socio-economic status actually have very different class compositions, thereby providing useful insights into issues of gentrification and neighbourhood mix. Implications for the relationship between class, gender and ethnicity are also discussed.

Strong, Weak and Invisible Ties: a Relational Perspective on Urban Coexistence

Felder, Maxime

Swiss Federal Institute of Technology in Lausanne (EPFL), Switzerland
maxime.felder[at]unige.ch

The dichotomy between “strong” and “weak” ties is a common theme in the sociological scholarship dealing with urban space (Forrest and Kearns, 2001), yet sociologists and anthropologists have long been describing the prevalence of impersonal relations in urban contexts (Lofland, 1998). Such relations can be described as fleeting encounters (between people unknown to each other), while others – as in the case of “nodding” relationships – are more durable and have yet to be conceptualised. Relationships with “familiar strangers” – those whom the urban dweller recognises and observes repeatedly but with whom he or she never interacts – have an emotional significance (Fischer, 1982, Morrill and Snow, 2005), help the urban dweller develop “home territories” (Lofland, 1998), or “comfort zones” (Blokland and Nast, 2014). In order to consider these relations as social ties in their own right, I developed the notion of “invisible ties”. Through an empirical study of urban life in four residential buildings in Geneva, I propose to understand coexistence as an urban fabric held together by strong, weak and invisible ties. In the presentation of my empirical findings, I focus on strong and weak ties first, analysing the more central residents with respect to sociability, or what I term the “entrepreneurs”. Then, I consider how peripheral residents have become “figures”, who may have few weak and strong ties in the building but are nevertheless familiar to many and connected to them with “invisible ties”. I will explain how figures contribute to coexistence without socialising.

RN37_05a | Urban inequalities: Ethnicity, gender and age

Incorporating Ethno-cultural Diversity in Local Civil Society in Superdiverse Urban Neighbourhoods. The Case of Borgerhout In Antwerp

Oosterlynck, Stijn; Laoukili, Fatima

Department of Sociology, University of Antwerp, Belgium
stijn.oosterlynck[at]uantwerpen.be,
fatima.laoukili[at]uantwerpen.be

Local civil society organizations play a crucial role in supporting coexistence and generating social cohesion in urban neighbourhoods. However, their community building capacity is seriously hampered by the difficulties they encounter in incorporating the increasing ethnic and cultural diversity in cities. This paper is concerned with identifying the conditions under which local civil society in superdiverse neighbourhoods in Western cities succeeds in incorporating ethnic and cultural diversity. The paper focuses on Borgerhout in the Belgian city of Antwerp, which is both a prime example of Belgian urban multiculturalism and of vigorous extreme-right organizing. We start our analysis from the survey-based observation that in general both membership and leadership of local civil society organizations in Antwerp is pre-dominantly white and does not reflect well the existing ethno-cultural diversity in society. We also observe that while local civil society organizations tend to value 'community building' more than other civil society roles, building community with citizens with a different social background is valued significantly less. This suggests a civil society context which discourages ethnic-culturally mixed civil society organizations. Against this background, we explore socially innovative practices that work to incorporate ethno-cultural diversity in local civil society in the neighbourhood Borgerhout in Antwerp. We find that, despite the hostile environment created by the electoral rise of the extreme-right in the 1980s and 1990s and more recently the trend towards neo-assimilationist urban diversity policies, a more ethnically mixed local civil society is slowly but steadily emerging in the neighbourhood, which is amongst others related to the emergence of an immigrant middle class, the supportive role played by social work organisations and the bottom-up dynamics in youth and sport clubs.

Understanding Attitudes Toward Immigration in Cities with High and Low Immigrant-Population: Empirical Results of a Postal Survey from Two German Cities

Starcke, Jan; Hoffmann, Maria-Anna

Technische Universität Dresden, Germany
jan.starcke[at]tu-dresden.de, maria-anna.hoffmann[at]tu-dresden.de

Post WW2 Germany has been divided into a communist eastern sector (GDR) and capitalist western sector. Disparities in culture and norms between the citizens of East and West Germany are still anchored in people's minds even 30 years after reunification. This holds particularly true for the historically grown differences in attitudes toward foreigners that also express in election results of right-wing political parties in the "old" and "new" federal states. In the paper we will present empirical results from a survey that has been conducted in the context of the research-project SiQua within the cities Dresden (former GDR part) and Essen (West part) at the begin of 2019. Whereas Essen seems to have a greater acceptance of refugees, Dresdens' inhabitants have the reputation of tending a strong antipathy towards refugee-immigrants even though the cities' foreigner-proportion is still much lower compared to most other German cities. With the help of Heitmeyer's Theory of Social Disintegration we test the Hypotheses that with rising emotional commitment to the East part of Germany anti-immigration attitudes increase, while the regional commitment to West Germany has no comparable effect. Multigroup structural equation modeling (SEM) is used to compare the results between Dresden and Essen. At the same time, we take into consideration further explanatory variables e.g. social insecurities, deprivation, experience of discrimination, education, age, and urban fear of crime. Empirical results are discussed in the light of transformations of urban communities related to the recent migration wave and its association with fear of change and the unknown.

A Study on the Meaning and Value of Housing for Migrant Workers

Lee, Sang Ji

Seoul National University, Korea, Republic of (South Korea)
lsj4482[at]hanmail.net

This study explores the meaning of housing for migrant workers and the social interactions in residential space in Korea. A stable residential space is recognized as a basic condition and necessary social desire for human living, and it is meaningful in that it reflects human life while providing an essential space for living. Nonetheless, exploring the meaning of housing is often not done properly in the case of the vulnerable people who have a lot of economic and social constraints in choosing the residential space. In particular, most of the immigrants who entered into Korea through the Employment Permit System (EPS) live in housing provided by companies because of the economic reasons, and these are mostly non-residential buildings such as containers and vinyl greenhouses. Therefore, in Korea, many studies pay attention to the physical conditions such as the inferiority of the residential environment. However, studies focused on physical conditions have limitations in examining the interactions and social relations among migrants in residential space. In other words, the physical condition of being comfortable, safe and equipped with better facilities may not be the first factor of consideration for choosing the house. Therefore, this study analyzes the discourse related to immigrant housing in Korea and examines what factors are important for migrant workers and how interactions and social relations are structured and stabilized through residential space. For this task, I analyzed the literature on immigrant housing in Korea and interviewed migrant workers.

Rap Music as a Tool Against Urban Exclusion and Racism: the Portuguese case

Varela, Pedro

Center for Social Studies - University of Coimbra, Portugal
pedromfvarela[at]gmail.com

The artistic practices of afrodescendants in Lisbon metropolitan area are an emerging phenomenon of urban culture, which allows processes of access to the city, denouncement of racism or against social and economic exclusion. Rap music in Portugal has been, for a long time, a tool of black youth to denounce racism, police brutality, poverty, urban exclusion or the denying of access to the city. Many Rap lyrics, images or imaginaries bring us to new and silenced urban landscapes. Among afrodescendants in Portugal, Rap has been also used to build networks, and artists, internet videos and their music circulate between neighbourhoods, different peripheries and to the centre of the city. Networks and places of sociabilities build around Rap music are central to understand the struggle of black youth for the "Right to the City". In the last years, Lisbon has become a growing known touristic destination and today it is suffering a deep process of gentrification. Afrodescendant artistic

practices have been gaining some space in the city. However, peripheral black youth continue to be deeply excluded from the city, living many times in self-constructed neighbourhoods or housing projects in the suburbs and unable to access the city. Rap music and Hip-Hop culture bring us important questions of Lisbon city life as: racism, police violence, poverty, unemployment and urban exclusion. Based on archival research (music, audio and video) and ethnography on peripheral neighbourhoods and places of sociabilities, this contribution intends to understand the role of Rap as a tool to the access of the city.

Centring Place in The Analyses Of Black Mixed Race Identity

Campion, Karis

University of Manchester, United Kingdom
karis.campion[at]manchester.ac.uk

When the function of place is referenced in mixed race studies, it is often evoked through the topics of heritage, family trees and racial ancestry (Gaskins 1999, Sims 2016), or the focus is centred on how national contextual effects impact on the formation of mixed race identities (Caballero 2005; Joseph-Salisbury 2016; Mitchell 2013; King-O'Riain et al 2014). In some analyses, place is even treated as a mere backdrop which fails to recognise how it functions as a major point of reference for ethnic identifications. Drawing on 37 interviews with Black mixed race people aged 20-56 years old in the post-colonial, post-industrial city of Birmingham (UK) this paper warns against the continued absence of place in critical mixed race studies. It identifies how mixed race identities intersect with immediate localities by showing how attachments to the local and departures from it were particularly transformative for their racial selves. Neighbourhoods were the blueprint which they worked from to negotiate their ethnic identities. Lessons regarding race in the home were made legible, when they were contextualised in the broader spaces beyond that boundary which were loaded with racial symbols and histories (Keith 2005; Amin 2002). Despite the tendency in studies on mixed race to privilege racial identity as a defining feature of the mixed race experience, this paper argues that mixed race identity becomes knowable through places inhabited and moved through. By situating mixed race identities within the thick material context of the city the paper demonstrates the agency and power that place has in organising social life and identities.

RN37_05b | The right to housing 2

Earthquake, Class Reconstruction and Pro-housing Resistance. From Shack to Landmark, a Case Study in Sicily

Zampieri, Pier Paolo

University of Messina, Italy
pzampieri[at]unime.it

This work will examine a process of residential resistance in the district of Maregrosso (Messina) and connect it to the complex rebuilding process of the city in the aftermath of the great earthquake of 1908. The temporal coincidence of the earthquake, the very first national emergency, with the highest point of the modern urban science has produced in Messina an uncritically modernist isotopic urban model which has not included the poor social class within the historic part of the city. A whole social segment of inhabitants has been projected in an endless residential emergency along with a spatial emargination. The area of Maregrosso has undergone the phenomenon of the first post-earthquake shack building becoming a transition zone and still being urbanistically prisoner of such emergent imbrication. Such a landscape has given birth to the story of the concrete modeller Giovanni Cammarata who has turned his unauthorised shack into an odd urban park halfway between a cathedral and a dialectical Disney park. This is iconographically connected to the traditional Sicilian heritage and the surrounding landscape. Leaving out this "total work" from the mere artistic interpretations (Outsider art), I will make a proposal of interpretation connected to the social history of the city as a cultural response to a modernist spatial model.

Neoliberalization of Social Housing in Turkey: The Case of Kayaşehir

Ruben, Duygun

Boğaziçi University, Turkey
duygunruben[at]gmail.com

"This study focuses on the neoliberalizing transformation of social housing in Turkey in the 2000s. The subject of urban transformation has been extensively studied in the Turkish case from the lens of neoliberalism/neoliberalization, albeit without a specific focus on social housing. In turn, the transformation of social housing in the AKP era has been studied from the perspective of welfare regime transformation. This study contributes to the literature by offering an account on the transformation of social housing in Turkey through the lens of neoliberalization. This study initially argues that the *gecekondu*s (informal settlements in Turkey) and the housing cooperatives, which have been historically widespread forms of housing provision in Turkey, can be interpreted as forms of social housing. Then, it explains how, in the AKP era, *gecekondu*s and housing cooperatives have declined as forms of social housing provision and instead,

social housing provision by a central state institution, the Mass Housing Administration, was established. In explaining these transformations, this study utilizes the concept of "actually existing neoliberalism", which describes neoliberalization as a process containing both commodifying aspects and context specific factors depending on locality and temporality. Analyzing the transformation of social housing in the AKP era, this study identifies three "features" of neoliberalization of social housing in Turkey, namely commodification, redistribution and increased capacities of the state. Finally, this study traces these three features of the neoliberalization of social housing in Turkey in the biggest mass housing site constructed in Istanbul, namely Kayaşehir, through collecting information on Kayaşehir from primary sources and interviewing the residents."

Local Variations In Housing Affordability – How Do Cities Use Their Power To Alleviate Housing Affordability Problems In A Nordic Country?

Sutela, Elina (1); Juvenius, Jutta (2); Rasinkangas, Jarkko (1)

1: University of Turku, Finland; 2: University of Helsinki, Finland
elina.sutela[at]utu.fi, jutta.juvenius[at]helsinki.fi, jarrasin[at]utu.fi

Housing affordability is a topical question in Europe. In many European countries housing prices are growing faster than income. Lack of affordable housing hits hardest to the poor population and often reinforces homelessness. It may also become both a physical and social barrier of entering and living the city. This is especially the case for low-income service workers and other key workers who are needed in the daily functions of the city. Cities have a lot of power in housing questions. In this article, we look at local level of housing policies and cities' role in housing affordability questions. This paper is a case study of three major cities in Finland. We will base the analysis on expert interviews and housing policy documents. In the analysis we ask, what are the aims of local housing policies, and how do the cities use their power to alleviate housing affordability issues. Finland makes an interesting field for the case study: Finland is one of the Nordic countries and considered as a Nordic welfare state. Yet the housing policy is different from the other sectors of social policies: it is selective and market-driven. Finland is rapidly urbanizing, and the cost of housing is going up in the biggest cities. Especially in the Helsinki metropolitan area many residents are struggling to find housing they can afford. Still, the levels of homelessness are going down. The cities are major actors in housing sector: they have an autonomous status and monopoly on zoning. The cities are also the biggest and one of the last remaining producers of social housing.

Contesting urban regeneration in Lisbon. Insights from the ROCK project

Corrêa Nunes, Mafalda; Falanga, Roberto

Instituto de Ciências Sociais, Portugal
mafalda.nunes[at]ics.ulisboa.pt, roberto.falanga[at]hotmail.it

In the last few years, Lisbon has experienced turbulent transformations. While the 2009 debt crisis led to a dramatic economic recession, the recent growth of big capitals in the real estate market and tourism industry has significantly contributed to the country's financial stability. At a point where Lisbon is being celebrated globally as one of the most attractive destinations to visit, work and invest serious concerns arise regarding the persistence of long-standing socioeconomic cleavages and the disruption of new urban inequalities. In order to address some of these challenges several initiatives of urban regeneration are being promoted in Lisbon by local and supra-local organisations. In the framework of the ongoing H2020 project ROCK - Regeneration and Optimisation of Cultural heritage in creative and Knowledge cities - this paper focus on an in-depth investigation on the social transformations in the Marvila neighbourhood and the role of citizen engagement in cultural heritage-led regeneration. The emergence of a grassroots strategy led by local residents to drive their collective claims for public spaces and services' renewal highlights relevant aspects about engagement processes in urban regeneration and the extent to which local communities can reclaim their vision and rights, either in synergy or in opposition to public and private agents acting in the field.. Accordingly, this paper reflects on the complex and interwoven set of imaginaries, interests and agendas of urban regeneration that are currently being contested in Marvila. Empirical knowledge collected through ethnographic research will explore the impacts of multi-scale governance in urban contexts, and the role of grassroots participation within wider urban transformations.

Commonifying From Inside The State? The Case Of “La Comunicadora” And The Promotion Of Alternatives To Capitalism

Vidal, Vera

UOC, Spain
veravidal[at]uoc.edu

First conceived as an alternative to neoliberal markets, sharing economy platforms have turned out to have mixed outcomes. They have challenged traditional sectors, public authorities and local communities, putting more pressure on strained resources and infrastructures, contributing to labor precariousness and patterns of inequalities. As a response, communities and local governments are exploring alternative models like platform cooperativism, which takes into account governance, knowledge or technological policies. An example is the city of Barcelona. The victory of the left-wing citizen platform Barcelona en Comú created the city hall's political shift towards a model favoring the commons and technological sovereignty for the city. My contribution proposes to reflect on how the State is trying to channel digitalization to promote alternatives to capitalism and whom this serves. Barcelona's La Comunicadora “incubation” program is a relevant example of such effort. Now in its third edition, the program is led by Barcelona's economic promotion public agency. Its aim is to “commonify” sharing economy platforms to promote models closer to the commons and the Social and solidarity economy. Is the public administration using this initiative to reinforce its power or is it redistributing power to civic society? What alternative models are emerging from La Comunicadora? This study was carried out using participant observation and interviews with the project holders, the teaching team and the public administration. It was triangulated through the analysis of content produced by the participants for each session through a collaborative documentation tool.

Urban Resistance And The Creation Of Political Subjectivities: From Struggles Against Eviction To Everyday Life Continuities

Pereira, Patricia; Corte-Real, Madalena

CICS.NOVA, Faculdade de Ciências Sociais e Humanas da Universidade Nova de Lisboa, Portugal
ppereira[at]fcsh.unl.pt, mcortereal[at]sapo.pt

This paper brings together two complementary ethnographical research projects based in Lisbon: a case-study about the struggle against eviction of an entire building in Mouraria, a neighbourhood located in the historical city centre traditionally associated with low income and migrant populations, and a long investigation about the revitalisation project of the neighbourhood, started in 2011 by the local authorities. This empirical case allows us to critically discuss diverse modalities of resistance to residential displacement and to urban transformations that reinforce social inequalities. We will problematize both consciously politicized struggles for the right to stay put and different forms of everyday resistance. The latter are often invisible, consubstantiating in the continuity of the presence of low income residents and city dwellers, in their day-to-day practices and in the places where they occur (Lees, Annunziata & Rivas-Alonso, 2017; Giroud, 2007). These practices and places are associated to a reality that simultaneously precedes the present logic of urban regeneration and is deeply entangled in the continuous process of transformation to which urban spaces are subjected. We question whether everyday practices can effectively contaminate political practice (Hall, 2011) and how different types of resistances spark the formation of new political subjectivities (Boudreau, 2009) among groups and individuals with different social backgrounds and different situations regarding economic resources to face pressures on living conditions.

Urban Grassroots Movements in the Illiberal State. Reconsidering the effects of post-socialist transformations in Hungary

Olt, Gergely; Buzogány, Áron; Kerényi, Szabina

Hungarian Academy of Sciences, Hungary
olt.gergely[at]gmail.com, buzogany[at]zedat.fu-berlin.de, kerenyi.szabina[at]tk.mta.hu

In our paper, we would like to discuss the rapidly changing character of urban spaces and the role of recreational spaces in the gentrifying post-socialist city of Budapest. We would like to analyze the power in self-organization and strategies of mobilization of local urban communities, and we would like to claim that the recent developments towards an 'illiberal state' in Hungary have triggered a return towards grassroots politics. While this might be a positive development in itself as it could help grassroots movements regaining legitimacy, we show in the paper that these local (urban) movements remain haunted by structural constraints and are limited in their potential to use political opportunity structures, transactional activism and discourses which would make their mobilization effective. The analysis that follows builds on several fields of expertise regarding social mobilization in Hungary. In the early 2000s, transnationalization and Europeanization have dominated both the political agenda and the scholarly literature, leading to organizational changes (often described as NGOization) and ideational reframing of local urban environmental activism. Using two case studies of urban environmental protests, the contribution illustrates the post-euphoric development of the Hungarian grassroots movement in period that was marked since 2010 through the consolidation of a self-termed 'illiberal' regime. Faced with a difficult environment, we identify reorientation towards grassroots activism as a new trend driven by the closure of opportunity structures. This goes together with the alienation of local protests from institutional channels of influence-seeking and the weakening of ties with potential political allies such as political parties or professionalized NGOs.

RN37_06b | Neighbourhoods and neighbouring as a conceptual and empirical challenge 2

Including Neighbourhood Selection in a Neighbourhood Effects Model

Troost, Agata A.; van Ham, Maarten; Janssen, Heleen J.

Delft University of Technology, the Netherlands
a.a.troost[at]tudelft.nl, m.vanham[at]tudelft.nl,
h.j.janssen[at]tudelft.nl

Selection bias has long been at the heart of discussion about neighbourhood effects. To what extent are these effects caused by neighbourhood characteristics, such as positive role models or the quality of local institutions, and to what extent are they just a result of people self-selecting into neighbourhoods based on their preferences, income, and the availability of alternative housing? This paper contributes to better understanding of this issue by modelling people's preferred types of neighbourhoods and later including them in a neighbourhood effects model predicting individuals' income. We build upon an earlier article by van Ham, Boschman & Vogel (2018) and aim to improve the analyses by including individuals who moved during five years, not only one year, thereby reducing the underrepresentation of groups who move more rarely; as well as by looking not only at income, but also directly at income change. We compare the models using data from three major Dutch cities: Amsterdam, Utrecht and Rotterdam. Our results show that there is a significant effect of average neighbourhood income on individual income even after controlling for explicitly modelled neighbourhood selection. Still, the effect becomes much smaller while including such controls, which suggests that studies without them could overestimate the size of neighbourhood effects.

The New Normal Of The Urban And Its Shadows: Residents' Perspectives From Istanbul And Leeds On Belonging And Place Attachment

Yuksel, Z. Ruya

The Graduate Center, CUNY, United States of America
z.r.yuksel[at]gmail.com

Through in-depth interviews with residents of Leeds and Istanbul, this research studies how residents of different cultural and geographical contexts construct meanings within urban spaces and in doing so it sheds light upon the impact of the new ways of urbanisation and marketing of urban spaces. This is significant because cities are now facing an increasing competition for inward investment, refurbishment, and the

relationship between residents and the city can either reinforce or undermine these efforts. However city planners and local governments who review the fundamental purpose and rationale of the urban within the context of 21st century requirements may not fully consider the perceptions of the local residents. Pile (1999) emphasised the physical environment of the urban as a symbol of its citizens' social relatedness and belonging and when the physical environment is disordered, the social functions that it serves become harder to identify (Mumford, 1938). The current speed of urbanism is pushing residents to mould and shape themselves into the spaces that they can find and afford, and the developers and policy makers to seek new ways to squeeze out the scarce urban spaces for housing and businesses, often driven by the additional financial gain on the side. In an age where cities started to follow a "one fits for all" formula to create an attractive image complete with its luxury high-rise residential suites, offices and shopping centres packed into a single building, this research asks whether we are being more socially isolated or united through these newly defined divisions.

Bottom-up Neighborhood Rebranding: Community Building or Loss of Place Identity?

Tartari, Maria (1); Gerosa, Alessandro (2)

1: IULM, Italy; 2: Università degli Studi di Milano, Italy
tartari.maria[at]gmail.com, alessandro.gerosa[at]unimi.it

In the last decade, the economic crisis has seen the main European cities as the perfect stage for social segregation. Peripheral areas have often been reshaped through uneven urban development processes and that has typically involved the rebranding of the area concerned as a symbolic boundary. European urban policymakers increasingly utilize urban rebranding as planning tools to foster social change and attract economic capital, imposing a top-down changing of the very identity of a district. In literature, these phenomena have been broadly investigated, though, we have observed that there is a gap about bottom-up place rebranding processes related to outcomes such as gentrification and loss of place identity. Indeed, the shared sentiment within the academia sheds light mainly on the inclusive nature of bottom-up interventions, focusing on the successful results rather than seeing the big picture. The present work aims to re-think on this debate extending the analysis on the harmful social impacts that bottom-up urban rebranding might have on local hyper-diverse communities. In fact, in such a complex scenario, neighborhood rebranding, even when constituted for the sake of a culture-led social and urban regeneration, may mirror the very logic of misappropriation if interventions are uncritically enacted through false forms of participation. We read this phenomenon thanks to the exploratory analysis of an Italian case study that took place in Milan, in an emerging peripheral multi-ethnic area, recently renamed NoLo by a specific group of residents. As we will argue from our results, we assess both the potential benefits of a bottom-up symbolic and economic renewal and its limits in terms of marginalization and loss of place identity.

RN37_07a | (Un)making urban development

Planning For Sustainable Cities By Crossing Boundaries – Exploring How Conflicts Of Interest Are Managed By Integrating Different Types Of Knowledge In Urban Planning

Saldert, Hannah

University of Gothenburg, Sweden
hannah.saldert[at]gu.se

Implementing Sustainable Development Goals in urban planning has been suggested as a key strategy to transform society to become more sustainable. When implementing the SDGs, one of the main challenges and possibilities for urban governance is the ability to manage conflicting interests. Conflict management is therefore decisive for sustainable urban development. Knowledge integration has been identified as a key element to support conflict resolution. However, the processes of knowledge integration have so far received limited attention. This paper aims to deepen understanding of what happens when different actors are involved in the knowledge production for planning future sustainable urban districts. The paper seeks to answer the following research question: What does different actors' perspectives on knowledge and knowledge use mean for conflict resolution practices in urban planning? The research is conducted through a case study of how conflicts of interests are managed when planning for sustainable districts in the urban development project RiverCity Gothenburg, Sweden. Within this project, I follow an informal collaborative knowledge production process. Informed by theory on co-production of knowledge and boundary work, I apply an interdisciplinary knowledge typology to map out different types of knowledge used to reach agreement within the project, and their relations to different actors. This paper contributes to a more systematic and in-depth understanding of the role of knowledge use in conflict resolution practices and processes within urban governing.

From Social Services to Urban Planning: Accessibility for People with Disabilities – The Case of Municipal Professionalization

Yabo, Mariela

Ben-Gurion University, Israel
mariela229[at]gmail.com

Israel's Equal Rights for People with Disabilities Act, and specifically its Accessibility Chapter, promotes a shift in the discourse on disability, from charity to human rights. Using the Municipality of Tel Aviv-Jaffa as a case study, this research examines how disability legislation is implemented in practice. Combining qualitative methodology and Critical Disability theory, this paper compares the municipality's actions before and after approval of the Accessibility Chapter. It examines how principles stemming from the social model of disability, formally integrated into the law itself, have been translated into municipal planning practices. The findings show that the municipality has undergone significant processes of professionalization and institutionalization. This facilitated comprehensive implementation of the Accessibility Chapter and its underpinning principle of inclusion. But these processes have also led to a shift of authority, from welfare professionals to accessibility advisors and urban planners; this has prevented citizens with disabilities from participating in decision-making processes on policies that affect their lives in the city. This paper presents a critical organizational analysis of the field of accessibility for people with disabilities in an urban context. I argue that the professionalization of the field of accessibility affects the participation of people with disabilities, due to the institutionalization of professional practices, and the inherently technical and operational nature of the urban planning professions. Disability Studies scholars have proposed strategies to ensure the participation of people with disabilities alongside the drive to professionalization, notably in the field of medicine. I suggest that these strategies should similarly be adopted in the field of urban planning.

Development Plans In French Rural Municipalities: Social Interactions Between Private Developers And Planning Authorities

Le Bivic, Camille (1); Melot, Romain (2); Devisme, Laurent (3)

1: AgroParisTech, INRA-SADAPT, France; 2: INRA-SADAPT, France; 3: ENSAN, AAU-CRENAU, France
camille.le-bivic[at]inra.fr, Romain.Melot[at]Agroparistech.fr, laurent.devisme[at]crenau.archi.fr

Researches in urban sociology have explored the relations between private and public actors within the planning process but have showed limited academic attention to small size cities. The focus has widened in recent years to include the notion of rural planning (Frank & Reiss, 2014), identifying rural areas specificities: sparsely populated municipalities, strong influence of farmers, weakness of the available expertise, visibility of agricultural and natural surfaces, limited strategies to cope with dispersed urbanization and proximity between local stakeholders (elected officials, landowners, inhabitants and developers). This contribution proposes to investigate planning practices in peripheral municipalities. The field study presented is the rural fringe of the Nantes metropolitan area, a conurbation of the French Atlantic coast marked by a high demographic growth and an important urban sprawl in the last twenty years. We explore the interactions between elected authorities and private developers that lead to local trade-offs on the urban planning process. The study concerns small municipalities considered as rural in regard of the definition of functional urban areas based on commuting data. We develop a quantitative analysis of planning permissions and building permits in 80 municipalities, and qualitative case-studies based on interviews with a panel of developers and local elected officials involved in urbanisation projects.

The Social Side of Anti-Sprawl Strategies: a Comparative Analysis of Minneapolis, Denver, and Portland

Manella, Gabriele; Rimondi, Tommaso

Università di Bologna - Alma Mater Studiorum, Italy
gabriele.manella[at]unibo.it,
tommaso.rimondi[at]studio.unibo.it

What are the conditions that make a city more sustainable? Which ones are probably unique? Which ones could be possible in other cities too? My proposal moves from these research questions with a specific attention to land use management. Very often, indeed, excellent anti-sprawl practices have also some negative effects, and they generate new problems and new forms of inequality. I will focus on three "mature" US urban areas, where the awareness of this problem has gradually increased in the last decades. I will consider cases with a relatively similar size and located in three different parts of this country: Denver (Colorado), Minneapolis (Minnesota), and Portland (Oregon). Four points will address

my proposal: 1. The major accomplishments of these cities in land use policies. 2. Some conditions that led to these accomplishments. 3. The potential social costs associated with compact urban growth. 4. Which lessons other cities might draw from these cases. In particular, I will focus on the social equity effects of anti-sprawl strategies in terms of the rise of housing prices as well as the difficulty in managing the process in order to include all the potential stakeholders. I will also point out the local governments of these cities are acting to mitigate these negative effects. My study is based on the analysis of some statistical data, a historical and political reconstruction of the land use management process, direct observation, and interviews with local experts and key-informants.

RN37_07b | Inequalities in urban space

All City and no Play: Tackling Urban Inequality Through the Study of Child (Un)Friendly Public Spaces

Ferro, Lígia (1); Barbosa, Inês (1); Lopes, João Teixeira (1); Seixas, Eunice Castro (2)

1: University of Porto / Institute of Sociology, FLUP, Portugal;
2: University of Lisbon, SOCIUS/CSG, ISEG, Portugal
lferro[at]letras.up.pt, inesbarbosa83[at]gmail.com,
jmteixeiralopes[at]gmail.com, euniceseixas[at]gmail.com

Recent research points out the relevance of environment and physical context for children's individual and social development. Despite this evidence, children's practices, needs and desires are scarcely included in urban planning and urban public spaces are often designed by and for "adults". Previous research has highlighted changes in "children's geographies" and inequalities in their access to the city (at the symbolic level but at the material one as well). On the other hand, intergenerational, interclass, interethnic and intergender ties established through urban sociabilities in public spaces can be paramount for enriching the city as place for cultural diversity. Starting from an ethnography carried out in the city of Porto, Portugal, which is currently experiencing an accelerated process of gentrification and housing crisis, we discuss the first results within the scope of the project CRiCity. Drawing from the data collected through observation, field diaries, walking along and interviews at two parks in the city of Porto (in Paranhos and Campanhã), we show how age, gender, class and ethnicity are intertwined, shaping the uses of public space, urban sociabilities and belonging to the city. We also present the first recommendations for including children in the urban planning as a way to effectively address their "right to the city" and their "right to participation", as enshrined in the Convention on the Rights of the Child, 30 years ago. Project "Children and their right to the city: Tackling urban inequity through the participatory design of child friendly cities" (CRiCity) has funding from the Portuguese Foundation for Science and Technology.

Social Status, Social Structure and Space - Social Inequality in Germany and its Consequences for the People

Goebel, Jan (1); Dittmann, Joerg (2)

1: DIW Berlin Socio-Economic Panel Study (SOEP); 2: University of Applied Sciences and Arts Northwestern Switzerland
jgoebel[at]diw.de, joerg.dittmann[at]fhnw.ch

Social inequality, understood as an unequal distribution of resources (e.g. income, education), manifest unequal social participation and different scopes and chances of social action. Social inequality manifests itself in different ways, between different population groups and between territories, e.g. regions, city districts and residential areas. The spatial accumulation of people with low social status has an own quality, often labeled as the "double discrimination of poor people" (Friedrichs/Blasius 2000). In this presentation, we will dynamically describe different forms of spatial related social inequalities for Germany and examine its impact on individuals. In a first step, we will characterize ethnic and social segregation in Germany for the years 2007 to 2015, by using small-scale spatial data (500 households per subregion on average) for all municipalities in Germany. In a second step, we turn to representative longitudinal SOEP data at the individual level and compare his or her socioeconomic situation to the social structure of the neighborhood and the mediate area in which the person lives. In a third step we will examine the significance of spatial related social inequality on aspects of individual well-being including aspects of satisfaction and of social cohesion like trust in institutions and perceptions of justice. The possibility to connect household survey data from the SOEP (SOEP V33.1) and territorial-spatial information (microm) based on exact geo-coordinates is a special feature that enables to research spatial implications of social inequality in Germany and its consequences for individual wellbeing.

The Right to the City: Mass Tourism and the challenges for Public Spaces

Araya Lopez, Alexander

Ca' Foscari, University of Venice, Italy
alexander.arayalopez[at]unive.it

In recent years, several cities and countries around the globe have started to pay attention to the negative outcomes associated to the global tourism industry. From the so-called touristification or Disneyfication of the city centers to the impact of anti-social behavior on the host communities, the relation between tourists numbers and the (re)definition of public spaces has been associated to the broader discussion on the "right to the city" (as originally proposed by Lefebvre, and later re-interpreted by Harvey, Purcell, among other). This paper focuses on the discussion on the notion of public spaces, describing the challenges that the ever-increasing number of tourists are generating in both the physical spaces and particularly in the uses (lived spaces) of the city. For example, both fishermen in Venice and sexual workers in Amsterdam indicate that their livelihoods are threatened by masses of

tourists that are only interested in capturing photos for their Instagram. With a particular emphasis on the policing of 'anti-social behavior of tourists', and the proposed solutions to control them by local authorities in Venice, Amsterdam and Barcelona, this paper explores the risks of policing the city based in 'us versus them' narratives, explains the limits of the solutions based on the re-location or re-education of the tourists, and addresses the impact that this over-policing might have in the lives of local citizens. This paper is part of the ongoing RIGHTS UP project 2018-2020 (Marie Curie IF) and will present a theoretical reflection based on preliminary results and will discuss some empirical information collected in situ in the aforementioned cities (through observation, informal conversations, media analysis, visual sociology, social media analysis, etc.)

The Effect of Urban Transformation on Senior Citizens' Social and Economic Capital: The Case of Istanbul

Güler, Zuhal (1); Duman, Betül (2); Otrar, Mustafa (3); Şentürk, Murat (4)

1: Abant İzzet Baysal University, Turkey; 2: Yıldız Teknik University, Turkey; 3: Ministry of National Education; 4: Istanbul University, Turkey
zuhalguler69[at]hotmail.com, betulduman[at]hotmail.com, motrar[at]yahoo.com, muratsenturke[at]gmail.com

The subject of this study is to reveal how the urban transformation has done publicly in Istanbul has impacted the levels of social and economic capital for individuals aged 65 and older. On this point, the questions of the extent to which and how urban transformation answers or doesn't answer the needs and expectations of the elderly, being the most fragile, also gain importance. The senior citizens with low socioeconomic status residing in settlements that have run up against publicly-handled urban transformation increase the importance of this study because, in this way, the effects of publicly-handled urban transformation can be exposed. The purpose of this study is to explain how and why urban transformation affects which components of both senior citizens' quality of life, as well as their social and economic capital that can be considered in connection with this, in the contexts of ageing in place, active ageing, and the phenomena of social exclusion or social integration. The universe of the study is composed of neighbourhoods in Istanbul that have run up against publicly-handled urban transformation. While the sample has been determined using the purposeful/guided sampling technique, the number of individuals who would be applied the questionnaire in the districts and related neighbourhoods that have experienced publicly-handled urban transformation has been determined using the proportionally stratified sampling technique. The quantitative data collection technique has been used as the data collection technique, and in this context, 1,800 senior citizens have been applied the questionnaire by way of direct interviews. Evaluating the data by transferring to the computer environment was performed by means of the quantitative data analysis program, SPSS.

RN37_08 | Spatial segregation in cities

“That thing they call a ghetto”: Distinctions in a Stigmatized Neighborhood in Copenhagen Hansen, Christian Sandbjerg

Aarhus University, Denmark
csh[at]edu.au.dk

In this paper, I investigate the social divisions and stigma management in a tainted area in Copenhagen, known as the Northwestern, currently transforming as the “new” gentrified area in the city. On the backcloth of the political economy of place in the contemporary capital of the Danish welfare state, I draw on an interview sample to analyze the residents lived experience, sense of belonging and everyday place-making in a publicly blemished territory. I highlight four main principles of vision and division that structure the resident’s perception and appreciation of their place: The golden past versus the stigmatized present, the immigrants versus the Danes, the welfare clients versus the ordinary citizens, and the future hipsters and creatives versus the old residents. I argue that the management of the territorial stigma must be seen in light of these structuring principles and in relation to the trajectories of the residents.

Methodological Considerations for Exploring Marginalized Urban Experiences: A Qualitative Geospatial Approach

Martini, Natalia

Jagiellonian University, Poland
natalia.ewa.martini[at]gmail.com

Inspired by Nishat Awan’s critical remark on the task of imagining cities that has for too long been the preserve of the privileged and the powerful, this presentation addresses the question of how to make the conditions necessary for editing back the neglected spatialities of the city into our accounts of urban space. Through reflections from an on-going study on the homeless city, that focuses on portraying the city as it manifests itself in the practical course of everyday life of its homeless dwellers, this presentation considers methodological possibilities for exploring and presenting marginalized urban experiences opened up by incorporation of geospatial technologies into qualitative urban inquiry. It discusses the potential of a methodological practice of walking supplemented with location-aware technology, i.e. Global Positioning System (GPS) and Geographic Information System (GIS) software, for facilitating better understanding of how marginalized urbanites navigate their ways through the city, how they negotiate social boundaries and address material barriers, and how these practices mark spatial patterns of their

(non)belonging in the city. This presentation demonstrates how narrative, visual and spatial data generated whilst walking may be brought together within GIS, and how its analytic and representational power may be taken advantage of for better understanding of how the lack of privilege is paced out through the city. It suggests that the combination of the walk-along method with geospatial technologies offers new ways of approaching spatial forms of inequality in the city.

The Politics Of Territorial Stigmatization

Schultz Larsen, Troels; Delica, Kristian
Nagel

Roskilde University, Denmark
tschultz[at]ruc.dk, kdelica[at]ruc.dk

This paper analyses how social symbolic and material struggles over the city and especially the neglected and stigmatized territories are tightly linked to struggles over the reconfiguration of the state. The object is to draw up a preliminary construction of a field of urban politics – here in the case of Denmark: This construction offers an analysis of how different power and knowledge hierarchies play a pivotal role in the continual transformations, which the different solutions to urban stigmatization have affected – both in terms of professional categorizations and in terms of drawing and redrawing the social and symbolic boundaries in the city but also in terms of new moralities- and forms of local belonging and citizenship. As such focus is neither on the city nor on the state par se but on how the city and the state and their post-crisis transformation are intimately linked. On this backdrop, it is possible to outline a new socio-spatial configuration that reforms Harveys (1989) entrepreneurialism by combining it with new forms of authoritarianism both in the city and at the level of the state. Theoretically and methodologically this study is inspired by Bourdieu’s reflexive sociology highlighting relations of symbolic power and its inscription in the city (Bourdieu 1991; 1999; Wacquant 2008; 2009; 2016). Empirically we combine a macro analysis of policy documents and a microanalysis of structured relational biographic interviews with 47 project managers engaged in territorial de-stigmatization work in practice. Based on this we flesh out the contours of the new authoritarian governance of urban marginality as politics and practice.

Profits of Trans/locality? Spatial Segregation and Practices of Organizing Resources in Times of Translocal Mobility and Communication

Krüger, Daniela; Vief, Robert George; Schultze, Henrik; Blokland, Talja

Humboldt-University Berlin, Germany
daniela.krueger[at]hu-berlin.de, robert.vief[at]hu-berlin.de,
henrik.schultze[at]hu-berlin.de, talja.blokland[at]sowi.hu-berlin.de

Increasing mobility changes how and where people access goods and services. These practices of organizing resources still are an expression of social inequality, but translocal mobility and communication challenges the way scholars have imagined urban inequalities to date. Studies conclude that social and spatial inequality coalesce and find expression in an unequal spatial distribution of resources, goods and services – that are said to lack in marginalized neighborhoods. Pierre Bourdieu (2018 [1991]) introduced the concept of spatial profit to refer to the interrelation of space and social position. Profits result: (1) as the proximity to desired infrastructures, (2) as position through the symbolically beneficial address and (3) the profit of occupying space to keep undesirable goods or people at bay. In our presentation we scrutinize and broaden the idea of spatial profit as a profit of bounded localization. We assume that the concentration of desirable goods and services occur in specific neighborhoods, but investigate whether people also profit from the ways they use social relations and organize resources, goods and services considerably independent of locality. Thus, we suggest overcoming the spatial determinist thinking that people are restricted to the goods and contacts they are spatially surrounded by. We show for whom different spatial scales can be effectively used by presenting first results from a representative quantitative survey in four Berlin neighborhoods. The survey was conducted in the ongoing research project “The World Down My Street: Resources and Networks Used by City Dwellers” (DFG-funded interdisciplinary Collaborative Research Centre 1265 ‘Re-Figuration of Spaces’).

RN37_09 | (Post)modern urban transformations

The Change Occurring in Daily Life by Culture-led Urban Transformation: Culture Valley Project Sample

Turan, Büşra; Ayar, Merve

Istanbul University, Turkey
bsrturan91[at]gmail.com, merveyayar[at]gmail.com

Modernization has given rise to significant changes in daily life.

It is claimed that the first thing which directly shows this change in Turkey is the neighborhood. Especially the degradation of neighbor relations is an important component of the changes taking place in daily life. Moreover, the structural transformations in the neighborhood are also one of the most important reasons for this kind of changes. A part of these transformations in Istanbul are carried out by the culture-oriented applications of urban transformation. A project named "Kültür Vadisi (Culture Valley)" is conducted as a culture-oriented urban transformation project in Zeytinburnu, Istanbul. With this study, it was tried to understand how this project changed daily life in the relevant neighborhood, and it is hoped to contribute to developing a projection for the new projects which may be conducted in future and to determining of the sustainability of the current project. In the study, the change of daily life in the Merkezefendi Neighborhood in which Culture Valley Project is conducted is tried to understand by depicting. In the scope of the study, very few of the neighborhood residents could be reached because most of them have moved. Some of the residents of the neighborhood and, tradesmen, administrative directors and clergymen who still maintain the relationship with the neighborhood were met with. During the study, in-depth interviews were had and participant observations were made. The study which is performed during the transformation will shed light on what happened and what will happen in daily life.

Vision of Global City and Transformation of the Old Towns: İstanbul Historic Peninsula as a Case Study

Şentürk, Murat

Istanbul University, Turkey
murat.senturk[at]istanbul.edu.tr

Since the second half of the 1970s, İstanbul's goal and vision has been to become a world city. Although this vision has been slightly changed as a global city these days, the content has remained almost the same. This paper will analyze the undergoing changes of the old towns as a result of the global city vision. In order to understand that global city vision, we will discuss some projects, which were produced by different governments in the city of İstanbul, in-depth interviews and documentary analyses were used to carry out qualitative research. In-depth interviews were conducted with people who held posts as top executives in the İstanbul Municipality, such as mayors, council members, city planners, consultants etc. In conclusion, this vision has always been the showcase and strength of Turkey and put into practice in order to strengthen İstanbul's position among world cities again. However, the projects that were carried out in line with this vision have brought about significant changes in city's social, economic and cultural life. During 1970s the direction of the capital flow was towards cities, and clearly İstanbul has had its share of this economic change.

Regeneration and Spatial Segregation in Post-Modern York, UK

Takeda, Naoko

Waseda University, Japan
bxp05011[at]nifty.com

In this presentation I will explore the re-segregation process of York. York is a typical commercial and trading city from medieval to modern. Two rivers flow through the city center, and York used to be the hub point of water transportation leading to the North Sea. And in the 19th century a railroad passed through, became a hub point of new industrial age. In recent years, the tourism industry is very strong in York. Many tourists can enjoy elegant shops that offer refined local products in the historic city center. In this way redevelopment has proceeded in York from historical heritage to commercial and tourism city. At the same time, new segregation has occurred in the city center. 120 years ago Rowntree conducted pioneering poverty research in York. He mentioned about poorest area in York where were Hungate and Walmgate located at the both banks across the River Foss. The changing process of both districts are very different. At present Hungate is a representative redevelopment area, and young rich families live there. On the other hand Walmgate keeps old street structure. Though tourists enjoy shopping at old local shops, but there are many public houses in the back street, poor elderly people live there. Though slum clearance projects were conducted in both districts by city of York, the characteristics of the two areas have become quite different. I will explain some reasons of these difference refer to the changing process of commercial city.

RN37_10 | Urban change and local sustainability

Improve Energy Efficiency In Condominiums Of Working-class Neighbourhoods. Lessons From Field Inquiries In Two French Case Studies

Leone, Flavia (3); Lefevre, Marie-Pierre (2); Melot, Romain (1)

1: Université de Tours, France; 2: Université Paris Est, France; 3: Université Paris Saclay, France
flavialeonef[at]gmail.com, marie-pierre.lefeuvre[at]univ-tours.fr, romain.melot[at]agroparistech.fr

Public authorities are worried about the lack of maintenance and repair works in lower class condominiums, that lead to energy poverty. Assistance programs supported by public policies target condominiums classified as "in financial need", but most working-class buildings do not profit from this support restricted to extreme situations. Therefore, growing concern has raised about the capacity of poor condominiums to achieve energy transition. How could collective action be shaped when owners have limited leeway and incentives to invest? How could be improved the value of their real estates in run-down districts where the housing market is unattractive ? We propose to expose empirical results of on-going field inquiries in the suburbs of two French conurbation, Paris and Nantes. We focused our research on : coordination issues in the condominiums governing bodies (role of leaders, conflicts and cooperation dynamics); relations between residents, syndic, and works companies; legal consciousness of residents. The inquiry was based on interviews with 1° key actors of housing policies at the local level, representatives of condominium councils; 2° a panel of residents of the condominiums investigated, exploring their personal path, motivations and attitudes towards projects of energy improvements.

Changes in Everyday Life and a Mega Sport Event: A Case of FIFA World Cup 2018 in a Small Russian City

Markin, Maxim; Nadezhdina, Evgeniya

National Research University Higher School of Economics, Russian Federation
mmarkin[at]hse.ru, nadezhda[at]hse.ru

The research examines the changes in everyday life for the citizens of a small city hosted a mega sport event. The Olympic Games, World Cups, etc. are normally organized in big cities where their local authorities are ready to solve the traffic problems and other logistical tasks, and the citizens regularly communicate with a lot of visitors from different countries. Contrariwise, hosting a mega sport event is a challenge for local authorities of small cities, and their citizens rarely face so many guests, especially foreign visitors. As a result, mega sport events can dramatically change common practices of the citizens and they normally have contradictory expectations. What did the citizens of a small city expect before a mega sport event? How did their everyday life really change? The research studies a case of FIFA World Cup 2018 that took place in a small Russian city Saransk. More than 50 in-depth interviews with the citizens were conducted in June and July 2018. The findings demonstrate that, in spite of its size, Saransk is being under reconstruction since the beginning of the 2000s. As a result, the citizens were ready for building a new stadium, hotels, modernization the airport, etc. As the citizens were afraid of foreign visitors, especially from Asian, African and Latin American countries, they avoided non-European visitors first but then they began actively communicate with all the guests. So the citizens became the participants of the international festival that changed their everyday life for two weeks.

Urban Regeneration and Sustainability on a fast-changing industrial area from Lisbon. From Morphologic margins to Social Borders

Martins, João Carlos

University of Lisbon, Portugal
joao.martins[at]ics.ulisboa.pt

Urban Regeneration has become a role model on EU and State funded urban policies to replicate creativity (Breitbart, 2013) and knowledge transfer (Engelsman, 2017), to requalify degraded socio-territorial units, particularly on former industrial landscapes (Jaworski & Thurlow, 2010). These fragmented spaces and communities become a contemporary focus of social sciences research (Loures, 2014), as well as EU funded programs combining Knowledge and Creativity (Florida 2005) towards urban sustainability (Huang et al., 2017). Marvila (Nunes & Sequeira, 2011; Nevado, 2018; Gennari, 2018), an eastern riverside civil parish in Lisbon, present internal boundaries among its urban occupants, mixing different soil uses and community backgrounds. Despite public drive on Urban Regeneration Role Models; the unrestrained fast-moving urban change (promoted by newcomers with different economic and cultural backgrounds), is particularly visible on its former industrial warehouses and urban voids on the riverside. Till now, strong physical barriers (train lines), and sociospatial appropriations on Social Housing, have constituted a frontier to suburban Gentrification processes already in place on riverside (Lees et al., 2009; Gomes, 2015). This paper will explore State Led Regeneration undergoing in Marvila, eastern Lisbon. To do this, we will focus on the role of institutional actors, namely, policy makers, social workers and local entities on Urban Regeneration. We'll present some preliminary spatial, socioeconomic, cultural and urban policies impacts, consequential to contemporary change in Marvila. We'll conclude by arguing further co-participative actions are needed to ensure the implementation of 2030 UN Urban Agenda at local level and avoid forms of Culture led Gentrification.

JS_RN01_RN13 | Intergenerational Relations in Times of Ageing Societies

Great-grandparent: a non-existing family role? A French example

Kushtanina, Veronika

University of Burgundy Franche-Comté, France
veronika.kushtanina[at]gmail.com

In 1992 A. Cherlin and F. Furstenberg observed a lack of role for great-grandparents due to an “extreme age gap” (p. 92), accentuated by the fact that the grandparent role is already occupied by the children of great-grandparents. At the same period C. Attias-Donfut and M. Segalen (1997) made the same observation in France. These statements should be re-examined at least for two reasons. Firstly, in the both cases authors produce a rather uniform image of great-grandparenting as “the oldest old” while demographic data show that 10% of French women are already great-grandmothers at the age of 70 and by 83, half of them access to this new statute (Cassan & all., 2001). Secondly, since the 1990s the life expectancy (and also the one without incapacity) has increased in France (INSEE), while the age of retirement is being postponed. These two trends might question the lack of role for great-grandparents. In this communication I analyze 12 family monographs gathered in 2007-2011 and present the first results of an on-going exploratory research within 10 families belonging to different social groups in which I crosscut biographical interviews with different generations. I will question how different styles of great-grandparenting are produced by different social factors. The first analysis shows that, on the one hand, in the families where one of the intermediate generations is unavailable (due to a death, geographical or relational distance or professional activity), great-grandparents may take part in childcare even for very young children. On the other hand, the relation history of young parents with their grandparents also influences the role the latter can play for their great-grandchildren.

The Relationship Between Childhood Socio-Economic Circumstances and Intergenerational Solidarity in Later Life: Socialisation Versus Resources

Maes, Margot ; Vergauwen, Jorik;
Mortelmans, Dimitri

University Of Antwerp, Belgium
margot.maes[at]uantwerpen.be,
jorik.vergauwen[at]uantwerpen.be,
dimitri.mortelmans[at]uantwerpen.be

When an elderly parent becomes frail and dependent, it is mostly their spouse or their adult children who become care

providers. Previous inquiry about upward intergenerational solidarity shows that the probability of caregiving of adult children strongly depends on one’s gender and socioeconomic status. This has been explained in terms of social exchange or family norms. However, these studies neglect an unexplored, but important part of the life course, i.e. a person’s childhood. The formative years is a very important period in which a child is socialized and where, among other things, filial norms and expectations with regard to care are shaped. By using cumulative inequality theory, we examine to what extent the socioeconomic position in childhood has a lasting impact on the probability of informal caregiving in a later stage of the life course, i.e. when adult children’s parents become care dependent. Furthermore, we investigate the association both between childhood and current SES and caregiving at present. In this way, we gain insight in the relationship between one’s social mobility patterns and caregiving. Our data stems from both the fifth and sixth wave of the Survey of Health, Ageing and Retirement (SHARE), complemented with the corresponding retrospective modules on childhood. Empirical results were derived from multivariate analysis techniques. The paper will present the first results from these analyses.

The importance of Relationship History for Provision of Informal Care to Parents. A 10-year Follow-up of Middle-aged Daughters and Sons in Norway

Nordbø, Hanna Vangen

NOVA, OsloMet, Norway
hanna.nordbo[at]oslomet.no

In Norway, elder care is considered a state responsibility, and older people in need of help are thus entitled to receive help from public services. Nonetheless, a large share of adult daughters and sons provide help and care to their parents. One explanation may be that the two generations have a long lasting close relationship and that children help their parents out of affection and love. Another reason for helping may be the adherence to filial responsibility norms – a perception that children ought to help parents in need of care. This study takes a longitudinal approach in order to investigate whether previous attitudes towards filial responsibility and relationship history (i.e. earlier perceived quality of the relationship and contact patterns) matter for current provision of regular help and care to parents. The analyses are based on data from two waves of the Norwegian Life course, Ageing and Generation Study (2007 and 2017) and include 899 daughters and 840 sons aged 50 and older. The results of the analyses show that when analysed over time, there is no association between earlier filial responsibility norms and current provision of help and care. Perceived quality of the relationship and contact patterns ten years earlier on the other hand, matters for parent care, both for daughters and for sons. The Norwegian welfare state model allows for more independent and choice-based intergenerational relations. The results indicate that in such a context, relationship history is important for middle-aged children’s provision of help and care to parents.

Multi-Generational Care, Intergenerational Ambivalence and Prioritisation of Care

Yamashita, Junko (1); Soma, Naoko (2)

1: University of Bristol, United Kingdom; 2: National Yokohama University, Japan

J.Yamashita[at]bristol.ac.uk, soma-naoko-vr[at]ynu.ac.jp

This paper deals with upward and downward intergenerational ambivalence and the prioritisation of care through the experience of carers those we are simultaneously providing care for both elder and younger generations in the middle of multi-generational and multi-fields of caring relationships. The ageing of the population and the rising average age of mothers at the time of childbearing suggest these so-called sandwich generations are increasingly becoming common in advanced economies. A theoretical framework is developed by combining two perspectives on intergenerational relationships and care. The first perspective concerns the social norms on intergenerational and multi-generational care that individual internalise, family relationships impose and society addresses (e.g., Pfau-Effinger 2005). The second examines configurations of family policies (e.g., Saraceno and Keck 2011) that influences upon their practice of multi-generational care giving. Drawing on original data generated from a mixed approach of questionnaire surveys (9,224 samples), semi-structured interviews (32 samples) and focus groups interviews (6 groups) in Japan, the empirical analysis first presents the meaning and practice of multi-generational caring relationships, and second the evidence of both upward and downward intergenerational ambivalence. Thirdly it investigates whether structural contradictions (family policy frameworks, economic conditions and social norms) that confront individuals in certain situations cause ambivalent attitudes towards the elder generation, the younger generation or both, and how they interconnectedly influence upon carers/family's practice of prioritisation among different types of care. Based on the findings, this paper concludes with examining its implications to the UK context.

Social Inequalities in Support Patterns Between Multiple Generations in Europe Over Time

Quashie, Nekehia (3); Brandt, Martina (1); Deindl, Christian (2)

1: TU Dortmund, Germany; 2: HHU Duesseldorf, Germany; 3: TU Dortmund, Germany

Nekehia.Q[at]chula.ac.th, martina.brandt[at]tu-dortmund.de, deindl[at]uni-duesseldorf.de

Family members support each other across the entire family cycle. Parents help their adult children with financial transfers and hands-on-support and childcare, while children in mid-life often support their older parents with help and care. However, profound social inequalities linked to different need and opportunity structures as well as public transfers within different contexts are suspected. While there is some research on each aspect separately, and some research on the connections between certain transfer types at certain family stages, there is still no conclusive study bringing together all different support types between multiple generations from different social backgrounds over time. In our view, taking a longitudinal multi-generational perspective is essential to capture dependencies and negotiations within families from different socio-economic backgrounds within different regional contexts. If middle-aged parents have to take care of their own older parents, they have fewer resources for their (grand-)children, who might then receive less attention and support from them. This may differ according to access to support from public or private institutions. Here, country and regional specifics have a huge impact on support patterns within the family, which can only be captured when looking into developments and change. Using six waves of the Survey of Health, Ageing and Retirement in Europe (SHARE), we look at intergenerational transfers between multiple generations over time across European regions, considering mid-aged Europeans in the "sandwich" position between older parents and children and include multiple transfer directions and types over time to assess the links between social inequality, changes on the family and country level, and intergenerational solidarity in Europe's ageing societies.

JS_RN01_RN16 | European Health Policy and Ageing Societies: Challenges and Opportunities

Older Patients Discharged from Hospital to Community Care. Hospital Nurses and Community Nurses' Experiences of the Quality of Transition

Gautun, Heidi (1); Billings, Jenny (2); Bratt, Christopher (3)

1: OsloMet Oslo Metropolitan University, Norway; 2: University of Kent UK; 3: University of Kent UK
Heidi.gautun[at]oslomet.no, J.R.Billings[at]kent.ac.uk, Christopher.bratt[at]gmail.com

Older patients' transitions from hospitals to community care need to be improved. This paper investigates hospital-based nurses' and community-based nurses' experiences with the quality of older patients' transition from hospitals to community care. We use data from recent nationwide Norwegian surveys with nurses working in inpatient wards in acute hospitals (N = 2, 431) and nurses working in nursing homes and home nursing (N = 5,816) to test two hypotheses. First, we test whether nurses working in community care report lower quality of transfer than do nurses in hospitals. We also test whether nurses working in community and nurses in hospitals differ in their reports on information provided about patients, with nurses in community care being less satisfied with the information provided. Analyses with structural equation modelling support both hypotheses. We conclude our paper by discussing how transfer of older patients from hospitals to community care can be improved. Specifically, we suggest not to rely mainly electronic communication, but to increase the direct contact (face to face and by telephone) between hospital nurses and community nurses, especially between the hospital nurses and the home nurses.

Making Buildings for Social Care in Later Life: The Absent Presence of Building Users in Architectural Work

Nettleton, Sarah (1); Buse, Christina (2); Martin, Daryl (3)

1: University of York, United Kingdom; 2: University of York, United Kingdom; 3: University of York, United Kingdom
sjn2[at]york.ac.uk, christina.buse[at]york.ac.uk, daryl.martin[at]york.ac.uk

This presentation explores findings from the sociological project, 'Buildings in the Making,' which examined the work of architects who design buildings for later life care in the UK. Despite claims that architectural design can enhance the quality of life of older people, combined with a growing body of evidence on age friendly design, there is little sociological insight into how designs for later life are operationalised throughout the design and construction process. The study opened the 'black box' between the initial commissioning of buildings through to their delivery, in order to understand how ideas about good practice in design for anticipated building users are sourced, deployed and translated. Interviews were conducted with 26 architectural professionals, observational research was carried out with work of nine architectural practices, and a sample of three design and construction projects were closely followed over a period of 10-18 months. In this presentation we focus on how building users, especially older people and care workers, are imagined and/or consulted by architects and other members of the design and construction team. It also discusses how good practice in design for later life can come into tension with different regulatory requirements, financial constraints, tensions between promoting independence and concerns for safety and the competing requirements of different stakeholders. These in turn are explored in light of the varying models of commissioning and routes of procurement that can enable or constrain the translation of design aspirations in to delivered projects. Despite aspirations on the part of some architects, clients and other stakeholders, eventual users often disappeared from the focus of building projects and constituted an absent presence at the heart of design.

JS_RN01_RN21_09 | Addressing Older People in Survey Research: Potentials and Limitations

Older Co-Researchers and Social Inclusion

Hoppania, Hanna-Kaisa; Vilkkö, Anni; Topo, Päivi

Age Institute, Finland
hanna-kaisa.hoppania[at]jikainstituutti.fi,
annikrv[at]gmail.com, paivi.topo[at]jikainstituutti.fi

Democratisation of social research and inclusion of lay people as co-researchers in research projects is growing. It is still relatively marginal practice. In social gerontology researchers are practically always younger than those who they study. Little is known how this affects the results of interview studies, in which the manner of social interaction plays a crucial role. This paper presents a pilot study in which older people were trained as co-researchers to interview other older people. The study is part of an evaluation of an on-going programme Elämänote ("Grip of life") in which 20 NGOs in Finland run three-year community projects to improve the social inclusion of older people who live at home (i.e. are not residents of care homes). Through a qualitative longitudinal approach, 20-40 participants will be interviewed three times over a period of two years. The interviewees will be older people recruited as volunteers from the same localities. The purpose of this paper is, firstly to describe the pilot phase of the research in which seven interviewees were recruited and trained. They each completed two interviews with the same interviewee. Secondly, we discuss the way we conceptualise and operationalise social inclusion in the theme interviews. Finally, we present the initial results of how the method developed here functions and what were the first findings of the interviews in terms of social inclusion of older people. We will relate our discussion to similar European projects (BAS; Buffel 2018).

Consequences of Context Effects and Provision of 'don't know' Categories for Survey Data Quality in Nursing Home Residents: Results from Split- ballot Experiments

Kutschar, Patrick (1); Weichbold, Martin
(2); Osterbrink, Jürgen (1)

1: Paracelsus Medical University Salzburg, Austria; 2: Paris Lodron University Salzburg, Austria
patrick.kutschar[at]pmu.ac.at, martin.weichbold[at]sbg.ac.at,
juergen.osterbrink[at]pmu.ac.at

Background. Both question and response order may affect the quality of survey data. This is of special concern when interviewing nursing home residents (NHR). Decline in cognitive function is assumed to increase the likelihood of response order but decrease the likelihood of question order effects. Also, a link between cognition and the probability of don't know (DK) response styles has repeatedly been posed with respect to satisficing theory. Methods and Split-ballots. Data of 396 NHR from the cRCT 'PIASMA' (2016-2018) are used to test above mentioned assumptions. Standardised instruments were applied to examine pain, depression and quality of life in NHR with no, mild or moderate cognitive impairment (CI). Several split-ballots experiments were conducted: Question order effects were tested by reversing the item order within the seven-item Brief Pain Inventory 'Pain Interference Scale'. Further experimental conditions were implemented in 15-item 'Geriatric Depression Scale': (a) reversed answer categories (no/yes); (b) additional DK category per item (yes/no/DK). Results. As expected, only in NHR with no CI three items were answered significantly different due to question order (e.g. joy of living was negatively rated if presented last rather than first). Significant response order effects were observed for NHR with advanced CI (recency effect: 3 items) but also for those with no CI (primacy effect: 3 items). Offering an DK category neither affected DK-frequency nor item distributions. Discussion. Context effects seem to limit data quality in surveys of (institutionalised) elderly. Direction and strength of such are moderated by the individuals' cognitive function. This talk discusses explanations for the observed or absent effects and furthermore presents consequences for selected statistical measures (i.e. scale scores, internal consistency, correlations).

Mobile Data Collection with Smartphones: Collecting Social Behaviour Data In The Everyday Lives Of Older Adults

Seifert, Alexander (1); Wolf, Friedrich (2)

1: University of Zurich, Switzerland; 2: Goethe University Frankfurt, Germany
alexander.seifert[at]zfg.uzh.ch, Fr.Wolf[at]em.uni-frankfurt.de

This talk explores an underutilized method in sociology and gerontology: mobile data collection with smartphones. This method belongs to the family of ambulatory assessment and experience sampling that make it possible to assess and track older people's ongoing thoughts, feelings, behaviours or physiological processes in daily life using a smartphone. The primary goal of mobile data collection via smartphone is to collect in-the-moment active data (i.e., subjective self-reports) and/or passive data (e.g., data collected from smartphone sensors). This method is growing rapidly in popularity, due to its many advantages: First, its findings are ecologically valid, because they are collected during people's day-to-day lives in their real environments; second, the reports are collected in the moment, and are therefore less prone to memory bias than retrospective assessments; third, intensive, repeated measurements of one participant capture within-person information; fourth, real-life data are rich in contextual information, as they allow for the combination of self-reports and objective activity assessments, using the sensors that are already built into smartphones; and fifth, as measurement devices, smartphones are both powerful and widespread in the general population. The presentation will address the advantages of this method by first introducing the method, and then discussing its use in two exemplary studies among older adults: one on daily smartphone/internet use and wellbeing (N = 35, 60-70 years old, tracked over 7 days), and the other on daily neighbourhood contact affecting positive day-to-day valence, loneliness and attachment (N = 77, 61-91 years old, tracked over 20 days).

Interviewers' Assessment of the Respondents' Ability to Understand Survey Questions. Does Respondents' Age Matter?

Zyczynska-Ciolek, Danuta; Kolczynska, Marta

Polish Academy of Sciences, Poland
dzychynska-ciolek[at]ifispan.waw.pl, kolczynska.1[at]osu.edu

Many survey questionnaires include at the end a set of questions for interviewers. For example, the European Social Survey from its very beginning contains the following question addressed to interviewers: 'Overall, did you feel that the respondent understood the questions?'. In my paper I use data from the ESS Round 8 to investigate how interviewers answer this question. In the first part I analyse general differences between European countries in this respect. In the second one I focus on the interviewers' assessment of the elderly respondents' ability to understand the questions. The ESS creates a convenient opportunity to conduct such an analysis, as there is no upper age limit of the participants: the oldest respondent in 2016 was 105 years old. The ESS dataset also contains interviewers' characteristics that I use as control variables.

JS_RN01_RN21_10 | Using Methods of Quantitative Analysis in Ageing Research

Challenges of Measuring Age Discrimination in The Labour Market Via Surveys In Central And Eastern European Countries

Varlamova, Maria (1,3); Perek-Bialas, Jolanta (1,2)

1: Institute of Sociology, Jagiellonian University, Poland; 2: Warsaw School of Economics, Poland; 3: Phd Student at Marie Skłodowska-Curie Actions ITN EuroAgeism
maria.varlamova[at]uj.edu.pl, jolanta.perek-bialas[at]uj.edu.pl

Age discrimination, which is increasingly revealed in the ageing labour market, continues to be still an under-studied area of social science mostly due to lack of adequate data. Especially few scientific studies are devoted to the quantitative research in the countries of Central and Eastern Europe. The paper will present the way in which ageism in the labour market could be currently analysed for this part of Europe (via available secondary data and surveys).

It will also outline how the employers surveys could contribute to better understanding of the many facets of ageism in the labour market. And as it is problematic to obtain large scale data, it will be shown, how the concrete techniques such as Bayesian Structural Equation Modelling could be used to overcome the problems of small samples. In this study, the employers surveys from Poland (2009, 2010 and 2017) will be used to show the possibility and the way for such surveys to be helpful in the detection of ageism in the labour market. The paper is of interest to both the research network of sociology of ageing and of quantitative methods. The conclusion will present a discussion of other available data (besides of surveys) that could be used in such studies. Also some ethical concerns need to be raised to update the research community on the risks and limitations of using certain quantitative approaches while researching this subject.

How Does (Old) Age Affect Data Quality? Findings from the German Ageing Survey (DEAS)

Hameister, Nicole; Klaus, Daniela; Engstler, Heribert

German Centre of Gerontology, Germany
nicole.hameister[at]dza.de, daniela.klaus[at]dza.de,
heribert.engstler[at]dza.de

One central dimension in exploring the potential and limitations of quantitative ageing research is the quality of existing survey data. Using the German Ageing Survey (DEAS), we will put forward findings for the interrelation of age and several methodological issues. DEAS is a nationwide representative cross-sectional and longitudinal survey of the German population aged over 40 and had started in 1996. Participants are questioned in detail on their objective and subjective living situation. Also, tests of cognitive capability and physical functioning are applied. Information is gathered via a CAPI and a self-administered PAPI and CAWI (since 2017) questionnaire. We will concentrate on two main issues: First, we will present findings on whether and how age correlates with attrition, non-response, tendencies for acquiescence or satisficing, as well as cognitive abilities and the factorial structure of several psychological instruments and scales. Second, we analyse the longitudinal accuracy and plausibility of retrospective biographical information: in each survey year, respondents are asked for their fertility biography (the number of children they have born, in which year they were born, and whether these are still alive). This repeated recording allows to compare deviations in the recollection of major biographic events and to analyse whether intra-personal inconsistency rises with age. We will conclude with an evaluation of data quality in older (DEAS) respondents and provide some practical suggestions for survey designers and data users in quantitative ageing research.

Access to Training in Older Age: Using Bayesian Hierarchical Modelling in a Comparative Lifecourse Perspective

Turek, Konrad; Henkens, Kene

Netherlands Interdisciplinary Demographic Institute,
Netherlands, The
kon.turek[at]gmail.com, henkens[at]nidi.nl

Ageing policies give high priority to lifelong learning (LLL) in older age, yet the effects of public investments are unsatisfying in many aspects. One of the most challenging problems is the reproduction or reinforcement of the existing inequalities through unequal access to education. As an indicator of the strength of barriers to enter training, accessibility plays a key role for the efficiency of LLL policies. A lifecourse approach using longitudinal data provides a promising perspective to study determinants of accumulation mechanism. It allows us to see path dependency (i.e. tendency to continue a particular activity or state) in individual trajectories and one of its elements – accessibility. When applied to comparative analysis, longitudinal patterns of behaviours can reveal essential aspects of broader structures or systems. We analyse path dependency and accessibility of training in a comparative lifecourse perspective. First, we ask whether training participation is path-dependent and analyse how previous attendance affects further attendance.

Then we shift to a comparative perspective and ask about the differences in access to training between countries and factors that can explain them. The data come from Survey of Health, Ageing and Retirement in Europe (SHARE). We observe individuals in twelve European countries over five years. As we show, accessibility of training differs between countries and can be related to macro-characteristics such as economic performance, demand for human capital, labour market, welfare regime, active ageing climate, and training systems. The study design requires a complex multilevel modelling with random slopes for lagged dependent variable and cross-level interaction that could be handled only by Hierarchical Bayes Models.

JS_RN01_RN37_03 | Urban Ageing: Towards an enhanced spatial perspective

Ageing, Housing Affordability and Spatial Age Segregation: Evidence from the UK

Sabater, Albert (1); Finney, Nissa (2)

1: University of St Andrews, United Kingdom; 2: University of St Andrews, United Kingdom
albert.sabater[at]st-andrews.ac.uk, Nissa.Finney[at]st-andrews.ac.uk

In most post-industrial ageing societies, the patterns of spatial age differentiation that exist are comparatively recent phenomena. In the UK, the current policy focus on 'ageing in place' highlights one possible mechanism expected to increase spatial age segregation. However, the potential consequences of the so-called "affordability crisis" –the fact that both owner-occupied and private rental housing have become increasingly unaffordable– have so far been neglected. Building on previous work, this paper examines trends in spatial age segregation and provides evidence of the impact of housing unaffordability on the patterns of intergenerational space within the UK context. Combining harmonised data from 2001 and 2011 Censuses as well as rich housing market data (property sales and rentals) and income estimates for small areas, we first investigate whether, and to what degree, communities along the urban-rural continuum are becoming residentially segregated by age. Second, we study whether residential age segregation between older (aged 65 and over) and younger (aged 25-44) adults is connected to housing (dis)advantage. The results confirm an increasing trend in the age differentiation of urban and rural communities over time, and indicate that areas with higher unaffordability levels are becoming more residentially age segregated. This pattern of reduced spatial interaction between older and younger adults highlights that there is an important socioeconomic dimension to spatial age segregation. Our findings reveal that housing unaffordability is partly responsible for the lower spatial interaction between older and younger adults. Thus, we argue in this paper that a fundamental shift is needed among the group of actors who are involved in place-making and place-shaping of different communities to avoid the emergence of generationed spaces in contemporary ageing societies.

"This Is A Good Place to Grow Old": A Narrative Analysis of Ageing In And Out Of Place

Ryan, Louise; Kilkey, Majella; Lorinc, Magdolna; Tawodzera, Obert

University of Sheffield, United Kingdom
louise.ryan[at]sheffield.ac.uk, m.kilkey[at]sheffield.ac.uk,
m.lorinc[at]sheffield.ac.uk, otawodzera1[at]sheffield.ac.uk

In the context of an ageing society, there is increasing attention on how people navigate and make sense of particular places through the ageing process (van Dijk et al, 2015; Van Hees et al 2017; Kearns and Coleman 2017). Ageing, coupled with bereavement and diminishing support networks, may impact on people's sense of belonging in local places (May 2011). Of course places are constructed and dynamic; continually made and remade over time (Massey, 2004). As well as perceived changes, there may also be material changes which impact on long term residents especially older people. For migrants, ageing may result in additional challenges. For those who arrived in Britain to work, ageing and retirement may raise questions about return to the country of origin (Ryan, 2004). But return is not necessarily easy as 'home places' also change over time and migrants may no longer feel a sense of belonging there – feeling 'out of place' (Valentine and Sporton, 2009). In this paper, drawing on new data from a large UK ESRC-funded project (Sustainable Care 2017-21), we explore how older, retired migrants narrate their experiences of ageing in and out of place. We focus on rich qualitative interviews with Irish, African Caribbean and Polish migrants in London and South Yorkshire. We examine their relationships to places through intersections of age, gender, ethnicity and class, and across different scales – local neighbourhoods, towns, cities and transnationally. In so doing, we contribute to understanding older people as active agents in place-making, while also paying attention to changing materialities of place through time.

Complexity and Contradiction: A Study of an Ageing Population's Experience of Urban Space

Scanlon, Peter; Ellis, Geraint; Flood, Nuala

Queens University Belfast, United Kingdom
pscanlon02[at]qub.ac.uk, g.ellis[at]qub.ac.uk,
N.Flood[at]qub.ac.uk

The nebulous of street patterns and urban forms that abound modern cities tends to be vehicle-centric or steered by a neo-urbanism tradition which sets pedestrian against vehicular in a struggle for supremacy (Marshall, 2005, pp. 41-48). This study will consider how the urban environment, its spatial semiotics and patterns provide the platform for engagement for an ageing population in the communities they reside. Furthermore, growing older requires a flexible and evolving environment making seniors more vulnerable to the effects of their urban setting on health and daily lives (Beard and Petitot, 2010; Kerr et al., 2013; Ribeiro et al., 2013). The research model intends to capture the collective praxis of people who live and actively engage in their urban environments. Moreover, it will explore urban centres along Ireland's Atlantic corridor, a region on the fringe of Europe with a blend of rural/urban centres under influence from their hinterlands and its dispersed populations. This study will utilise narrative mapping, walking interviews and spatial analytical methodologies. This model is expected to generate a new perspective and new data on how regional and urban/rural policy makers, planners and urban professionals can create and shape urban spaces to meet the needs of an ageing and diverse population.

Nostalgia, Solastalgia and Biographical Contextualisation: Perspectives on the (Post)Socialist Social Change Among Older Czechs

Galčanová, Lucie

Masaryk University, Faculty of Social Studies, Czech Republic
galcanov[at]fss.muni.cz

There is long-term interest within environmental sociology in the place attachment, belonging and residential satisfaction among older adults in the context of social change. In this paper, I take a closer look into how these concepts are related to theories of commemoration, especially to the notion of nostalgia and solastalgia, and I will elaborate their usefulness, also noting the pitfalls of interpreting data from qualitative interviews on perceptions of change among older adults. I call for a fine-grained distinction between theoretical depictions of 'contentment' among older residents, offering the concept of 'biographical contextualisation' in order to better understand the evaluation of social change over a long-term perspective. To illustrate the application of the concept, the paper draws on empirical data from two projects on quality of life among older adults: those living in the biggest towns (N=36) and in rural areas (N=21) in the Czech Republic.

JS_RN02_RN03_10 | Performative and Arts-Based Methods in Biographical Research

Creative Applications of Biographical Research Methods; thoughts on the inter-disciplinarity, analysis and interpretation of biographical data

O'Neill, Maggie (1); Nurse, Lyudmila (2)

1: UCC, Ireland; 2: Oxford University, United Kingdom
maggie.oneill[at]ucc.ie, lyudmila.nurse[at]education.ox.ac.uk

Since the publication of two editions of the *Handbuch Biographieforschung*. Springer VS (Lutz, H., Schiebel, M. and E. Tuider [editors]) in 2018, to which we contributed our chapter: Nurse, L, & O'Neill, M (2018) *Biographical Research in the UK: profiles and perspectives*, which provides an overview of developments and new dimensions in biographical research in the UK, we have been re-visiting work and publications of the colleagues whose biographical work we reviewed in the chapter. In the proposed paper, we reflect on the challenges of selecting materials for the chapter due to the wide variety of creative applications of biographical methods in the UK and continue our search for an interactive platform for exchanging best practices. We have been also reflecting on the status of the analytical tools that biographical researchers developed over the last decades and on the increasing multi-disciplinarity of biographical studies.

A Migrant's Biography as Art

Kijonka, Justyna

University of Silesia in Katowice, Poland
justyna.kijonka[at]us.edu.pl

The works of art derive from the artists' personal experiences, and sometimes even a traumatic event, but when it tells the story of not only the individual artist but the common experience – in this case – of migrants, it is especially engrossing for sociologists. The aim of this paper is to analyse the biography of migrants in the context of the palimpsest graphic art "Ilebiland" (1992-93) by Brygida Wróbel-Kulik, which is a graphic representation of the biographies of individuals of German descent who had migrated to Germany. Brygida Wróbel-Kulik put her own experiences and significant symbolic information on real maps (labyrinth, spiral, significant colours). Her work is a tale about migrating, questing for a promised land and homeland. The border as an experience (series "Stany Graniczne/Grenzzustände", 1978-1984), which is also common for my interlocutors plays an important role in this series. The paper is based on research that I carried out on migrants who came to the Federal Republic of Germany from

Upper Silesia in Poland as "(Spät-)Aussiedler" – "ethnic Germans" between 1970 and 2000.

Frames of Live: The Visual-Verbal Interplay in Photo-Biographical Research

Gonçalves, Ana (1,2); Bergamo, Alexandre (3)

1: Universidade de Lisboa, Instituto de Ciências Sociais, Lisboa, Portugal; 2: Instituto Universitário de Lisboa (ISCTE-IUL), Centro em Rede de Investigação em Antropologia, Lisboa, Portugal; 3: Universidade Federal de Santa Catarina - UFSC, Florianópolis, Brasil
goncalves-ana[at]campus.ul.pt, a_bergamo[at]hotmail.com

As a research tool, photography is being used, with increasing frequency, in social sciences. Therefore, in recent years, it has been faced and problematized in a much more profound manner. Nevertheless, despite such overall achievement, it is still quite common that pictures turn up in social studies mainly as a way of capturing and displaying the various and passing aspects of life. That is why most of the images included in them show panoramas or details of social contexts, collective and personal activities, primary and secondary groups or individuals. This proposal aims to contribute to the discussion of photography within the biographical research, viewing it as a specific medium of life narratives. Besides, it provides an opportunity to put side by side researches, based simultaneously on visual and biographical data, lately conducted in Portugal and Brazil. Drawing from particular cases, we intend to be attentive to matters of generating, recording, and transmitting memories and stories, while we will take a closer look at the mutual interference of the visual and the verbal in the biographical act, and show how this inflected gender and class relations. The empirical data also will allow us to identify how personal and collective narratives get involved in the process of fabrication of images, and how photographs might provoke (in the double sense of stimulating and challenging) memories in both oral and written testimonies.

Assemblage of Memory. A Female Experience of Memory Transmission and Performance

Niziołek, Katarzyna

University of Białystok, Poland
k.niziolek[at]uwb.edu.pl

The paper is aimed at presenting and discussing an interdisciplinary, collaborative research project that - as I believe - directly addresses the session aim of approaching creative applications of performative methods and their contributions to the development of biographical narrative research. Thematically, it is devoted to the history of so-called "bieżeństwo", which was a migration of people from eastern Poland forced by the retreating Russian Army in 1915 (during the First World War), when the Germans broke the eastern frontline. The stories of those refugees, among whom a large number were peasants of Belarusian origin and women with children, make a crucial part of the regional history that - for one reason, due to its gendered nature - has been transmitted mostly within families. Methodologically, the approach applied in the project is based on participatory theatre that engages non-artists both as content providers, and on-stage performers. Consequently, the paper is focused on the project participants, all females, and their experience of memory transmission and performance. Both the topic (memory of "bieżeństwo"), and the method (participatory theatre) are briefly introduced to raise questions of the scientific possibilities and limitations of such an interdisciplinary, theatre-based approach to qualitative research.

Parenting Strategies around Young Children’s Education in Urban China – Intensive, Responsible and Stratifying?

Eklund, Lisa

Lund University, Sweden
lisa.eklund[at]soc.lu.se

This project investigates the empirical realities of shifting norms and practices around young children’s education in urban East Asia. In particular, it examines how parenting strategies are entangled with aspirations for human capital accumulation and upward social mobility, as well as the best interest of the child, and how these notions are reconciled and enacted differently along gender, generation, and class lines. Based on ethnographic fieldwork in Beijing and Shanghai, the paper outlines the ways in which parents’ strategies around their children’s cognitive and academic development are motivated, negotiated and prioritised and how parents navigate through compromises, sacrifices and contestations to realise these strategies. Working with the concepts of intensive motherhood, responsible parenting and stratified reproduction it serves to illuminate ways in which parenting cultures both reflect and reproduce inequalities not only with regards to gender and class, but also with regards to intergenerational relations. In order to understand parenting strategies around young children’s education in urban China it is argued that the familialistic welfare policy context, which strengthens dependencies within families both between parents and across generations, as well as the low-fertility context need to be taken into account, as many children are their parents’ ‘only hope’. Parents’ strategies also mirror well China’s ambition to take a lead in the global economy by raising competitive producers and consumers. Yet, among some upper middle-class families, the interest of the child is taking precedent over human capital accumulation, which gives a different meaning to responsible parenting, but at the same adds to intensive motherhood by balancing demands on children’s mental and emotional wellbeing and demands on cultivating and nurturing their skills and knowledge.

A Gap in Development: The Effect of Parental Involvement on Children Cognitive Skills

Troncoso, Patricio; Morales-Gómez, Ana

University of Manchester, United Kingdom
patricio.troncoso[at]manchester.ac.uk,
ana.morales[at]manchester.ac.uk

Living in poverty during childhood is harsh enough in many aspects. Regarding a child’s overall development, its consequences can be devastating. The so-called socioeconomic gap during compulsory education and beyond, has been widely reported by educational research. But when and how is this gap created? It has also been found that the quality of care that guardians provide has a sizable impact on cognitive development at the earlier stages of life. To test this hypothesis alongside the socioeconomic component, we used data from the Chilean Longitudinal Survey of Early Childhood (ELPI). We developed a threefold measure of parental involvement composed of positive parenting, parental stimulation and ineffective parenting, to unveil what can make a difference in a child’s cognitive skills. We found that the effect of parental involvement varies across children from different socioeconomic backgrounds, from as early as three years old. Cognitive scores are found to be higher for children living in the wealthiest households. Although discouraging at first glance, it is also found that a high level of positive parenting has a stronger positive impact on deprived children, while the negative impact of ineffective parenting is stronger on the most advantaged children. This fits into a narrative of striving for success and resilience against all odds for deprived children. The parental involvement construct can contribute to further our understanding of the socioeconomic gap in cognitive skills acquired by children, which can be particularly relevant for tackling the inequality-related gaps in a variety of later-life outcomes.

Irresponsible or Incapable? Discussing Parents as Users of Early Childhood Education and Care Services in Finland

Alasuutari, Maarit; Kauppinen, Anni;
Paananen, Maiju

University of Jyväskylä, Finland
maarit.alasuutari[at]jyu.fi, anni.kauppinen[at]gmail.com,
maiju.paananen[at]tuni.fi

The official functions of Finnish early childhood education and care (ECEC) concern learning and development of children and work-family reconciliation. Children have an unconditional entitlement to ECEC, and thus, every parent is able to enroll her child in ECEC. Due to the universal access and the educational function given to ECEC, one could assume that using ECEC services would have become a social 'norm'. However, this seems not to be the case, since the unconditional access to the services has been recurrently debated. While the debates may concern children, they often concentrate on parents. In this paper, we investigate the discourses municipal politicians draw on when they discuss and debate universal access to ECEC from parents' point of view. Applying Foucauldian thinking, we understand the discourses as producing specific subjectivities for parents and implications of 'proper' family life. The data was collected in 2016, when the Finnish government enforced a restriction in the hours of the unconditional entitlement to ECEC. However, municipalities as providers of ECEC could decide whether they enforce the governmental restriction in their area or not. The data includes qualitative interviews with municipal politicians (31) in 10 municipalities and the council debates about the local enforcement of the governmental restriction in three of these municipalities. The analysis applies discourse analytic tools. The analysis shows two main discourses, the discourse of irresponsible parents and the discourse of incapable parents, which the politicians draw on both in the council debates and interviews. While the discourses produce very different subjectivities for the parents as users of ECEC services, they both suggest that the 'normal' use of ECEC is linked with parents' labour market participation.

A Child as A Subject in Childcare Selection? Parents' Notions of The Child and Early Childhood Education and Care

Kuukka, Anu Katriina; Siippainen, Anna;
Alasuutari, Maarit

University of Jyväskylä, Finland
anu.kuukka[at]jyu.fi, anna.siippainen[at]jyu.fi,
maarit.alasuutari[at]jyu.fi

When the child is nine months old, Finnish parents need to decide about future childcare arrangements. They can choose either to continue taking care of their child at home, or to return to paid work. In the latter case, they can choose from a range of early childhood education and care (ECEC) services or a combination of these. In Finland, the enrolment in out of home care is relatively low, less than 30% of children younger than two years attend ECEC. In this paper we focus on parents' accounts for their decision to enrol their one-year-old child in ECEC and especially, on the accounts that focus on the child. We analyse what the conceptions of the child are that the parents draw on and whether they assume the child have agency in the childcare selection. The study takes a novel perspective to research on childcare selection, since previous research usually relates the selection to the socio-economic background of the family (Sylva & al. 2007). The child's role as a 'participant' or 'agent' in the selection is rarely studied. The agency potentially produced to children in parents' accounts is examined as a discursive phenomenon. The methodology draws on discourse analysis. The data consist of 63 qualitative interviews with Finnish parents whose youngest child was one to two years old. The study forms part of the CHILDCARE project financed by the Strategic Research Council at the Academy of Finland. The findings show the understanding of ECEC as an arena for the child's social relations. A young child is, especially, described as an agent in the childcare selection through her/his relationships to peers and ECEC activities.

JS_RN04_RN13_02 | Parenting, Childhood, Scheduling and Time

“Helicopter Parenting” As A Social Problem

Lee, Ellie Jane

University of Kent, United Kingdom
E.J.Lee[at]kent.ac.uk

A tension central to modern Western childhood is that between protection and autonomy. From the point of view of scholarship concerned with parenting cultures, recent decades emerge as increasingly dominated by an ethos of protection in a particular form. Understanding of risk, it has been argued, has qualitatively modified, to mean childhood experiences considered previously innocuous or even beneficial to the development of autonomy have come to be associated with harm. In turn, the responsibility of the parent has simultaneously expanded in line with a perceived need to protect by managing childhood risk. ‘Parenting’ as a term has been understood from this perspective to include connotations of self-consciousness in the part of parents regarding the need to risk-manage, as well as a required openness to professionalised accounts of risk. In this context, the growing visibility of the terms ‘overparenting’ and ‘helicopter parenting’ this century appear notable. This paper will consider this development drawing on methodologies developed in the sociology of social problems (Best 2008) and presenting a qualitative media analysis of ‘helicopter parenting’ in the British media 1992-2019. The central question considered is whether claims about parents who ‘helicopter’ or who are ‘overinvolved’ in their children’s lives challenge the prevailing understandings of risk. It will be argued that evidence points less to a reconstruction of childhood entailing a greater emphasis on autonomy, than continuation of the demand that parents manage risk, albeit in a reworked form.

Free from School in The Child's Best Interest

Proboeuf, Pauline

Sciences Po, France
pauline.proboeuf[at]sciencespo.fr

Both sociologist of the family and of education have taken a strong interest in the educational practices implemented by families: from parental strategies regarding school choices to the importance of parents’ socioeconomic background on children’s educational outcomes. However, few studies have investigated the interrelation between educational choices and other life choices. By examining a particular population, parents who decide to homeschool their children, I hope to fill this gap. Parents decide to homeschool in their child’s best interest, but their choice has an impact on the family itself,

especially on mothers, who decide to invest more in the domestic sphere. This research uses both qualitative and quantitative data, collected in France, in both rural and urban areas. It includes forty in-depth interviews with homeschooling parents; six ethnographic observations at home; a descriptive data analysis of around six hundred responses to an online survey; and textual data from social networks (Facebook pages of parenting groups). With these data, I analyze parents’ depiction of the world of childhood and unpack the role they assign themselves as parents. The parents in my sample often identify “turning points” in their life course to justify their educational choices. I demonstrate how parents, and above all, mothers, redefine their identity (Faircloth, 2009) and adapt their daily life to sustain their choices, sometimes with the help of parenting networks, which help parents create new norms. Finally, I illustrate how their definition of the child’s best interests has a strong impact on other aspects of parents’ lives, from political beliefs to consumption and domestic activities.

Off We Go to a Bright Independent Future: Social Mobility, Educational Aspirations for Children, and Middle- Class Parenting in Urban China

Chen, Meng (1); Zhu, Di (2)

1: Shanghai University, China; 2: Chinese Academy of Social Sciences, China
mchen[at]shu.edu.cn, zhudisoc[at]163.com

This study assesses how perceptions and practices of parenting in Chinese middle-class families have evolved in the past decades under the dual influence of marketization and globalization. Drawing on Bourdieu and Lareau, the paper argues that parenting practice is not only affected by the habitus that has been inherited from one’s origin family but shaped by their experience of social mobility as well as educational aspirations for children. Based on semi-structured in-depth interviews with parents of preschool and school-age children, I emphasize the importance of connecting the past and the future in understanding the current parenting practices. While Chinese middle-class parents have different experiences of social mobility, their parenting practices tend to be similarly affected by their perceptions of their current socio-economic situation and, for some, experiences of upward mobility. Intergenerational transmission of parenting styles is subject to the force of change that results from middle-class parents’ reflections and their intentional or unintentional practices of ‘doing middle-class’. Furthermore, with fierce neo-liberalist educational competition and an increasingly wide range of educational options in the context of globalization, child-rearing practices of the middle-class parents are clearly shaped by their educational expectations for children. For middle-class families, although the aim of child-rearing is often simplified as ‘bringing up the child to an independent person’, parenting practices are often adapted to serve the goal of realizing the educational expectations.

“I Think Life Experience is Just as Important as Education Really”: Mothers’ Understanding of Primary School Children’s Well-Being in Education and After-School Activities

Head, Emma

Keele University, United Kingdom
e.l.head[at]keele.ac.uk

This paper draws on a qualitative project with mothers of primary school children in England to explore maternal understandings of children’s well-being in relation to formal school and leisure time. Education is a sphere where forces of globalisation are being felt in terms of the measurement of children, schools and nation states. The concern with the ‘performance’ and outcomes of children has meant that formal education has become an area where norms of ‘good’ parenting as intensive parenting are communicated to children and their parents. Alongside these shifts, children’s leisure time has also changed in recent years. There has been a decline in freely accessible public spaces for families; rising anxieties about children and time on screen; and an increasing marketisation of sport, music and other activities for children. I draw on mothers’ narratives of schooling and after-school activities to consider how education and leisure are understood to impact on children’s well-being in different ways. Lareau’s (2002) work on childhood and her idea of ‘concerted cultivation’ have been influential on understandings of after-school activities as part a middle-class concern with securing the social position and future prospects of their children. The accounts from my study suggest a multiplicity of reasons for engagement with after-school activities for working- and middle-class mothers. For some mothers, how children spend their leisure time is understood as providing alternative experiences to the increasingly target-driven formal education system and becomes a significant part of family life. I conclude this paper by considering how the demands of schooling and leisure time impact on the well-being of mothers and their children.

JS_RN04_RN13_03 | Parental interpretations of children's 'best interests'

What’s Best for the Child? Parents Decisions on the Treatment of Children’s Variations of Sex Development (VSD) in France

Larrieu, Gaëlle

Sciences Po, France
gaelle.larrieu[at]sciencespo.fr

People with a VSD are born with variations in sex characteristics -including chromosomes, gonads, genitals or sex hormones- that do not fit the typical definitions of male or female bodies. In recent years, conflict has arisen over the early surgery performed on newborns and children, and more generally about the management of VSD and the role of parents, children, and medical experts. This issue has become the interest of international organizations and policy makers. When a child is diagnosed with a VSD, early intervention is often required, and parents are asked to make decisions in their child’s best interest. Previous sociological studies have considered this issue from a theoretical perspective, but his paper contributes to the literature by focusing on parents’ personal experience when managing their children’s VSD. How do parents interpret their child’s best interests? How do they make decisions regarding surgery, gender assignment, and the implication of the child in the process? In which actors do they put their trust? This research is based on more than twenty in-depth interviews with French parents of children with a VSD, various meeting with doctors and associations, as well as an examination of documents produced by associations and medical experts. The empirical analysis shows that parents find themselves in a state of uncertainty when their child is diagnosed with a VSD and are required to make long-term decisions within a few weeks. Parents often have trouble evaluating their child’s best interest and lean on doctors to define it. The study unveils three key factors that mediate parents’ behaviour: Previous family experiences, medical and scientific knowledge, and socioeconomic background.

Best for the Child and the Mother? Infant Feeding Decisions in Spain

Dominguez Folgueras, Marta

Sciences Po, France

marta.dominguezfolgueras[at]sciencespo.fr

The WHO describes breastfeeding as « the normal way of providing young infants with the nutrients they need for healthy growth » and recommends breastfeeding exclusively on-demand for the baby's first six months. Breastfeeding is recommended as the best for the child, and this recommendation is often framed under the "risk paradigm". However, it ultimately depends on mothers' bodies and preferences. The literature has shown that whereas some women find breastfeeding enjoyable and empowering, others experience it as negative and feel more empowered when they use formula. When making decisions about infant feeding, mothers need to take into account their individual interest as well as the baby's, and their decisions are socially situated. This is the starting point of this research. I analyze women's experience and decisions about infant feeding and try to disentangle the different definitions of the child's and mother's best interests and how they are (re)constructed by mothers depending on social factors. I use data from a longitudinal project that carried out semi-structured interviews with 58 women in Spain. Women were interviewed during pregnancy (in 2011) and again when their babies were 18 months old (in 2013). Almost all women intended to breastfeed their children, but they ended up following different feeding strategies (from exclusive formula feeding to long-term breastfeeding). The role of relevant experts, as well as mother's relationship with the labor market emerge as key factors that mediate mothers' definition of what's best for them and their children. Surprisingly, the role of socioeconomic background did not appear as significant in the interviews.

Contingent Care: Motherhood, Citizenship and Social Reproduction Across Difference

Humphris, Rachel

University of Birmingham, United Kingdom

r.humphris[at]bham.ac.uk

This paper brings feminist perspectives on public/private space and home studies into dialogue with scholarship on urban encounters through the notion of 'home encounter'. Drawing on 14 months participant observation with more than 200 Romanian Roma families in the UK, the article traces how the (re)production of difference operates within child welfare home visits through the notion of appropriate motherhood, 'safeguarding' and the 'best interests of the child'. The home can exacerbate perceived differences, becoming a painful site of exclusion but it can also allow migrant mothers to purchase a form of social belonging through hosting. The article argues that migration regulations and welfare changes are affecting and reconfiguring the most intimate spaces of migrant's family lives. The home becomes a site for both the contestation and

reproduction of racialized and classed understandings of motherhood, citizenship and social reproduction. Home encounters demonstrate the significance of private space and notions of appropriate parenting to understanding how diversity is governed and heightens the urgency of a gendered and spatialized lens to notions of intercultural encounters across difference.

JS_RN04_RN13_04 | Doing research with children and parents

Rights or Responsibilities? Disabled Children and Young People's Perspectives on their Rights to Education, Work, Leisure and Travel in the Context of Neo-liberal Policies in Japan and the UK

Martin, Katie (1); Larkins, Cath (1);
Koizumi, Hiroko (2)

1: University of Central Lancashire, United Kingdom; 2: J.F. Oberlin University, Tokyo, Japan
kmartin[at]uclan.ac.uk, Clarkins[at]uclan.ac.uk,
koizumi[at]obirin.ac.jp

Over the past 20 years, concerns have been raised in UN Concluding Observations regarding violations of the rights of disabled young people in both the UK and Japan. This prompted a UK-based group of young community researchers (aged 12-24) to initiate participatory research investigating disabled children and young people's rights to education, work, leisure and travel. Interviews were undertaken with 77 disabled children and young people (aged 9-26) in Japan and 33 in the UK. Data was analysed by 23 young community researchers and 3 academics in the UK and Japan. The findings from Japan indicate that demanding family working hours policies, and restrictive education and afterschool hours care are accompanied by inadequate provision of accessible and relevant leisure facilities, lack of awareness of leisure opportunities and the benefits of play, and challenges regarding buildings, the costs of travel and the travel system itself. All of these issues were compounded by a lack of parental, professional, governmental and general public understanding of disabilities. There were assumptions about employment within families and a lack of focus on government and business readiness to employ disabled young people. These findings are echoed in emerging analysis of the UK data. We suggest that a neo-liberal approach to children's citizenship, family and education policies in the UK and Japan emphasises disabled children's responsibility to create themselves as future productive citizens. It makes children and their families responsible for providing disabled children and young people's leisure and working opportunities whilst maintaining structural barriers to these.

Biographical Approach to Studies of Parenting Culture: Mothers' Experiences Relating to Children's Upbringing

Nurse, Lyudmila

Department of Education, University of Oxford, United Kingdom
lyudmila.nurse[at]education.ox.ac.uk

The proposed paper focusses on challenges and opportunities of qualitative biographical methods in studying parenting cultures. The paper is based on the findings from the EC H-2020 ISOTIS project qualitative biographical study of mothers of pre-school and school age children, which was conducted in 10 European countries in 2018. Built upon the concept of bio-ecological systems of personal development by Bronfenbrenner (Bronfenbrenner 1979; Bronfenbrenner & Ceci, 1994; Bronfenbrenner & Morris, 2006), the study inter alia explored experiences of mothers from economically and culturally disadvantaged families relating to upbringing of their children. Use of the biographical approach in the comparative qualitative study of mothers enabled us to gain insight into interaction between different systems in child's upbringing. Common research methodology provided an insight into the meaning of parenting from the perspective of mothers from a variety of social, economic and cultural backgrounds (native-born, immigrant or ethnic minority) in modern European societies, including changing perspectives on parenting cultures from their own childhood and as compared to their own parents parenting styles.

Children's Views On "Good Care": The Case of Nanny and Au pair care

Eldén, Sara Karolina

Lund University, Sweden
sara.elden[at]soc.lu.se

Care for children is, one could argue, a thoroughly researched subject, but children's own narratives of everyday care, as well as their views of what constitutes 'good care' is less explored. The practice of hiring nannies and au pairs to care for children is a widespread solution to work-family dilemmas among middle-class parents. It has been studied from the perspective of paid domestic workers (Anderson, 2000; Ehrenreich & Hochschild, 2002; Widding Isaksen, 2010), and from the perspectives of parents, analysed through the theoretical lens of 'intensive' mothering/parenting (Hays, 1996; MacDonald, 2010; Eldén & Anving, 2016). This paper takes the children's own perspectives as a point of departure: their understandings and narrating of the care situation they find themselves in, when their parents hire nannies and au pairs to care for them. The data comes from a study of 'nanny families' in Sweden, where all participating actors – nannies/au pairs (26), parents (28), and children (19) – have been interviewed. The children's narratives contest conceptualizations of care done by both parents and nannies/au pairs, about the possibility of dividing care into manageable blocks of time, and 'menial' (labour) and

'spiritual' (emotional, qualitative) tasks (Roberts 1997), pointing instead towards everyday care as consisting of emotional doings. Through the children's narrating, it becomes obvious that being in a care situation with a nanny/au pair requires that reciprocal sentient activities (Mason, 1996) are carried out, if the situation is to be considered 'good'. The paper argues for the necessity of including children's perspectives in researching families and parenting culture in general, and care in particular, as these have the potential of challenging taken-for-granted assumptions.

Who Is Involved in Parental Separation and What Are Their Roles? New Insights from Children's Perspectives

Zuccato-Doutlik, Marlies; Kogler, Raphaela; Zartler, Ulrike

University of Vienna, Department of Sociology, Austria
marlies.zuccato-doutlik[at]univie.ac.at,
raphaela.kogler[at]univie.ac.at, ulrike.zartler[at]univie.ac.at

Numerous children experience parental divorce, be it in their own families or in those of relatives, friends or classmates. Although parental separation and its consequences for children have been well-researched, scholarly knowledge about children's concepts of children's and other participants' roles in the course of the divorce process is limited. Based on a participatory study with 60 8- to 10-year-old children in one rural and one urban Austrian region, we analyze how respondents conceptualize the roles of children and other involved persons during the process of divorce. The study comprises focus groups, individual interviews and a wide range of participatory child-friendly methods like drawings, games, handicrafts or storytelling. The study is not primarily interested in investigating what children think about their own parents' divorce but includes children with divorced parents as well as children who did not experience parental separation. Results show that children's accounts about actors and roles were differentiated and rich in detail. Children's concepts of divorce and their imaginations of involved participants included a wide variety of actors like children, parents, relatives, friends, parents' new partners or officials like judges or children's counsellors. While adults' roles were predominantly characterized as powerful and influential, the respondents' constructions about children's roles and possibilities for child participation ranged from powerless and passive (no possibility or intention to participate) to active and reflexive (informed action based on profound knowledge about children's rights). Furthermore, children's accounts contained numerous stereotypes that will be presented and related to concepts of children's agency.

JS_RN04_RN13_05 | Meanings of 'child welfare' and 'good parenting'

“Good Parents” and “Beloved Children”: Child Welfare Services, State Intervention and Intensive Parenting

Szóke, Alexandra

Institute for Regional Studies, Hungarian Academy of Sciences,
Hungary
alexa.szoke[at]gmail.com

Parenting is one of the most private intra-family relationships, yet it has increasingly become the target of professional and state intervention. In Hungary, child welfare professionals are primarily responsible for ensuring that parents fulfill their responsibility of looking after the well-being of their children. They are expected to act “in the child’s best interest”, which in practice often leads to enhanced monitoring of family life, financial punishment or the removal of children from families. Up until recently, these were particularly directed towards poor, uneducated (often Roma) parents, considered to lack parental skills. My paper examines how the new trend of “intensive parenting” influences the work of these professionals and their relationship to families. Based on a year-long ethnographic research, the paper shows how the new parenting culture have significantly changed what professionals consider ideal parenting. While earlier neglect was assessed mostly in physical terms, currently a strong emotional parent-child relationship is promoted. Increasingly the ultimate judgment of parenting ability has become parental “love” and a “strong” parent-child bond. However, as my research shows, these are extremely subjective and fluid notions that are often used to reinforce personal convictions and dominant values about parenting, deservedness and social belonging. At the same time, professionals often find intensive parenting practices problematic and, in its extreme cases, just as endangering to the well-being of children as neglect (formerly linked to low education and poverty). The paper reveals the ways the new parenting culture is changing child welfare professionals’ understanding about what “good” parenting and an ideal childhood is, as well as the ways this is reflected in their relation and practices towards both well-to-do, educated and poor, uneducated families.

Casas de Pensamiento Indígena (CPI): Being an Indigenous Child in Bogota Sanchez Caro, Carmen María

Université Paris 13, France
carmenmsanchez[at]gmail.com

This proposal aims to present a few tensions and contradictions when it comes to question global policies and local interpretations related to indigenous children and ECEC services. What it means to attend to young children from indigenous communities in Bogota. Could early childhood education and care (ECEC) services be reduced to ethnic backgrounds, as is the case of Casas de Pensamiento Indígena (CPI)—indigenous childcare services. Therefore, this presentation highlights how indigenous caregivers, parents and children face an institutional script that asks them to perform indigenism. This means they spend the day enacting authenticity or an indigenism as a means to assure their rights and protect their cultural identity. The question is what cultural identity are they defending? The one institutionalized by others? When thinking about indigenous affiliations, the notion of “edges” in Rancière’s (1998) helps to theorize and question the idea of wellbeing or diversity as a way to limit oneself in differentiating oneself. Where does the indigenous category begin and where does the children category stop? Where does the ECEC services script begin and where does the family discourses stop? The first results, show some different ways of being in society, like to be a child, to be indigenous, and to be a citizen in a place where young children are cared for in Bogotá.

Social Investment in Childhood: Arguments in the Academic and Institutional Arenas

Martin, Claude

CNRS, France
claude.martin[at]ehesp.fr

Social investment is one of the last emergent concepts in the “Welfare modeling business” at the international level. The main argument is the following: earlier this preventive investment during childhood, bigger will be the “dividend”, in terms of avoided costs when children reach adulthood. Since the beginning of the century, some academics are supporting its use at the EU level (Esping-Andersen, Hemerijck, Palier) and a lot of publications are discussing its pertinence. This concept also received a strong echo in the French institutional arenas. In our presentation we propose to synthesize this current debate around social investment, its main hypothesis and arguments but also its limits before presenting the way this notion is adopted in French recent official reports to give a background to the parenting support policy. We argue that it seems more a concept oriented to avoid cost in the future than to support children well-being in the present. It is also a notion which gives place to many quiproquos among family and children professionals.

Children's Perspectives and Interaction as Starting Points for Reflections on "Child well-being" and "Parenting"

Türkyilmaz, Aytüre (1); Alberth, Lars (2)

1: Wuppertal University, Germany; 2: Leibniz University Hannover, Germany
tuerkyil[at]uni-wuppertal.de, l.alberth[at]ish.uni-hannover.de

Childhood sociology has established an empirically based approach to research into growing up: Historical developments and globally varying conditions of childhoods are taken into account and interpreted as central components of social ordering. In recent years, 'child well-being' has become an important keyword for the discussion of socialization and its contexts within the field of childhood studies as well as in (inter)national social reporting. However, child well-being does not represent a consistent theoretical concept. Rather, it is a broad term for a large number of indicators which, taken together, are intended to reflect the qualities and differences of growing up. Furthermore, the search for conditions of well-being clearly reveals a politically motivated future-orientation and is mainly approached ex-negative, i.e., based on the deficits of disadvantaged classes. This also applies to the term 'parenting', which receives a similar amount of attention in political debates. In this way, indicators do not only document the varying empirical realities of children's lives, but are themselves expressions of an understanding of 'good childhood'. On the basis of qualitative data from studies on educational inequalities and child protection, we take an interactionist point of view, thus going beyond a one-sided approach that focuses on structural dimensions and adult actions. Instead, we argue to take both the children's perspectives and their relevance for contexts of socialization into account, aiming for a process-oriented framework for research on the inequalities in growing up.

JS_RN05_RN09 | Financialisation and Its Impacts on Everyday Life

JS_RN05_RN09_II_09 | Financialisation and its Impacts on Everyday Life I

Connecting Policy with The Personal: UK Pension Reforms and Individual Financial Decision Making

James, Hayley

University of Manchester, United Kingdom
hayley.james[at]postgrad.manchester.ac.uk

Automatic enrolment into workplace pensions was introduced in 2012 to stem the falling levels of private pension saving. The policy has led to more people participating in workplace pensions; yet, most are saving at minimum default contribution rates (which are unlikely to deliver adequacy in later life) and are not engaging with financial incentives offered for greater contributions. The economic models of decision-making that have provided the foundation for the pensions industry and supporting policy have not been able to explain sufficiently why people are not engaging with pension saving as expected. This research approaches pension decision-making as a practice embedded in the subjectivities of everyday life, drawing on literature from the sociology of consumption. The research follows a constructivist-interpretivist methodology using semi-structured interviews with 42 participants aged 25 to 45 years old who had experienced automatic enrolment into workplace pensions. The findings suggest that there are different approaches to pension decisions which connect to the social, cultural and moral worlds of individuals. The research identified four pension decision-making approaches which responded to the shifting context of an individual's everyday experience. These approaches represent specific challenges for policy and industry in terms of recognising the complex and varied nature of personal interaction with pension decisions. This paper provides an empirically grounded and theoretical understanding of pension decision-making, which contributes to the formation of a sociological model of financial decisions as a practice of consumption. It also contributes to commercial and policy solutions which may help to improve pension adequacy in later life.

Multigenerational Householding in the Age of Financialization: Mortgage Family Practices in Warsaw

Olcoń-Kubicka, Marta; Halawa, Mateusz

Institute of Philosophy and Sociology at the Polish Academy of Sciences, Poland
marta.olcon[at]gmail.com, mateuszhalawa[at]gmail.com

As the first postsocialist generations was going on their own in Warsaw, Poland, since 2000s, and among the middle-classes, the focus on lifestyle, consumption, and educational achievement gave way to a new passion—real estate. The global trends of rising wealth inequalities and the financialization of housing, combined with the local housing crunch, has made homeownership a challenging and fraught project for those starting new households. This paper uses ethnographic research to investigate practices of householding among first-time mortgagors against the background of emerging postsocialist housing imaginaries, which tie housing assets to visions of current and future good life. The mortgaged apartment becomes overdetermined as not only shelter, but status object, passive-income investment, source of asset-based welfare, and future gift or inheritance. Despite the purported individualization built into mortgage contracts, we show how mortgage debt in the name of young household members is attached to, embedded in, and cared for in broader kinship networks. This way intergenerational family moralities and practices of relational accounting are revealed as a central and overlooked aspect of mortgage finance. Focusing on the relationship between mortgages, families, and financialization, we analyse how the classed experience of unequal housing trajectories in the past and the present shapes expectations of and decisions about the future. The paper is based on ethnographic research in 28 young family households in Warsaw and on interviews with 18 parents supporting their adult children's pursuit of homeownership.

'Fuck You Money!': Seeking Early Retirement and Financial Independence as A Paradox of Hyper-capitalist Strategies as Well As Anti-capitalist Resistance

Van der Horst, Hilje; Wahlen, Stefan

Wageningen Uversity, Netherlands, The
hilje.vanderhorst[at]wur.nl, stefan.wahlen[at]wur.nl

Increasingly people seek financial independence and early retirement (FIRE) through strategies of low spending, high saving and investment. This FIRE movement shows a paradox: On the one hand, the practices propagated are highly capitalist in nature, and consist of intense financialization of household practices and decision making. On the other hand, there is a striking sense of protest against the current capitalist system that exploits both people and nature. People affiliated with FIRE rethink their way of living and look for a way out through consumption and investment strategies. Having the kind of money and assets that allow them to say 'Fuck you!' to any kind of paid activity is seen as the ultimate freedom. We will scrutinize FIRE by concatenating the theoretical lenses of diverse economies with that of social practices and by means of a content analysis of online blogs. Diverse economies emphasize marginalized and hidden practices, including creative alternatives and challenges to capitalist neoliberal society. Theories of practices account for the myriad of day to day activities that have been hidden from mainstream economic thinking. We attest that the combination of both sets of thinking will assist in critically assessing the paradoxes that the FIRE movement entails.

Narratives of Housing Financialisation of Young Adults from the Czech Republic

Samec, Tomáš

Institute of Sociology of Czech Academy of Sciences, Czech Republic
tomas.samec[at]soc.cas.cz

Many European cities are dealing with the impacts of housing financialisation. In this paper, I present the case of the Czech urban centers such as Prague and Brno which currently face housing affordability crises. The data from Czech Statistical Office indicate that since 2016 the prices of apartments in Prague have risen by approximately 35%. I aim to unfold whether increasing housing prices affect the housing pathways of young adults – people in their 20s and early 30s. Young adults are currently entering housing market which relies heavily on the mortgage loans, where housing is becoming an investment and where they compete with expansion of short-term rental such as AirBnB. In other words, they are entering financialised housing market. I study their housing pathways through the interviews and focus groups with young adults from Prague, Brno, Pilsen and Olomouc collected in the ongoing research project. I aim to focus on what discourses

surround the practical actions of young adults; to what extent the language and narratives are financialized themselves. Does financialisation of housing inscribes in the language of young adults or does certain discursive practices perform the housing financialisation; or both? Specifically, I explore to what extent are young adults able to express their stance toward their housing situation with or without usage of financial language and unfold how they frame their understanding of the current situation on housing market.

JS_RN05_RN09_II_10 | Financialisation and its Impacts on Everyday Life II

Over-indebtedness, Debt Management and Saving: Drawing Class Boundaries in and Through Financial Education

Maman, Daniel (1); Rosenhek, Zeev (2)

1: Ben Gurion University of the Negev, Israel; 2: Open University of Israel, Israel
dmaman[at]bgu.ac.il, zeevro[at]openu.ac.il

Notions and practices of financial education have evolved in the last decades as an important institutional field where the constitutive traits of the desired financial subject are formulated and communicated. At the national level, the responsible and calculative financial subject is formulated in universal and neutral terms, as seemingly detached from social locations and hierarchies. Yet, the financialization of everyday life has different qualities and effects for individuals and families differently positioned in these hierarchies, and subjects are accordingly financialized in different modalities. In this paper we examine different modalities of financial education associated with different class positions, comparing them in terms of organizational practices and contents communicated. We analyze financial education programs conducted by different agencies in Israel that target, implicitly or explicitly, different social classes. We examine the modes of operation and instructional and informational materials disseminated by these programs, focusing on the ways in which responsible and proper financial conduct is defined, explained and justified, particularly with regard to debt management and saving. Our analysis reveals significant differences between these programs concerning premises about proper and improper financial conduct and their causes, forms of intervention employed, meanings attached to practices of personal finance, and prioritized habits and dispositions. We contend that these differences indicate that financial education contributes to the drawing and signalling of class boundaries within a setting of financialization of everyday life, where the positioning of different populations in the financial sphere plays a key role in the production and reproduction of social hierarchies.

The Everyday Politics of Debt in Denmark - A Cosmological Interpretation

Schwarz, Benjamin

Roskilde University, Denmark
bschwarz[at]ruc.dk

The normalisation of financial consumption has brought a financialised culture into existence. This 'financialisation of everyday life' urges people to internalise the logics of financial capitalism, becoming self-responsible, risk-taking - and inevitably for some, debt-plagued - 'financial subjects'. The research on financialisation has been informed by Foucauldian and ANT frameworks, basing their analyses of how state bodies and financial markets govern financial consumers in UK and USA on documents. Recently scholars have pushed for more sensitive accounts, urging researchers to move closer to people's actual engagement with debt, to reflect on how this engagement is conditioned by among others geographical location as well as to experiment with alternative theoretical lenses. In this presentation, I will try to answer this call by presenting my PhD on people struggling with debt in Denmark. Drawing on interviews with debt-ridden people and observations of their institutional encounters, I will argue that their everyday experiences of confusion, deprivation, humiliation, isolation and surveillance are manifestations of an overall logic guiding the governance of debt - what I will think of as a 'cosmology'. My argument is that these sensations are the necessary product of, on the one hand, an extremely liberal financial market and, on the other, institutions whose formal instruments are too weak to recover outstanding debt. This creates a situation of institutional skepticism and (improbable) threats and makes room for less formal, morally charged "instruments" - or rather rituals - of shame, sacrifice and, in very rare cases, purification. The presentation will paint a radically different picture of Denmark, otherwise often imagined as the perfect welfare state that suspends the need for incurring debt and for individual responsabilisation when that debt turns bad.

Relationship with the Brand Throughout Life. Biographical Narrative Interview in Consumer Research

Skoczylas, Łukasz Mateusz

Adam Mickiewicz University in Poznań, Poland
luke[at]amu.edu.pl

The aim of the speech is to present a biographical narrative interview as a research technique in consumer research projects, especially in the field of research on the relationship between the brand and the customer and the relation to newer products introduced to the market. The presentation will be based on the experience of the research project "Towards relational forms of using banking services", carried out in cooperation between the Institute of Sociology of Adam Mickiewicz University in Poznań and Santander Universidades. Within this project an interdisciplinary team carried out 20 biographical narrative interviews, which were then subjected to qualitative analysis. The sample consisted of people aged 24-36, women and men, residents of large cities (over 500,000 residents), medium cities (over 50,000 residents) and small towns. They were qualified for research because of their time perspective (previously examined) and age. The specific problems that occurred in the interviews were analyzed in relation to relatively narrow and non-emotive subject of the research project. The course of the interviews will also be presented, described on the basis of the interview phases identified by F. Schütze.

JS_RN05_RN12 | Sustainable Consumption and Wellbeing

Young People's Use Of 'Good Life' Narratives

Loukianov, Anastasia; Burningham, Kate; Jackson, Tim

University of Surrey, United Kingdom
a.loukianov[at]surrey.ac.uk, k.burningham[at]surrey.ac.uk,
t.jackson[at]surrey.ac.uk

Ranging from Ancient Greek philosophies to today's marketing pitches, the concept of the 'good life' has been woven into a wide variety of narratives, each with differing levels of compatibility with social and environmental sustainability. In the last decades, academics have increasingly turned towards good life narratives that could theoretically deliver decent standards of living within the limits of the planet (Gough, 2017; Jackson, 2017; Raworth, 2017). But as our ability to meet sustainable futures comes under growing threat, exploring which narratives resonate with lay people becomes essential. Reflecting on focus groups and participant filmmaking with twenty-two 10 to 14-year-olds in the South of England, this paper explores which narratives of the good life are used by these young people to describe and represent what living well means to them. Young people's personal productions are envisioned as vehicles of collectively shaped, ideologically laden, and historically contingent narratives of the good life. Particular attention is paid both to the theoretical factors of wellbeing in relation to which these narratives are called upon and to the contexts in which they are performed. While given narratives should not be understood as straightforward reflections of young people's beliefs about the meaning of the good life, they constitute sense-making tools that have tremendous influence on lifestyle aspirations. As such, young people's use of these narratives is a crucial topic for anyone interested in sustainable futures.

How Do People Practice Green Public Spaces as a Consumption Corridor? Initial conceptual reflections linking

satisfiers, to practices, to needs

Sahakian, Marlyne (1); Anantharaman, Manisha (2); Di Giulio, Antonietta (3)

1: University of Geneva, Switzerland; 2: St Mary's College, United States of America; 3: University of Basel, Switzerland
marlyne.sahakian[at]unige.ch, ma20[at]stmarys-ca.edu,
antonietta.digiulio[at]unibas.ch

The significance of green public spaces towards "sustainability" is well-documented in relation to social inclusiveness, human health and biodiversity protection, yet how green public spaces enable the achievement of what Ian Gough has termed "sustainable wellbeing" (2017) is less understood. The GRESPA (Green public spaces in the cities of South and Southeast Asia) project, with empirical research currently underway in four cities (Chennai, Metro Manila, Shanghai, and Singapore), hypothesizes that green public spaces are synergistic satisfiers that contribute to meeting multiple protected human needs, towards human well-being. In this paper, we lay out the conceptual framework relating the notion of protected needs and satisfiers to social practice theory and green public spaces. This conceptualization advances a view that social practices are spatialized and performed; spatialized, in that practices are made possible or impossible by the material arrangements and emplaced norms and regulations, co-constructed by a range of stakeholders; performed, in that we study the activities and doings in the park, rather than solely people's representations. Through triangulation, we demonstrate how we plan to study protected needs methodologically, in relation to descriptions of park practices, reflections on a list of protected needs (Di Giulio and Defila 2018), and visual representations of park spaces and practices. We end the paper with some initial insights from fieldwork, notably what is made visible and rendered invisible in practicing park spaces (e.g., what is allowed or not, for different people, in different spaces, and varying times of day). We conclude with some discussions on green public spaces as consumption corridors, and how parks relate to other forms of un-sustainable consumption, in the context of cities where air-conditioned microclimates are increasingly normalized.

Challenging Laundry Conventions in Finland and Switzerland: When Upper Limits to Consumption Contribute to Wellbeing

Laakso, Senja (1); Sahakian, Marlyne (2); Dobigny, Laure (2); Godin, Laurence (2)

1: University of Helsinki, Finland; 2: University of Geneva, Switzerland

senja.laakso[at]helsinki.fi, Marlyne.Sahakian[at]unige.ch, Laure.Dobigny[at]unige.ch, Laurence.Godin[at]unige.ch

Laundry practices are held together by similar collective conventions, such as notions of comfort and convenience, across European households. However, they are performed in highly diverse ways, both between countries and within households. We compare laundry practices in Finland and Switzerland before and after an ENERGISE Living Lab (ELL) challenge, which set a relative upper limit to wash cycles over a four-week period, among 37 households in Finland and 36 in Switzerland. This relative “upper limit” can be seen as a “consumption corridor” maxima (Di Giulio and Fuchs 2014), established through a participatory approach and as part of a European H2020 project to reduce energy usage related to heating and laundry in eight countries and among approximately 300 households. For this paper, we begin by discussing our conceptual approach, towards a definition of sufficiency in relation to energy usage that involves changes in habitual and routinized practices, as well as setting upper and lower limits to consumption (Sahakian et al. 2019). We then compare laundry practices in Finnish and Swiss households, based on both qualitative data that describes practice elements, and quantitative data on wash temperatures, cycle frequency, and household roles. In a third section, we compare what changes took place in the households during and after the introduction of the ELL laundry challenge. We then discuss what is similar and what differs between the two contexts in relation to wellbeing, including freeing up time, and reconsidering what is dirty and clean, among other factors. In a conclusion, we discuss how sufficiency measures focused on setting upper limits can translate to wellbeing.

Sustainable Mobilities for Wellbeing: Hedonism or Eudaimonism?

Psarikidou, Katerina

Lancaster University, United Kingdom
a.pсарikidou[at]lancaster.ac.uk

This paper aims to contribute to emerging debates around the challenge of changing mobility systems towards a lower carbon direction without compromising people’s experiences of wellbeing. There is an increasing number of studies that underlines the interlinkages between mobilities and wellbeing (e.g. Ziegler and Schwanen, 2011; Ettema et al, 2010; Nordbakke and Schwanen, 2014). However, a lot of them are based on narrow, mostly quantitative, approaches to wellbeing and mobilities, mainly reduced to indicators for travel satisfaction. This paper opens up to a more multifaceted

analysis that builds on Aristotelian hedonic and eudaimonic approaches to wellbeing – the first perceived as a ‘good life’ achieved through the satisfaction of personal desires, while the second as a ‘good life’ realised through a purposeful engagement in the society (see Christie, 1998; Sayer, 2011; O’Neil, 2006; Nussbaum, 2000) – for the investigation of Sustainable Mobilities for Wellbeing. For the EPSRC Liveable Cities project, I asked participants from the UK city of Birmingham to describe their mobility practices associated with their perception of ‘good life’. In this paper, I provide an analysis that unpacks the complex interconnections between mobilities and wellbeing. I explore the possibility for mobility practices to constitute not only ‘means’ for the accomplishment of social practices of wellbeing, but also ‘practices of wellbeing’. However, I also help realise the more blurred boundaries between hedonic and eudaimonic, individualistic and social wellbeing. I suggest that shifting towards more ‘eudaimonic’ and ‘social’ approaches to wellbeing can be key for transitioning towards sustainable mobilities for wellbeing.

Estimating and Implementing “Sustainable Consumption Corridors” In Practice

Bartiaux, Françoise

F. N.R.S. & Université catholique de Louvain, Belgium
francoise.bartiaux[at]uclouvain.be

Di Giulio and Fuchs (2014) have proposed the concept of “sustainable consumption corridors”, as well as some objections thereto and their responses. This contribution intends to continue this discussion by trying to frame it within a social practice theory approach, with a focus on the practices dealing with the estimations of the lower and upper limits of sustainable consumption. De Giulio and Fuchs base their concept of “sustainable consumption corridors” on the notion of “individual objective needs”, a notion that I will discuss both theoretically and empirically. Issues of power and of legitimacy are at stake to pretend to define with “objectivity” lower and upper limits of consumption. To illustrate empirically the misleading notion of “individual need”, I show the range of energy consumption levels across social groups using different proxies and taking Belgium and different surveys as an example. The following proxies are used and discussed: the yearly electricity consumption per income quartile (SEREC survey, 2004), an estimation of the ecological footprint (Wackernagel and Rees, 1996) per profession (WWF-Belgium, 2006), and a new index of capability deployment (based on Nussbaum, 2000) according to households’ access to affordable warmth (Generation and gender Programme, 2009). The discussion includes some epistemological and ethical aspects of these three proxies, as well as measurement issues. (All estimations presented are from previous quantitative studies I was associated with.) Finally, a few policy instruments (thought of or really tested) to implement such “corridors” are briefly presented to illustrate the pitfalls for estimating and implementing these “sustainable consumption corridors”.

A Capital and Skills Perspective on The Social Use of The Internet Of Things: Social Inequalities In The Advancing Network Society

van der Zeeuw, Alex; van Deursen, Alexander; Jansen, Giedo

University of Twente, the Netherlands
a.vanderzeeuw[at]utwente.nl,
a.j.a.m.vandeursen[at]utwente.nl, giedo.jansen[at]utwente.nl

In this article we use survey data to explain different types of social uses of the Internet-of-Things (IoT) platform using forms of capital and internet skills. How people use the IoT socially is crucial in trying to understand how people create, maintain, or absolve social relations in a networked society. We argue that the IoT platform entices new manners of social communication that emphasize network individualization and increase the risk for exploitation of an information-based economy. Based on research in Computer Mediated Communication we define four types of social uses for the IoT platform. Ranging from individual use, sharing with strangers, sharing with acquaintances, to sharing with a partner, we test two frameworks on sociocultural backgrounds: the effects of who you are in terms of structural position in relation to capital and the effects of what you can do in terms of acquired internet skills. We found that internet skills contribute positively to owning IoT devices however, forms of capital are better predictors for the social use of the IoT platform. The effects of social capital, income, and education are inverted on private use and on sharing IoT data with a partner. Suggesting the importance of household dynamics for the IoT platform in a social context. Sharing with acquaintances and strangers are both predicted by cultural activities. Sharing IoT data with acquaintances can especially be attributed to social capital in the form of relations that escape the immediate household. We conclude that varying figurations of capital and internet skills predict how the IoT is used socially and that the social advantages of the IoT platform is unevenly distributed.

Digital Health and Big Data. Analysing Knowledge and Criticism in digitized Health Care Systems

Lenz, Sarah

University of Basel, Switzerland
sarahmaria.lenz[at]unibas.ch

Against the background of increasing datafication and digitisation, the knowledge and practices transformations as well as the associated challenges and potentials in the health sector require intensive research. The motives, activities, visions and ethical concerns of those involved in the development and evaluation of large amounts of personal data guide the digital transformations in health care. In light of the growing importance of digital health technologies and big data in primary health care, the talk investigates on following questions: Who are central actors in the field of institutionalised digital health? What are common and different visions or critiques associated with digital health, algorithm-driven medicine and big data? What are the challenges it poses, and how do organizations mediate between different or conflicting institutional demands? These questions will be answered by using qualitative interviews conducted with different actors in the digital health care system (clinical staff, digital health start-ups, clinical big data analysts) and taking into account the perspective of organisational studies. The analysis of the interview data is based on the documentary method of interpretation, which is particularly suited to reconstructing the implicit knowledge and subjective experiences actors refer to when resolving institutional conflicts. It therefore serves as the basis to analyse what is crucial in dealing with digital change in health care. In addition, the lecture reflects the benefits of organizational studies for the understanding of digitization in the health care system. The findings show that positive visions associated with digital health care and big data are limited where big data and digital technologies meet between highly regulated health care sectors and less regulated consumption markets. This is where moral and ethical concerns emerge.

Simply Complex? A Discourse Analysis on Future Living with The Internet Of Things

Teigen, Helene Maria; Mainsah, Henry

Oslo Metropolitan University, Norway
helte[at]oslomet.no, henryma[at]oslomet.no

A commercial for the Norwegian telecommunications company, Telenor, invites us to imagine a “Smart Home of the Future” where an elderly woman navigates her house, using IoT devices with voice activation to, for instance, find her purse and water her plants. Another commercial for a Norwegian supermarket chain, REMA 1000 (with the slogan “simple is often best”), shows a man unable to get into his house using the voice activated door lock because his mouth is swollen from a dentist visit and the door thus does not recognize the command. This paper looks at the emergence of “smart” and “connected” Internet of Things and environments, and how these are manifested in popular discourses around the “homes of the future” and smarter living. The increase in home devices and things connected to the Internet promises several positive features, such as enhancing convenience, comfort, leisure, and security. When you flip the coin, however, potential risks related to privacy and security emerge as well. Furthermore, IoT technologies require familiarization and adaptation by consumers, and may be time consuming and demanding to master. This paper explores the tension between the envisioned simplicity of future living with Internet of Things and the complexities in landscapes and infrastructures that the new technologies represent. The discussion in this paper is based on a discourse analysis of promotional videos, product descriptions and other promotional materials by technology producers, as well as exhibitions on living with the Internet of Things.

Homo Interneticus - the Sociological Reality of the Mobile Online Life

Nadolu, Bogdan; Nadolu, Delia

West University of Timisoara, Romania
bogdan.nadolu[at]e-uvt.ro, delia.nadolu[at]e-uvt.ro

The digitalisation of the everyday life has become a common reality for more than a half of the global population. To be connected 24/7 on several devices, to be at only one click/touch away from a huge amount of digital contents, to be available for interactions with almost any users from around the globe have become common facts. The insertion of the communication technology in our daily life is higher and deeper than never before. Into this paper, we follow to identify the main sociological dimensions of the so-called Homo Interneticus. We started from the follow research questions: how long the Homo Interneticus spends on-line and why? Today it is very easy to have 24/7 access to the Internet from the smart-phones. The classical idea "how long did you spend online?" is not any more calculated in hours. Usually the people go online as long as they need, any time when they need. Beside this reshape of the online time there are still the question how long did we spend online daily, or, with other

words, how many hours we are not offline. For obtaining a more accurate answer, we intend to apply an online experimental questionnaire that will include several questions about the self-evaluation of the online activity and a screen captures with the statistics of the internet utilization from the smart-phone during a week. Thus, it will be collected a detailed profile of the online daily activities, and the amount of time spent with this from the mobile phone. Even if this study will be just an explorative one, the outputs will offer content for furthers research hypothesis.

Making Sense of Algorithmic Bias in Communities of Knowledge

Hosszu, Ramona Alexandra (1); Stoicescu, Maria Valentina (2); Botezatu, Mihai (3)

1: University of Bucharest, Romania; 2: University of Bucharest, Romania; 3: Romanian-American University, Romania

alexandra.hosszu1[at]gmail.com,

maria.v.stoicescu[at]gmail.com, mihaibotezatu[at]gmail.com

Every day, algorithmically mediated actions take part in the design and redesign of the digital society. Organizations use existing knowledge to identify actionable patterns and create predefined rules that will facilitate solving specific problems, claiming to simplify and optimize human decisions and actions. Algorithms impact various areas of life, changing the social construction of sleep through sleep tracking apps, redefining intimacy through dating apps and platforms, informing policing and legal decisions or mediating work contracts. Recent critical literature about algorithms has targeted the biases, discrimination and asymmetrical power relationships produced by algorithmically mediated decisions. Algorithms are made by organizations and individuals or groups of individuals belonging to a society and acting upon socially generated data. Thus, algorithms reflect and modify previous social biases. Social monitoring and criticism of an emerging algorithmic society is distributed across multiple communities of practice – from scientific disciplines in technical, social and humanistic fields, to journals, blogs, vlogs, wikis, and other forms of knowledge making and sharing. In this paper we identify types of scientific, professional and lay knowledge referring to algorithmic bias, and we discuss the main types of arguments brought forward in these genres and communities of knowledge.

Degrees of Deceptions: Faking of and in the Credential Society

Hartmann, Eva

University of Cambridge, United Kingdom
ebh27[at]cam.ac.uk

How do you know whether the news in the media are true or faked? The challenge of established modes of verification and the loss of public trust in the media world have gained much public attention in recent years. Far less attention has been paid to a similar trend in the sphere of education, where fake degrees and other credentials have gained in importance. Established technologies of credentialisation are facing in an age where an increasing number of people do not work in the country where their degrees had been issued, and where non-degree (micro) credentials are mushrooming as part of life-long learning. The challenge is essentially the results of an intensification, digitalisation and internationalisation of the credential society, to use a term that Randall Collins coined almost four decades ago (Collins 1979). It is against this backdrop that the paper will explore the different attempts to make use of blockchains as a technology of authentication of credentials and the platforms they create. I will first develop a theoretical framework that draws on political and economic sociology as well as critical media studies and that sheds light on the enabling conditions of authority. The case study will be used to explore the extent to which these new technologies and platforms establish new forms of transnational private authority. The paper will end by discussing the implications for universities and other educational providers and the re-articulation of the complex relationship between knowledge, power, authority and legitimacy in a digital age, that some refer to as new Dark Age (see e.g. Bridle 2018).

'The Medicine World Needs Great Data, and Finland's Got It': A Qualitative Study

Blell, Mwenza Thandiwe (1); Homanen, Riikka (2)

1: Newcastle University, United Kingdom; 2: Helsingin Yliopisto, Suomi, Finland
mwenz[at]gmail.com, riikka.homanen[at]helsinki.fi

Data about the Finnish people is being touted as a new source of economic growth for Finland. The country is being marketed as a place in which the welfare state has created exceptionally valuable data resources (both from its biobanks and healthcare data), as a byproduct of having created a society apparently without socio-economic disparities, with excellent health care, high levels of education, and tech savvy. Such claims draw from the domain of bioethics to advance the argument that Finland is a more appropriate place for human subject research, particularly in terms of medicine and health, than the global south and other places in the global north in which far greater inequalities exist. The bioethical argument that people in Finland are not vulnerable and their recruitment for health studies not exploitative is a key strategy in this marketing. However, it is also being deployed now for the recruitment of

Finns for clinical trials of pharmaceutical products, such as the vaccine trials in Benin that used Finnish people as trial participants. If health data is a resource then, like all publicly generated resources, there are also socio-political implications to its marketisation, in addition to these ethical considerations. This paper draws from recent fieldwork in Finland with health data creators, researchers, and policymakers, exploring the creation of Finnish health data as a resource with value.

Virtual Rings and Hate Networks on Facebook

Maretti, Mara; Russo, Vanessa

1: Dep. of Legal and Social Science - Università di Chieti-Pescara Italy
ma.e.maretti[at]gmail.com, russov1983[at]gmail.com

Online hate, especially as manifested by means of social media, is a phenomenon that has currently been extensively studied and has also been a subject of concern at the governmental level. Its ability to mutate rapidly from one form to another has made it difficult to arrive at a satisfactory definition of this social phenomenon. Examples of hate speech occupy large areas within the field of Facebook: in fact, parts of the informational content of various kinds of online sources have become nothing less than catalysts of hatred. The aim of the study is to create a typological analysis of hate speech, a profile of online 'haters', and an analysis of characteristic features of the 'reply to comment' confrontation area. It has, in fact, become evident from research that confrontations between 'haters', conducted by means of public messages posted on Facebook, account for a large amount of the dialogues that appear on RtC (reply to comment). These posts sometimes degenerate into veritable 'virtual rings' having no connection to the subject originally under discussion. The present research is a multiple case study concerning itself with three areas – immigration, race relations, and antipolitics – that arouse especially virulent hatred in national public opinion. The analysis is divided into four phases: 1) selection of public posts; 2) analysis of discussion networks for each individual post, and clustering of the most frequent 'reply to comment' entries; 3) text mining of language used in each area (immigration, race relations, and antipolitics) in order to identify words and expressions typically used; 4) classification of each individual ring in accordance with the Grounded theory method and by means of NVivo software.

JS_RN07_RN09 | The Economics, Politics and Cultures of Dark Networks

Towards an Elementary Theory of Dark Networks

Jacobs, Mark

George Mason University, United States of America
mjacobs[at]gmu.edu

Dark networks conduct nasty business: human smuggling, child- and sex- trafficking, trade in drugs, extortion, financial fraud, money laundering, influence peddling, terror. Although by definition their activities are hidden, they are often hidden in plain sight, and as Federico Varese has shown, mafias (as an example) operate within many of the same inherent constraints as more legitimate enterprises. The relative neglect of dark networks by our discipline is shameful. Global and national transformations of social life are multiplying these practices, in what Manuel Castells calls “the network society.” This paper represents a preliminary attempt to establish a theoretical foundation for the sociology of dark networks, based among other elements on Simmel’s theory of the secret and the secret society and their increasing significance for a world of expanding social networks in a credit economy; Goffman’s theory of social life as a confidence game; John Thompson’s insights about the transformative effects of mediatization on the public sphere; and Edward Shils’s conception of “the torment of secrecy” as a corrosive imbalance of privacy and publicity.

From the Outskirts to Urban Peripheries: National Criminal Collectives In North And Northeast Brazil

Rodrigues, Fernando de Jesus

Universidade Federal de Alagoas (Brazil) London School of Economics (Visiting Fellow), United Kingdom
ferssa[at]gmail.com

Until very recently, there was no perception that West-Centre, North and Northeast Brazil were connected to national and international criminal collective networks such as PCC (Primeiro Comando da Capital), in São Paulo, and CV (Comando Vermelho) in Rio de Janeiro. A series of massacres in Brazilian prisons from 2016 has put pressure on researchers to reevaluate their investigation agendas. From the findings of fieldwork and questionnaires I intend to draw on some developments within the dark networks under which the North and Northeast have connected to transnational drug trade. The work is based on research on juvenile prisons and poor neighbourhoods (including shantytowns) in one of the poorest and the most agrarian states of Brazil, Alagoas. Through juveniles and their families’ trajectories, I point out

how work, family and criminal migration have become entangled. Furthermore, I aim to bring some evidence of how these migration movements are tied to new state and trade developments in their lives. From this, I sketch representations of emotional, cultural and economic transformations that seem closely connected to a singular process of the state’s expansion on the “new” urban poor, and the spreading “façções” as criminal collectives through “peripheric” regions in Brazil. In the end, I highlight how this scenario is interdependent from some movements worldwide.

“See, ‘Trust’ Is a Word Rarely Used in Here...”: Mistrust, Credibility and Collaboration among Anonymous Hacktivists

Creswell, Philip K

Uppsala University, Sweden
philip.creswell[at]soc.uu.se

It has been over a decade since the first political manifestations of the digital scene dubbed Anonymous. In that time, the hacktivist arena has seen increased policing, high-profile arrests, and the introduction of state actors posing as hacktivists. Engagement in this arena, where actors are anonymous or pseudonymous, introduces challenges for participants because alters may be like-minded participants or something else entirely: federal agents, trolls, or rivals from other networks. Using an analysis of observations in Anonymous chat rooms and interviews with hacktivists, I show that participants respond to these uncertainties by structuring their interactions and organizing public discussions in ways which manage risks from law enforcement, external antagonists and internal rivals. Through codified and openly discussed strategic protection of one’s personally identifying information, as well as subcultural norms of obfuscation through humor, participants signal their assessment of the milieu as risky. However, many participants also rely on circles of associates and even friends for information, threat assessment, collaborative projects and emotional support. This suggests that while perceptions of risk may increase barriers to cooperation in mediation, it may also lead to individuals developing stronger interpersonal ties with alters. This finding contrasts portrayals of Anonymous as a ‘pure’ example of swarm or crowd behavior online. Rather than finding activists who perform fleeting activism and lack social infrastructure, my analysis suggests that activists have developed strong, persistent, collaborative relationships; a social sinew at the center of the swarm.

Non-Enforcement as Informal Pact: Towards a Political Economy of Illegality

Dewey, Matías

Max Planck Institute for the Study of Societies, Germany
dewey[at]mpifg.de

Contemporary analyses on the state usually take it for granted that official attempts to manufacture social order occur within the confines of the law. Accordingly, the voluntary compliance of subordinates is achieved through bureaucratic processes and political will imbued with legality. Based on ethnographical work on the infringement of different types of laws in Argentina, this presentation holds that democratic states can also establish social order by forging informal pacts with specific social groups outside the confines of the law. It is argued that informal pacts are initiatives based on the non-enforcement of the law introduced by authorities and aimed at establishing a mutually beneficial exchange. The case analyzed indicates not only the significance of informal pacts for further research, but also the importance of observing organized inactions as well as identifying errors, gaps and overlapping rules as sites for the illegal extraction of useful political resources.

Bad Banks? Corporate Governance and Corporate Social Irresponsibility in Times of Economic Turmoil

Koos, Sebastian

University of Konstanz, Germany
sebastian.koos[at]uni-konstanz.de

The global financial crisis is deeply rooted in the irresponsible banking and lending practices of the global financial service industry. The crisis had devastating consequences, not only for debtors, the loans of home-owners, pension plans of retirees, but also for the employment and income of many citizens around the world. After brief stagnation, inequality has increased drastically due to "bad banks" sparking recession. In this paper we focus on the global banking and financial services industry to analyze under which conditions banks engage in irresponsible behavior in times of financial crisis. We are specifically interested to understand how different national institutions and corporate governance arrangement influence whether banks behave irresponsibly, thus whether different forms of regulation and control might foster or hinder corporate irresponsibility. Theoretically, we combine institutional theory with a focus on corporate governance. We expect that banks are more likely to behave irresponsibly in contexts with little regulation of the financial market and weak firm-level corporate governance. Empirically we use the Asset4 Environment, Social and Governance (ESG) data set to test our claims. ESG data are collected by analysts to assess investment risks and provide metrics for social responsible investment decisions. Our data contains information on 407 financial and investment services firms located in 49 countries from 2005 to 2015. The structure of the data allows to assess both comparative differences and changes over time in the social and economic performance of firms. Our analysis show that "good" corporate governance can indeed lower the likelihood of bad banks.

JS_RN07_RN15_09 | Globalising Cultures: Globalised Territorialism and Transnational Anti- Cosmopolitanism

European Transnationalism in The Making: Decolonialising The Normalised National Narratives Across the Isle of Ireland

Vieten, Ulrike M

Queen's University Belfast, United Kingdom
u.vieten[at]qub.ac.uk

The paper will explore how the paradox of contrasting sexual politics in Northern Ireland and the Republic of Ireland, sits uncomfortably, but temporarily at the table of wider processes of Europeanisation and transnationalism. Whereas Northern Ireland is dominated by conservative gender and adversary ethno-religious/ national rule, the Republic is dismantling long established nationalist policy; the latter in recent years by democratic vote supporting gay marriage and also challenging constitutional sexist abortion law. Far right orientations across Europe have been normalised and mainstreamed, foremost in the last decade. But as far as the Island of Ireland is concerned far right populist narratives of national cohesion do not work: The North is split by sectarianism, and the South is undergoing fast secularisation of a predominant Catholic society. Though I will not focus on Brexit (e.g. the aftermath of it) the UK exit from the EU epitomises the fragility of nationalist as well as trans-nationalist narratives, and sheds light on a need to engage more fundamentally and by that de-colonialising normative 'national' orientations crossing the line of nation state imaginations. First, the specific contexts of the two countries with respect to sexual politics and historical legacies of ethno-religious group identity containers will be briefly introduced, followed by a conceptual and critical reading of the notion of the colonial/ de-colonial and processes of transnationalism. Thirdly, it will be discussed how political identities are enmeshed with mainstream (hetero-)normative frameworks undermining a more inclusive outlook of transnational societies.

“The Whole World’s Welfare Desk” and other Transnational Anti- Immigration Narratives on Deservingness

Pyrhönen, Niko Johannes; Bauvois,
Gwenaëlle

University of Helsinki, Finland
niko.pyrhonen[at]helsinki.fi, gwenaelle.bauvois[at]helsinki.fi

During the 2000s, right-wing populist parties have increasingly added economic arguments in their political rhetoric for the purpose of justifying an anti-immigration agenda. In addition to its function as a justificatory resource, this welfare nationalist framing of anti-immigration mobilization has helped (particularly Nordic) parties in appealing to a divergent electorate of blue and white collar workers. For the former, questioning immigrants' deservingness to welfare redistribution carries the promise of better availability of the scarce redistributive resources, whereas the allure of lower tax burden is being harnessed to electrify the middle classes. Around the globe, the recent years have seen many types of intransigent anti-immigration rhetoric channeled to potential electorates via countermedia, the 'ultrapartisan' outlets that position themselves against the 'elitist' mainstream media. This paper assesses how these protagonists of immigration control – both the countermedia outlets and the discussants – narrate the role of the state to its citizens and other denizens. We then further explore the extent to which welfare nationalist anti-immigration narratives are particular to the Nordic culture of political mobilization – as opposed to being transnationally domesticated for local contexts. We collect one month of coverage from three countermedia outlets Kansalainen (FI), BreitbartNews (US) and Fdesouche (FR), comparing the absolute and relative frequencies of articles that mention specific (i) immigration, (ii) redistribution and (iii) immigration and redistribution keywords. We then analyze the top shared articles and their comments quantitatively, axially coding the subject matter using ATLAS.ti.

The Glocal Way to Deterritorialisation: Hybrid Identities, Hybrid Imaginaries, Hybrid Products

Giumelli, Riccardo

University Verona, Italy
riccardo.giumelli[at]univr.it

The purpose of this paper is to reflect on the possibility of a change in the widespread idea of 'Made in...', which we all are familiar with, in relation to some values and an identity that remind us of the place where products are manufactured. In a world where the processes of globalisation, or rather of glocalisation, are deconstructing the fundamental paradigm of the nation-state and territoriality in favour of mobility (Elliot, Urry, 2013), connectography (Khanna, 2016) is it still possible to speak unequivocally of Made in...? In particular we need to rethink the meaning of "origin". Process of deterritorialisation, virtualization and glocalisation of collective identities are the frame of our work. Most of researches (D'Astous and Ahmad, 1999; Hsieh et al., 2004; Kotler and Gertner, 2002; Nebenzahl et al., 2003; Papadopolous, 1993) had proven a significant effect of COO (Country of origin) information and/or brand name on consumer perception. In line with these researches, we can move to a sociological point of view showing how cultural processes are modifying the perception about the origin of a product or a particular identity. If in the precedent ESA conference, in Prague (2015), we highlighted the relations between territory and Made in., in this case we try to explain, through ideal type examples (PRADA, Starbucks, Caffè Nero), how different hybrid products shed a light to the transition from a consumer perception affected by COO (Country of Origin) and by BOO (Brand of Origin) to the more perceived COPO (Cultural of Product Origin) or COBO (Cultural of Brand Origin). In other words, culture and hybridization before territory.

JS_RN09_RN17 | The Gig Economy: Bright and Dark Sides of the Future Labour Market

JS_RN09_RN17_04 | Platform Work: Needs, Activation and Representativeness in the Era of Digital Labour

Platform Work and Platform Workers in Italy: An Exploratory Study

Arcidiacono, Davide (2); Pais, Ivana (1)

1: Università Cattolica, Italy; 2: Università di Catania, Italy
davide.arcidiacono[at]gmail.com, ivana.pais[at]unicatt.it

The platform economy fully represents new pathways of the global economy and the complexity of work in the post-industrial age. This depends on its tendency to generate non-standard and flexible activities that stand outside traditional forms of identification, protection and contractual regulations. Forms of work emerging from platforms can vary: first, there are the most complex, qualified and specialized, provided by professionals. They take advantage of this new intermediation between supply and demand to intercept highly challenging opportunities. Second, we find low-skilled microtasks that follow processes of global outsourcing and representing the last frontier of an informal neo-Taylorism. Third, we can also find forms of traditional work with different levels of qualification, which are offered firsthand, yet taking advantage of the digital intermediation to increase the number of clients. Lastly, there are work forms requiring low qualification as to circumvent possible entry barriers of the market, or to overcome the traditionally informal nature of supply-demand matchmaking. Within such a varied population of workers, it is difficult to trace and clearly classify the workers' needs and motivations, with the aim to form specific programs on both the regulatory and social protection level. Our analysis is based on a sequence of research activities: Mapping work platforms that are currently operating in Italy as an analysis of the reference scenario; A ethnographic analysis of the "communities" of the subjects within the platforms, as well as in other social networking spaces, such as Facebook groups; A qualitative analysis (focus group and in-depth interviews) to platform managers/founders and different type of workers following Codagnone and De Groen's categorization in four groups.

This Must Be the Place. Food Delivery Business Model, Riders' Mobilization, And the City

Andrei, Filippo; Frangioni, Tommaso

University of Turin, Italy
filippo.andrei[at]unito.it, tommaso.frangioni[at]unito.it

The focus of this research is the mobilization of riders in the food delivery sector in the city of Torino. Since winter 2016, a group of gig-workers started a protest to gain better work conditions. Through the participant observation of the mobilization, interviews with riders (considering workers of Foodora, Deliveroo and Glovo), and content analysis of the Facebook page of the collective, the research aims to investigate the relationship between emerging representations of urban space and technological infrastructure. The perspective we adopt is informed by social shaping theory. This theoretical framework stresses the dialectical process between technology and society and between technology and social actors. Thus, it refuses rigidly deterministic concepts and taking into consideration the power differential of social actors in the governance of technological instruments (Flichy 1996). The peculiar characteristics of the technology limit the range of actions available to social actors, but simultaneously, they can manipulate technological devices and repurpose them. This leads to unpredicted uses, that sometimes might be conflicting with the original goals imagined by the designer or the organization that adopted them (Sartori 2012). This happens also in regard to urban infrastructure, a framework which is at the same structuring and structured by the actions of these two collective actors. The theoretical aim of the paper is twofold: to reflect upon mobilizations in the gig economy, and their relationship with "old" labour movements and "new" social movements approach, and to discuss the multi-scalarity of platform economy as a simultaneously global and local phenomenon.

Not only riders

Bellini, Andrea (1); Lucciarini, Silvia (2)

1: Dipartimento di Scienze della Comunicazione, Roma, Italy; 2: University of Florence, Italy
Andrea.Bellini[at]unifi.it, silvia.lucciarini[at]uniroma1.it

Platform work is not an exclusive occupation, it co-exists with other types of self-employment, usually off-line, as a secondary activity to integrate income and a way to define a professional identity. That is the case of many creative workers, particularly vulnerable ones, who are exposed to discontinuous jobs and wages, to which they often respond by holding multiple jobs, sometimes even outside the creative field. Digitalisation can foster the workers' well-being, depending on the capacity to modify – even radically – the employment regulation, the role of social and economic institutions – both national and supra-national – and the actors' power relations. The current regulation is related to "the work as it was" more than "the work as it is". Western capitalism has to redefine protections for an increasing number of non-standard workers. As many scholars have already shown, the welfare capitalism' regulation system is characterised by two different approaches to the non-standard workers (NSWs): a positive one, that think about NSW as "quasi-employees", and a more disruptive other, considering the NSWs as "quasi-self-employed". Several times, in literature, it has been highlighted how the fragmentation of work and the diversification of the conditions of workers could play as a barrier to collective action, and to the capacity of industrial relations actors to represent their interests. However, as many studies have shown, few innovative trajectories are being shaped both the traditional, longstanding union and the new forms of representation, as bottom-up movements, "quasi-unions" and so on. The paper aims to explore new forms of representation in Italy and the Netherlands, focusing on the actions developed by "Smart" cooperative for graphic and web designers, working on and offline.

(Schreyer/Schrape 2018). Our contribution sheds light on the dynamics behind the workers organization in Germany. This is of particular interest due to the fact that the German protest is mainly supported by an independent syndicalist union, crossing national frontiers. Traditional unions are involved only in a few cities and the willingness to cooperate between both entities is low. Thus, our research so far shows that a rather unconventional and more radicalized approach to organization and action against the employer seems to be more attractive for the bicycle riders in German cities. The paper examines the drivers that led to protest and solidarity among the bike couriers. We analyse three potential drivers against the background of the specific institutional and cultural environment in Germany: 1. the nature of precarious work, 2. the specifics of the economic sector, 3. The particularity of the young, partly international workforce. Beyond these contextual factors, the paper investigates the biographical experiences that decide on whether a biker participates in protest or remains acquiescent and how unions are perceived subjectively. Our findings are based on expert interviews with young union members and activists, as well as biographical interviews with riders that decided to take action against the grievances surrounding them at their workplace.

Resistance Against the Recommodification of Labour on Food-delivery Platforms in Germany: Structural Drivers and Individual Motivations

Neumann, Denis (1); Trappmann, Vera (2);
Seehaus, Alexandra (1)

1: Freie Universität Berlin, Germany; 2: Leeds University Business School, United Kingdom
denis.neumann[at]fu-berlin.de, V.Trappmann[at]leeds.ac.uk,
alexandra.seehaus[at]googlemail.com

The two main on-demand Food-delivery platforms in Germany Foodora and Deliveroo are publicly accused of practices of hyper-exploitation. Employment relationships are not or rather (Degner/Koch 2018) weakly regulated and the efficiency-driven algorithm lacks transparency concerning working hours, the payment-system and shift assignment

JS_RN09_RN17_05 | The Gig Economy: Bright and Dark Sides of the Future Labour Market I

Can the Gig Economy Be Compatible with Standard Employment? A Case Study of Food Delivery Platform in Belgium

Piasna, Agnieszka; Drahokoupil, Jan

European Trade Union Institute, Belgium
apiasna[at]etui.org, jDrahokoupil[at]etui.org

The digital platform economy has a great potential for changing the way work is organized in the society and for disrupting existing employment models. In this new reality, employees are replaced by 'independent contractors', and jobs become 'gigs'. The depart from the standard employment relationship is accompanied by a powerful narrative of flexibility, independence and entrepreneurship, where traditional definitions of dependent employment should no longer apply. In this paper, we ask whether work in the gig economy is indeed incompatible with standard employment. We explore what are the needs from work of platform workers and to what extent they can be fulfilled within standard employment? The analysis is based on a case study of one of the largest food delivery platforms, Deliveroo, in Belgium. The case is particularly interesting because the platform hired workers through an intermediary, which gave standard employment status and respective protection to workers. The analysis furthers the understanding of the nature of the flexibility entailed in platform work and the preferences of workers regarding work and employment conditions. We also identify the role of local regulations and institutions. The case shows that platform work can be carried out within standard employment and it can thrive under standard employment regulations, contrary to the view and practices promoted by the platforms. Standard employment, as opposed to 'independent contracting', can be compatible with the business model of the platform economy and, more importantly, also with the flexibility that the workers value.

Between the Old and the New – the Gig Economy and Its Characteristics

Mika, Bartosz

University of Gdańsk, Poland
bartosz.mika[at]ug.edu.pl

To fully understand the impact of the 'gig economy' on the labour market we have to identify in detail the features of the phenomenon itself. In the proposed speech, we will present the theoretical justification for treating the gig economy as a

modern 'cottage industry'. As pointed out by Srnicek or Soderberg the phenomena of platform capitalism have a lot in common with the quite old-fashion "putting-out system" (for example the capitalist is a supplier of the raw material and the employees own the means of work). Furthermore, exactly as the cottage industry, it has its differences and limits. We will indicate the most important of them, distinguishing socio-economic features of crowd-work (e.g. MTurk), work-on-demand via apps (Uber) and renting of owned resources (Airbnb). We will also try to highlight the possible scenarios of future dynamics. If platform capitalism reminds "the putting-out system", the history of the latter can be a lesson for the future of the labour market.

Recruitment Devices in the Gig Economy: How a Labour Supply Takes Shape in the Market for Food Deliveries

Perrig, Luca

University of Geneva, Switzerland
luca.perrig[at]unige.ch

The great majority of digital platforms nowadays rely on a freelance workforce. This implies that workers are free to decline any task that is sent to them. A major problem for platforms is thus to ensure a sufficient supply of labor at any time of the day. That is not an easy task and platforms put a lot of effort to mediate labor supply and demand. In this paper, I will argue that platforms intervene on multiple occasions in the process of recruiting workers until completion of the transaction and thus contribute to shaping the market that they create. I will do so drawing from an ethnography of online food deliveries in Western-Switzerland. The goal of a delivery platform is to conclude as many transactions as possible. To do so, workers should go through a series of stages until completing the task that is sent to them. They should download the app, log-in, be at the right place, at the right time, and accept the orders they receive. At each stage of this process, workers are free to log out, ending the transaction. In order to frame the workers' activity, the platform has to rely on devices and manage its workforce at distance. The user interface, the matching algorithm, the pricing mechanism, and the user ratings come crucial in this endeavor. I will show that both the design and use of these tools are essential to understand the functioning of the market.

Thriving or Just Surviving: Divergent Inequalities in London's Gig Economy

Maier, George

London School of Economics and Political Science, United Kingdom
g.maier1[at]lse.ac.uk

Based on interviews with London's AirBnB Hosts, Uber drivers and Amazon Flex workers, this study highlights the divergent nature of inequalities as income sources become increasingly casualised through digital platforms. While studies have independently shown AirBnB hosts to gain increased income compared to letting their properties in long term markets, others have shown Uber and Amazon Flex workers to find themselves increasingly in positions of financial disadvantage. This paper interrogates these divergent patterns by looking at the changing relationship between capital and labour, alongside the increase of finance-based capitalism. In this study Uber and Amazon Flex workers were found to engage in long periods of unpaid and unrecognised labour as a necessity for using the platform productively – this includes prolonged waiting periods for jobs to become available during which they are encouraged to continuously refresh the app and remain diligent and ready to respond. They are also encouraged into debt obligations (Uber now serving as a credit broker to its drivers), undermining the implied flexibility of such work. Meanwhile, AirBnB hosts in the study made ongoing attempts to distinguish themselves utilising their cultural and economic capital, to stand out and be seen as valuable on the platform. Those with the “right” type of capital needed to be most successful and face the fewest risks on the platform tended to be wealthy, white and male. Hosts who were female, had limited economic or cultural capital reported high levels of risk and discomfort while hosting. This study therefore aims to show how capital and labour relations are being reworked in the gig economy.

JS_RN09_RN17_06 | The Gig Economy: Bright and Dark Sides of the Future Labour Market II

Ideologies Within New Employment Forms: Precariously Employed Youth from The UK And Greece

Ioannou, Gregoris

University of Glasgow, United Kingdom
gregoris.ioannou[at]gmail.com

There is a substantial literature on labour market flexibility, precarious work and non-standard employment and a burgeoning one on “work on demand”, the gig economy, crowd work and coordination by platforms. This paper focuses on the ideological dimension and the discourses that accompany the new forms of employment from multiple perspectives and especially the views and understandings, ideas and beliefs of the workers engaged in it. The research, situated at the intersection between working conditions and subjective experience aims to identify the extent to which a process of internalization of market values and neo-liberal worldviews is at work and the extent to which these values and worldviews are modified and adapted in the context of their appropriation. It will be empirically based on content and discourse analysis of life story semi structured interviews conducted with selected persons aged 20-35 from the UK and Greece in the hospitality and care industries, who have been fully socialized in the digital era and have only experienced precariousness in their work life trajectory. The interviews will focus on the perceptions of the workers about their work, their rights within it, expectations from it and beyond it and its place in their everyday life. The socio-political orientations of the agents will also be examined not in the narrow sense of party-political affiliation but in the broader sense of ideas about values, perspectives and stances on socio-economic and public issues.

Operating in Capitalist and Moral Economies: Freelancers' Sympathy, Strategic Alliance and Resistance to Prejudice

Zeng, Yiluyi

University of Warwick, United Kingdom
yiluyi.zeng.16[at]mail.wbs.ac.uk

How do freelancers deal with loosely established employment practice? Reflecting on semi-structured interviews with 60 independent professionals from Taiwan and England, this study looks at whether the traditional frameworks of organizational exploitation and self-exploitation are appropriate to understanding unfair employment practices encountered by freelancers. Additionally, I examine the conflicts between freelancers and their clients and how they influence professional identity and payment negotiation. Preliminary analyses result in three findings: First, inexperienced freelancers are motivated by financial and human capital accumulation, thus inevitably have to undergo a period of self-exploitation before reaching a satisfactory stage of fair negotiation. However, both inexperienced and experienced operate in capitalist and moral economies, such that they consider each clients' project (e.g. adding value to society) and financial condition to determine appropriate price. Second, to minimise replaceability and stabilise sources of work, highly skilled freelancers diversify skills and form alliances with other freelancers. Freelancers divide labour in cooperative partnerships, forming complementary alliances to carve out a niche in their profession while escaping the exploitation typically associated with division of labour. Third, the freelance experience is impacted by social and cultural factors. Some clients don't necessarily understand or appreciate the investment and skills involved in freelancers' work. Clients' skewed judgements of freelance work creates asymmetrical valuations of the work, and such evaluational asymmetry is manifested in different perceptions of the client vs the freelancer regarding the respectability of the profession, which also results in gaps in expected payment.

JS_RN09_RN17_07 | The Gig Economy: Bright and Dark Sides of the Future Labour Market III

Embodied Precariat and Digital Control in the 'Gig Economy'. The Mobile Labour of Food Delivery Bicycle Couriers

Popan, Cosmin

Manchester Metropolitan University, United Kingdom
c.popan[at]mmu.ac.uk

The promises of flexible and autonomous work promoted through mobile apps are the latest trend within a 'gig economy' relying on a workforce of independent contractors whose conditions of employment, representation and social protection are often exploitative. Driven by the 'lean platform economy', developed after the financial crisis of 2007–2008, the 'gig work' received several criticisms in recent years. They range from its contribution to the dissolution of jobs into atomised tasks that undermine the role of jobs as anchors of the social structure (Pesole et al. 2018), the algorithmic management of work which enhances digital control (Rosenblat 2018; Rosenblat and Stark 2016) and the challenges they pose to workplace organisation and unionisation (Woodcock 2017). This presentation proposes the investigation of mobile work undertaken by cycle couriers using delivery apps such as Deliveroo and Uber Eats to account for how the precarious nature of these jobs and their digital surveillance are embodied, negotiated and contested. The paper draws on an ongoing ethnographic research, which involves participant observation as a Deliveroo rider in East London and interviews conducted with fellow workers. It considers the following questions: What is the impact that big data analytics, communications capture and mobile device design have on worker surveillance on and off the job? How is the increased flexibility advocated by platform mobile work influencing the precarious nature of contemporary jobs? How is the algorithmic management of platform mobile work affecting workplace solidarity and organisation? In what ways is the data collected by Uber and Deliveroo informing transport planning practices? What is the role of lean platforms such as Deliveroo and Uber Eats in facilitating transition towards low carbon mobility futures?

Peer Surveillance in Aesthetic Labour

Vonk, Laura

University of Amsterdam, Netherlands, The
l.a.vonk[at]hva.nl

Research has shown the importance of employees' aesthetics in interactive service work, particularly by stressing the role of employers in commodifying workers' capacities and attributes (e.g. Warhurst et al., 2000). Based on 25 "wardrobe interviews" (Woodward, 2007), this paper examines the role of peer surveillance in aesthetic labour. Interactive service employees, all working in precarious (and often multiple) jobs, were interviewed in front of their wardrobes, using items of clothing to elicit narratives and reflections on practices of dressing and grooming for work. Due to the flexibility of their employment, these workers cannot rely on routing or set norms in their daily presentation of self. Analyses show that corrections by peers are highly salient in respondents' experiences of learning and adapting to aesthetic standards in the workplace. This article therefore suggests the importance of peer group mechanisms in studying lookism (Warhurst et al., 2009) in contemporary – and arguably future - labour markets. Warhurst, C., Nickson, D., Witz, A., Cullen, A.M. (2000). Aesthetic labour in interactive service work: some case study evidence from the 'new' Glasgow. *Service Industries Journal*, 20(3),1-18. Warhurst, C., Van den Broek, D., Hall, R., & Nickson, D. (2009). Lookism: The new frontier of employment discrimination?. *Journal of Industrial Relations*, 51(1), 131-136. Woodward, S. (2007). *Why women wear what they wear*. Oxford: Berg.

Superconductr: Artistic Interventions in Digital Platform Labour

Kispert, Matthias

University of Westminster, United Kingdom
info[at]matthiaskispert.com

Superconductr is an artistic research project whose investigations focus on structural conditions and contradictions in digital platform labour. superconductr's work aims to make these visible through artistic methods including delegated performance and interventions that utilise the functionalities of existing digital labour platforms, through participation in activism for precarious workers' rights, and through theoretical investigations. The name superconductr refers to Michel Foucault's definition of power as the conduct of conduct. Conduction is here seen as the transmission, control and mining of data streams in networks that facilitate the mobilisation, capture and extraction of human labour power. This paper will present a number of superconductr's projects, including 'Workers leaving the cloud factory,' which through videos sourced on Amazon Mechanical Turk and Microworkers restages the Lumière brothers' 1895 film 'Workers leaving the factory,' to explore the dissolving of both spatial and temporal boundaries between work and non-work. 'Work hard dream big' and 'Doing and nothingness' enact and document Bartleby-esque refusals of participation in normative paradigms of sanguine entrepreneurial self-exploitation on Fiverr. 'Capitalism doesn't love me' and 'Workers laughing alone for money' deal with anxieties

brought about by precarious working conditions, and the auto-affective labour necessary to function in a world of compulsory and competitive self-optimisation. superconductr is a project by artist Matthias Kispert. www.superconductr.org

Cultural Ideals of Gigwork in Popular Management Literature

Venäläinen, Juhana

University of Eastern Finland, Finland
juhana.venalainen[at]uef.fi

The presentation analyzes the cultural ideals of the gig economy and gigwork as they are represented and circulated in popular management literature. The research material consists of 13 "pop-management" guidebooks, published in 2016–2018, around the topic of gig economy. The analysis of the books was based on an iterative coding process that incorporated both qualitative and quantitative approaches, seeking answers to the following questions: 1) How is the gig economy defined in the literature? 2) What are the recurring concepts that are harnessed in portraying the transforming landscape of work? and 3) What are the motivations, opportunities, and requirements related to the gig economy from the perspective of a prospective gigworker? The presentation demonstrates that in the pop-management literature, the gig economy is represented as a field of drastic change, often highlighting its sudden and abrupt character while at other times positioning it in a longer continuum in the transformations of work and the economy. The traits expected from an "ideal gigger" were identified as entrepreneurialism, prudence, self-development, malleability, and sociability, whereas the motivations of participation and the opportunities that the gig economy offers were categorized through the notions of versatility, meaningfulness, and self-determination. In addition to providing empirical analyses to discuss the discursive construction of the phenomenon of the gig economy, the paper discusses critically the role of the pop-management books as tools of self-education that contribute to building a hyper-individualized entrepreneurial self.

JS_RN09_RN20_RN21_10 | Crossing Methodological Boundaries: Quantitative and Qualitative Methods in Economic Sociology

Let's Talk About Needs: A Laboratory Experiment on The Influence of Social Distance on Distributive Justice

Neuhofer, Sabine

University of Vienna, Austria
sabine.neuhofer[at]univie.ac.at

We are confronted with the matter of distributive justice on a daily basis – be it in the household context about the just distribution of chores or cake, or in political discussions on pensions or unemployment. Pluralist theories of justice and empirical justice research suggest that the type of social relation that exists between people influences the distributive justice principle they choose, according to which goods should be allocated. Among the main justice principles of equity, equality and need, the latter has so far received least attention in terms of behavioral measures. Justice theory postulates that principle of need is related to close social relationships, which can be distinguished from formal relationships by their degree of social distance. Social distance can be split into the dimensions of time and communication. In a laboratory experiment I find that these dimensions not only matter for themselves, but also interact with each other. A content analysis of the communication protocol of the experiment further shows that the actual content of the communicative act indicates in which frame of action is activated, which in turn influences the choice of distributive justice principle. This combination of methods shows that people try to find or justify different strategies within the controlled action space of the laboratory experiment, which would otherwise remain unnoticed.

Linking Theoretical Aims by Crossing Methodological Boundaries. On the Usefulness of Various Data Types for Economic Sociology

Baur, Nina; Hering, Linda

Technische Universität Berlin, Germany
nina.baur[at]tu-berlin.de, linda.hering[at]tu-berlin.de

Within economic sociology, numerous theoretical approaches exist. These approaches influence how research questions e.g. on market exchange, consumption, production and work are specified in social research e.g.: Are researchers interested in interactions, social meaning or structure? Are they interested in micro-, meso-, macro-sociological phenomena? How do they handle spatiality (e.g. do researchers want to analyse local or national economies or global value chains?) and temporality (e.g. everyday market interactions, long-term economic transformations)? How these questions are answered influences the overall research design as well as choice of data and methods. Using examples from their own research, the authors discuss the usefulness of various qualitative and quantitative data types – such as ethnographies, visual data (e.g. photography, videos), qualitative interviews, surveys, process-generated data (e.g. aggregated statistical data, business directories, newspaper articles, engineering literature) and cartographic data – for addressing different types of theoretical aims within economic sociology. The paper argues that (1) for economic sociology, the differentiation between qualitative and quantitative methods is less useful than that between different data types. (2) No single data type can assess all theoretical aims within economic sociology. (3) Therefore, methodological boundaries have to be crossed and methods linked, integrated and mixed in order to be able to study economic interactions.

Structures and Mechanisms - Methodological Problems of Explanation in Economic Sociology

Fuchs, Gerhard

Universität Stuttgart, Germany
gerhard.fuchs[at]sowi.uni-stuttgart.de

Economic sociology like sociology in general is interested in detecting and analyzing structures, regularities in action. As Martin (2012) has noted this search, however, has been derailed by the fantastic belief that social structure is something that causes regularities in action, when social structure is simply what we call regularities in action. In many parts of the social sciences therefore an interest in the genesis of structures and processual problems has developed (e.g. Abbott 2016; Langley/Tsoukas 2016). This comes along with some interesting methodological challenges. How can we answer the question of how something came into existence without answering this question in a more or less historical manner, which rightly stresses the qualitative elements of processes, but is short on generic explanations? One way that has been repeatedly proposed to avoid this dilemma has been a concentration on mechanisms. Powell/Padgett in their 2012 volume on the emergence of markets and organizations for example propose a list of mechanisms responsible for the development of novelty and another one for the stabilization of novelty. Mechanisms as such, nevertheless, are no explanations, they need to be connected to stories about what is going on. This, however, should not exclude quantitative approaches. The proposed paper discusses the potential mix of quantitative and qualitative methodological approaches for the study of economic problems, given the example of the genesis and development of electricity markets in Germany.

Factors that Influence Music Artists Success: Analysis of Russian Music Scene

Litvinova, Lada

HSE University, Russian Federation
lada.lit.vine[at]gmail.com

Presented paper is aimed to factors influencing music artists success. Technologies have altered the way music is produced, promoted, distributed and consumed. Music availability is increasing, new forms of communication with the audience are emerging, musicians face with the problem that being good is not enough to be successful. Musicians need to survive in a competitive market and need to know what factor inflate their commercial success. Leaving artistic recognition out of the spotlight, we focus on commercial success, defined as attainment of legitimacy and measured, accordingly, by multiple indicators of acceptance by an audience (number of views, number and downloads, position in charts and sales). The main specificity of presented work is integration of different aspects of the musical product, such as technical audio characteristics (loudness, sequential complexity), vocabulary statistics (semantic and linguistic), performance characteristic (singles, albums, video and concerts ratio, instruments, communication with audience). All data will be collected from open sources. The results we expect will reflect relationship between different factors of music production and performance and musical artists success. The paper will add an interesting and important contribution to the existing literature on music scenes and also suggest a complex way for advancing research on musical artists success. Finally, it will make an important empirical contribution to musicology area. Whereas music is not pure creativity, but like any art an industry, the results of current study will raise interest not only among academics, but also among music industry decision-makers such as managers, labels and producers.

JS_RN11_RN13 | Families, Intimate Relationships and Emotions in the Making of Social Worlds

JS_RN11_RN13_06 | Understanding change in relational processes in the context of wider networks over time

Collectivity, Separation and Closeness. Intimacy and Emotions in Narratives of Parental Relations in Youth across Three Generations

Hegna, Kristinn; Vasbø, Kristin

Faculty of Educational Science, University of Oslo, Norway
kristinn.hegna[at]iped.uio.no, k.b.vasbo[at]ils.uio.no

In research, the intimate relations between parents and youth are often described from the perspective of parents and as a precondition for development, social reproduction or socialisation. Young people's experiences and narratives of belonging in such intimate relations, are less described. This paper explores generational change in the stories of young people's relations to their parents, drawing on 73 life-history interviews with 18/19 year-old Norwegians (current generation), their parents (80'ies youth generation) and grandparents (50'ies youth generation). The study aims to contrast and compare the narratives of three generations' relations to their parents in youth. Starting from the family as a space for belonging and feeling 'at home' (Yuval-Davies 2006), our focus is on the practices of intimacy (Jamieson, 1998) and the sociocultural constructions of emotions (Lupton, 1998; Illouz, Gilon & Shachak 2014) across generations. The narrative analyses show that youth-parent relationships are described with warmth, admiration and a strong sense of belonging by today's youth as well as by their grandparents. The oldest generation trust and respect their parents' authority and display a sense of familial collectivity. The current generation trust and feel safe with their parents, due to their closeness to them as individuals and emotional openness. The generation of 80'ies youth emphasise individual autonomy, describe their relationship to their parents as distant, conflictual, distrusting and, in retrospect, with a sense of longing for the emotional openness of today. Contemporary youth describe trusting and interdependent relationships with their parents, and are co-producers of the youth-parent relationship as they nurture their intimate relations to their

parents. This cross-generational study provides a nuanced illustration of youth-parent relations in the context of historical change.

Shared intimacies? A Longitudinal Analysis of Two Partners' Networks of Emotional Closeness

Castrén, Anna-Maija

University of Eastern Finland, Finland
anna-maija.castren[at]uef.fi

What happens in two partners' networks of emotionally significant relationships during the first years of marriage? The conventional idea is that as two partners become committed to each other, their individual networks gradually 'grow in' and start to overlap. This has been referred to with the concept of marital network, meaning the joint network of partners in a stable, long-term relationship. This paper reports findings from an on-going study in which two partners' (in a couple) emotionally significant relationships are analysed at two time points. Data consist of information on the networks of 13 Finnish mixed sex couples in their first marriage. Longitudinal data were collected at the time of couple's wedding (T1) and after three to eight years of marriage (T2). Different kinds of data are used: personal narratives of wives and husbands interviewed individually and longitudinal structured information on the people they consider emotionally significant at the two time points. The analysis draws from a figurational perspective that combines insider and outsider perspectives and highlights both the subjective view of research participants expressed in qualitative interviews and the relational setting delineated with tools of network analysis. The results highlight differences in the relational processes of two partners in a couple and a variation in extent to which being in a couple (and becoming a parent, for example) influences an individual's circle of the closest persons.

Being a Daughter in Transnational Family –everyday emotional negotiation of Japanese women in southeast London

Takahashi, Kaoru

Goldsmiths, University of London, United Kingdom
ktaka002[at]gold.ac.uk

This study presents various ways of maintaining transnational family kinship with a particular focus on the parent and daughter relationship based on my ethnographic fieldwork on Japanese women migrants in southeast London. Understanding the ongoing transnational identity of the Japanese women who maintains their emotional attachment to multiple places seamlessly in everyday life and practice, this study explores how they negotiate the role of 'caring Japanese daughter' in their everyday lives in southeast London through transitions in their gendered identity. By focusing especially on their emotional experience, this study aims to uncover the way that Japanese cultural and social norms of caring in a parent and daughter relationship shape the women's emotion and practice in London. The relationship between daughter and parents and the corresponding emotional experiences they encounter seem to be highly personal. However, asking questions about what shapes their emotions, what it is like to be a 'good daughter' and what emotional response to their parents they think is 'correct' in a particular cultural context, can tell emotion as the embodied experience of social expectation or shared values. Particularly in the case of Japanese cultural norms, responsibility for elderly care in Japanese households has been shouldered primarily by women. This study illuminates the complex interplay of transnational relationships with the life course, as well as the way they perform and practice their gendered and ethnic identity within it. By doing so, it also speaks to the validity of emotion as a sociological lens to understand the migration experience.

Being A Father And A Refugee: Encountering New Social Worlds As Part Of Fatherhood And Family 'Integration' In The UK

Miller, Tina (1); Dermott, Esther (2)

1: Oxford Brookes University, United Kingdom; 2: University of Bristol, United Kingdom
Tamiller[at]brookes.ac.uk; Esther.Dermott[at]bristol.ac.uk

This paper explores the intersections of the emotional life of families and personal relationships through a focus on the experiences of Syrian refugee men who are fathers. The research project from which the data emerges is a small scale longitudinal qualitative project focused on men's experiences of fatherhood and doing family life in the UK, following forced migration from Syria. It focuses on how paternal responsibilities are (re)framed and everyday practices maintained and/or changed as the household is managed,

within different structural contexts and cultural and gendered expectations. What aspects of personal relationships and paternal caring and work are/can be continued and what aspects of these are prioritised in relation to doing family? How is emotional life understood and experienced as familial relationships are managed across country borders and 'host'/new country normative assumptions? What connections do they maintain and/or create?

JS_RN11_RN13_07 | Creating 'community' or social division?

"I Don't Mind They Are Friends, but I Wouldn't Let My Child Go To Their House": Emotions and Subjectivity Negotiation among Families in Socially Diverse Schools

Mendoza Horvitz, Manuela

UCL - Institute of Education, United Kingdom
manuela.mendoza[at]gmail.com

Drawing on a global context of tension between national ideologies driven by democratic values and the challenges posed by increasing levels of social diversity, the paper reflects on the ways social diversity in a school may shape particular subjective dispositions to otherness on students and parents. The paper discusses literature around school mix (the school's social diversity) and school mixing (the interactions between students/parents from different backgrounds), and their possible relationship with the development of democratic and inclusive attitudes. Studies addressing the possible effects of school mix on democratic learning argue that both inclusive and exclusionary dispositions may emerge depending on the form heterogeneity takes, particularly depending on whether there is school mixing or not. Based on Pierre Bourdieu's concept of habitus and further sociological developments of it (e.g. Bottero, 2010; Decoteau, 2016; Lahire, 2003; Reay et al., 2009; Sweetman, 2003; Vincent et al., 2018), the paper outlines an analytical sociological framework to conceptualise the possibilities for subjectivity to change and, eventually, for inclusive dispositions to emerge through the experience of social difference. This discussion will be illustrated by the case under study in an ethnographically oriented research about friendship in socially diverse schools: the Chilean educational system. Chile is a key country to observe both an exceptional socioeconomic educational segregation (the most segregated among OECD countries) and an unusual process of educational reforms attempting to promote inclusion and diversity of school populations, which renders it a privileged lab scenario to explore potentialities to take advantage of such a diversity.

“It’s a tiger instinct - that’s my baby!”: Responsibility, Emotion and Affect in Families’ Educational Activism

Fretwell, Nathan; Barker, John

Middlesex University, United Kingdom
n.fretwell[at]mdx.ac.uk, j.a.barker[at]mdx.ac.uk

In this paper we present emergent findings from a qualitative study investigating the involvement of families in grassroots struggles over education. Parent-led educational activism is a growing phenomenon in the UK. From local conflicts over the academisation of schools to national campaigns targeting budget cuts, high-stakes testing, and threats to SEND provision, families have been at the vanguard of battles over education. Drawing on data collected through extensive semi-structured interviews with parents involved in campaigns against academisation in East London and Essex, we offer insights into the under-explored field of family activism in education. Our focus here is on the emotional spurs prompting parents’ resistance to powerful state institutions and actors and the affective commitments sustaining their activism (Jaspers, 2018). Whilst powerfully rooted in the intimate, emotional dynamics of parental love and responsibility, these deeply personal (e)motives create new social horizons (Ahmed, 2018). Indeed, we argue that parental responsibility transcends the simplistic binary between self-interest and altruism to forge wider solidarities. As keenly tuned to the future as the present, doing what is right for the family translates into doing what is right for the community; for the children to come. The vigour of parents’ accounts, their feelings of anger and frustration, their narratives of exclusion and betrayal, alongside their concern for their children and the communities in which they live, help deepen our understanding of family-state interactions, grassroots political activism and the sociality of emotion, whilst also attesting to the power and promise of an emotional politics. Keywords: family activism; emotions; education; community, academisation

Talking Politics or Biting your Tongue?: Brexit, Emotions and Everyday Family Life

Davies, Katherine

University of Sheffield, United Kingdom
K.Davies[at]sheffield.ac.uk

This paper explores how the UK’s 2016 referendum on the European Union has been experienced within family relationships. Drawing upon data generated as part of a qualitative interview-based study funded by the British Academy between 2017 and 2019, the paper outlines the silences, arguments, debates and conversations that people are having in their everyday family relationships in reaction to Brexit and the political debates surrounding it. British media outlets have commonly described the UK as a nation divided by Brexit, yet we know very little about what this means for people in their everyday lives and relationships. This paper

unpacks the trope of ‘divided Britain’ by considering how Brexit is lived in everyday family relationships. Interviews with both ‘remainers’ and ‘leavers’ from different generations reveal that, despite often disagreeing with their family members about Brexit, people expend a great deal of effort and skill in avoiding divisions within their family. Building on Hochschild’s (1993) concept of ‘emotion work’, the paper demonstrates different practices of ‘talking politics’ in families, pointing to the work that goes into avoiding conflict and paying particular attention to the role of ‘biting your tongue’ when discussing Brexit with loved ones.

JS_RN11_RN13_09 | The transformative and regressive potentialities of new social forms

Smart Technology and Education of the Emotions. The Family as the Community of Practice

Fanizza, Fiammetta

University of Foggia, Italy
fiammetta.fanizza[at]unifg.it

Regarding peer education practices and in conformity with some of the principles of positive psychology, the possibility of employing digital devices in “the education of the emotions” is the subject of a quantitative investigation of a sample of middle school students: of the total student population of 1,775, the study involved 1,070 students (just over 60% of the total student body), divided into 412 girls (38.5%) and 658 boys (61.5%). Rejecting theses and theories based on the automatism of time spent online and the insurgence of pathological addictions in adolescents, an online questionnaire of 21 questions revealed forms of socialization and emotional skills of adolescents in order to study at length the intergenerational communicative relationships and to identify forms, themes, concepts, and meanings that can effectively contribute to the construction of society.

Overseas Pre-wedding Photography, Consumerist, and Female Individualism

Chen, Wei-Ping

École des hautes études en sciences sociales, Paris, France
pinger.c[at]gmail.com

Since the 1990s, it has become common for middle-class couples in Taiwan to have pre-wedding photos taken in professional studios with staged scenes and costumes related to various cultures and ethnicities. In the last five years, overseas pre-wedding photography involving couples traveling to Paris has become a trend among Taiwanese couples. This paper explores how heterosexual couples, particularly women, embody intimacy in pre-wedding photographs taken in Paris, a destination often associated with female individualism and sexual fulfillment. In the times of global economic uncertainty and changing norms where the viability of marriage is called into question, this niche in wedding culture, with its dreamlike, romantic fantasies involving image-driven bodily and identity makeovers and consumerist experiences, sees couples undergo cultural and economic transformations and encourages women's intensive emotional and communicative involvement. I focus on the cultural consumption of pre-wedding packages tailored by Paris-based, Mandarin-speaking experts that combine photography with tourist services, bridal fashion, floristry, and even car rental. These packages are branded with a "French touch" and are marketed as an emotional commodity. Through an analysis of images, social media discourses, and interviews, I examine these embodied practices in the context of female individualism in consumerist societies in which transnational movements of commodity, culture, and capital are gendered and classed. Furthermore, I demonstrate how gender and pre-wedding photography inform each other and show that in this pre-wedding consumerist culture, women look to specific destinations such as Paris for authenticity and intimacy in relation to their daily lives.

Intimate Matters: Entangled Spaces and Embodied Rhythm in Communal Housing

Törnqvist, Maria

Uppsala University, Sweden
maria.tornqvist[at]edu.uu.se

Communal housing, meaning people who are not necessarily related by family or marriage but share residence in a more or less intimately organized way, is an example of a potentially intimate arena in-between the private and the public. The dwellings have common spaces for social interaction as well as private areas, they serve somewhat similar emotional and practical needs as families, yet they are organized in ways that, at times, recall the structure of workplaces and organizations. This presentation draws on interviews and ethnographic data from eleven communal dwellings in urban Stockholm, Sweden, three cohousing units and eight small-scale communes.

Although the sample comes across as a fairly distant and individualist set of relations, the study also conveys expressions of voluntary and involuntary closeness, tightly connected to the materialities of a shared home; its everyday beat and proximity of bodies. Although communal residents often do not become 'best friends' and although housing relations are often without promises of continuation, many residents account for a deep entwining, not necessarily with other housemates, but with the shared home as such. Through an investigation of the spatial-temporal structure of communal housing, the presentation explores how this way of living matters intimately to people and how the intimate matters of communal housing can become an important aspect of peoples' social worlds and lived everyday relations.

Single Life and Happiness

Lolle, Henrik Lauridsen

Aalborg University, Denmark
lolle[at]dps.aau.dk

For decades, we have witnessed big changes in family structures, from the experiments developing out of the cultural change in the sixties to a highly differentiated pattern of family types. One of the more profound changes is that growing individualization has resulted in a huge number of people living alone, either deliberately choosing to live alone or, for instance, becoming alone after a spoiled marriage. Even though we have witnessed this development for decades, we know surprisingly little about how we as humans handle these new circumstances. We know quite a lot about the effects from broken marriages on the children and about the difficulties that sole mothers are confronting. However, we know very little about how living alone affects happiness, or more generally, how it affects peoples' subjective well-being (SWB)? In this paper, I will analyze SWB among different types of families and life trajectories. The study will focus on Denmark 1990-2017, based on the European Values Study data (coupled with data from administrative registers to get a more detailed picture of trajectories). The paper begins by briefly putting Denmark into a comparative context as regards happiness, the incidence of broken marriages and the relationship between family status and happiness. I will argue that Denmark is a well-chosen case for investigating SWB in families of late modernity. Besides the main question, I will investigate several other causal mechanisms connected to the main question, e.g. if effect from living alone on SWB is moderated by sex and age.

JS_RN13_RN21_10 | Introducing (Under-Utilised) Surveys for European Family Research

Growing up in Germany: Introducing a Representative, Multi-Study Survey of Children, Youth and Families

Recksiedler, Claudia (1,2); Quellenberg,
Holger (1); Prein, Gerald (1); Pötter, Ulrich
(1)

1: German Youth Institute, Germany; 2: NCCR LIVES,
Switzerland
recksiedler[at]dji.de, quellenberg[at]dji.de, prein[at]dji.de,
poetter[at]dji.de

The set of surveys called AID:A (Growing up in Germany) continues the long tradition of interdisciplinary survey research on child development, youth, and the family at the German Youth Institute. Starting in 2009, a first survey (AID:A-I) provided information on family formation, parenting, child and youth development, and work-life balance based on a representative sample of 25,000 persons aged 0 to 55. A second survey (AID:A-II) was conducted in 2014. It partly replicated the first survey and added a multi-actor design on co-parenting and couples decision making. It thus transcends the limitations of classical household surveys that restrict information to the household members. Extensive information on siblings and parents living outside of the household is available and a particular emphasis was further put on gathering information on father involvement and non-traditional family forms, such as lone parents and patchwork families. In 2019, a new, cross-sectional installment of the survey (AID:A-2019) was launched. It features the inclusion of detailed interviews with all members of the household, as well as an oversampling of vulnerable populations such as migrants. We expect realized interviews from 6,000 households and 12,000 persons on non-traditional family forms and youth development. We illustrate the potentials and possible applications of these data sources by providing an empirical example from our own family research. The datasets AID:A-I and AID:A-II are freely available for scientific use from the research data center of the German Youth Institute. We expect data from AID:A-2019 to be released for scientific use in the beginning of 2020.

The Generations and Gender Programme: New Methods and New Questions

Emery, Thomas

The Generations and Gender Programme, Netherlands, The
emery[at]nidi.nl

The Generations & Gender Programme (GGP) is a large research infrastructure focusing on demographic behaviour and family dynamics (www.ggp-i.org). Its predecessor was the Family and Fertility Surveys (FFS) in the early 1990's which was run in 20 countries by the UNECE. The GGP was established to build on the success of the FFS and was fielded as a longitudinal panel study in 19 countries during the 2000's. In 2020 a new round of the survey will be conducted in countries across the world. Ahead of this, the GGP has set up a centralized survey instrument which allows for data to be collected from across the globe via face to face and web interviews. The centralized CAPI and CAWI system also opens up the possibility to integrate a number of different types of data with the traditional Generations and Gender Survey (GGS) and better explore how family life is changing. Such new forms of data include web-data, geo-spatial data and administrative data. In the presentation we will draw on data from several countries to illustrate the potential of these advances and what they might mean for family sociology. This paper will present the initial preliminary findings from recent fieldwork experiments and piloting and their implications for the new round of data collection in 2020. Given the cross-national nature of both the GGP and the experiment itself, the results presented will be of broad interest to survey researchers and family sociologists as we adapt to a changing and evolving data environment.

Databases Prepared in the FamiliesAndSocieties Project: LawsAndFamilies, ARPNoVa, EUFamPol and LargeFamilies

Olah, Livia Sz.; Neyer, Gerda

Stockholm University, Sweden

[livia.olah\[at\]sociology.su.se](mailto:livia.olah@sociology.su.se), [gerda.neyer\[at\]sociology.su.se](mailto:gerda.neyer[at]sociology.su.se)

The FamiliesAndSocieties project aimed at investigating the diversity of family forms, relationships, and life courses in Europe; assessing the compatibility of existing policies with family changes; and contributing to evidence-based policy-making. Relying on a conceptual framework informed by a multidisciplinary approach, the project explored the growing complexities of family configurations and transitions within and across European countries as well as their implications for men, women and children with respect to inequalities in life chances, intergenerational relations and care arrangements. Four new databases were established in the project on: i) legal family formats available for same-sex and different-sex couples in Europe (LawsAndFamilies Database), ii) Assisted Reproductive Technologies regulations (ARPNoVA), iii) family-policy initiatives of the European Union (EUFamPol) related to fertility which cut across core aspects of family life, such as employment, care and gender, and (iv) online survey on large families (LargeFamilies). Links to these open access databases are displayed at the project website at http://www.familiesandsocieties.eu/?page_id=3533 where further details on the main content are presented. Freely downloadable FamiliesAndSocieties Working Papers [nr. 75(2017), 79(2017) and 80(2017) at http://www.familiesandsocieties.eu/?page_id=131] provide additional information on the structure of three of these databases. For ARPNoVA such information is available at the link of access. We hope to contribute to better informed analyses on family-related matters via these databases.

The Household, Income and Labour Dynamics in Australia (HILDA) Survey and its Potential for Family Research

Wooden, Mark; Laß, Inga

University of Melbourne, Australia

[m.wooden\[at\]unimelb.edu.au](mailto:m.wooden@unimelb.edu.au), [i.lass\[at\]unimelb.edu.au](mailto:i.lass[at]unimelb.edu.au)

The HILDA Survey is Australia's first ever nation-wide household-based panel study. While the topic coverage of the study is extremely broad, it is intended to have a focus on income, labour market outcomes and family life. The study commenced in 2001 with a responding sample of 7682 households selected to be broadly representative of the Australian population living in private households. Data are collected on an annual basis from all members of these households (aged 15 years or older), along with everyone else who was living with them at the time of interview. Today 17 waves of annual data are available, and provide 253,182 observations from 31,206 unique people. Among HILDA's key strengths for family research are: a) an array of questions about intra-family relationships, household formation, and fertility and fertility intentions; b) collection of data from all adult household members, thus enabling the analysis of dyads such as couple relationships or parent-child relationships; and c) most importantly of all, the tracking of people over time, thus facilitating the analysis of change over the life course. This paper presents an introduction to this survey. It provides a summary of the design and the process by which the sample was selected, the type of information being collected, and the procedures employed for data collection. The paper concludes with a discussion of some of the family-related issues that the HILDA Survey data has been and, in the future, could be, used to examine.

Doing Family Across Borders: Role of Routine Practices, Traditions and Feasts in Lithuania Česnūitytė, Vida (1,2)

1: Mykolas Romeris University, Lithuania; 2: Vilnius University, Lithuania
v.cesnūityte[at]mruni.eu

The research aim is to identify practices dedicated for strengthening family relationships, practices that are typical to the multi-local families with members across borders. The relevance of the topic is conditioned by the following factors: (a) diversity of family formation and daily life spread in the beginning of twenty first century encourage search for alternative family definitions and research methods; (b) theoretical approach on family practices and doing family suggests alternatives for the conceptualization of multi-local families; (c) lack of knowledge on family practices of multi-local families. Theoretical approaches of family practices (Morgan, 1996; 2011), doing family (Smart, 2007), family networks (Widmer, 2006; 2010; Jallinoja & Widmer, 2011) applied in the research. Empirical analysis is based on two databases – data of representative quantitative survey and data of quota survey. Quantitative survey represent adult Lithuanian population. Persons with various migration experiences selected in quota surveys. Both surveys carried out in Lithuania between June-October, 2018 within the national research project “Global migration and Lithuanian family: family practices, circulation of care and return strategies”. Family practices like daily routine, traditions and feasts explored. The research results reveal that various family practices differently influence relationships among significant persons assigned as family members. Though, the same family practices effect differently relationships within networks’ of persons who have (direct or indirect) migration experience and who not. Finally, persons with migration experience have less common practices with Ego, though existing family practices are more intensive. Keywords: family network; migrant families; family practices; doing family.

Familial Displays Across Borders: The Case of Lithuanian Parents-Children Living Separately

Juozeliuniene, Irena; Budginaite Mackine, Irma; Martinkene, Ginte

Vilnius University, Lithuania
irena.juozeliuniene[at]gmail.com, irma.budginaite[at]fsf.vu.lt, g.martinkene[at]gmail.com

The scripts of ‘good family’ denote structural organization and the ways family should be done. Building on the concept of ‘family display’, we focus on transnational families and examine how emigrants undergo the boundaries, which are set up by ‘low mobility’ discourse, and convey to their underage children and elderly parents that their actions constitute ‘doing family things’ and their relationships are ‘family relationships’ (Finch, 2007), regardless of the geographical distance. We tested how the concept could be applied on the level of quantitative data analysis and draw insights from a survey carried out in Lithuania in 2018 using quota sampling (N=406), targeting families with children under 18 at the time of migration (mothers from mother-away families; fathers from father-away families; parents from both parents-away families) and adult children abroad with elderly parents in need of care in Lithuania. Data analysis focuses on three areas that provide answers to questions how mothers/fathers’, daughters/sons’ and designated carers’ displays are done; what methods are used and how often it is done? Research findings reveal gendered ways of familial displays. With regard to mothers/fathers’ displays, research findings disclose different parenting strategies. With regard to daughters/sons’ displays, gender differences are observed in the ways care responsibilities are delegated and overseen. The authors offer the way to understand how migration induced structural changes highlight designated carers as significant persons in doing and displaying family. The paper contributes to migration and transnational family studies by expanding understanding how family display is enacted in different child-care/elderly-care familial arrangements.

Closeness Despite Distance? Parent-Child Relationships in Europe

König, Ronny; Isengard, Bettina; Szydlik, Marc

University of Zurich, Switzerland

koenig[at]soziologie.uzh.ch, isengard[at]soziologie.uzh.ch, szydlik[at]soziologie.uzh.ch

Intergenerational cohesion and support across the whole life course are important characteristics of parent-child relationships. Next to financial support, care and help or support of grandchildren, contacts between parents and their children are an important form of intergenerational solidarity in contemporary societies. Traditionally, different kinds of contacts as well as their frequency strongly depend on geographic proximity. Therefore, increased spatial mobility may reduce (opportunities for) intergenerational solidarity. However, nowadays families might be able to face the challenge of greater geographical distances and time restrictions by employing various new communication technologies. Although contacts between parents and their offspring are not only relevant for the individuals themselves but also for society in general, little is yet known about the determinants and country-specific differences in general and the situation for multi-local families in particular. Due to the relevance of intergenerational contacts as an important precondition for many other forms of solidarity, the presentation addresses the impact of geographic distance on contact frequencies in an international perspective. The empirical multilevel analyses are based on pooled data of the fifth and sixth wave of the Survey of Health, Ageing and Retirement in Europe (SHARE) including 19 countries. The research questions are: (1) How intense are parent-child contacts in general, and (2) how do they vary by country and geographic distance? (3) Which impact has the usage of modern communication technologies on maintaining intergenerational contacts, and (4) which further micro-, meso- and macro-structural determinants are relevant for more or less intense intergenerational contacts in European families?

Questions of Belonging across Borders: Continuity and Change in Transnational Family Memories

Schnitzer, Anna

University of Zurich, Switzerland

aschnitzer[at]ife.uzh.ch

The focus of this contribution lies on family memories of transnational families and on the question of the significance of these memories for the conceptualization of the family as a unity. Family memories can be conceived both as family practices as well as part of family biographies. In this context questions of belonging interfere with questions of preserving continuity and opening up to change. Thereby, languages form an important basis for family memory and processes of communitarisation that have to be overcome after arriving in a new environment (Purkarthofer 2017). Different dimensions

of continuity and change in questions of belonging in transnational families will be shown as key results on the basis of qualitative analysis. In the project that forms the basis of this contribution, familial practices of narrating and remembering are observed, following the question how practices of memorisation become important for forms of communitarisation in families with migration histories. In addition to participant observations, family biographies are collected through family interviews with family members of different generations. Theoretically, the project is following conceptualisations of remembrance work (Inowlocki 2003) and remembering as social practice (Rosenthal 2010), as well as remembering as a form of communicative communitarisation (Keppler 1994). Methodologically, it takes a reconstructive perspective that takes situative logics into account as well as the biographical processing of situative experiences. From this perspective, ethnographical and biographical approaches can benefit from one another (Dausien/Kelle 2005; Schnitzer 2017).

JS_RN13_RN35_09 | Relatives at a distance: Understandings of family in post-migration constellations

To Search or Not to Search? Finnish Transnational Adoptees' Deliberations on Searching for First Parents

Ruohio, Heidi Hannele

University of Jyväskylä, Finland
heidi.h.ruohio[at]jyu.fi

"To search or not to search" for first parent(s) is probably one of the most emotional and personal decisions that an adopted individual has to make. Although ties between the adopted child and his or her first parents are not valid before the law, previous research shows quite clearly that both adoptees and their first parent(s) are often interested in each other's. Nevertheless, this interest does not always turn into pursuing actual search. In this presentation, I ask how do transnational adoptees come into the decision to search or not to search. The data used for this presentation consists of 24 semi-structured interviews conducted with adult-age transnational adoptees during 2009-2010. Choice to concentrate on adult-age adoptees is a methodological choice that sees meanings of origin as temporarily changing, but also an ethical choice with which I take part in a paradigm in adoption studies that tries to grasp some of the "long-term impacts" of adoption. Interviewed adoptees were born in nine different countries of origin, the most common being Russia, Ethiopia, Colombia and India. Theoretically, I follow Margaret Archer's (1995; 2012) critical realist theory of agency and internal conversation in analyzing adoptees' decision-making about searching. According to Archer, agency and actions are constrained and enabled by structures, and structures have the ability to influence on person's motivations to act. Results will be discussed in relation to Archer's understanding of modes of reflexivity: communicative reflexives, autonomous reflexives, meta-reflexives and fractured reflexives. Results will bring forward the complex nature of decision making process concerning searching first parents.

A Comparison of Couples' Living Arrangements between Migrants and Non-Migrants in Germany

Kuhnt, Anne-Kristin (1); Krapf, Sandra (2)

1: University of Duisburg-Essen, Germany; 2: University of
Mannheim, Germany
anne-kristin.kuhnt[at]uni-due.de, skrapf[at]mail.uni-
mannheim.de

A large body of literature has addressed ethnic disparities with respect to education, labor market, health, and family outcomes in the last decades. However, we know only little about young migrants' partnership status, i.e. in how far they differ from non-migrants with respect to having a living-apart-together relationship (LAT), living in cohabitation or being married. Understanding the partnership behavior of migrants is important because it allows us to assess one dimension of social integration. This is particularly interesting in Germany, where more than 20 percent of the resident population are immigrants or the descendants of immigrants. In this paper, we compare the partnership living arrangements of migrants (N=3,005) and non-migrants (N=9,018) living in Germany. Our analysis distinguishes between different clusters of origin countries (Eastern Europe, Southern Europe, African Countries), a differentiation that is often used in integration research. We draw on data from the first wave of the German Family Panel pairfam, which was surveyed in the years 2008 and 2009. The data contain information on partnership status and migration background of women and men of the birth cohorts 1981-83 and 1971-73. In our multinomial regression analysis, we focus on explanatory variables such as migrant generation, educational attainment, labor force participation, and religion. Descriptive findings show that especially marriage is more common among migrants than among non-migrants. Preliminary results of our multiple regression analysis controlling for socioeconomic and cultural variables suggest a less clear pattern of differences between the diverse subgroups of our sample. Keywords: Living arrangements, Migrants, Integration research, Acculturation

A Longitudinal Analysis of Psychological Well-being of Ghanaian Children in Transnational Families

Haagsman, Karlijn; Mazzucato, Valentina

University Maastricht, Netherlands, The
r.haagsman[at]maastrichtUniversity.nl,
v.mazzucato[at]maastrichtUniversity.nl

Most of what is known about how migration impacts the health and well-being of migrants and their children comes from studies focusing on migrant families that live together in a host country. Yet since the 2000s, qualitative transnational family studies have highlighted the existence of migrant families that live apart while still operating as families. These studies have mainly documented that having parents abroad negatively affect children's education, behavior, physical health, mental health and emotional well-being. Yet most of the research on transnational families has been qualitative and small-scale, making it difficult to determine whether separation in itself is driving the results or whether it is certain characteristics of the transnational family. Recently, large-scale studies, using cross-sectional data have indicated that characteristics of the transnational family arrangement determine how the child fares. This study is one of the first to employ panel data, to investigate changes in psychological well-being over time allowing a closer analysis of what factors can best explain changes in well-being status, such as reunification or caregiver changes. It will investigate different forms of transnational care arrangements paying attention to who the caregiver is, the gender of the parent who migrates and the location of migration. In short, we want to improve the analysis of transnational families by paying due attention to the diversity of arrangements and how these change over time. The study analyzes data collected in three waves in 2013, 2014 and 2015 in Ghana amongst secondary school students between the ages of 12 to 21 (N=741). It measures the psychological well-being of adolescents using the Strengths and Difficulties Questionnaire (SDQ).

JS_RN13_RN35_10 | Relatives at a distance: Doing family in current migration regimes

The International Migration of Couples: Timing – Motives – Outcomes

Erlinghagen, Marcel

University of Duisburg-Essen, Germany
marcel.erlinghagen[at]uni-due.de

Migration of couples should be understood as a product of bilateral negotiations between the two partners rather than an effect of individual decisions. Against this background, the paper investigates in the timing, motives and outcomes of international migration of couples. Based on data from the first two waves of the new and unique German Emigration and Remigration Panel Study (GERPS) the paper tries to answer the following questions: Are there differences between male and female partners in the timing of migration? How do different migration motives correlate with gender and education? How does partnership quality develop in the very first month after migration? How do childless couples and parents differ with regard to these parameters? GERPS will provide information on approximately 4.000 couples from which at least one spouse has recently emigrated from Germany to any other country or has recently re-migrated to Germany. The results will contribute to the ongoing debate about tied movers and family related inequalities of migration. Since most research deals with internal migration, we add new evidence on these topics by investigating in international migration. Moreover, whereas much of the previous literature on international family migration has focused on migration from less gender-egalitarian and economically less developed countries, our study uses data from Germany, where livings standards and gender equality within couples are – by global standards – relatively high.

Family Migration Practices of Refugees in Germany: The Timing Of Spouses' And Children's Migration

Sauer, Lenore; Kraus, Elisabeth

Federal Institute for Population Research, Germany
lenore.sauer[at]bib.bund.de, elisabeth.kraus[at]bib.bund.de

Although the numbers of forcibly displaced persons worldwide has increased substantially over the last years, studies on refugee populations in European destination countries are still sparse, especially concerning transnational family arrangements and family reunification practices. This paper aims to fill this gap by examining the process of family migration and reunification practices among male and female refugees who recently arrived in Germany from Afghanistan, Iraq and Syria. Using data from the first two waves of the Refugee Sample of the German Socio-Economic Panel (IAB-BAMF-SOEP) and applying descriptive statistics as well as logistic regression models, we disentangle the heterogeneity of refugee families' migration processes. Specifically, we analyse different types of family migration trajectories (joint versus independent versus family stage migration) and the probability of reunification with the left-behind partner and/or children in the destination country and to what extent this is shaped by socio-economic conditions, family networks and the legal situation of the first mover. Preliminary results on spousal migration behaviour reveal that the husband's educational attainment and financial situation in the origin country determine whether couples arrive together at the destination. Moreover, solo migration is associated with the presence of other extended family members at the destination. We conclude that conventional theories for explaining economically motivated migration decisions and outcomes have to be adapted to the context of forced migration, and that further research is needed on the gender-specific characteristics of refugees.

Who Counts as “Unaccompanied”? The Making up of Family Relations in the Context of Migration Management in Germany

Ülpenich, Bettina

Heinrich-Heine-Universität Düsseldorf, Germany
bettina.uelpenich[at]uni-duesseldorf.de

This presentation explores the social construction of family relations in the context of migration management based on qualitative interviews with social workers in youth welfare service in Germany. Large numbers of Unaccompanied Refugee Minors (URM) have been resettled in Germany and taken into care. As the interviews show, not only do case workers try to identify who counts as unaccompanied, they make family relations count through their assessments. In my paper I assume that minors who end up being classified as travelling “alone” are a social construction, interlinked with the migration regime, where identities are questionable and a specific doing family can be considered. This leads to the central aim of this paper: How do professional case workers proof and evaluate family relations? When and how do family relations become questionable and when do they count? And most important, how “is family done” during the assessments? The empirical examination of taking unaccompanied minors into care clarifies that companions have to be ignored or made relevant by the case workers. The main finding suggests that family relations are not taken for granted, they have to be verified. Case workers reach out for reliable documents to investigate family relations, guardianships and parents in the distance, while the lack of legal documentation leads to them being questioned. That means family members are documented family members. To do family, case workers use the differentiation between documented and undocumented people created by legal boundaries and border crossing, reproducing a migration regime in which undocumented migrants' access to rights and belonging is limited.

JS_RN15_RN28_10 | Boundaries, Barriers, and (Multiple) Belongings Through Sport

Grasping of the Ethnic Identity Gap in Transnational Social Positioning-Case: Turkish Football Players between Berlin and Turkey

Aktan, Oktay

University of Kiel, Germany
aktan[at]gender.uni-kiel.de

Even the semi-professional football generates a social field (Bourdieu) in which the players feel themselves between the possibility of transnational mobility. This has significant impacts on the players' self-positioning. This self-positioning takes an oscillating character when football is investigated in a migration context. In order to put the research focus on this intersection, I have conducted a field study on the semi-professional Turkish football players. The group discussions with the players demonstrate that they present themselves between the patterns of inclusion and exclusion - due to their everyday confrontations with stereotypes and prejudices. The phenomenological reconstructions of this self-presentation pattern indicate that this self-positioning has an ambivalent character which is constituted between the players' constructions on mind (Mead) and their self-experiences (Goffman) in everyday life. As a result the social body (Shilling) i.e. "migrant body" finds himself between a type of belonging to the social field in Berlin and the transnational positioning i.e. moving to "homeland" via bonded social capital (Putnam) networks. This way of perception of the homeland as a heterotopie (Foucault) generates a compensatory social space for the excluded body. The question here is how this heterotopie transforms the self-perception pattern of the players especially their nation- and ethnic based embeddedness in and after this transnational movement. In order to answer this question, some sequences from the empirical data will be introduced in my presentation with the aim of reconstructing the players' ethnic and national identity based on the interpretation of their experiences in the "homeland".

VAR (video-assistant-referee) as Neo- Colonialism? Reading the FIFA 2018 Mens World Cup YouTube Video Comments

Petersen-Wagner, Renan (1); Ludvigsen,
Jan (2)

1: Leeds Beckett University, United Kingdom; 2: Liverpool John
Moore's University, United Kingdom
r.petersen-wagner[at]leedsbeckett.ac.uk,
J.A.Ludvigsen[at]2018.ljmu.ac.uk

The 2018 FIFA Mens World Cup saw the introduction of video-assistant-referee (VAR) as one of its main talking points. For the first time officials had the assistance of replays and VARs to support decisions. Nevertheless, the introduction of VAR was not without controversies. To understand how fans experienced VAR we employed a digital sociological approach (Marres, 2017) by focusing on one loosely defined community (FIFA's Official YouTube channel), and used digital tools (Rieder, 2015) to scrap users' comments. We scrapped over 300,000 comments from 31 videos that were analysed through CDA (Chouliaraki & Fairclough, 1999). Three main categories emerged: Global North vs Global South; Non-Neutrality of Technology; VAR is Killing the Beautiful Game. In this paper our analysis focus on the first category - using the remaining two as support - to argue that VAR was comprehended as a tool for neo-colonialism. Fans recognised VAR as: favouring loosely defined Global North sides; improving Global North sides' chances; controlling Global South players' actions. We argue that VAR operated as a panopticon (Foucault, 1985) that rationalised/standardised the ways of playing (Mignolo, 1999; Santos, 2014) following an Eurocentric interpretation of the rules. Our findings highlight the paradoxes of technology, where VAR operated as a tool for systemic control and YouTube acted as a site for anti-systemic movements (Bragança & Wallerstein, 1982) that allowed for transnational networks of hope (Castells, 2012). We conclude by showing the reflexive nature of borders (Beck, 2004) where boundaries, barriers and belongings become more transient and fluid.

Football Fandom as an Identity Component among Turkish-speaking Diaspora Members in France

Irak, Daghan

Aix-Marseille University, France
daghan.irak[at]univ-amu.fr

Turkish-speaking diaspora communities in Europe are often described as one of the most self-enclosed communities of their kind. Football fandom, especially fandom of the “Big Four” (Beşiktaş, Galatasaray, Fenerbahçe and Trabzonspor), is very popular among these communities, as international games of these games in Europe are often played in a home-field atmosphere. This kind of fandom, with the help of communication technologies like the Internet and satellite TV, has created a bond between these communities and their “homeland,” presumably reinforcing Turkey’s role in the identity formation, even in the third generation immigrants who were born in the host country. However, football fandom, as a mediated and globalised cultural practice, also paves the way for a broader perception of the world, since many fandom practices are shared globally, and the international fixtures are an important part of football. Equally, it may be hypothesised that fandom may also create a connection with the host country through football, as most Western countries that have received immigration are also major football countries. The aim of our paper is to explain the role of football fandom in diaspora communities, and also confirm or refute a possible role of football in bonding with the host country. As a case study, this research will work on the followers, who are confirmed to live in France, of the French-language Twitter accounts of the “Big Four” of football in Turkey. Through Social Network Analysis (SNA) and textual analysis, the paper will reveal the nature of diaspora football fans’ relationships with football clubs in Turkey, France and Europe.

Who May Represent the Nation? Sport, Migration and Citizenship in a Globalising World

Oonk, Gijsbert

Erasmus University, Netherlands, The
Oonk[at]eshcc.eur.nl

Summary States increasingly accept ‘imported’ or migrated talent to promote their country’s name and fame in major sporting events like the Olympic Games or FIFA World Cup football. On the one hand, this increases the freedom of mobility and options for talented athletes. On the other, if a nation wishes to upsurge its chances in international sport events by using talent without any prior relationship with the country, this stretches the notion of ‘nationality’ and ‘national belonging’. We propose three categories of relationships between migrant athletes and the state: (1) ‘thick’ and the most common or ‘ideal type of citizenship’; (2) ‘mixed’ forms of citizenship, where the prior relationship through *jus sanguinis* or *jus soli* is distorted by external territorial (colonial) expansion, or a *ius nexi* relation; (3) the ‘thin’ form of citizenship, where migrant athletes have no prior relationship with the countries they represent, and where countries buy talented athletes in return for citizenship (Shachar 2017, 798). The ‘thick’ and ‘thin’ qualifications may help us to understand ‘citizenship as claims-making,’ as suggested recently by Bloemraad (2018) from a theoretical perspective.

JS_RN15_RN37_02 | Transforming Cities in a Global Transforming World

City, Privileged Object of Visualisation: Explaining Global Urban Change with Scientific Visual Narratives

Kowalewski, Maciej

University of Szczecin, Poland
maciej.kowalewski[at]usz.edu.pl

The aim of the paper is to analyze the importance of the scientific description of global urban change mediated by the data visualization (graphs, animations, infographics). The main research question is how the visual tools for presenting research results create the images of the city? If such data visualities are regarded as a type of text, it is possible to define visual discourse as a set of narratives referring to ways of thinking and talking about the urban change, mediated by images. In this term, the graphs are not just data presentations, but ready-made texts of urban studies, both describing and designing urban realm. The author sees those graphs as not only an indicator of urban processes, but also as 'new urban narrative', as images constellations shaping understanding of global urban change. New visual technologies (animated data visualization, GIS, 3D interactive tools) make possible to depict the processes taking place over time - both in the perspective of one day (e.g. spatial mobility) and cumulative data showing the variability of phenomena in decades (e.g. demographic changes). Visual data in urban studies work in the same way as a tourist brochure, which documents or makes probable the urban experience, or as an architectural visualization, which activates the imagination and convinces the investor of the validity of the expenditure. Similar, scientific visualizations are not limited to the academia, but also become a part of the popular culture, urban policies, etc.

New urban practices in Russia's periphery

Kitsos, Vasileios

södertörns högskola, Sweden
vasileios.kitsos[at]sh.se

This study is part of a doctoral dissertation that employs a common research frame upon uncommon case studies: The global outreach of urban regeneration, and the changes it brings in institutions and physical space in secondary cities, located outside the global core but striving for increased attractiveness, competitiveness and livability is addressed. The study wishes to contribute to a better understanding of the mechanisms associated with urban regeneration in a globalized era, through the study of its imposition or

(re)emergence upon a very specific institutional, physical and geohistorical context, that of Eastern Russia. It also touches upon the topic of knowledge transfer and circulation in the contemporary Russian city. While scholarship on urban regimes in Russia is becoming increasingly diverse and looking beyond the core, this study attempts to insist in establishing and articulating a locally-bound perspective that perceives urban regeneration from within, as a product of a constellation of space-defined relations, decisions and actions. In this line, case studies are seen not as detached decisions taken elsewhere -although this might as well be a fact- but as parts in becoming, of a palimpsest that is the urban condition. A convergent parallel design method has been applied. Empirical material that will be presented consists of information derived from (1) official documentation and media reports (2) interviews and (3) observations of physical urban spaces attributes during fieldwork. One of the case studies will be presented in detail.

Skopje: The "Kitsch" And "Bastard" Capital of The Statues

Pezzoli, Silvia; Moroni, Sheyla

University of Florence, Italy
silvia.pezzoli[at]unifi.it, sheyla.moroni[at]unifi.it

FYROM (that named its self Macedonia, now Northern Macedonia) became independent in 1991 and Skopje became its capital. Rebuilt in 1963 (after a devastating earthquake) Skopje reproduces the "ethnic composition" of the State and it's inhabited by a "Macedonian" majority, (about 50 %) a conspicuous Albanian minority and groups of Roma, Serbs, Turks, Bosnians and Bulgarians. In 2010 the Prime Minister Nicola Gruevski (2006-2016) launched a project: Skopje 2014, that "marks the beginning and the political end" of the narrative of Macedonia that the strongly nationalist government proposes (Jovanovski, 2017). The strong urban and architectural imprint that the Gruevski government tried to give the city, sees the constant presence of harsh and widespread protests (mainly stemming from the Faculty of Architecture) due both to the its wasteful trajectory (about 450 million euros) and the strong request of freedom of expression (2008, 2009 and 2016, above all). The choices of nationalists engaged in "civil wars" groups (Tetovo, 2001 and Kumanovo, 2015) fight for the redefinition of the city center, where new "buildings of the power" and hundreds of statues intend to reconnect with the national-patriotic identity discourse and the imaginary dating to the end of the nineteenth and the beginning of the twentieth century. The study of the events that intersect the city of Skopje has been supported by a qualitative interdisciplinary research divided into three phases: analysis of archival photographic material, direct observation and collection of photographs taken in two different moments (November 2016 and July 2018), selection of some statues to investigate their identity and political function and their (possible) re-memorization, re-semanticization and contemporary reallocation (Marques-Pimenta de Faria, 2013).

JS_RN16_RN20_10 | Co-creation/Production/Design in Health and Healthcare: Cutting-Edge Approach or Smart Branding?

When is Co-production not Co-production? Investigating co-production within the context of Patient and Public Involvement (PPI) in healthcare research in England
Williams, Oli

King's College London, United Kingdom
osw3[at]le.ac.uk

UK health policy dictates that members of the public, patients and carers are to play a key role in healthcare decision-making on the basis that 'lay advisors' or 'experts by experience' can help to improve health policies and services. It is for this reason that the National Health Service (NHS) strongly encourages patient and public involvement (PPI) and that PPI is a mandated component of all National Institute for Health Research (NIHR) funded research. Co-production has only recently come to prominence within PPI for NIHR funded healthcare research but has quickly been promoted as a gold standard. However, there is now such variety in conceptualisation and practice of co-production that critical inquiry is required to investigate: (i) to what extent 'co-production' occurring within the context of PPI in healthcare research represents and resembles forms and practices of co-production which have gone before (ii) how this compares with co-production practices in the healthcare sector outside of funded research and (iii) how and in what ways the state-sponsored process of PPI in healthcare research alters the fidelity of co-production as understood and practiced elsewhere? These lines of inquiry are being pursued in a three-year qualitative study investigating a national network of applied health research organisations. Of particular consideration is the historical development of the concept of co-production and the needs and constraints of those applying it in different contemporary contexts. The ultimate aims of this research are to address instances of perceived misappropriation and to promote good practice and positive outcomes.

Exploring, Measuring and Enhancing the Co-production Of Health and Wellbeing at The National, Regional and Local Levels Through Comparative Case Studies in Sweden And England: The 'Samskapa' Research Programme (Study Protocol)

Sarre, Sophie (1); Robert, Glenn (1); Kjellström, Sofia (2); Areskoug Josefsson, Kristina (2); Andersson Gäre, Boel (2); Andersson, Ann-Christine (2); Ockander, Marlene (2); Käll, Jacob (3); McGrath, Jane (4); Donetto, Sara (1)

sophie.sarre[at]kcl.ac.uk, glenn.robert[at]kcl.ac.uk, sofia.kjellstrom[at]ju.se, Kristina.Areskoug-Josefsson[at]ju.se, boel.andersson.gare[at]rjl.se, Ann-Christine.Andersson[at]ju.se, Marlene.Ockander[at]ju.se, jacob.kall[at]doingrural.se, justjanie[at]btopenworld.com, sara.donetto[at]kcl.ac.uk

Introduction: co-creation, co-production and co-design are advocated as effective ways of involving citizens in the design, management, provision and evaluation of health and social care services. Although numerous case studies describe the nature and level of co-production in individual projects, there remain significant gaps in the evidence base. Our overall aim is to explore, enhance and measure the value of co-production for improving the health and wellbeing of citizens. We will focus on three fundamental issues: (a) measures of co-production processes and their outcomes, (b) mechanisms that enable inclusivity and reciprocity, and (c) management systems and styles. Methods and analysis: nine confirmed co-production projects will form the core of an interactive research programme ('Samskapa') during a six-year period (2019-24). Six of these will take place in Sweden and three will be undertaken in England to enable knowledge exchange and cross-cultural comparison. The programme has a longitudinal case study design using both qualitative and quantitative methods. Cross-case analysis and a sensemaking process will generate relevant lessons both for those participating in the projects and researchers. Based on the findings we will develop explanatory models and other outputs to increase the sustained value (and values) of future co-production initiatives in these sectors. Dissemination: Given the interactive nature of the research programme, knowledge dissemination to stakeholders will be ongoing throughout the six years. An additional dissemination mechanism to practitioners and other interest groups will be through external workshops in collaboration with participating case studies and citizens both during and at the end of the programme.

Revealing the Labour. The 'Hidden' Co-Production of Planning for (Tele)Care in the Home

Wilson, Rob; Brittain, Katie

Northumbria University, United Kingdom
Rob.Wilson[at]northumbria.ac.uk,
Katie.Brittain[at]northumbria.ac.uk

Telecare refers to the use of digital or information and communication technologies (ICTs) to facilitate health and social care delivery to individuals in their homes. This paper explores the idea of telecare by foregrounding its interconnections with care and caring activities, paid and unpaid. It draws on research as a part of a wider study of business models of assistive living technologies from a set of interviews about telecare with older people and their carers in the North of England, UK. Previous sociological work on telecare conceives it as a function and components of technical systems with the focus being the effects such systems have on the user. This has led to observations that such tools and technologies create work for the user in their domestic environment. The question is what is the form of this work, who is involved and how does the work get done? In order to address these questions we adopt a conceptual positioning of telecare as part of a wider carer network using Glucksmann's framework of the 'total social organisation of labour' (TSOL), we provide an analysis that contributes to understanding how a socio-technical approach to telecare reveals ways to improve our understanding of how formal and informal care interact.

Photovoice As A Promising Approach to The Co-Creation of Knowledge: Capturing And Communicating Ethnic Minority People's Lived Experiences Of Severe Mental Illness And Its Treatment

Halvorsrud, Kristoffer (1); Rhodes, James (2); Mae Webster, Georgia (1); Francis, Joy (3); Haarmans, Maria (2); Dawkins, Natalia (1); Nazroo, James (2); Bhui, Kamaldeep (1)

k.s.bhui[at]qmul.ac.uk

Mental health related stigma inhibits many from seeking help. Conventional therapeutic methods relying on the spoken word only may not elucidate the full range and nuances of patient/lived experiences. We present a photovoice project as a promising approach to the co-creation/co-production of knowledge, in which ethnic minority service users and those involved in their care captured photos of their own lived experiences of severe mental illness and/or its treatment. Evidence suggests that many projects claiming to co-create/co-produce knowledge merely employ service users to verify their findings. In contrast, our photovoice participants steered the process from its inception by representing their lived experiences, selecting issues of importance to them, reflecting on these through photography, and pursuing wider impacts by dissemination at public exhibitions. Altogether seven photovoice workshops were facilitated over six months in London and Manchester (England), while three local exhibitions were hosted at participating community centres and two subsequent exhibitions showcased the participants' work to the public. Twenty-one people, from a diversity of ethnic minority backgrounds and receiving a variety of diagnoses, were involved in the project. Participants reflected on how the use of photography had provided an empowering platform from which to communicate sensitive issues. The public exhibitions enabled their narratives to reach a public audience, contributing towards challenging mental health stigmatisation. 92% of delegate feedback at the public exhibitions either 'very strongly' or 'strongly' agreed that 'photos and captions were well displayed to communicate the narratives of lived experience of mental health and its treatment'.

JS_RN16_RN22_RN30_10 | Adolescents and Obesity in Context: Moving Beyond Individual Choice

Confronting Obesity: Co-creating policy with adolescents

Bröer, Christian; Ayuandini, Sherria;
Veltkamp, Gerlieke; Evelyne, Baillergeau

University of Amsterdam, Netherlands, The
c.broer[at]uva.nl, sp.ayuandini[at]gmail.com,
g.veltkamp[at]uva.nl, E.Baillergeau[at]uva.nl

How to arrive at macro level or system-based approach for overweight prevention in the European Union? In this presentation we will describe one particular approach and present some first findings from the so called CoCreate project. The Horizon 2020 funded project "Confronting Obesity: Co-creating policy with adolescents" aims to bring together scientific knowledge and youth experiential knowledge. CoCreate strives to empower youth to envision and test policy changes at the macro or system level. CoCreate is premised on participatory democracy and assumes that political engagement and innovation arise from learning and intervention processes. More particularly, the involvement of youth is based on Participatory Action Research (PAR). While running PAR, we also research if and how this approach leads to novel policy ideas, readiness for action, learning and inclusive policy making. CoCreate is meant to include diverse groups of youth. This presentation will address the problems involved in reaching out to and recruiting disadvantaged youth across different national and local context. We will present first data from the recruitment phase of CoCreate. Diversity and inequality have different shapes across these contexts. We want to discuss the question what this means for a system based prevention approach. How can we reconcile local diversities with generic and systemic interventions? CoCreate runs in 5 European countries: Norway, UK, The Netherlands, Portugal and Poland. Parts of CoCreate extend to South Africa and to the US/Texas. It started May 2018 to finish in 2023. The involvement of youth starts April 2018. Researchers from the social sciences, epidemiology, psychology and medicine are contributing and 250 citizens aged 16-18 are to be engaged with.

Fatness & Blackness: Considering the cultural dynamics of curves

Appleford, Katherine

Kingston University London, United Kingdom
k.appleford[at]kingston.ac.uk

The purpose of this paper is to consider the importance of cultural understandings of fatness and beauty when engaging in medical debates such as those concerned with adolescent

obesity prevention. Drawing on empirical research conducted in 2015 which focused on racial distinctions in women's motivations for dieting, the paper argues that for some women 'fullness' is important in terms of desirability. Indeed, for many young black women the beauty ideal may well centre around notions of 'slim-thick', which place significant emphasis on having curves. Consequently, the paper suggests that health and medical programmes which set out to tackle obesity need to acknowledge the cultural differences in understandings of beauty, and ought to consider the cultural and social dynamics of food and fatness too, as both can be read as symbols of love, care and nurture.

"What's a normal weight?" - Body Size Norms in Origin- and Receiving Country and Immigrant Adolescents' Weight-Status Self-Assessment

Kern, Matthias Robert (1), Heinz, Andreas
(1), Stevens, Gonneke (2), Walsh, Sophie D.
(3), Willems, Helmut (1)

1: University of Luxembourg, Luxembourg; 2: Utrecht
University, Netherlands; 3: Bar-Ilan University, Israel
matthiasrobert.kern[at]uni.lu; andreas.heinz[at]uni.lu;
G.W.J.M.Stevens[at]uu.nl; Walshs@biu.ac.il;
Walshs[at]biu.ac.il

Many young people struggle with correctly assessing their weight-status, often leaving over- or underweight to go unnoticed and preventing adequate intervention. Weight-status perception differs cross-nationally and cross-ethnically revealing a considerable influence of social context. In particular, cultural norms regarding body-size seem to serve as benchmarks for weight-status assessment. For immigrant adolescents this brings up the problem of multiple reference frames. As they are often simultaneously embedded within heritage- and receiving culture normative regimes, they might assess their weight-status against the backdrop of either heritage- or receiving culture body-size norms or both. In our study we investigate to which extent weight-status assessment among immigrant adolescents is affected by origin- and receiving country body-size norms, using data from the 2014 Health Behaviour in School-Aged Children study. The cross-national design of the study enabled us to aggregate body-size norms for 41 countries in Europe, Asia and America and subsequently identify a large and ethnically diverse sample of 8132 immigrant adolescents in 23 receiving countries from 41 origin countries. Descriptive analyses reveal considerable differences in body-size norms between the different countries. Cross-classified multilevel regression analyses demonstrate a significant effect of heritage- and receiving culture body-size norms on weight-status assessment, with a stronger impact of receiving culture norms. Stratified analyses reveal a stronger influence of heritage culture body-size norms among first- than among second generation immigrants, and a stronger influence of receiving culture body-size norms among second- than among first generation immigrants. The results corroborate our expectations regarding the persistency of cultural norms and help contextualize inter-ethnic differences in weight-status assessment.

Exploring Nutrition in Context: What Do 11-Year-old Girls Eat and Think of Food?

Fernandez, Eluska; Horgan, Deirdre; Kitching, Karl

University College Cork, Ireland
e.fernandez[at]ucc.ie, d.horgan[at]ucc.ie, k.kitching[at]ucc.ie

In Ireland, healthy eating policies for children and young people are often being framed in the context of increasing concerns about childhood obesity, an issue which according to the Irish government requires a multi-faceted approach that involves 'the development of knowledge, skills and attitudes that influence behavior on food selection and consumption' (HSE, 2018). These concerns reflect the hegemony of 'obesity discourse', which emphasise individual attributes in the pursuit of health, as well as top-down approaches that involve 'giving students information'. Our paper will discuss findings from a study undertaken in an all-girls primary school in a disadvantaged neighbourhood of a city in Ireland. It will reveal findings from a number of creative and participatory research exercises undertaken with 5th class students, which explore what students already know and have learned and experienced about nutrition both in their own lives, at schools, in their community and wider context. These exercises include focus groups where students 'speak back' to health promotion questionnaires and reflect on what different questions they would ask of researchers about their eating and spending habits; and a mapping of food outlets exercise in their own community, which highlights material and structural factors (e.g. availability of good quality food in low income areas). Drawing on critical pedagogical approaches that problematize individualizing practices and recognize how discourses on nutrition are also mediated by gender, inequality and power, our study engages students in discussions about wider food policy issues that go beyond the focus on individual behaviour.

Exploring A 'Practice Change' Approach to School Physical Activity Intervention

Spotswood, Fiona (1); Wiltshire, Gareth (2)

1: University of Bristol, United Kingdom; 2: University of Bath, United Kingdom
fiona.spotswood[at]bristol.ac.uk, grw35[at]bath.ac.uk

Child and adolescent obesity continues to be a major public health concern. Critical scholarship problematizes the dominant behavioural-individualist approach to some eating and physical activity (PA) interventions and the potential of an alternative approach drawing on theories of practice has been widely noted. Focusing on practices reimagines intervention as shaping sets of collective conventions through managed changes to practice interrelationships and anatomies. However, there is little evidence of the viability of this approach. This study considers whether, and how, a practice-change approach to school physical activity participation is operationalizable. Mixed ethnographic research in primary school one considered (1) which practices are available to pupils during a school day that are physically active (2) how the configuration of materials, competences and meanings serves to enable or constrain PA, and (3) how practices are enabled or constrained by their interrelationships. Through this interrogation of practices, we set the scene for the pilot project in school two; a co-designed programme of practice change. Learning from the pilot includes that: o The interconnectivity of practices inside and outside the school, performed by multiple practitioners, implicates pupils' PA participation. The anatomy of a wide range of practices shapes the PA 'culture' of the school. Prioritisation is required. o Operationalizing a practice-based plan requires a multitude of well-established management techniques such as co-creation, coalition-forming and social marketing. o Evaluation of practice change requires theoretical and practical sensitivity; e.g. a long term and measures of collective social value in addition to quantifiable increases in PA participation.

JS_RN20_RN27_01 | Decolonising Social Research: Practices and Reflections on the Democratisation of Social Research

Doing Participatory Action Research in Times of Neoliberalism

Vargiu, Andrea (1); Cocco, Mariantonietta
(1); Mendiwolso-Bendek, Zoraida (2)

1: Università di Sassari, Italy; 2: Lincoln University, United
Kingdom
avargiu[at]uniss.it, mcocco[at]uniss.it,
ZBendek[at]lincoln.ac.uk

During last decades Participatory Action Research (PAR)/Community Based Research (CBR) have developed as a prominent approach to social research and learning based grounded on a dialogical and dialectic methodology and epistemologies. The development of this approach respond to disciplinary tensions within the complexity of social sciences and to challenges and dilemmas arising from direct research discourses and practices. Academic literature related to these factors abounds, whereas wider societal issues that significantly contribute to determine the evolutions of both are much less explored. Nevertheless, one might find it hard to say the overall societal context within which they evolved hasn't changed since the early days of PAR/CBR; or maybe there are new articulations that have enriched the PAR/CBR without challenging dominant epistemologies. In this presentation, authors will introduce some levels of discussions of the implications societal changes have vis-à-vis theory and practice of PAR/CBR, notably by referring to present context within which – willing or not – all actors classically involved in PAR activities (researchers, citizens, practitioners, policy makers) act in arenas that are strongly marked by dominant epistemologies. Discussion will follow based on reference to practical action research experiences about ways to work out coherent and effective practices aimed at positive social change.

“Politik als Beruf”. Thinking the Quality of Public Action Vinci, Fiorella

eCampus University, Italy
fiorella.vinci[at]tiscali.it

The contemporary debate regarding elites embodies, frequently and not without misunderstandings, also that regarding the competencies of the elites (Rosanvallon 2017). In western societies, once the pact between ruling classes and society broken (Magatti 2009), in the era of the digital revolution, higher education appears ineffective and functional exclusively for the reproduction of traditional elites. But can the profession of politician today disregard a higher and academic education? And as social scientists how can we contribute to this debate? Proceeding from these questions, the paper proposes to analyse, according to an institutional-generative logic, some qualities of political man identified in the well-known Weberian conference. The analytical-historic perspective is the first lesson that the Weberian study offers: the struggle and selection for power always occurs within specific frames and institutional communities and is ever more, the constant result of a process of professionalisation in which the relationship between ethics, science and politics comes to the fore (Bruhns, Duran 2009). Making, in a Faustian way, a pact with the devil characterises the profession of politician but does not exhaust his action; the exercise of the ethics of conviction is not distinctive of its action, he must give proof of an ethics of responsibility. But what is the ethics of responsibility? How and where can it be learned? At the beginning of the 21st century reflecting on the ethics of responsibility could perhaps constitute an interdisciplinary research programme in the light of which one could rethink the historical sciences of human culture.

Academic Neo-colonialism in Writing Practices: Geographic Markers in Three Journals from Japan, Turkey and the US

Ergin, Murat; Alkan, Aybike

Koc University, Turkey
muergin[at]ku.edu.tr, aalkan[at]ku.edu.tr

A global academic division of labor haunts contemporary academic production and affects how scholars from different regions present the context and the methodological assumptions of their research. The epistemological implications assign southern knowledge to the status of “data” for the use of northern “theory.” The institutional consequences affect the training and promotion of scholars, and the distribution of academic resources. The persistence of global power relations in academic production is partially an indicator of the achievement of the West in establishing a Eurocentric relationship with the rest of the world. This paper looks at the manifestations of the contemporary academic division of labor in scholarly writing. We examine articles published in three international academic journals, based in Japan, Turkey, and the United States (American Sociological Review, Social Science Japan Journal, and New Perspectives on Turkey), and focus on the different ways in which authors use geographic markers, words that indicate that a title, an abstract, or a sentence is written in reference to a particular location—a country, a city, or another geographic entity. Scholarship in the North relies on a writing style that reflects and reproduces its privileged position in the global academic division of labor. However, southern scholars tend to write in a style that makes heavy use of geographic markers, which reflects their underprivileged position in global academic world as “case” or “data” producers for northern theory.

scientifically robust findings and can very well provide empowering tools for citizens to develop solutions to their communities’ problems. It also increases science literacy and overall public awareness about the science. On the other hand, there are also sceptical voices regarding citizen science data quality issues, claiming that citizen science lacks scientific and theoretic standards. Authors of this paper are from Eastern EU countries, Lithuania and Hungary, where citizen science initiatives are unnoticed, rare or silent; hardly any projects can be identified that use the term ‘citizen science’ for self-definition. The fact that the term has limited acknowledgement represents unequal knowledge production and multiple science cultures within and beyond Europe. The paper will point out how citizen science in such a context could help us to decolonise research. The paper is based on qualitative data analysis.

Citizen Science as a Way to the Democratisation of Social Research

Butkeviciene, Egle (1); Balázs, Bálint (2)

1: Kaunas University of Technology, Lithuania; 2:
Environmental Social Science Research Group, Hungary
egle.butkeviciene[at]ktu.lt, balazs.balint[at]essrg.hu

Despite an anti-science movement in some sections of society, there are great opportunities for public engagement for scientific research in a transition towards a more cooperative research and innovation sector. There are multiple ways of engaging public perspectives and knowledge in scientific discourse and policy-making. This article will present citizen science as a proper and passionate participatory research methodology for research and knowledge generation, offering a transformative way to the democratisation of social research. Being a relatively new but rapidly growing field, citizen science expands public involvement in science and research and supports alternative models of knowledge production (Hecker et al, 2018). For decades being below the radar for most professional scientists and policymakers, citizen science nowadays aims for multiple social goals beyond

JS_RN20_RN28_01 | Qualitative Research in the Field of Sport and Embodiment

Diagrams of Bodily Inscription: Relational Spaces in the Sociological Description of Sport

Dudley-Smith, Russell (1); Whiteman,
Natasha Ewa (2)

1: UCL, United Kingdom; 2: University of Leicester, United Kingdom
r.dudley-smith.14[at]ucl.ac.uk, new9[at]leicester.ac.uk

With illustrations from the sport of fencing, this paper introduces a method for describing the partially non-discursive and tacit constitution of skill. Social Activity Method (Dowling, 2009) - an approach that involves the development of relational spaces - is presented as enabling a principled description of modes of social action within sporting activity. The paper follows Dowling's (2014: 304) suggestion that the body be considered sociologically as a process of "developing inscription" emergent in the alliances that grant and receive its participation. This process of inscription can then be diagrammed in a rigorous way by making the social-semiotic principles of their construction explicit. The method is able to produce a finely textured account of sporting skill. Fencing is a useful case study because it involves a great deal of play between the discursive and the non-discursive - disputes about 'what happened' in action are frequent. Empirical data is provided from television coverage of the 2012 Olympic Games, attempts by textbooks to convey the skills of the sport, and the presenting author's experience as a fencing coach. A series of diagrams of inscription are presented: maps of the modes composing threat, sporting tempo and distance, balance, and the possibilities of experiment (including feints). These enable a detailed account of some major shifts in skill necessitated by rule changes introduced under pressure from the IOC and the media. The paper therefore argues that an account of bodily inscription also has the potential to open up a sociology of sport more generally.

'Contact Zones' of Knowledge Communication: Touching and Sensing Bodies in Youth Training and Dementia Diagnosis

Singh, Ajit Jacob

Leibniz Institute for Research on Society and Space, Germany
ajit.singh[at]leibniz-irs.de

Phenomenological, anthropological and cultural-historical studies (i.e. Merleau-Ponty 1966, Classen 2012, Howes 2018) provide deep insights into the meaning of senses and especially of touch. Sociology (of the body) struggles to examine the social relevance of tactile and haptic modes of accessing reality. Even Simmel's extremely fruitful 'sociology of the senses' focused primarily on seeing, hearing or smelling. However, considering specific social contexts and the (professional) knowledge about and of the body, touching other bodies is a central component of various communicative practices. The contribution approaches the communicative production of these social "contact zones" from an interactionist perspective, using videographic data (Tuma et al. 2013) on knowledge communication in youth sports training (Singh 2019) and on dementia diagnosis situations. It will be asked how sociality is structured by the coordinated interplay of communicative actions (Knoblauch 2013) of touching, feeling and seeing? I will comparatively discuss how touching is situated, framed and realised and how embodied knowledge is mediated and objectified as a result. Finally, the possibilities and limits of a video-based research of sensory practices will be reflected. While sports training aims at the communicative production of an embodied "special knowledge", dementia diagnoses are concerned with the availability of everyday (embodied) knowledge and the examination of a cognitive and dementia changed status. The tactile "crossing" of body boundaries is essential in both cases. Although the tactile micro-practices of doctors and trainers may resemble each other, the communicative actions go hand in hand with culturally specific ways of understanding embodied constructions of meaning.

The Methodological Gap: How to Apprehend Body and Embodiment in Sociology

Aromatario, Aurélie

Université Libre de Bruxelles, Belgium
Aurelie.Aromatario[at]ulb.ac.be

For several decades now, most sociological studies focusing on the body have been asserting the lacunas in the existing literature whereas confiding in the increasing interest for the topic to solve the issue. Different conceptualizations of the body will be presented here as well as and their contribution to qualitative methods in a sociology of body and embodiment. The sociology of the body often keeps focused on the symbolical dimension of the body, as surface laden with social inscriptions (Le Breton 2015). However, calling on Merleau-Ponty's phenomenology (1945) has been an insightful lead in order to theorize the body as a social product but also as a subject that produces society, deeply enrooted in the individual and collective experience (Csordas 1990; Crossley 1995; Paterson and Hughes 1999; Ram and Houston 2015). Yet, most of those researches fail to describe a tangible sociological methodology, and remain evasive instead. The same critique applies to feminist theory, despite the insistence - also influenced by phenomenology - on the lived body and the specificity of the female experience (Grosz 1992, Dolezal 2010, Parkins 2000). Focusing on embodiment, several studies succeed in introducing astute processes to provide a privileged access to otherwise indescribable sensory experiences, whether involving the researcher as their own subject (Allen-Collinson 2011, Spatz 2017), whether using hybrid techniques and multiple substrates for interviews (Coe and Strachan 2002, Akinleye 2016). This review reveals that, if body and embodiment seems to remain an unreachable matter, methodology is often its blind spot. Nevertheless, some results indicate the need for actively addressing this issue, and that the development of innovative methods is not only feasible but also to be encouraged.

A Sociological Analysis of The Temporality of parkrun

Lin, Yuwei

University of Roehampton, United Kingdom
yuwei.lin[at]roehampton.ac.uk

parkrun is a free, weekly, 5km timed running event taking place every Saturday morning 9am sharp across the UK and other countries. Over the past decade, parkrun events have attracted millions of participants, and the number of event locations has grown exponentially. The events and the organisers have gained huge media attention, including articles in the national newspapers, documentaries, TV news. Existing studies have looked into why parkrun is so successful and how it engages with groups who are less likely to be active (e.g., Stevinson et al. 2015, Fullagar 2016, Whiltshire 2018). While existing research suggests key factors shaping the longevity of parkrun, more research is needed in order to understand the social meanings of collective sport activities (such as parkrun) in a neoliberal society. The aim of this study is to use the sociological concept of 'time' and 'temporality' to understand the organisation of parkrun events and individual motivations. Based on my participant observation at various parkruns across the UK, I will discuss how time, a critical element in everything we do, plays a pivotal part in driving parkrun activities. Not only because all the events are time recorded, but also because of control and ownership and organisation of time. Analysing the participation and organisation of parkruns through the lenses of 'time' can provide not only deeper insights into individuals motivations, but also a richer description of what happens prior to, during, and after each parkrun. In other words, it helps us to gain a better understanding of the organisation of, the development of infrastructures of, the participation in parkruns.

JS_RN21_RN31_03 | The Challenge of Measuring Antisemitism

The Challenge of Studying Antisemitism and how Survey Experiments Can Help us to Address it

Beyer, Heiko (1); Liebe, Ulf (2)

1: Heinrich-Heine-Universität Düsseldorf, Germany; 2: University of Warwick, United Kingdom
heiko.beyer[at]uni-duesseldorf.de, Ulf.Liebe[at]warwick.ac.uk

Empirical research on antisemitism grapples with the issue of social desirability bias. In many studies using standardized surveys, the measurements are distorted because respondents lie about their attitudes and behavioral intentions. The presentation promotes a new approach to study antisemitism using survey experiments. This methodological toolbox allows for a more subtle measurement of antisemitism and offers various ways to include variables which account for the normative context of antisemitic speech and other types of action. To illustrate the benefits of the approach we present example studies which were conducted in Germany during the last ten years.

New Ways of Scrutinising Overt and Subtle Antisemitism in Hungary Barna, Ildiko; Knap, Arpad

Eotvos Lorand University, Faculty of Social Sciences, Hungary
barnaidiko[at]tatk.elte.hu, knap.arpad[at]gmail.com

The level of antisemitism in Hungary has always been among the highest in Europe. Representative surveys show that approximately 33 to 40 per cent of the Hungarian population is antisemitic. Although there has been some fluctuation, the level of antisemitism has remained quite stable. Moreover, we found, based on representative surveys among Hungarian Jews, that although the proportion of those having experienced or witnessed antisemitic acts one year prior to the survey decreased massively from 79 to 58 per cent between 1999 and 2017, the perception of antisemitism severely deteriorated. While in 1999, 37 per cent of Jews thought that antisemitism was strong or very strong in Hungary, in 2017 65 per cent said the same. This high discrepancy between experience and perception is due to several factors, being one of them the spread of online hatred. This fact makes the analysis of online sources necessary. Due to the vast amount of unstructured online textual data, their examination demands new tools, one of them being Natural Language Processing (NLP). NLP is an interdisciplinary field of research in the intersection of computer science, artificial intelligence, as well as linguistics. In our research, we apply NLP on a massive corpus of recent Hungarian news articles, social media content, and online forum comments. NLP makes possible not only the examination of the structure, the main topics, and actors of overt antisemitism but the identification of underlying subjects and specificities of latent antisemitism. In our paper, we present the first results of our research.

Assessing Antisemitism on Twitter

Miehling, Daniel Armin (1); Jikeli, Gunther (2,3,4)

1: OTH-Regensburg Germany; 2: Indiana University, United States of America; 3: Potsdam University, Germany; 4: CNRS, France

daniel1.miehling[at]st.oth-regensburg.de,
g.jikeli[at]gmail.com

Recent reports on online antisemitism highlight the rise of antisemitism on social media platforms. While this is plausible, several methodological questions arise when assessing such claims. How is the rise of antisemitism measured? How are they quantified in rapidly growing and diversifying platforms? Are the numbers of antisemitic messages rising proportionally to other content or is the share of antisemitic content increasing? Are antisemitic messages mostly disseminated on infamous websites and fora such as The Daily Stormer, 4Chan/pol or 8Chan/pol, Gab, and closed social media groups, or is this a wider phenomenon? However, at the root of methodological questions is the challenge of identifying a consistent way to identify diverse manifestations of antisemitism. Answering any substantive questions requires reliable methods for identifying antisemitic content in large datasets. Previous studies have used antisemitic keywords and combination of keywords, such as “kike” or “Jews” and “kill” or tracked antisemitic memes. (Finkelstein et al. 2018; Gitari et al. 2015) Others rely on manual classification, but fail to share their classification scheme and do not use representative samples. This paper presents the methods of a research project that a) aims to provide meaningful figures of the percentage of antisemitic tweets when keywords, such as “Jew*” or “Israel*” are used and b) develops a ground truth dataset of antisemitic/non-antisemitic tweets that can be used in AI programs to find antisemitic tweets in large databases. We also present our approach of using a definition of antisemitism that is transparent and verifiable.

Challenges of Measuring and Assessing Antisemitism: Phenomena, Perspectives and Methodological Considerations

Stoller, Kim Robin

International Institute for Education and Research on Antisemitism (IIBSA), Free University Berlin, Germany
kim.stoller[at]iibsa.org

Quantitative methodology, aiming to measure antisemitism in Europe or in specific European countries, is confronted with a challenge. Beside the lack of many comparative studies, quantitative attempts must define how they want to assess the current situation. Over the last years several quantitative studies and monitoring reports were published, focusing on different perspectives and phenomena. This paper discusses some of the different existing and possible attempts and methodological challenges, focusing on the following aspects: 1. Surveys on antisemitism: Perception of Jews; direct/ indirect communication; potentiality of action in a changed context/ latency; level of obsession; dehumanization/ demonization; justification/ toleration/ advocacy of antisemitic acts. 2. Jewish people's experiences with hate crime, discrimination and antisemitism. 3. Antisemitic incidents, hate crimes and perpetrators: Civil Society reports on antisemitic incidents and police statistics on antisemitic hate crime. 4. Mobilization of antisemitism: demonstrations, lectures etc. 5. Antisemitic Discourse: Antisemitism in Traditional Media and Social Media

Being Egyptian-Austrian and Viennese? The City, the Nation and Narrative Constructions of Belonging of Young Muslims in Zurich and Vienna

Novak, Christoph

University of Vienna, Austria
Christoph.novak[at]univie.ac.at

In contexts exhibiting nationalistic discourses, which pathologise Muslimness (as is the case for Austria and Switzerland today), constructing belonging to different collectivities while also constructing oneself as Muslim becomes a highly political act. Simultaneously diverse cities provide environments in which inhabitants' ideas of monolithic, fixed identity become replaced by a greater awareness of one's context-specific, boundary-crossing and flexible identifications, according to Paul Gilroy. Taking those two phenomena –anti-Muslim racism and effects of urban diversity – seriously, this presentation discusses how young self-identified Muslims living in Vienna and Zurich construct their belongings in interaction with a non-Muslim researcher. The research project assesses a diverse set of data gathered through a three-step process (narrative interview, photo-taking activity, photo-interview). This approach provided participants with different possibilities to present themselves and influence the research process. The analytical focus lies on the deliberate and implicit choices manifest in narrative constructions, made in conversations with a (gendered, raced, etc.) audience (the researcher). This presupposes scrutiny of the researcher's positionality, its contextual influence on the narrative construction and the interview situation. The methodological framework adopted (Narrative Constructionist Analysis; Esin, Fathi, Squire) aligns with this requirement, as it allows to assess the content of narratives, as well as the interview situation and interactions (e.g. co-construction of narratives). In this presentation, I will focus on constructions of

belonging to different collectivities (cities, nations), while also assessing the role of language (specifically local vernaculars) as part of these constructions. By contrasting findings from Zurich and Vienna, it will be possible to see how certain characteristics are specific to one location, while others might be an effect of urban space in general.

Interethnic Contact and Social Cohesion in Twelve Ethnically Diverse Neighborhoods in Four European Cities

Carvalho, Rui F.

Brown University, United States of America
rui_carvalho[at]brown.edu

European cities have been facing rising challenges related to increased ethnic diversity in the last decades. Therefore, there has been a growing number of studies examining the effects of migration-driven diversity for the livelihoods and social cohesion of neighborhoods. Many such works have found a negative relationship between ethnic diversity and social capital/cohesion. However, this effect seems to be mediated by individual and contextual features such as (the quality of) social, particularly inter-ethnic, contact with neighbors. In this context, we ask: (a) what socio-demographic and attitudinal elements are associated with the formation of inter-ethnic contacts in ethnically diverse neighborhoods (i.e. where residents are directly exposed to diversity); and (b) what are the effects of inter-ethnic contact for neighborhood social capital/cohesion. We answer them by using data from a questionnaire applied to the residents of twelve multi-ethnic neighborhoods in four European cities (Bilbao, Spain; Lisbon, Portugal; Thessaloniki, Greece; Vienna, Austria). Using regression models predicting inter-ethnic contact of various types and degrees of intimacy, we find that exposure to diversity does not uniformly decrease neighborhood social capital/cohesion. Also, migration background is the single most important individual predictor of neighborhood inter-ethnic ties and social capital. And, the relationship between social capital, as well as personal values/attitudes, and inter-ethnic relations is not uniform across types of contact, being stronger for less intimate relations. These and other results highlight the importance of viewing inter-ethnic contact and social capital as multifaceted concepts, whose dimensions are shaped by different demographic, cognitive and behavioral factors.

Measuring the Role of Ethnic Diversity and Out-Group Size in Dutch Neighborhoods: A Mediating Effect of Neighborhood Cohesion on Fear of Crime

Glas, Iris (1); Jennissen, Roel (2); Engbersen, Godfried (1)

1: Erasmus University Rotterdam; 2: The Netherlands Scientific Council for Government Policy
glas[at]essb.eur.nl, jennissen[at]wrr.nl, engbersen[at]essb.eur.nl

A lot of scholarly attention has been paid to the consequences of living in an ethnically diverse society. Various studies have found that more ethnic diversity in the neighborhood is related to 1) lower levels of social cohesion and 2) higher levels of fear of crime. The level of ethnic diversity is generally measured by diversity indices such as the Herfindal-Hirschman-Index (HHI). In this study, we argue that current diversity indices fail to detect actual diversity effects primarily because these diversity measures correlate strongly with ethnic minority share. We therefore propose an alternative: a group-specific HHI that measures the diversity of the out-group in a neighborhood. As a result, every ethnic group in a neighborhood obtains their own diversity score. We apply our advanced HHI to study the consequences of diversity, while controlling for relative out-group size. In addition, we address the potential interrelationship between fear of crime and neighborhood cohesion. We apply multilevel equation modeling techniques to analyze the different relationships and use data of the Dutch Safety Monitor (N = 86,382) in combination with detailed register data. Our study is one of the first to detect a 'true' diversity effect on cohesion. We do not find any support for the hypothesized diversity effect on fear of crime. The findings apply to both native and non-native Dutch.

Fearless City Suburbs: Collaboration, Distance work, and the Shaping of Local Integration Policy Fields

Zapata Campos, María José; Zapata, Patrik

University of Gothenburg, Sweden
mj.zapata[at]handels.gu.se, patrik.zapata[at]spa.gu.se

In the last decades the organizing of the labour market integration of immigrants has become a salient activity for public sectors and other actors. Yet differences in life expectancy, employment and school performance for residents of foreign background living in stigmatized and marginalized city suburbs persist in most European cities when compared with the native residents living in the city centre. What was previously mainly an affair for national governmental bodies today involves a myriad of actors: municipalities and regional bodies, companies, interest groups, but also community-embedded civil society organisations as well as individuals, who all design and implement individual and collaborative initiatives meant to facilitate the integration of vulnerable groups into the labour market and the society. This widening of initiatives reflects a general transition from traditional ways of governing to more collaborative and interactive forms of governing the city, and migration. Recent triggering events such as the so-called refugee crisis in Europe that peaked in Sweden 2015, has prompted a myriad of actors in Swedish cities to start experiments addressing the 'labour integration' challenge, that diverge from established practices. This paper has as a starting point the role of collaboration as a source of institutional change in the organizing of migration and integration in the city. The paper zooms in the setting of the urban suburbs of the city of Gothenburg and adopting a relational understanding of space and distances, it examines the 'distance work' conducted by these coalition of actors to develop the necessary immunity to prompt change. We argue that exploiting physical, cultural and organisational distances, enabled these actors to develop new practices and roles that shaped the integration policy field.

JS_RN35_RN37_09 | Bordering and policing

Spatial Practices and Belonging in New Arrival Cities

Steigemann, Anna Marie

TU Berlin, Germany
a.steigemann[at]tu-berlin.de

Combining research methods from architectural and social sciences and combining the two into new hybrid methods that also include refugees stronger into the research and knowledge production process, the paper investigates physical, material, social, and symbolic appropriation processes by Syrian refugees currently housed in urban humanitarian settings in Jordan and Germany. We ask: What spatial knowledge is mobilized at the arrival cities? How does this knowledge hybridize practices of the place of origin, experiences made during the escape, as well as during and after the arriving and uncertain period of stay at an unfamiliar place of asylum? How do spatial appropriation processes collide with humanitarian logics and technocratic emergency management approaches at the place of asylum? We argue that arriving refugees mobilize “urban knowledge” at the place of asylum which can only be understood as a spatial and urban re-figuration process, which is equally at work in the case of other migrants, migration and translocal processes. In particular, our paper looks at the ways in which refugees perceive, adapt to, appropriate, and alter their new urban environments physically and socially and of how they thereby draw on existing and evolving stocks of urban and spatial knowledge, urban experiences, and relationships in so-called emergency accommodations in Berlin and the more urbanized refugee camp Zaatari in Jordan. Finally, our paper tries to explain how migration transforms urban space physically and socially and how planning and the social and technical infrastructures affect migrants’ mobility – socially and spatially.

Policing Undocumented Immigrants Through Spatial Practices

Zur, Hadas

Tel Aviv University, Israel
Hadastu[at]post.tau.ac.il

South Tel Aviv is a space of controversy. In the past two decades, it has become the home to various immigrant groups living in Israel. In recent years, the settlement of asylum seekers and refugees has raised tensions between local Israeli residents; some demand their deportation while others protest against it. The groups are in dispute over ethical and moral values, holding contesting visions and claims over this space. In this reality of heated conflict and inconsistent government policy towards immigrants, one formal actor is constantly “in the field”; State police alongside municipal police are responsible for maintaining public order and

enhancing security and control in the mixed neighbourhoods. However, due to erratic and ambiguous government policy regarding refugees and asylum seekers, police officers experience inadequacy. Policing an undocumented society of immigrants makes administrative tools such as reports, fines and even arrests, ineffective. This situation led to a spatial turn in policing: Foot patrol, hyper-surveillance, situational crime prevention are spatial practices aimed to 'restore governance'. However, the performance of strong governance in the urban sphere collides with the lack of policy in the national level. Police are under criticism from the right for being 'too weak on immigrants' and from the left for militarizing urban space. Based on ethnographic work, interviews with police officers, residents and NGO's, this paper presents the complexity of policing urban immigrant areas in a time of policy crisis and moral dispute. This site of inquiry juxtaposes the national and the urban, the political and the spatial.

Who Belongs Where? Research Around the Selection Process During The Placement Of Refugees By Screen-level Bureaucrats

van Dam, Angelique

Erasmus University Rotterdam, Netherlands, The
angeliquevandam7[at]gmail.com

Successful resettlement requires a safe place for refugees. Besides preferences of refugees of certain spaces and available facilities, municipalities are also interested in a successful match of refugees and space; so much that they prefer certain categories of refugees over others. Families and highly educated refugees are at the top of this hierarchy. This research focusses on the selection process and understandings of a 'right fit' of person and space during the matching of refugees and space within the Netherlands. Bureaucrats that are trusted with the task of selection and matching do this without getting into personal contact with the person that they decide for. They operate behind a screen basing their judgement on limited information. Therefore, we call them screen-level bureaucrats. Building on the work of Lipsky (1980) this study will show that screen-level bureaucrats use their policy discretion in almost all their cases. Moreover, it will show that stereotyping lies at the basis of the very elaborate stories about persons and places where screen-level bureaucrats rely their judgements on (e.g. ideas on where gay, families and high or low skilled newcomers belong). Through extended interviews (46) and observations (34) over a one-year period on a national, regional and local level (city of Rotterdam), this study sheds light on the practices of screen-level bureaucrats and the construction of belonging in the first phase of refugee resettlement in the Netherlands. This study emphasizes the complexity of interaction in digital space: even without physical contact, images are constructed that have consequences for the distribution of rights and facilities where social categorisation, stereotyping and principles of deservingness play a very important role.

Rescaling Borders in The City

Fauser, Margit

Bielefeld, Germany

margit.fauser[at]uni-bielefeld.de

Contemporary transformations of the border have entered central stage in many debates on migration. Externalization, digitalization, the involvement of multiple institutional, private and civil society actors as well as citizens in the control of borders and the management of cross-border movements are subjects of a growing research field. Far less recognized is the growing relevance of the urban scale and the city in recent border transformations. In the city a variety of local actors, administration, welfare organization, and private actors are involved in exercising local control and thus in the organization of social but also territorial exclusion and inclusion. Scholars in urban studies for their turn have pointed to contemporary transformations that concern the institutional and geographical re-organization of the urban scale, its relationship with other scales, in particular national, the interconnection of horizontal and interscalar networks and the emerging importance of urban governance. This is premised on an understanding of the urban as produced and subject to multiscale dynamics. The question that this contribution thus addresses is how urban border transformations and the emergence of urban border space can be understood from an approach to scaling. To this end theoretically the contribution brings together migration research, border studies and urban studies in order to shed light on the ongoing transformations and spatial re-organization of the border. In empirical terms, I use results from a German city case study to show the relevance of this perspective for an understanding of the production of border spaces at the urban scale and the question how the border figures in contemporary rescaling.

JS_RN35_RN37_10 | Cities in times of migration "crises"

City, Migration and the Challenges of Urban Cultural Policies: The Example of the "International Cities of Refuge Network" (ICORN)

Glauser, Andrea

University of Lucerne, Switzerland
andrea.glauser[at]unilu.ch

This contribution explores the conditions of the "International Cities of Refuge Network" (ICORN) as an example of municipal approaches to migration and human rights. In recent years, numerous cities have developed strategies to counter the tightening of border controls and mobility regimes by nation states in Europe and the USA. For example, with the founding of Sanctuary Cities and the launch of the Palermo Charter for Global Freedom of Movement and Establishment, local governments and organizations have been aiming to achieve more inclusive migration policies. These municipal approaches to migration are associated with diverse challenges and sometimes contradictions. This has primarily to do with the fact that cities in a national context often do not have the last word – in legal terms – on residence permits and citizenship. Such tensions are not least noticeable in the context of urban cultural policies, as this contribution shows based on the example of the International Cities of Refuge Network (ICORN). ICORN aims to protect freedom of expression by offering residencies to writers, artists and musicians who are at risk in their country of origin as a direct result of their work. Based on interviews with parties involved, this contribution explores why the participation of cities in Europe in this network varies so widely from country to country and what kinds of challenges these attempts to offer refuge and to protect freedom of expression faces.

Mixed Communal Living and Individualized Support as Catalysts Of Refugees' Social and Structural Integration? The Case of CURANT (Cohousing and Case Management For Unaccompanied Young Adult Refugees in ANTwerp)

Van Raemdonck, Laura; Mahieu, Rilke

University of Antwerp, Belgium
laura.vanraemdonck[at]uantwerpen.be,
rilke.mahieu[at]uantwerpen.be

In various European cities, urban authorities and local stakeholders are exploring ways to tackle challenges arising from recent refugee flows. A central concern is the integration of refugees within local communities and economies. We focus on one of the most vulnerable refugee groups: unaccompanied young refugees. While the particular needs of this group have been studied, a research gap exist with regard to the policy programmes in place for unaccompanied refugee youth. By outlining the findings of a longitudinal study on the 3-year support and housing project CURANT (Cohousing and case management for Unaccompanied young adult Refugees in Antwerp), we aim to bridge this research gap. This project covers a holistic social policy intervention for young unaccompanied refugees aged 17-21. On the one hand, it contains intensive individualized supervision, including various types of support, training and therapy. On the other hand, it comprises cohabitation with a local flat mate ("buddies", aged 20-30) in various housing units during a period of at least one year. The program's overall aim is to support the social and structural integration of young refugees. The analysis draws on a mixed method methodology including interviews, surveys and secondary data collected with the project's main stakeholders (unaccompanied young adult refugees, the cohabiting buddies, and social organizations involved in this project) and observations of the program's activities. In our analysis, we assess the merits and pitfalls of mixed communal living and individualized professional support as tools to facilitate young refugees' integration.

Nordic Ties and London Lives: Urban Belonging, Transnational Networks and Mobility Intentions of Nordic Migrants under the Brexit

Uncertainty

Koikkalainen, Saara

University of Helsinki, Finland
saara.koikkalainen[at]helsinki.fi

As a multicultural hub of finance, art, design and science, London has long attracted migrants interested in the study and career opportunities the city has to offer. During the past decades, it has been an important destination also for intra-European migrants originating from the Nordic countries. Thanks to the Brexit process, these rather privileged migrants have been forced to question their inclusion in the British society and the global city of London and consider futures that may involve either staying in the UK, return migrating or moving elsewhere. In a few years, London has thus transformed from a key destination of mobile Europeans and of those on global careers, to a space of uncertainty. The situation is a natural experiment on how a reversal of free movement rights affects the dynamics of European migration regimes, how migrant careers are managed under changing conditions and how the re-emergence of national borders within borderless Europe influences the ways in which mobility is imagined and executed. Based on online survey (n=163) and interview data gathered during 2018-9, this presentation focuses on Nordic migrants currently living in London. It examines how these migrants see their position on the social hierarchy of the city and its job market, express feelings of belonging to this urban space and maintain both local and transnational networks back to their countries of origin.

Cities and Critical Democratic Experiences: Welcoming Solidarities with Refugees in the UK Cities

Oztimur, Nese

Soas, University of London, United Kingdom
noztimur[at]gmail.com

The framework of this paper encompasses background of migration studies, critical urban studies, political theory, and decolonial epistemic perspective. The primary purpose is to generate and discuss the questions about the possible contribution of the recent refugees to the development of critical democratic restructuring of the European cities. The outcomes of the ethnographic study (20 case studies) which focused on the comparison of the 'ART' based activities of the different charities, solo artists, galleries, collectives or aid organizations to 'help', 'welcome' or 'care' of the refugees in London, Bristol, and Cambridge constitutes the research basis for the examination of the paper's questions: Can the appearance of civic engagement –welcoming, helping and caring for the refugees- in European cities cultivate the enlarging of the new forms of politics and urban solidarity relationships and so radical democratic urban space imaginations? This leading question has a connection with the other questions which are related to the construction of the epistemic relationship between the refugees and welcoming groups: How the relationship between the welcome groups/aid organizations and refugees are constructed? In what ways these groups, organizations, and charities are different from each other regarding their aims, activity contents and relationships with refugees? How is this relationship being re-created, transformed or deconstructed within the everyday encounter, interaction and co-performance of them within the cities? Might these co-performance and solidarity relationships have a potential to contribute to the reshaping of the urban space as a locus of radical democratic struggles?

RS01 | Gaming at the Boundaries: Imagining Inclusive Futures

RS01_05 | Work, Labour and the Politics of Video Game Making and Playing

Rejecting Neoliberalism In Video Games

McMahon, Christopher Edward

University of Liverpool, United Kingdom
mcmahonc[at]liverpool.ac.uk

My doctoral thesis looks at the influence of neoliberalism within AAA video games. Whilst giving a talk on my work I was asked “what would a Marxist game look like?” I wasn’t sure at the time but it got me thinking what a radical AAA video game would be and if there already is one. The purpose of this paper is to highlight how neoliberalism reinforces itself as an ideology within AAA video games and attempt to theorise how video games can resist neoliberalism. This will be done by looking at the Grand Theft Auto series and Mark Fisher’s work on Capitalist Realism. A series like Grand Theft Auto presents us with a representation of our world in which inequality, segregation, gang violence, and the possibility of entrepreneurial success (legal or otherwise) are inevitable parts of reality. Not only this, but these parts of reality are there to be enjoyed. Through the exploration of the city, violence, and player appearance and stat progression we can chart the pervasive influence of neoliberalism in play and how it captures the radical potential within that play. From here the paper will explore possible ways in which AAA video games could reject neoliberalism within the way players are allowed to play by looking at game-play mechanics like permadeath.

‘Unspeakable Inequalities’ in a Post-socialist Videogame Industry – Investigating Polish Game Workers’ Perspectives on Gender Inequalities

Ozimek, Anna Maria

Tallinn University, Estonia
aozimek[at]tlu.ee

Drawing on 41 semi-structured interviews with Polish videogame workers, this contribution investigates those workers’ understandings of gender inequality in the videogame industry. This paper engages with the theme of the research stream in two regards. Firstly, in this presentation I investigate the experiences of videogame workers outside

‘core’ videogame production regions – North America and Asia-Pacific. Secondly, this paper discusses the workers’ ‘common’ sense understandings of persistent inequalities within the videogame industry which are also defined by the socio-cultural boundaries of who does and does not belong in the industry. I position the interviewees’ understandings of gender inequality in a broader discussion about ‘postfeminist sensibility’, understood as an analytically useful tool in investigating cultural producers’ often-times contradictory ideas about gender inequality in contemporary workplaces (Gill et al. 2017). I argue that the interviewees’ attitudes toward gender inequality need to be understood in relation to the construction of new entrepreneurial subjectivities and embedded in a post-socialist socio-cultural context. This presentation discusses three characteristics of postfeminist sensibility identified in the interviewees’ narratives: expression of gender fatigue; emphasis on women as the advantageous sex; and a focus on self-surveillance. The interviewees discussed instances of gender inequality and discrimination in the videogame industry but repudiated such instances and discussed them as singular events, acknowledging inequality as being persistent in other industries or in Polish culture as a whole by simultaneously discussing the progressive nature of the videogame industry. References: Gill, R. et al. 2017. A postfeminist sensibility at work. *Gender, Work and Organization*. 24(3), pp.226-244.

Marx At The Arcade: Videogames, Work, And Organising

Woodcock, Jamie

University of Oxford, United Kingdom
jamie.woodcock[at]oii.ox.ac.uk

Over the past year, the videogames industry has become a site of worker organising. Following GDC in 2018, local chapters of Game Workers Unite (GWU) have sprung up across the world. There are clear grievances for workers in the videogames industry, for example, crunch and long working hours, lower pay compared to similar roles outside games, lack of diversity, as well as precarity and project-based employment. The UK branch has been the first to join a trade union – although the SJTV existed previously in France. This paper will reflect on the experience of these previously unorganised workers in the UK. Drawing on ethnographic and interview data from the beginning of GWU in the UK, the paper will put these processes into conversation with Marxist theory, applying a critical analysis inspired by workers’ inquiry and class composition. Through this conversation, broader questions are drawn out about the role of academic research, the state of the videogames industry, as well as a reflection on the role of work and play in contemporary society. The paper concludes by imagining what futures in the videogames industry could now look like.

Spatial Reasoning: Re-coding spaces for inclusive game making

Kerr, Aphra; Savage, Joshua D.

Maynooth University, Ireland

aphra.kerr[at]mu.ie, joshua.savage.2015[at]mumail.ie

Research on gamejams have presented them as an informal education space to encourage creativity (Ryan et al. 2015). Others have argued that all female gamejams and incubators are effective interventions to improve diversity in games (Kennedy, H. 2018). This paper presents the findings of a three-year research project which sought to identify strategies for reducing barriers to inclusion in informal game making events. This project firstly surveyed and observed three gamejams in three different cities. We found that these events created a welcoming culture for young male programmers. We identified a range of barriers to others in the design and culture of these events. The project then organised six 'female friendly' game making workshops in two different locations. Our workshops were largely successful in attracting women and men. However, as the attendees diversified we identified virtual and physical barriers that clashed with our game making pedagogy. In this paper we explore how what Kitchin and Dodge (2011) define as coded spaces and code/spaces influence inclusion initiatives. We use these theoretical concepts to explore the boundaries and barriers to inclusive game making futures and to question post-feminist diversity projects. Harvey, A., & Stephanie Fisher. 2014. RS01_06 | Gender, Identity and the Politics of Inclusion and Exclusion in Video Game Culture(s)

Disability and Mental Health as a Video Game Live Streamer

Johnson, Mark R

University of Alberta, United Kingdom

markrjohnsongames[at]gmail.com

In this paper I explore economic and inclusion opportunities for people with disabilities and mental health issues afforded by the 'live streaming' of video games. This involves the live broadcast of one's game playing activities over the internet to a globally dispersed audience. In 2016, 2017 and 2018, the leading live streaming platform Twitch.tv broadcast over 500,000 years of video, which were produced by over two million regular broadcasters ('streamers'), and consumed by an audience of several hundred million viewers. Every kind of game is broadcast live on Twitch, accompanied by a webcam of the streamer and their live commentary. From this activity streamers can profit, up to and including a full-time living 'wage' for those at the highest levels. Numerous successful streamers with chronic health issues have discussed the personal and professional benefits streaming brings them. Utilising data from a research project with 100 interviews, alongside approximately 500 hours of ethnographic observation, this paper examines the experiences of live streaming for broadcasters with disabilities, mental health issues, or physical health issues. Firstly, I explore the positive elements of streaming for these broadcasters, focusing on the many conditions represented in this demographic, and the benefits streaming gives for inclusion and community. Secondly, I consider the negative experiences of these streamers, focused on entanglements of health and technology that make their streaming lives potentially more challenging than their colleagues. Thirdly, I focus on the economic opportunities, and the potential for entrepreneurial activity, the platform affords. I conclude the analysis by exploring how these aspects make live streaming a potentially exemplary emancipatory and entrepreneurial space for these individuals, but not one without challenges.

Two Perspectives On Gaming Among Senior Citizens

Gałaszka, Damian

Jagiellonian University, Poland
damian.galuszka[at]doctoral.uj.edu.pl

Gaming has become a widespread leisure activity that is popular among increasingly diverse groups of people. Reports suggest that the population of gamers is increasing in age and becoming more inclusive. This process has been noted by many researchers, who study such issues as the relations between gaming and disability or population ageing. Nevertheless, some questions still remain unanswered. This presentation aims to provide new data regarding gaming among senior citizens that result from the author's research projects. The first of them is a digital ethnography project, which studies a self-description of highly engaged older gamers from two most popular Internet discussion forums: "The Older Gamers" (www.theoldergamers.com) and the "Senior Gamers" (www.seniorgamers.net). In order to obtain information on their characteristics (including their gaming history, motivations and expectations), the posts published in the introduction sections of the mentioned Internet forums were subject to analysis. Although the time range of interesting forum posts extends from 2005 to the present, the amount of investigated data was limited to messages published by users aged >50 years (N=471). The second project is a work-in-progress exploratory study, which analyses the understudied phenomenon of gaming among the Polish senior citizens. The analysis of the role of digital games in a sample group of Poles aged 60+ is based on narrative in-depth interviews. Not only a discussion of findings from the above-mentioned research projects will be presented, but also a comparison of most important similarities and differences between both groups of senior citizen gamers.

[Cos]Playing with Videogames: Identity and Performance in Cosplay

Crawford, Garry; Hancock, David

University of Salford, United Kingdom
g.crawford[at]salford.ac.uk, d.r.hancock[at]salford.ac.uk

Following James Newman's assertion that games research needs to focus more on what people do with games, and how they play with them, this paper focuses on the practices and culture of cosplayers and how they (re)interpret and bring to life video game characters. In particular, one of the core questions frequently discussed in both the academic literature and also often by cosplayers themselves, is, to what extent cosplay is about playing out another character, or is it more a means by which cosplayers express or explore aspects of their own (existing) identity? Drawing on over five years of ethnographic research and also the innovative use of art as both a method and data, this paper explores the complex and often thorny issue of identity and cosplay, and in particular, considers cosplay as a performance of identity. Cosplay, we argue, is a performance that allows participants to explore new and existing aspects of their identity, such as their gender and sexuality, and through performative play, expand who they are and who they can be.

Engaging Women In Games. The Stakes Of Diversity Challenges In French Esports Institutionalization

Vansyngel, Samuel

University Paris 13, France
samuel.vansyngel[at]gmail.com

In France, the recent institutionalization of esports rise non only a growing interest for the competitions but also some gender balance challenges. On July 2018, “Esports and diversity” meeting was organized by two important associations (France Esport and Women In Games) in order to “promote”, as they said, professional women gamers. Indeed, we observe that men are mainly prevailing in French tournaments. But how exactly are women supposed to become more numerous? What is specifically proposed to empower female players in such a masculine environment as esports? An ongoing institutional ethnography that we are caring out in different French esports settings (teams, LANs, events) will try to answer these questions. First of all, we will show that women are already present in esports. However, they are rarely have a status of player. Performing the organizational functions, participating in costume contests, or as a saleswoman on the merchant stands, they reproduce the ordinary social work division and these secondary roles leave them invisible. Secondly, we will show that strategies like “developing the women market in esports” that are put forward by some actors, reactivate the gender-based consumption by promoting women figures in gaming industry and professional players. The other frequent strategy discovered by our field-work consist of promoting gender diversity by developing the history female champions, but it is also an extension of a gender discrimination: the industry does not tend to reconsider the competitive masculine culture, even if some actors want to fight sexism. At last, glorifying the winners of battles results on forcing the women to play by the rules in which men are in advance more competent thanks to their masculine socialization.

‘Where are all the female gamers?’ – Female Gamers and Competitive Gaming in Esports

Law, Ying-Ying

Staffordshire University, United Kingdom
ying-ying.law[at]staffs.ac.uk

Female gamers have often been routinely marginalised with a lack of acceptance in video game spaces. However, many studies tend to focus on the marginalisation and exclusion of female gamers within private spaces (such as in their own home), rather than their participation in public spaces (such as gaming events). Traditionally, women in public gaming scenes have often been documented as the marginalised girlfriend, or more recently as the hyper-sexualised or sideshow professional player/all female team. This example prompts some worthwhile considerations on access to gaming and game spaces where entry involves a more complex structural arrangement, including networks, gaming know-how and access to technology/games – in particular, in esports (electronic sports - competitive gaming with high stakes). To date, some esports tournaments and organisations have started to consider the gender diversity of video game communities with ‘women only tournaments’ and ‘women gaming spaces’ to normalise the notion of women competing. For example, Smash Sisters is a series of women’s crew battles feature the Super Smash Brothers games, GirlGamer Festivals, WEGS women-only tournaments for specific games (CS:GO and Hearthstone) with smaller prize pools and Badass Women of Hearthstone tournaments. However, there have been continuous debates whether women only tournaments can be justified. This places importance on understanding the attitudes towards female gamers and competitive gaming, as well as encouraging women to compete in video game tournaments on the same platform as men to challenge the gender diversity of video game communities within video gamer culture. There is also of equal importance to understand the attitudes towards male gamers and competitive gaming, as well as encouraging a balance between community and competition for competitive gamers.

How To Get A Baby? An Analysis Of Spanish Gestational Surrogacy Online Services

Marcuello-Servos, Chaime; Olaciregui-Rodríguez, Paz

Universidad de Saragosa, Spain
chaime[at]unizar.es, mpolaciregui[at]hotmail.com

There is a myth in consumer societies: market is there to satisfy desires of people. In the market society, everything seems to be for sale. Anyone who has enough money can buy anything, whether the law allows it or not. If someone with enough money demands a good or a service, then he creates a market. With Information and Communication Technologies, the market has become digital and online. In addition, since 1978 assisted reproductive technologies (ARTs) have allowed the creation of 'test-tube babies'. ARTs have served to satisfy many people's desire for fatherhood and motherhood and has created an industry with diverse options. One of them is the gestational surrogacy. This paper aims to analyse the offer of 'surrogacy online services' in the Spanish market. In the name of freedom, profit and non-profit organizations deal with rights, expectations and technologies. Having a baby has become more than just a gift of life. You can knock on the door of the surrogacy industry and purchase a baby. How does the online market work? Who are the operators of this market? What are the social consequences? The paper is divided in five sections including introduction and final remarks. First, the Spanish context of surrogacy is described. Second, the online presence of gestational surrogacy organizations and services is analysed. Third, the main social debates and political positions are discussed. This is not just a matter of infertility health issue; it affects the model of society we want.

Over-Rationalization Of Procreative Projects. Surrogacy Read Through The Theory Of Narcissistic Societies Bandelli, Daniela

LUMSA, Italy
daniela.bandelli[at]gmail.com

Narcissistic societies are focused on the daily present, low engagement in relational activities unless the relation is merely utilitarian. Usually narcissism in sociology is linked to low

nativity and poor projection into future generations. In this paper, on the contrary, I will link theory of narcissism to the social acceptance of gestational surrogacy, understood as an advanced way to realize the desire of having a baby at any cost but also, in many cases, as a way for women to pursue emancipatory/social mobility plans. I will highlight that in narcissistic societies, which are products of a broader process of rationalization, individuals are expected to prove their power through the realization of personal will over life-course and natural events: therefore they need to be good architects of life projects regardless constraints or casualty. Technology is the perfect ally in this endeavor and children are transformed into 'mean to an end'. Another feature of narcissistic societies is the devaluation of symbolic elaboration: practices that are different and similar are subsumed into non-distinctive categories, the surrogate is made the same as the original. In this line, conception made in laboratory is seen as the same, in term of quality of ultimate product, as natural procreation; gestational surrogacy is often conflated with adoption, and fetal development in carrier-uterus is considered technically the same as a pregnancy in the mother who is going to nurture the child once born. Thirdly, in narcissistic societies the father's authority is devalued: given that in parental relations source for authority is not given by money, which kind of authority are fathers through surrogacy representing?

Beliefs and Ideologies Regarding Filiation and Family Models: Attitudes and Behaviours against Surrogate Gestation

Rodríguez-Jaume, María José; Jareño Ruiz,
Diana; González-Río, María José

University of Alicante, Spain
mj.rodriguez[at]ua.es, diana.jareno[at]ua.es,
mj.gonzalez[at]ua.es

Subrogation is one of the most controversial forms of affiliation among public opinion even though it has become a global industry. This communication presents the results of a scoping review, from 29 studies that have evaluated the opinion and attitudes of society regarding subrogation as a new reproductive practice specifically between 1982-2016. Its purpose was to synthesize the available scientific information to identify areas of uncertainty and social construction processes, key aspects in the decision-making process regarding reproductive rights. The search of the scientific literature was carried out in the databases WOS, SCOPUS and ProQuest, without temporal and geographic restrictions, being complemented with references cited in primary sources, in review articles and in specialized journals of manual search. The research suggests that, in general, society disapproves of this practice and that subrogation is perceived as the least accepted option among the options offered by non-coital reproduction. It has been suggested that this social sanction is based on the fact that motherhood by subrogation truncates Western hegemonic ideological models of family and motherhood. - - Key-words: Surrogacy, Assisted Reproduction Techniques, Family Models, Public Opinion, Scoping Review.

RS02_07 | Motherhood and narratives

Feminism and the Contradictions of Motherhood

Corradi, Consuelo

Lumsa University, Italy
corradi[at]lumsa.it

Feminist theory has changed the world and deeply influenced sociological theory. The notions of power, gender, individual, self, patriarchy, cannot be discussed without reference to feminist theory, which was successful in influencing the ways sociologists investigate the welfare, family structure, work organization, political participation, leadership and much more. There are, however, crucial social issues on which feminist theory is weaker and internally divided. Surrogacy is the most recent. The purpose of this paper is to review the concept of motherhood in feminist theory. Until surrogacy brought it to the fore, this concept was overlooked and criticized as a disembodiment of women, transforming their wombs as a “public place”, and as a historic construction of the bourgeoisie, enslaving women to their instincts. The paper will examine when and why motherhood, which is one of the most common experiences in the life of a woman and the basic desire from which infertility grief stems, was disregarded, and with what consequences. The contradictory relationship of feminism to motherhood will throw light on the final aim of the paper. This is to show how the recurring feminist conflict between advocates of women’s freedom and self-determination versus critics of commodification and oppression is actually underpinned by a limited and individualistic notion of power and empowerment. The international prestige of white feminism has spread this very notion worldwide, but it actually adopts the neoliberal language of choice, rights and self-determination while at the same time criticizing the neoliberal foundations of contemporary societies.

Surrogate motherhood in Mexico

Cerva, Daniela; Pizaña, Manuela

Universidad Autónoma del Estado de Morelos, Mexico
dani.cerva[at]gmail.com, mapigo07[at]hotmail.com

This paper will present the results of the research in Mexico during 2018 and 2019. In Mexico, hiring wombs is part of the normative regulation of what we euphemistically name as “surrogate motherhood”, an ironic and even contradictory term since the woman will neither act as a mother nor surrogate functions; in addition, the local legal regulations - Tabasco and Sinaloa- that currently are insufficient and ambiguous, which have allowed the absence of real control over the registration of existing cases since its legalization. This legislation has undergone modifications taking into account the national casuistic experience and international law, in a restrictive sense, thereby limiting possibilities and consequences that could be avoided since the beginning. The

National Supreme Court of Justice has recently granted recognition to agreements on surrogate motherhood and implicitly on the hiring of wombs; but it has not resolved the unconstitutional actions in this regard. This phenomenon has enough reasons to be studied from a sociological perspective, considering critical points in the legal debate and public policies. The objective is to reveal that the practice of hiring wombs continues to date, meaning serious and flagrant violations of fundamental human rights of certain actors in the process, meaning, women, girls and children, prerogatives that collide against the interests of the alleged intended parents and the intermediary companies that are not always regular and willing to provide their services at all costs. As a result, legal and social conflicts in the Mexican law persist, to which non are provided with adequate regulation in positive law.

Surrogacy debate in Malta

Naudi, Marceline; Orsini, Gisella

University of Malta, Malta
marceline.naudi[at]um.edu.mt, gisella.orsini[at]um.edu.mt

Surrogacy is considered a sensitive and controversial topic and has created many discussions and diverging opinions throughout the years across the globe, including among feminists and LGBTIQ communities. Malta’s context is quite unique in that it includes a strongly Catholic ethos (abortion is still illegal in Malta), LGBTIQ rights which are considered number 1 in Europe and beyond, and a vociferous women’s rights’ lobby which reflects divergent views on this issue. There is no legislation as such regulating surrogacy other than the Embryo Protection Act (2012) which prohibits this practice in Malta. While amendments to this act were introduced in 2018, and clauses referring to surrogacy were part of the draft amendments, these were excluded in the final bill due to the storm of controversy raised. It was however announced at the time that altruistic surrogacy laws will be discussed in a separate act. Since then there has been no further public discussion. Nonetheless, it is known that Maltese nationals have bypassed national legislation and made private agreements in countries where surrogacy is allowed, highlighting the grey areas in the existent legislation (or lack thereof), and the possible need to regulate this phenomenon. This study will be exploring the opinions of the various interested parties (State, NGOs, others) in this debate through individual interviews, to attempt to untangle the arguments being used. It will also canvass the general opinion of the students of the University of Malta to help provide general background and context.

“Mother Nature” and the Nature of Motherhood. Sociological Analysis of Two Contemporary Narratives

Camorrino, Antonio

University of Naples Federico II, Italy
antonio.camorrino[at]unina.it

The phenomenon of gestational surrogacy “embodies” the complexity of late-modern society (Beck U.). The extraordinary enlargement of the technical universe challenges the relationship between human beings and nature, raising brand new issues, not only in this field. “Cosmic tasks” (Jonas H.), previously concerning the divine sphere, today can be the result of human choices. At stake, there seems to be the future of humanity. In environmental terms – implications of Climate change, for example – or in terms of medical technology: in both cases we face with decisions involving the lives of individuals that, at the moment, cannot answer for themselves. It is interesting that, in the case of “green” narratives, the claims of critical movements revolve around an evil technical dominion of an exploited environment – a maternal nature victim of a “male” domination – while, in the case of pro-surrogacy discourse, technoscience is the good instrument in order to achieve self-realization – a virtual mother temporarily victim of a natural deprivation. In both narratives individuals act in the name of a very authentic feelings: the love of Mother Nature and the love of motherhood. In the former case, technoscience is condemned as a factor of corruption of an original purity, in the latter it is seen as the medium of emancipation from the unjust constrains of an ungenerous nature. Showing why these two narratives, although apparently antithetical in their assumptions, are part of the same postmodern horizon of meaning, is the goal of this paper.

RS02_09 | Commodification of bodies

A Critical Perspective of the Post-Human Dismissal of the Body: Gestational Surrogacy within the Sociology of the Body of David Le Breton and the Sociology of the Self-Identity of Anthony Giddens

Porcelli, Giorgio

University of Trieste, Italy
giorgiots[at]gmail.com

Human beings have their existence through the corporeal forms that beget them. Every modification of these forms implies a different definition of humanity. If its limits are written through the flesh which shapes men and women, both subtracting and adding other components transform their personal identity and landmarks which concern them in the eyes of the others. The present contribution seeks to analyze the cultural roots and the social consequences of the disgust of maternity and more in general of the body that are widespread in many currents of post-humanism. Maternal and gestational surrogacy as well as an augmented or refused body are therefore considered the expressions of that dismissal of the body that characterizes post-humanism and cyberculture. These extreme implications of the posthuman thought will be analyzed, in the light of Le Breton's and Giddens' recent reflections. On the one hand, Le Breton discusses the theories of the augmented body, in which the body's limits are overcome through technological prosthesis and the support of the machine at all stages of human existence starting with ectogenesis which stands as the logical assumption of gestational surrogacy. On the other hand, according to Giddens' theory of Reflexive Modernity, we live in a time when the body and its natural dynamics are subtracted to the human beings and subjected to the domain of genetics and medicine and to the power of experts. It is then essential in the author's opinion to cope with these issues within a public debate about their ethical and social consequences.

Global Care Chains and Surrogacy. The Commodification of Bodies and Care Work in Global Capitalism

Morero, Anna ; Ortiz Monera, Rosa;
Domínguez Amorós, Màrius

Universitat de Barcelona, Spain
anna.morero[at]ub.edu, rortizmonera[at]ub.edu,
mariusdominguez[at]ub.edu

Surrogacy is often referred to as a form of transnational motherhood in cooperation with people who come from different geographical areas, and often also from different social classes and ethnicities. The global care chains are also considered a transnational form of maternity conformed by women from impoverished countries who perform care work for people, usually of a higher social class and also of different ethnicity. This communication aims to explore the common points of these two phenomena highly present in the Spanish society: surrogacy and the global care chains, and those factors that make them possible: globalization and the precariousness of care-related functions. In both cases, multiple inequalities are exploited at a global level to ensure the processes of reproduction and care in enriched countries. This communication is part of the R & D project "Surrogacy: parental transformations in Spain in the 21st century" (CSO2014 - 55556P) and will provide first data obtained in the framework of this investigation. More specifically, preliminary results of the survey about surrogacy in Spain will be presented. This survey is pioneer in the analysis of this topic from an integral and multidisciplinary perspective.

Removing the Charity Veil: Surrogacy as Reproductive Labor

Kern Graziuso, Bruna

Universidade Federal do Rio Grande do Sul (UFRGS), Brazil
bgraziuso[at]gmail.com

Surrogacy is the name of an accessory reproductive technique, usually coming after an in vitro fertilization, where a woman – called “surrogate” – carries a baby for someone else in her womb. This technique brings a lot of questions about the traditional gender roles – by separating motherhood and pregnancy itself – but, most importantly, brings questions about social, legal and moral implications of the financial compensation of surrogates, a subject that is not discussed frequently in the Sociology field. It is common to see studies criticizing the financial aspects of it – usually calling it commodification of body parts and exploitation of vulnerable women – but the moral dilemma is exclusive for the surrogate’s compensation: there are no discussions about the financial compensation of doctors, lawyers and agencies involved in a surrogacy journey. The main goal of this research is to frame surrogacy as reproductive labor, examining two different scenarios: the surrogates in the United States that are financially compensated and the surrogates in the United Kingdom that are not financially compensated. Through theoretical and empirical research, it is intended to answer those questions: Do British and American surrogates perceive their gestational services as work? Is there a difference in their perception due to the prospect of payment? Do social construction of motherhood influences in their perception of surrogacy as reproductive labor?

Barriers of Growth – Experts' Views on the Stagnating Aquaculture Sector in Germany

Lasner, Tobias; Gimpel, Antje

Thünen-Institute, Germany
tobias.lasner[at]thuenen.de, antje.gimpel[at]thuenen.de

Aquaculture can be seen as international success story. No wonder, that the EU formulates high expectations towards aquaculture in its strategy "Blue Growth". Notwithstanding, the German aquaculture sectors stagnates since decades. Within the scope of the EU projects SUCCESS and AquaSpace, German stakeholders from the fields of nature conservation, politics, economy, science and administration was brought together. Following an open design of qualitative research, recorded discussions aimed to identify the key issues linked to an (non-)expansion of the aquaculture sector in Germany. A combination of sequence analysis (open coding) and structuring text analysis was used in order to code and interpret 2,496 paragraphs related to the thematic field of aquaculture. Following an explanatory approach (Grounded Theory), our study argues, why the first economic power of Europe fails in a quantitative growth in aquaculture. One dominating theme discussed was the role of entrepreneurship. A storyline of argumentation characterizes the theme: i) German aquaculture is characterized by peasant, small-scale family businesses, which produce and distribute their products locally. ii) The seafood market rate should be lowered as (regional) fish production is perceived as most sustainable. iii) The peasant structure leads to a high potential of development in a niche market (high quality, sustainable and assumed as highly demanded). iv) At the same time the peasant structure is seen as barrier for essential growth of the sector (low innovativeness and a lack of capital for investments). Like others barriers identified (bureaucracy, nature protection) the central players (fish farmers) are described as imposed passive observers rather than risk-takers in a struggle of economic and conservational societal paradigm.

The Ups and Downs of the Szczecin Shipyard in the 21st century – the Memories of its Former Workers

Kolodziej-Durnas, Agnieszka

University of Szczecin, Poland
akodu[at]usz.edu.pl

Szczecin Shipyard was one of the leading companies in the political fight to end the communist regime. It was then a subject to many changes during the transformation of the

Polish economic system. Especially dramatic events took place in the first decade of the 21st century. In 2002 it was closed down but revived as a new company called Nova. However, it struggled with many organizational, technological and financial problems and finally collapsed in 2009. The presentation shows the opinions of the former Szczecin Shipyard workers on the reasons of the collapse and their doubts about the official explanations about its condition before 2009 as well as their hopes for its revival.

Companies Of The Maritime Economy. Insights On Corporate Visions And Strategies Towards Sustainability

Kronfeld-Goharani, Ulrike

Kiel University, Germany
kronfeld[at]ips.uni-kiel.de

As the ocean has moved into the focus of the political discourse on the "blue economy", ocean industry plays a key role in shaping "blue growth" as sustainable. However, little is known about the meaning of sustainability and the status of its implementation by corporations invested in the maritime economy. The present study addresses this gap. Drawing on the discourse theory of Laclau and Mouffe (2001 [1985]), the discourse on corporate sustainability is explored. It is found that of 396 surveyed companies only 61 provide commitments to and reporting on the issue of sustainability. A detailed analysis of these companies shows that there has been a shift from a voluntary to a mandatory commitment to the concept as a direct consequence of being exposed to massive pressures to meet the expectations of their employees, customers and shareholders. It is argued that Laclau and Mouffe's discourse theory provides an approach to help to explain the practice of corporations in re-framing these challenges as an entrepreneurial opportunity to save costs, to optimize efficiency in all business sectors, to stay competitive, and to gain a better public image. The paper concludes that it is likely that the current efforts of companies with regard to the anticipated increases in the exploitation of marine resources will not be sufficient to preserve ocean health in the long run. Finally, an assessment of corporate opportunities to strengthen the SDGs and contribute to a "sustainable blue growth" will be given.

Rights Based Management and the Perception of the Stakeholders on the "Limits to Privatization"

Coelho, Manuel Pacheco (1); Cá, Luis (2)

1: SOCIUS; ISEG/University of Lisbon, Portugal; 2: ISEG/University of Lisbon, Portugal
coelho[at]iseg.ulisboa.pt, lpereira.ca[at]gmail.com

Common Fisheries Policy (CFP) failed to reduce fleet capacity thus exerting fishing pressure on stocks. Overcapacity and overcapitalisation was identified in several studies as the principal failure of this E.U. Policy. This conclusion may be important for the on-going CFP reform and for the discussion about the tools to get sustainable management. Rights Based Management schemes have already been experimented in specific fisheries and localizations. The practical indications and lessons given by these experiences are fundamental to explore the feasibility of such tools and their social, economic and environmental impacts. The purpose of this paper is to continue this debate: A special attention is given to the possibility of introducing a more focused approach on Rights Based Management, in the form of ITQs (Individual Transferable Quotas) in the CFP. The paper introduces the basic theoretical framework of Individual Transferable Quotas and makes a critical review of ITQs introduction in European fisheries. The paper approaches the Portuguese case and reports the different perceptions of the Portuguese stakeholders facing this situation. Content analysis of semi structured interviews made with several agents, highlights significant social predicted impacts.

A Study on "Sense of Acquisition" of Elderly Fishermen on Islands: Two Islands in Zhoushan City of Zhejiang Province in China as Examples

Zhang, Wen

Shanghai Ocean University, China, People's Republic of
Wenzhang[at]shou.edu.cn

Taking two islands in Zhoushan City of Zhejiang Province in China as examples, this paper attempts to study on the "sense of acquisition" of elderly fishermen on islands in the perspective of ocean sociology. "Why is the sense of acquisition of elderly fishermen still insufficient, although they have acquired something in recent years?" This question has become the focus of this research and reminds me that elderly fishermen's dilemma is not only in terms of physical health and economic support, but also in terms of social support and psychological identity, while the latter have not been well paid attentions to. Drawing on in-depth interview materials of elderly fishermen, the author provides three reasons for the

insufficiency of their sense of acquisition. At the end of the paper, the author proposes that we should develop ocean social work vigorously, not only helping elderly fishermen to improve their economic treatment, but also enhance their sense of acquisition.

Déformation Professionnelle And The Construction of Occupational Identity: The Example Of Maritime Professionals

Grasmeier, Marie Cornelia

Bremen University, Germany
s_2d92ba[at]uni-bremen.de

The notion "déformation professionnelle" was coined by the Belgian sociologist Daniel Warnotte and refers to a tendency of occupational role bearers to unconsciously apply certain occupational habits to other, non-work situational frames in dysfunctional ways. As socially inappropriate behaviour, this may then lead to irritations, for example in case of a teacher who cannot stop lecturing even in private situations. In Bourdieu's terms, one could speak of an occupational habitus that does not fit non-work related social situations. This idea is also rooted in everyday knowledge and serves as a topos for the attribution of clichés to certain occupational groups. In my presentation, I will talk about the role of this topos as a resource for self presentation within the construction of occupational identities by maritime professionals. I will draw on autoethnographic data collected during my time working in secondary branches of the shipping industry. The findings presented here are part of my doctoral dissertation about the interactive construction of occupational identities of seafarers in the global shipping industry. My thesis is that the play with the notion of déformation professionnelle is employed as a strategy of boundary work (Frederik Barth) to mark the boundary between (former) seafarers as members of an occupational in-group and "landlubbers" as members of the out-group. The seafarers studied here play with the idea that they internalised certain practices and perspectives during their live at sea, in a way that they cannot but also apply these practices and perspectives in occupational as well as non-work contexts ashore. An example is the casual out-of-context use of nautical terms.

Gender in European Fisheries: Social Transformation and Cohesion Trends

Copete, Esther

University of Greenwich, United Kingdom
esthercopete[at]gmail.com

The deeply gendered culture in maritime spaces, which is driven by the view that women merely represent the “supporting” labour force on land, penetrates the political and administrative institutions at all levels. Therefore, negatively influences policy outcomes and the political participation of women in maritime fishery management. The effect of the division of labour in male-dominated maritime spaces has been the subject of maritime sociologist throughout Europe. Gender as a sub-field of sociology has offered the opportunity to study the sex power dynamic in various maritime activities (e.g. seafarers, the navy, fishing etc.) and has contributed to an informed knowledge on individuals as functional elements for the society. This paper explores how the EU multinational structure has impacted the lifeworld of women through changing fishery governance and regulation in case study sites. It shows the current status of social cohesion in European fishery communities. Findings are the result of interviews carried out under the Geography of Inshore Fishing and Sustainability project during 2012 and 2015 in 14 cases studies sites in England, France, Belgium and the Netherlands. The theoretical functional framework uncovers the functions of women within the fishery social structure in the maintenance of social cohesion and enables the analyse to explore different aspects of the fishery community capacity to self-maintain. Findings suggest that women’s inclusion in policy decision-making forums is beneficial for the achievement of the social cohesion strategy of “shared responsibilities” which aims to interconnect institutions and actors (public and private), situated at different territorial levels.

Outlining the identity of the Greek seafarer’s wife. The case of Chios Island

Katsounis, Ioannis (1); Paradeisi, Georgia (2); Lekakou, Maria (1)

1: University of the Aegean, Greece; 2: Panteion University of Social and Political Sciences, Greece
ykatsounis[at]stt.aegean.gr, gparadeisi[at]hotmail.com, mlek[at]aegean.gr

Greece constitutes a global power in the maritime sector. The Greek seafarers are well known for their seamanship. According to the Hellenic Statistical Authority, almost 12.500 Greeks work in ships which are either under the Greek flag or are Greek-owned flying a foreign flag. Even though there have been many studies for the Greek seafarers, there are no studies for the contribution of the seafarers’ wives to the Greek shipping miracle. The wives of the seafarers are a special case. As their husbands are away during the largest part of the year, they organize family and social life in their very own way. The purpose of the research is to record and highlight the social profile and the aspects of the daily life of the Greek seafarers’ wives. 70 wives of active seafarers, from Chios Island, were chosen and filled out questionnaires specially made for the purposes of this research. The selection of the specific location is not random, as Chios Island has a long history in the seafaring profession, from ancient times. The specific characteristic of these women is that the majority - due to the tradition of the island - comes from maritime families and is familiar with the particularities of the seafarer’s life. A quantitative and qualitative analysis followed the completion of the questionnaires and the data processing was carried out using the Statistical Package for Social Sciences (SPSS).

RS03_10 | Maritime Miscellanea

Trends and Men. The Development of Maritime Studies in French Social Sciences

Mariat-Roy, Emilie

Muséum national d'Histoire naturelle, France
mariatemilie[at]gmail.com

In this presentation, (1) we will first examine the diverse roots of a deeper interest in fisherfolk from a naturalist/positivist point of view to an aesthetic experience, from sociography to arts (literature and fine arts); (2) we will then focus on what will be so called in the 1970's maritime anthropology. This presentation will end by an analysis of research topics and their connexion with national scientific research policies today. In the first part of this presentation, we will give an overlook on many emblematic researches, from the folklorist Paul Sébillot and the historian Jules Michelet to field-works of Anita Conti and René-Yves Creston, first maritime ethnologists, more adventurers than scholars properly in a contemporary meaning. We will also present sociographies of Paul Bureau, a disciple of Frédéric Le Play. In the second part of this presentation, we will focus on what has been quite recently called "maritime anthropology", which gather three main directions of studies – local knowledges, fishing activities and market, and material culture matters/museography. The last part of the presentation will give an overview on the evolution of problematics and topics of researches in maritime studies in social sciences in France, from classical monographies to matters of gender specificities among fisherfolk, globalization, collapse of fish stocks, new resource management policies, conservation policies, commoditization of fishing rights and their consequences on fishing communities, fishing activities and perception of the sea and marine species among fishermen.

The Social and Demographic Portrait of Prostitutes in Polish Port Cities in the 1950s

Izdebska, Karolina; Kozłowska, Urszula

University of Szczecin, Poland
karolina.izdebska[at]usz.edu.pl,
urszula.kozlowska[at]usz.edu.pl

The aim is to analyse the phenomenon of prostitution in Polish port cities from the point of view of the socio-demographic situation in the 1950s. The sources used in the research (mainly documents drawn up by the Interior Ministry and the General Headquarters of Civic Militia) have been analysed. They, as well as other sources, served as a basis for a further analysis to define the prostitution in Poland of the end of the 1950s and its specifics in port cities. The analysis included, inter alia, the socio-demographic features of prostitutes, their types and problems, especially connected with health. The character of the phenomenon should be paid a special attention to. In most cases it was a street prostitution, and its later evolution took place in the 1960s.

RS04 | Men and Masculinities in a Changing Europe

RS04_05 | Men and Masculinities in a Changing Europe I: Caring Masculinities

Vulnerability and Caring Among Rural Men in Northern Sweden

Ridzén, Lisa Kristina

Mid Sweden University, Sweden
lisa.ridzen[at]miun.se

Men living in rural areas in Northern Sweden are often depicted stereotypically. Traditionally masculine, less modern and emotionally “harder” than urban men (and others): these stereotypes exist both in society in general, as well as in the field of rural gender identity research. As a result, we know little about how men care, or how they deal with vulnerable aspects of life. By describing the rural northern man as emotionally resolute, physically strong and naïve; and by focusing research on these traditional aspects of men’s ways of doing gender; a binary way of understanding gender, as well as problematic masculinity norms, are reproduced. Theoretically, the study draws on intersectional, post-structural, post-colonial and feminist approaches to gender, place and emotions. Building on in-depth interviews with men living in the rural north of Sweden the chapter examines and critically discusses how men constitute vulnerability and care, and how their conceptions of these emotions and practices can be understood in relation to historically and culturally constructed norms regarding place and gender. Following Butler’s (2006) theories of precarious lives and the need for recognition of dependency, and Fotaki’s and Harding’s (2018) theories of relationality and ethics of care, the chapter intends to highlight and discuss how men’s constitution of vulnerability and care can be understood in wider societal terms. From a feminist perspective on relationality, what do men’s way of doing care and vulnerability mean for society? By focusing on the constitution of vulnerability and care among a group of men that is frequently depicted through stereotypes I intend to critically investigate the intersections of norms of gender and place with the overall aim of challenging destructive masculinity norms.

Caring Masculinities. Constructing Masculinity and Care by Male Nurses Kluczyńska, Urszula

Collegium Da Vinci, Poland
urszula.kluczynska[at]cdv.pl

The modern model of nursing, developed in the 19th century by Florence Nightingale, contributed to this profession being associated with femininity, which prevented men from entering it. On average, one person in ten working in nursing is a man, but in Poland men constitute only 1.8% of the nursing staff. The aim of the presentation is to describe how male nurse define masculinities in the context of care. The analysis is based on individual, semi-structured, in-depth interviews. The study included 24 licensed male nurses working in the profession for at least 2 years. Data were collected between January 2014 and December 2015 in Poznan, Poland. The analysis allowed to describe some crucial aspects of defining care by male nurses. They perceived care as inherent aspect of work and life, defined care as care for and care about, but also underlined emotional labour. Masculinities were defined in the context of care. My research emerged five descriptions. Two of them were defined in context of negation: in first masculinity was defined in opposition to femininity, and in second caring is treated as a non-masculinity. Next two description of masculinity were connected with certainty: sense of realization hegemonic masculinity, and acceptance of caring masculinity. The last way of describing masculinity was linked with suspending gender in context of care. My presentation allows me to describe in more detail those way of defining masculinity by male nurse in context of care, but also relates my analysis to current masculinities theories.

“What I’ve learned is not to beat up my missus and kids”: Gender Equality and the Facilitation of Caring Masculinities through a Relationships Project

Ward, Michael

Swansea University, United Kingdom
m.r.m.ward[at]swansea.ac.uk

Non-formal educational settings have been an often neglected area within the studies of men and masculinities. It is within these non-school spaces that the most marginalized young men (aged 16-24) are likely to be situated. These sites include a range of services including secure or exclusion units, youth based work, Antenatal and postnatal care, mental health based programmes, parenting classes, mothers’ and fathers’ only groups and lifestyles classes. They are also more likely to include care leavers, young or expecting parents, those at high risk of mental health issues and under the care of social services. The services that they access are often disjointed which can exacerbate social inequality. One approach to challenge this has been the adoption of multi-agency teams working collaboratively to create a team around a family and marginalized young people. These teams include a range of health and social care professionals such as midwives, early years practitioners, family facilitators, social workers, youth workers, early language development workers and teachers. Drawing on a yearlong qualitative study of one such multi-agency team in a Welsh coastal city in the UK, this paper focuses on an ethnography of a six week relationship education class. In this paper I explore how non-formal educators promote healthy relationships through teaching men about toxic displays of masculinity and gender based violence, promoting values of care, respect, stability and reliability. In this paper I argue that it is through such practices that more damaging displays of masculinity can be challenged. This study adds to the emerging concept of ‘caring masculinities’ and how non-formal educational settings could be at the vanguard of having a positive impact on gender equality ‘downstream’.

RS04_06 | Men and Masculinities in a Changing Europe II: Antifeminism and toxic masculinity

Perpetrators’ Narratives And Global Political Virilism

Oddone, Cristina

University of Strasbourg, France
cristina.oddone[at]gmail.com

In domestic violence cases, men who take part in perpetrator programmes are invited to analyse their violent behaviours against their female (ex) partners and to verbalise their feelings of anger and revenge. Such contexts represent an interesting anthropological microcosm to observe the social construction of masculinities: an ethnographic fieldwork on perpetrator programmes in France and Italy has identified recurrent attitudes of victimhood together with the expression of the desire for retaliation. Such narratives seem to echo the arguments promoted at a global level by rising authoritarian movements and far-right parties. The rhetoric used by political leaders in countries like Italy, Hungary, and the United States among others, recalls similar sets of values ranging from (national) victimism to radical transgression/revenge, delegitimising EU rules, human rights standards, gender equality policies. The refusal of “politically correctness” includes sexist behaviours like negative comments about women and the idea that gender equality has already been achieved (or even exceeded by feminism). My contribution seeks to analyse the convergence between the narratives produced by violent men in perpetrator programmes and the global conservative rhetoric against feminism. The elements of continuity between the two settings can indicate the development of a renovated “hegemonic masculinity” which seems to successfully push the political agenda further right. The open hostility towards policies oriented at combating violence against women seems to nourish political virilism and confirms the political use of the term “gender” as a “Trojan horse” to mobilise supporters for neo conservative initiatives and to gain electoral consensus.

Sex Robots And Toxic Masculinity – Intimacy With Non-Humans Or Escape From The Society

Kubiński, Grzegorz

Pedagogical University, Poland
grzegorz.kubinski[at]gmail.com

The concept of toxic masculinity, understood as an expression of the patriarchal social structure, has become one of the most important problems of contemporary culture. Toxic masculinity is very often connected with heteronormative, extremely masculine behavioural patterns based on institutional religion. Although by the majority of the society toxic masculinity is criticized, it appears more and more visible in the social discourse in the form of informal movements like "incels" or "MGTOW". Their supporters postulate the dominance of men and the sustain of patriarchy, seeing women in a subordinate role. At the same time, there is a growing interest of both men and the media in the specific form of sexual fetishes such as sex-robots (fembots, gynoids) representing the objectified women's body. The sex industry estimates that sex robots will be one of the most important erotic gadgets in the following years. However, sexbots can be understood as "the ultimate Other" or non-human being with whom men can have sexual relations. In this case, sexuality will turn into the vast net of non-humans and humans and as the consequence probably change the way how the artificial beings can be perceived. Analyzing these two trends, the proposed paper attempts to answer the following questions: do men with extremely misogynist views are interested in erotic sex robots as a tool for maintaining the patriarchy or interest in such objects is more a form of sexual escapism from the postulated open and equal of society, and is there any possibility for the human society to accept non-human artificial beings as integral, intimate and sexual partners.

Men's Rights Activism in Italy: between anti-feminism and anti-sexism

Farci, Manolo; Righetti, Nicola

University of Urbino Carlo Bo, Italy
manolo.farci[at]uniurb.it, nicola.righetti[at]uniurb.it

In recent years, we are witnessing the re-emerging of a loose confederacy of men's online communities, from more traditional men's rights activists (MRAs) (Schmitz, Kazyak 2016) to the new misogynistic techno-cultures of the manosphere (Nagle 2017; Ging 2017). On the one hand, all these groups share the same pro-male anti-feminist rhetoric that place men as the silenced victims of a reverse discrimination (Marwick, Caplan 2018) and reinforce their sense of aggrieved entitlement (Kimmel 2015). On the other hand, many of these groups tend, like feminism, to reject the patriarchal notion of gender essentialism and bring to light the ways in which traditional gender norms negatively affect men socially and psychologically (Farrell 1974; Goldberg 1976). These "pro-male" movements are indicative of a wider

complex online backlash (Menzies 2008) as they accept some of the precepts of feminist theory such as the principle of liberal equality, while rejecting feminism as a label and political project (Nicholas, Agius 2017). The aim of this study is to explore how these two antithetical discourses are represented in the Italian MRA network. We will start with "Antisessismo" (anti-sexism), one of the Italian prominent MRA pages on Facebook with over 45,000 followers, continue with identification of the resulting network and its main clusters, using social network analysis, and complete the study with a qualitative analysis of the major groups and pages. We believe that deconstructing the boundaries between more moderate men's rights activism and feminism, and exploring the points of ideological convergence between the two movements could facilitate the building of an inclusive gender theory truly committed to dismantling patriarchal ideology.

Normative Sexuality as a Proof of Manhood? (Re)construction of Normative (Hetero)sexuality of Porn and Sex Addicts in the Czech Republic

Charles University, Czech Republic
barb.vesela[at]gmail.com

The abstract is based on intersection of feminist critical theory, queer and crip theory and focuses on the strategies that (hetero)sexual men are pursuing in order to overcome their sexual life style, which has been pathologised in western societies for decades (Rubin, 1998). Currently, the issue is being more or less silenced in order to maintain the status quo in the public discourse in the Czech context, as silencing of the risk of addiction could be seen as the side effect of normalisation of porn usage as integral part of male sexuality. I would claim that stereotypical characterisation and focus on dichotomy between male and female sexualities in the public discourse might have its share in the issue together with the neoliberal discourse. The neoliberal society to be characterised by individualisation and focus on self-reflection and self-help (Weeks, 2007) enables the former porn and sex addicts to start the process of "composing straightness" (McRuer, 2006, p. 155). Thus, we can claim that normative heterosexuality is less natural than it is usually assumed. Therefore, the words "queer" used in Tim Deans statement about queer culture and its way of manifestation and appropriation could be replaced by "straight": "To apprehend [straight] sexual institutions and practices as cultures is to acknowledge that they may warrant our respect even – or especially – when we do not immediately understand them. But it is also entails acknowledging that, unlike other cultures, nobody is born into or inherits [straight] culture: it becomes one's own culture only through modes of invention and appropriation." (Dean, 2009, p. 37).

Considering the Parameters of Transnational Bachelorhood

Mellström, Ulf (1); Henriksson, Erik Andreas (1); Priori, Andrea (2)

1: Karlstad University, Sweden; 2: Fulda University of Applied Sciences, Germany
ulf.mellstrom[at]kau.se, andreas.henriksson[at]kau.se, andrea.priori[at]sk.hs-fulda.de

Reaching beyond the media portrayals of 'dangerous migrant men', we ask what bachelorhood entails for migrated men within the European union. Using ethnographic data from Italy and interviews from Sweden, and drawing on previous research, we suggest that critical masculinity studies can be combined with the transnational family framework to situate the single men in a relational and transnational context. Our results indicate that bachelorhood is experienced as both freedom and a challenge to build a life that stretches across cultures and nationalities. In this context, masculinity is construed as both freedom from relations and as (conflicting) loyalties. Considering some differences between Italy and Sweden, we suggest ways in which to further examine transnational bachelorhood.

Gender Differences: from 'Old Boys' to new boys in Germany

Lechner, Götz

Leibniz Institute for Educational Trajectories, Germany
goetz.lechner[at]lifbi.de

Gender differences in mathematical competences have been reported widely and sign emblematic gender roles for decades and generations in our everyday perception. The German National Educational Panel Study NEPS assesses math competencies and allows permission to data from six starting cohorts of over 60,000 persons that were sampled through the years 2009 to 2017. NEPS started with babies, children at Kindergarten, students at the age of 10 and 14, first year University students and adults aged from their 20ies to the 60ies. As time goes by the members of these starting cohorts overlap as toddlers became children at Kindergarten, the Kindergarten-children pupils, student left school, and vocational training led to work. The Old Boys always display their supremacy in Math but: what about the young boys? Where do boys and girls start in this symbolic game, on equal level? Or with very clever math-girls and dreamy boys and is there a turning point when the children grew up? The database NEPS offers the chance to detect a new equilibrium of gender roles starting with the newborns in comparison with

their ancestor generations and cohorts as frame, not as family tie. This proposal promises to present ideas and findings on a core field of representation and construction of gender roles.

'Performing Masculinity in the context of the 'Refugee Crisis': African Men negotiating Gender Relations in Sicily'

Palillo, Marco

London School of Economics, United Kingdom
m.palillo[at]lse.ac.uk

Although an increasing interest in studying the intersection between migration and gender has emerged in the last two decades, research on refugee men as gendered subjects is extremely limited in current sociological accounts of the so-called 'refugee crisis'. At the same time, male refugees and asylum seekers are experiencing a 'hyper-visibility' in public debate with anti-migrant discourse depicting their masculinity/race as a threat posed to national security, cultural identity, gender equality and welfare systems in Europe. Here, the 'bogus' asylum seeker narrative has emerged to convey images of a dangerous masculinity characterised by idleness, dishonesty, hyper-sexuality, and cultural backwardness. Based on life-histories conducted with Sub-Saharan African refugee and asylum seeking men in Sicily, this paper aims to analyse their performance of masculinity in relation to such repertoire of meanings associated with the 'bogus' asylum seeker narrative. In order to do this, I will focus on how participants' negotiate gender relations with white women in Sicily as a means to illuminate the key role of gender, sexuality and race in framing notions of deservingness, right of asylum and need of protection in the context of the current 'refugee crisis'.

RS05 | Multi-locality and Family Life

RS05_05 | Multi-local family life: Challenging normative constructions of the family

The Spatiality of Doing Family in Multilocal Living Arrangements Through Nine Analytical Dimensions: between Barriers, Distance, Belonging and intermittent Coexistence

Duchêne-Lacroix, Cédric J.

University of Basel, Switzerland
c.duchene[at]unibas.ch

Although divorces, separations, singles and small households have increased in Europe, family is not over. To better understand this paradoxical situation, this contribution will tackle two main issues: what makes a family and what is the spatiality of it. Facing the diversity of the family forms, we have to think family not just as a configuration (Widmer and Jallinoja, 2008) but also as a node or an elastic ball of perpetual dynamics (Caring, Identification, reproduction etc.) which we can classify through 9 dimensions (Von Arx and Duchêne-Lacroix, 2014). In another words we propose to conceptualize the “doing family” (Schier, 2009; Schier and Jurczyk, 2007; Von Arx and Duchêne-Lacroix, 2014). Secondly, we have to think about the role of space in the doing family and especially the social aspect of the spatiality of doing family: how to cope with absence, how to live (better) together with or thanks distance (Nedelcu and Wyss, 2016), a choreography of coexistence (Weichhart 2013) etc.? Based on an own qualitative empirical material we present the spatiality of different family configurations. Through this analysis, we highlight the variation of the use and effects of the equivalent spatial qualities associated with the family configurations. Reference Von Arx, M., and Duchêne-Lacroix, C. (2014). Reproducing, budgeting, coexisting, caring, networking, “culturing”, positioning, identifying, displaying, ... Familienherstellungsleistung im multilokalen transnationalen Kontext. In *Questionner les mobilités résidentielles à l’aune de la multilocalité*, P. Hamman, M. Blanc, C. Duchêne-Lacroix, T. Freytag, and C. Kramer, eds. (Strasbourg: Neothèque), pp. 289–322.

The Role Of Local Cultural-Normative Constructions Of Children And Their Best Interests In Shaping The Lived Experiences Of Shared Custody Arrangements In Belgium And Italy

Merla, Laura; Murru, Sarah; Nobels, Berengère

UCLouvain, Belgium
laura.merla[at]uclouvain.be, sarah.murru[at]uclouvain.be,
berengere.nobels[at]uclouvain.be

Based on in-depth, qualitative fieldwork with over 40 children aged between 10 and 16, and semi-structured interviews with at least one of their parents, this paper examines the role that local cultural-normative constructions of children, their best interests, and the roles of mothers and fathers in families, play in shaping the lived experiences of shared custody arrangements in Belgium and Italy. After presenting the main characteristics of the everyday organization of this mode of living in the two countries, we examine the specific role that Italian and Belgian children, as well as mothers and fathers play in the coordination of this multi-local living arrangement. We observe in particular strong local differences, on the one hand, in children’s levels of autonomy and active participation in the management of the practicalities of moving between two homes and, on the other hand, in the roles that fathers and mothers respectively take in the organization of their children’s daily lives within, and across households. We then try to make sense of those differences by discussing how local cultural-normative constructions of children and families may shape these practices.

Transnational Families of LGB Migrants: Negotiating Familyhood Across Different Socio-Institutional Contexts

Vuckovic Juros, Tanja

University of Louvain, Louvain-la-Neuve, Belgium
tanja.vuckovic.juros[at]gmail.com

In this presentation, based on interviews with lesbian, gay and bisexual (LGB) migrants in Belgium and the Netherlands and their family members in Central and Eastern European (CEE) countries with a constitutional ban on same-sex marriage, I will show how mobility to a socio-institutional context strongly supportive of LGB rights can transform family relations and create new connections among family members separated by distance. Even though they are still under the radar of the transnational families literature, LGB migrants sustain similar financial and emotional ties with their families in countries of origin as other transnational migrants. However, their non-normative sexualities add an additional layer of complexity to transnational communication and care, particularly if LGB migrants must manage different normative expectations between receiving and sending societies. In case of some CEE LGB migrants who left for Western Europe primarily for economic reasons - and did not necessarily disclose their sexual identification before leaving - the distance and the 'new beginning' make the disclosure of sexuality and same-sex relationships to family members back home easier, sometimes resulting also in more intimate relations than before, despite the distance. Others, in contrast, continue to juggle different levels of disclosure between different segments of their transnational social networks. While same-sex marriage does not necessarily change these patterns, a birth of a child proves more transformative as it pushes LGB migrants into full disclosure. Simultaneously, new grandparents often engage in deeper communication and care with same-sex family across distance, thus negotiating a new sense of familyhood.

Transnational Connectedness; Ageing Migrant' Physical and Virtual Connectedness to Family and Place

Tawodzera, Obert; Ryan, Louise; Kilkey, Majella; Lorinc, Magdolna

University of Sheffield, United Kingdom
otawodzera1[at]sheffield.ac.uk, louise.ryan[at]sheffield.ac.uk,
m.kilkey[at]sheffield.ac.uk, m.lorinc[at]sheffield.ac.uk

Studies of migration and ageing have been especially important for increasing our understandings of the interactions between ageing migrants and their transnational families. The key argument is that despite living away from their countries of birth for many years, many ageing migrants continue to maintain connections with their families across national borders (Ackers and Dwyer 2002). Their everyday lives are argued to be transformed by new technologies that make it possible for individuals to maintain ties and remain socially connected across distance (Baldassar et al., 2017). However, ageing migrants' connectedness to people and places is dynamic due to their advanced age and migration histories. The intersections of time, age and life course might influence the way they remain connected to their home countries and the way they use new technologies. In this context, this paper discusses the physical and virtual connectedness of ageing migrants to people, places and organisations as well as conditions that shape their virtual transnational connectedness. We draw on new data from a large ESRC Sustainable Care Project (2017-21). Our analysis is based on in-depth interviews with three groups; African-Caribbean, Irish and Polish. We examine their transnational practices, focusing specifically on the themes of care, ageing, transnationality, inequality, use of new technologies and their relationships to place. Our research contributes to debates about the changing normative ideas and expectations about care, ageing, family relationships, use of new technologies and attachment to multiple places.

RS05_06 | Multi-local family life: Children's experiences

Transnational Families' "Habitus": A Research On Generations Of Italians Living In Belgium

Scocco, Marta; Crespi, Isabella

University of Macerata, Italy
marta.scocco[at]unimc.it, isabella.crespi[at]unimc.it

In recent years, many scholars addressed the transnational experience of families and a growing number of migration and family studies conceptualized international migrants and their kin as transnational families (Baldassar&Merla 2014). With increased mobility and improvements in both travel and communication technologies, more and more people are in fact experiencing transnational family lives. In this contribution we take in consideration the concept of "transnational family habitus" (Reynolds&Zontini 2018) as a theoretical tool for making sense of the ways in which children and young people from a migrant background are doing families transnationally. Furthermore, we combine the transnational perspectives with multi-local one, in order to analyse the family relationships in the context of multiple places and localities within and across national borders (Schier et al. 2015) The research presents results from a qualitative study drawing on 50 in-depth interviews realized with second and third generations of Italians living in Belgium in 2018/2019. Influenced by the work of Reynolds & Zontini, to better understand the consequences of the persistence of transnational network across the generations, firstly we develop the concept of "transnational family habitus". In particular, we focus the attention on the ways in which families inform children's practices, notions of identity and opportunities within and beyond national boundaries. Secondly, we analyse the conduct of everyday family life under mobile and multi-local conditions and specific strategies for maintaining relational attachments. Keywords: Transnational family habitus, Italians in Belgium, migrants, generations, everyday family life, multi-local conditions.

Home Without Family? Young Migrants' Experiences of Home, Place and Relationships in the City of Brussels.

Damery, Shannon

University of Liège, Belgium
shannon.damery[at]uliege.be

Home is rarely spoken of without the mention of family, but the meaning of both of these terms are being usefully interrogated by recent social science scholarship. While these concepts warrant further study in many areas, it has been the case that their revaluation often emerges in studies of migration. It is through migration studies that traditional

western ideas of family, as being nuclear and sharing the same physical space, and home, as being sedentary and synonymous with house, are disrupted and brought into question. When people move, by force or choice, it is an emotional time of transition, and it provides a window into many of the fundamental aspects of relationships, belonging and home. This paper builds on these evolutions by investigating the home-making, place attachment, and family connections of a group of young first generation migrants (aged 15-25) of different migratory statuses (undocumented, European citizens, refugees, unaccompanied minors) in the city of Brussels. By using data collected through fieldwork conducted with participants in traditionally non-home spaces, this paper reveals discoveries about the relationship between home, place and family, and how family may exist without home and home may exist without family.

Merging the Separated: Odor as a Medium of Cohesion and Belonging in Multi-local Families

Schlinzig, Tino

Technische Universität Dresden, Germany
tino.schlinzig[at]tu-dresden.de

High risks of divorce and separation and the increasing involvement of fathers in child care promote residential models that enable children to participate in the everyday life of the separated parents. However family members in shared residence arrangements are confronted with the challenge to establish attachment and a sense of we-ness against the background of cyclical growth and reduction of the household community and the changing rhythms and patterns of their everyday life. The empirical material presented in this paper suggests that as part of identity policies parents and children oscillate between referring to the other household to create a cross-spatial sense of belonging and at the same time applying territorialisation practices to promote a local family identity (Schlinzig 2017). The establishment of a local social order and belonging is hereby stabilized and experienced also sensually. At this odors are of particular importance. They enable the creation of closeness and identification beyond verbal communication, have the potential to merge what is separate and at the same time to distinguish (Soeffner 2012, Largey/Watson (1972). Following Goffman's (1971) "Territories of the Self", this paper explores the olfactory dimension of cohesion in multi-local families after separation and divorce: (1) The "sheath" and thus odors attached to clothes can be interpreted as a medium for the (unintended) perception of absent others and reintegration of the returning children. Interviews with parents and children can also show that (2) the living space understood as a "stall" serves as an odor marker and identification mean, and (3) the odorisation of mobile objects is applied to establish co-presence in absence.

RS05_07 | Multi-local family life: Work-family balance and attachment to place(s)

Place Attachment And Employers Ties Of Multi-local Knowledge Workers – The Case Of Stuttgart, Germany

Stadtler, Lisa

ILS - Research Institute for Regional and Urban development, Germany
lisa.stadtler[at]ils-research.de

Many cities in western industrial countries deal with increasing work-related mobility and multi-locality (Williams et al. 2013). Particularly skilled workers in creative and knowledge-intensive branches are affected, because of project based work and flexible working conditions (Nadler 2014; Plöger 2016). Due to skills shortages and increasing competition for talent, cities and employers have started to attract and tie workforces within these sectors (Musterd/Murie 2010), but several employees move to a new place of work without their partners or families and decide to live multi-local. The existing literature barely deals with the individual workplace decision-making of multi-local knowledge workers. Also the employer's role in work and residential decisions remains unclear. Contributing to this debate the paper deals with the question why multi-local knowledge workers in partnerships decide to live in several places and how employers influence their workplace decisions and residential location decisions. Furthermore, the paper deals with the question if and how multi-local workers create a sense of belonging and attachment to their cities of work as well as to their employers, even if they have relational attachments to other places. The paper focuses on the German city of Stuttgart and draws on ten qualitative interviews with multi-local knowledge workers.

Childcare Arrangements in Context of Transnational Families

Formankova, Lenka

Institute of Sociology, Czech Academy of Sciences, Czech Republic
lenka.formankova[at]soc.cas.cz

Work-life reconciliation strategies in the research on migrant population are largely neglected phenomena (see Williams 2012). Contributing to social policy research on work-life balance in the context of migration, I discuss childcare arrangements in transnational families as negotiated between different cultural models of care and welfare provision of (mutual) countries or origin, transition countries and country of destination and individual family situation. In the context of transnational families, the recent studies has focused on the role that state policies and international regulations play in facilitating or hindering family solidarity across borders. To

enhance our understanding of the family life of transnational migrants, I have conducted a study on the work - family reconciliation strategies of migrants from a Vietnam and Ukraine living in a Central Eastern European Country (CEEC) – the Czech Republic. I discuss the everyday strategies of childcare provision supported by results from analysing 30 biographical narrative interviews and 6 focus groups with mothers of Vietnamese and Ukrainian origin. The pre-migrant ideals of care play an important role in deciding on care arrangements, provided in multi-local and transnational context. The dominant discourses on 'good parenting' in the country of destination are supported, reinforced and eventually changed through specific family policy designs but are not always accepted by migrant parents. Though the care arrangements reflect the parents' values regarding appropriate care in the context of the available institutional setting, the dominant model of care from the country of origin stays often unchanged. At the same time the changing family's socio-economic situation and the labour market conditions in the country of destination contribute to fluidity of the childcare choices.

Economic Migration - Divides or Connects Families?

Švarcová, Markéta; Marková Volejníčková, Romana

Institut of Sociology of Academy of Science of the Czech Republic, Czech Republic
marketa.svarcova[at]soc.cas.cz,
romana.volejnickova[at]soc.cas.cz

This paper focuses on the multi-local and transnational forms of economic migration and the impacts (positive and negative) of this strategy on the family and private life of migrants from Ukraine. The aim of this paper is to map strategies of economic and financial support in transnational families (supporting family members in the host country and in the country of origin). We analyse qualitative interviews with economic migrants from Ukraine coming to the Czech Republic. We focus on the specific strategies of migrants who have decided to establish entrepreneurship in the Czech Republic. We point out how legislation and working conditions (e.g. types of employment contracts, length of working hours, branches), as well as the group factors (i.e. specifics of position of migrants on the Czech labour market) contribute to strategies in providing financial security, which can multiply vulnerable position of migrants in the Czech Republic. These strategies of providing financial security for themselves and their families in Ukraine contribute to disadvantage and discrimination, which is, paradoxically, the main reason for the decision to start entrepreneurship. The decision to leave the country of origin for economic reasons may bring up a threat of loosening or breaking the family ties. However, ongoing efforts to support the family in the country of origin through remittances and other forms of financial support help to maintain the family relationships.

The Politics of Urban Greenspace Engagements

Krarup, Troels

University of Copenhagen, Denmark
tr.krarup[at]gmail.com

So far, pragmatic sociology in general and Laurent Thévenot's sociology of engagements in particular has been mobilized almost exclusively in qualitative studies. The present study adapts the perspective for quantitative inquiry, presenting the results of a national representative survey (N ≈ 1.500) on engagements in urban green spaces in Denmark. The questionnaire captures a variety of engagements across familiar, individual and justificatory formats and their communality correlates: 'personal affinities to commonplaces,' 'choice in a liberal public,' and 'plural orders of worth' (Thévenot 2015). Specifically, it covers use of, preferences for and civic engagement in local greenspaces among the Danish urban population as well as regimes of justification. Of the justification questions, some operationalize the eight 'cités' so far identified by French pragmatist sociology (Boltanski and Chiapello 1999; Boltanski and Thévenot 1991; Thévenot, Moody, and Lafaye 2000) while others situate respondents in scenarios of controversy in relation to urban greenspaces and invite them to select justificatory responses. The study uses correspondence analysis, previously employed in studies by Boltanski (2007; 1984) to visualize relational patterns in complex data. By emphasizing contrasts in the data, correspondence analysis is particularly apt for the quantitative study of the politics of urban greenspace engagements. Thus, the analysis will produce a 'space of engagements' across formats and communalities, shedding light on the overall landscape not only of controversies and compromises but also of familiar attachments and individual plans in relation to local urban greenspaces in Denmark.

Communities Of Green Collaboration: Composing Commonalities In Collaborative Planning Of Public Urban Green Space

Christensen, Anette Gravgaard

University of Copenhagen, Denmark
agc[at]soc.ku.dk

Recent years has seen public landowners, from local governments to state branches, formally collaborating with civil society associations, private organizations and other institutional actors on the physical development of public urban green space. This development in urban planning sees new types of actors engaged. Far from only being classical green groups, such as environmental or outdoor associations, a broader range of civic, private and institutional actors, with a desire to use a public urban green space in different ways, are involved presenting a great diversity in the goals and motivations of the collaboration partners. As formal partners, they now take part in planning processes on the development and care of a public urban green space. Such efforts, here termed collaborative planning, compel the public landowners to adopt a different approach to green space management adjusted to the various practical engagements and resources of the collaboration partners. At the same time, an ongoing commitment is essential for public strategic planning and for the success of the green collaboration. Drawing on empirical findings from fieldwork in three such green collaborations in Denmark and deploying the notion of 'commonality in the plural' from pragmatic sociology, I want to further investigate, how commonality is built in these collaborations between the public landowners and a diverse set of civic, private and institutional partners. How do these formal communities of green collaboration successfully compose a common ground that enable them to create and maintain their coherence and collective efficacy over time?

Possibilities Of Green Publicity? Justifications And Critiques In Debates Over Organic Agriculture And Food

Lehtimäki, Tomi Henrik

University of Helsinki, Finland
tomi.lehtimaki[at]helsinki.fi

This paper discusses the issue of green justifications in pragmatic sociology. While green justifications can be seen as an important part of this analytical framework both because of the increasing significance of environmental problems, and on the further development of pragmatic sociology itself, the issue has remained somewhat under-theorised. By examining the development of organic agriculture in Finland, this paper examines how have actors attempted to construct green commonality and ecological bonds, and how have these attempts on the other hand been criticized. Organic agriculture offers a suitable case study, as it has emerged as a critique of conventional, techno-scientific agriculture. The conflict between organic and conventional agriculture therefore presents a case where actors are required to raise above their particular interests and to articulate conceptions about the common good. While numerous other forms of justification have played a important role in the development of organic agriculture, questions about environmental benefits and connections with nature have been at the core of these debates. The analysis then focuses especially on the question of whether green justifications have been able to distinguish themselves from competing principles of justification and establish the green order of worth as an independent form of valuation.

Pragmatic Sociology And The Environmentalism Of Everyday Life

Centemeri, Laura

CNRS, France
laura.centemeri[at]ehess.fr

Pragmatic sociology can help to shed light on the varieties of environmentalisms that participate in shaping our societies at different scale, from the local to the global. Beyond allowing for a more precise understanding of “environmental conflicts as conflicts of valuation”, pragmatic sociology-inspired analytical tools can help to explain the political and ecological relevance of what I am going to define as “context-sensitive value practices”. These value practices are a key feature of the so-called “environmentalism of everyday life” whose development is crucial for the emergence of “cosmopolitan communities of earth care”. My starting point is the discussion of how current theorizations of environmentalism in social movements studies fail to address the implications of the semantic ambiguity of the term environment, intended as both a reality subjectively experienced in processes of becoming and an external constraint or resource. This semantic ambiguity mirrors a variety of modes of valuation of the environment that orient people “value practices” and

participate in shaping ecologies. Following Laurent Thévenot’s work on regimes of engagement, I will distinguish between “emplaced”, goal-oriented and abstract modes of valuation. Value practices and their ecologies are stabilized and maintained through fixing conventions, developing techniques and producing arguments that support them as legitimate. Environmental movements can thus be defined as actors that elaborate arguments concerning what the environment is and why it is of value: these arguments articulate value practices and socio-technical imaginaries. As a conclusion, I discuss how this approach helps to shed light on the relevance of the intersection between politics, ontologies and ecologies for the understanding of the current forms of environmental critique.

Ways of Building Commonality for Environmental Justice. About Current Academic Debates in Human Sciences

Renou, Gildas

University of Lorraine, France
gildas.renou[at]univ-lorraine.fr

After other researchers (Luhtakallio & Tavory 2018), I will confront the sociology of engagements to a considerable challenge: the global controversies about the ecological sustainability of the socioeconomic system. I will focus on the emergence of public debates on Environmental Justice which appeared in the two last decades, after some scientists whistleblowed the common entrance in the Anthropocene epoch. Alongside with movements activists, scholars from various disciplines in human sciences participate in debates about the redefinition of justice and politics in the situation of an endangered human dwelling on earth. How to include biosphere and natural beings in the commonality? How to conceive the possibility of global justice between Northern and Southern societies since the first ones, rich and industrial, are collectively the main responsible for the global warming? The method of the sociology of engagements offers a precious perspective to go beyond oppositions between assertions conversally considered as unconciliable, especially by recognizing that the commoning processes cannot only rest on operations of generalization in the public spheres. First-person experiences have to be taken into account (Centemeri 2015). But experiences cannot be automatically treated as pure or genuine (vs. « fictive » conventional generalizations which can be denounced as untrue or factice) in the processes of commoning, without generating major problems for a pluralistic perspective. Contemporary commonality building seems to face a double danger: the hegemony of universal (and often quantified) orders of worth, and the (re)emergence of the idea of the incommunicability of experiences. I will illustrate this thesis through the figuration of two academic debates: the first one in social-ecological economics (Costanza/Escobar/Hornborg&Malm); the second one in cultural anthropology (Descola vs Ingold).

RS08_02 | Social movements and the sociology of engagements

The Russian “Vatniki” And The French “Yellow Vests”: An Attempt To Understand The We-Lower Class People

Clément, Karine

Ecole des Hautes Etudes en Sciences Sociales (EHESS), France
carine_clement[at]hotmail.com

Beyond the obvious differences in the context and environment of their living, the “invisible people” in Russia and in France have much in common beyond their invisibility in the public sphere. As shown by the recent “Gilets Jaunes” movement in France and the social criticism from below noticed in recent fieldworks in Russia, it seems that the “invisible” or socially despised/ignored layers of the society are not ready anymore to quietly play the game of the consenting governed. In the paper, I argue that they are sketching a new type of politics which is directed against institutional politics and those at the top of the institutional politics, while asserting a new horizon of commonality in both meanings of sharing something common and belonging to the common people (poulos). In other words, I propose to study the process of populization, which means the process by which people from the lower classes imagine themselves as sharing the same social experience to which they recover sensitive connections and which they requalify and value through close interactions, free talks and common practices or actions. The study relies on data from two field studies. One has been conducted in different Russian regions in 2016-2018, while studying ordinary nationalism, and provides information from 237 in-depth interviews with people of different socio-demographic profiles. The second comes from an on-going field research on the Gilets jaunes, mostly through informal interviews and observations. As astonishing as it can appear, the Gilets jaunes movement resonates very much, from my perspective, with what I have seen and heard in Russia among the lower-class people (what I label “vatniki” for the strength of the comparison).

Plural Engagements and Social Movement Studies: Theoretical Reflections and Post-Socialist Cases

Gabowitsch, Mischa

Einstein Forum, Germany
mischa.gabowitsch[at]einsteinforum.de

Social movement studies are currently at a critical juncture. The dominance of the political process school is on the wane, and attempts are being made to reconstruct the field based on

contributions from a range of theoretical perspectives and, most importantly, case studies from non-Western contexts. This paper outlines the contribution that the sociology of regimes of engagements can make to renewing social movement studies. The theoretical part reviews the state of the field, then discusses how a pragmatic approach can provide a useful framework to approach objects of study that contentious politics scholars often have difficulty accounting for, such as the diversity of regimes of engagement (strategic, critical, familiar and exploratory) in protest and the attendant emotional regimes. The empirical part discusses case studies of unconventional social movements from a post-socialist context, illustrating different modes of articulating plural regimes of engagement within the same situation. Examples are drawn from a study of protests against electoral fraud in Russia in 2011-13 and from a multi-year study of transnational commemorative movements that continue and transform the Soviet tradition of celebrating victory in World War II.

Building Translocal Commons: Climate Justice Networks in Turkey and Germany

Paker, Hande

Bahçeşehir University, Turkey
hande.paker[at]jeas.bau.edu.tr

How are borders, both geographical and social, transcended, negotiated and re-constructed to create common spaces that produce transformation? This paper focuses on local and transnational environmental spaces of action to analyze how civil society actors build commons around climate change. Ecological issues can be analyzed from the perspective of commons, which, applied more freely, has implications for the construction of a common public sphere. The analysis of encounters in and around the commons, simultaneously unifying and contested, opens itself to more general questions of democratic participation that makes co-existence possible, which has increasingly become precarious in the current neoliberal and populist ‘zeitgeist’. The paper argues that the conditions of building democratic commons need to be expounded by taking into account the specific mechanisms at the local and transnational levels, which make possible the forging of a common ground. Drawing on research on climate networks in Turkey and Germany, I comparatively analyze environmental civil society actors to delineate the extent and nature of their participation in the transnational public sphere built around climate change, identify limits presented by their national political contexts, and explore possibilities for building commons around climate protection, e.g. a shared anti-coal focus and commitment to climate justice. The interactions, frames, inherent conflicts and effectiveness of climate networks are identified through in-depth interviews with representatives of transnational, national, and local environmental organizations in Turkey and Germany, as well as participatory observation at COP21 and Breakfree events in Turkey.

Historical Background of the Gezi Protests and the Justice and Development Party's Policies

Yılmaz, Tülay

Tampere University, Finland
tulay.yilmaz[at]tuni.fi

Social protests and movements have unpredictable positive or negative impacts over societies and states. They might, on the one, enable democracy to rise, create a more liveable and more egalitarian milieu, on the other hand, cause to emergence of undemocratic and authoritarian regimes. The Gezi movements initiated by the actions of a few environmentally sensitive activists in May, 2013 still maintains its importance in terms of the politics and society in Turkey. In my PhD research, I study the Gezi movement as contentious politics, deploying the conceptual tools of political opportunity structure and of the effects of social movements. This presentation explores the historical background of the movement and the government (AKP- Justice and Development Party) actions, and furthermore, takes steps towards policy analysis of the current government. It is immensely important not to perceive the Gezi protests as the only social protests wave during the current government period. Before the emergence of the Gezi protest, there were many social protests criticizing the government's worker, environment, neoliberal policies and its conservative policies. A number of policies have been put into effect, particularly on workers, nature and the secular lifestyle, that have led to the annihilation of the nature and the elimination of workers' rights and restriction on the secular life and freedom. However, the Gezi protests have formed the peak point of these actions. In order to better understand, the political context, the consequences and the effects of the Gezi movement on the democracy and the current situation of Turkey, I look at policies and the political turn of the government in the period after the Gezi protests.

RS08_03 | Class, critique & participation in the sociology of engagements

The Different Worths of the Unemployed - Everyday Discourses on Unemployment in Denmark and UK

Nielsen, Mathias Herup

Aalborg University, Denmark
mhn[at]id.aau.dk

Much scholarly attention has been devoted to studying the role of stereotypical pictures of 'the poor' and how such are related to recent retrenchment reforms of western welfare states – e.g. through studies of media coverage or political rhetoric. Fewer have analyzed the moral languages activated by ordinary persons during discussions with their peers on these very same topics. This paper investigates how ordinary citizens in two very different welfare state settings, respectively Denmark and UK, discuss the issue of unemployment and justify their opinions during extensive group discussions, by leaning on and constructing certain images of the unemployed. In order to do so, the article suggest to bridge insights from the policy design literature focusing on 'social constructions of target groups' on the one hand and the 'pragmatic sociology of critique' on the other. Particularly, the idea of a plurality of co-existing orders of worth is of important: Reaching agreement about the worth of the unemployed is not merely a matter of placing the unemployed on a fixed axis ranging from a negative to a positive depiction. It is, more fundamentally, a matter of reaching agreement about the very nature of that axis. Empirically, the contribution explores qualitative data gathered from comparable deliberative forums held in the UK and Denmark. During its sessions, ordinary citizens were to discuss the future of the welfare state to formulate specific policy recommendations. The analysis demonstrates how participants in both countries make use of three quite different orders of worth – thereby constructing the unemployed negatively as well as positively along three different moral axes (creating respectively a market, an industrial and a domestic common world).

Critique as a Practice of Equality

Meriluoto, Taina

Tampere University, Finland
taina.meriluoto[at]tuni.fi

This essay is interested in critique as a practice of equality. It studies a project where people who have experienced homelessness organise and guide alternative walking tours in their home town. The tours are planned to give the “streetguides” an avenue to express their alternative viewpoints concerning an array of societal issues: homelessness, social and health services, the use of city space etc. The project’s aim is twofold: to present public critique and to claim the streetguides a legitimate position to do so. The proposition of sociology of engagements is that people are qualified as legitimate actors by following the situational coordinations of a given disposition (Thévenot 2014). This essay probes the possibilities of the inverse: whether, and how critique can be a tool through which equality is claimed. By building on Rancière’s (1991) conceptualisation of equality as a practice of recognising each other as valid partners in a dialogue (Deranty 2014) and connecting this pragmatic view to critical democratic theory more broadly (e.g. Griggs, Norval & Wagenaar 2014), the essay explores the streetguides’ capacity to act critically – to politicise that which appears self-evident or necessary – and by so doing, to claim themselves the position of an equal. While sociology of engagements offers robust tools in analysing critique in public debate (e.g. Ylä-Anttila & Luhtakallio 2016), it has so far paid less attention to the role it plays when people attempt to be recognised as equal participants in this debate. This essay interrogates the conditions of such recognition, and illuminates practices in which politicisation and equality are interconnected.

The Middle Classes’ Cultural Repertoires and Political Emotions of Citizenship in Finland

Tuukkanen, Roosa Helmi Henriikka

University of Tampere, Finland
roosa.tuukkanen[at]tuni.fi

This paper is a part of the research project Tackling Biases and Bubbles in Participation. The purpose of the project is to seize the citizens’ opportunities and ways to participate in the policymaking processes in the changing Finnish welfare society. This paper taps into the cultural repertoires of citizenship, including political and moral emotions, of the middle classes in Finland, and thus identifies, which kind of obstacles may stand in the way of participation, or prevent people’s voices from being heard in the policymaking processes. My research questions are: How do the working middle classes enact (or inact) their citizenship in the Finnish urban areas, and what kind of role emotions play in their cultural repertoires of citizenship? By approaching the political through the everyday practices of the “ordinary” citizens, the research seeks to grasp the citizens’ political capacities, interests and emotions. I employ the concepts of political and emotional belonging when addressing the question of the middle classes’ civic imaginations in Finland, as they may

reveal something more tangible about where the citizens place themselves in the society. Through these processes of belonging citizens not only find (imaginary) places for themselves, but also draw moral and symbolic boundaries to others, that do not quite fit in the picture.

Occupying Political Space? Minority Youth And Their Political Participation

Suni, Anna Elisa; Mietola, Reetta

University of Helsinki, Finland
anna.suni[at]helsinki.fi, reetta.mietola[at]helsinki.fi

This paper is based on ethnographic research focusing on a course designed for upper secondary school students coming from different language minorities. The course, organized by a multicultural foundation, aimed to move young people not so rooted in the society into the center of political and societal participation. During the course, the students were taught and encouraged to participate and produce content into ongoing political discussion by, for instance, interviewing politicians. Our research focuses on how relationship between ethnicity and participation is formed in the course leaders’ work, and how this is discussed by the participating young people. We are also interested of what kind of representations of “good citizenship” are produced and reinforced during the course and whether these ideas are adopted or challenged by the young participants. By focusing on young people, the study takes part in the topical academic discussion on young people, their attachment to and participation in society. In this paper our focus is in particular on the conceptions and representations of political participation. We ask how is political participation formed in the course content and in the activities engaged by the course participants, and how do these representations of political participation position young people in general, and in particular young people from different minority groups. Our discussion draws from the recent academic discussion concerning young people and forms of political participation.

RS08_04 | Public space and common-places

Urban Walking Tours As Operators Of Community And Enchanted Experiences

Brahy, Rachel

University of Liege, Belgium
Rachel.Brahy[at]uliege.be

Nowadays Festivals and events punctuate urban life more and more often. What about these events in a context of globalization and increased competition between cities? Is it only to increase attractiveness? Could economic ambitions of positioning on a tourist market be oriented around inhabitants and visitors concern? Considering the new requirements of citizen participation, how are these organizations thought and lived? Our proposal aspires to document this issue from three specific urban cases: Liège (Belgium), Nantes (France) and Lausanne (Switzerland). The devices studied in these three cities have the particular feature of being "pedestrian paths" on the one hand, and on the other hand, of relying on artistic/plant facilities. Thus, we question how to connect and to belong to the world from the lived experiences in these urban spaces. In a pragmatic, cultural, and political sociology perspective, we ask ourselves: how do the actors exercise their critical abilities on these routes? How are they helped (or prevented) by designers and operators, sometimes called "Enchantment Engineers" (Winkin)? How do they also share their experience (outside or within a community)? Our hypothesis is that the "path" instrument allows different ways of linking and connecting. Precisely, these different ways can be described. And they are related to both "liberal grammar" of the community and "grammar by common affinities" (Thevenot). Our points of support for this exploration are 1) the frame, free and public, of the "route" and 2) the potential for enchantment, attachment and intimate content in the works (plant or artistic). Thus, should we, broadly speaking, manage to put into perspective and question the enactment of speech about the city.

Common-place as a Public Site for Plurality

Jokela, Maija Elina

University of Tampere, Finland
maija.jokela[at]tuni.fi

This paper makes an effort to bridge Laurent Thévenot's theory of sociology of engagements with the theories of affect, understood as visceral "engagement" in the world. This bridging is done through an ethnographic case study of an asylum seekers' and their Finnish supporters' protest camp, "Right to Live". Recent studies on European solidarity movements acting with or on behalf of asylum seekers after the 2015 "long summer of migration" has highlighted the importance and mobilizing effects of things belonging to the

regime of familiar attachments, namely emotions/affects and familiarity with asylum seekers from local settings, as friends and neighbors. However, a common-place can be seen not only as a mobilizing factor but as political in its own right. Friendships between citizens and non-citizens as well as the affectual and embodied practices of solidarity can be seen as crucial parts of solidarity protests' political message and action. As my case study demonstrates, affectual ties and practices in the protest camp created a common-place ("village", "living room", "family") in a concrete as well as abstract sense among citizens and non-citizens while maintaining a level of justification, internally and externally, and managing these levels by switching scene styles. I claim that the regime of familiar attachments was not only a medium for creating internal cohesion but it also made public close attachments, embodied and visible in the urban space as well as in traditional and social media. Common-place was thus a public site for plurality.

Politics of Space: Notes for a Pragmatic of the Common

Pattaroni, Luca

EPFL, Switzerland
luca.pattaroni[at]epfl.ch

Based on an ethnography of political squats in Geneva, this paper explores the spatial dimension of commonalities. It argues that in the political process of ordering a common life, space plays a central role as it constitutes the articulating element between situated experience and the institution of the common. This political dimension of space will be analysed through the comparison between three different squatting experiences. Each of them illustrates a distinct composition of commonalities that can be, to a certain extent, related to Laurent Thévenot regime of commonalities in the plural and, more broadly, to three of the main European political traditions (anarchism, socialism and liberalism). We will in particular show how each of those political regimes of the common are linked to specific forms of every day engagement of the squatters in collective life along contrasted material settings of collective spaces. This exploration will allow us to reflect on the spatial dynamics of a politics of engagement and their role in the emancipatory and oppressive effects each regime of the common entails. In the end, more than distinct political and spatial model, the three regimes appear as dynamic counterbalances of each other, accounting for the contradictory dynamics pervading the squatting experience – where emotions, attachments, convictions, intimacy are closely intertwined – and the political attempts to stabilize a lasting common. This dynamic exploration of the building of commonalities will allow us to reflect in the end to the broader epistemological and theoretical stakes of a pragmatic of space and the common.

Festivalization of Minority Claims for Public Belonging: Civically Engaged Festivals in Central European Cities

Raposova, Ivana

Masaryk University, Slovenia
ivana.raposova[at]mail.muni.cz

Recent years have seen a rapid increase in initiatives that blend artistic practices with civic action and use cultural events to foster intercultural dialogue and promote ethnic and social diversity. Such events create space for collective coordination of a great variety of social actors and open new possibilities for tackling social exclusion of minority groups. I explore three civically engaged cultural festivals that take place in the Central European cities of Vienna, Bratislava, and Brno and, drawing on the pragmatic sociology and civic action approach, I identify several scene styles of collective coordination commonly generated by these festivals. I discuss different conceptions of the civic worth each of these scene styles promotes and focus on wider implications of the respective styles for the capacity of festivals to succeed in promoting the societal change they envision and to further inspire civic engagement among the public.

RS08_05 | Engaging with the migrant question across sectors

The Voices In The Plural Of Syrian Refugees Students: Groping (Un) Known Arenas

Souza, Lucas Freitas de (1,3); Resende, José Manuel (1,2)

1: University of Évora; 2: CICS.NOVA, Portugal; 3: Políticas Públicas e Dinâmicas Sociais, Portugal
souza.lfd[at]outlook.com, josemenator[at]gmail.com

The public arena observes the rise of voices, previously hushed, crying out for recognition. "The political and moral voices arose, inevitably, from an appeal to the virtues of citizenship and to the call to responsibility" (Caetano, 2014). These multiple voices claim a better intercultural interlocution. Other voices, which also invest in this arena, oppose such actions. In these multiple moments the public arena is constituted (Cefai, 2011). Multiple voices echo in the public arena. Others remain silent. Others avoid competing for their place. They get involved in acquainted and nearby spaces. Portugal has been welcoming innumerable immigrants and refugees. The voices are now multiplying and entering the public arena to be listened to. This communication intends, on one hand, to discuss theoretically the very construction of the public arena, raising the questioning about the requirement of the participation of the various existing voices; on the other

hand, to question the making of the commonality of these multiple voices (Thévenot, 2014), from the figure of the foreigner, represented by the person of the Syrian refugees who study in Lisbon and Évora. In the follow-up to this intention, the communication also questions about the problems arising from these interlocutions between the existing arenas and the voices that dwell in them, concerning the corporality of the Syrian alien refugee in the figure of University student. Key words: public arena; multiple voices; Commonality Foreign.

On The Translation Of Citizen Needs Across Regimes Of Engagement - Co-Production In Cross-Sectorial Collaborations

Grubb, Ane; Frederiksen, Morten

Aalborg University, Denmark
grubb[at]socsci.aau.dk, mfr[at]socsci.aau.dk

In the wake of the polyphonic critique of the New Public Management paradigm launched by academics, public employees and politicians alike, notions of trust-based governance, actively engaged citizens and cross-sectorial organizing have gained political momentum and caused ambiguous concepts like co-production and co-creation to resurface along with their promises of democratic, innovative and cost-efficient public services. While the role and representation of citizens in the provision of public services have received ample scholarly attention, the representation of citizens in cross-sector collaboration needs further exploring. More specifically, we need more empirical evidence on whether and how the ideal of representation and active participation in practice extends to citizens without the cognitive or deliberative skills necessary to access, navigate and influence the spaces where policy is planned and justified. Based on a qualitative research project that study the role of vulnerable elderly citizens and refugees in cross-sector co-production between public and civil society agents this paper contributes knowledge on the topic. With the work on plural cognitive formats and regimes of engagement by Laurent Thévenot as orienting framework, we trace how the needs of citizens without resources to engage in public justification travel from the familiar to the public regime of engagement by way of volunteers and front-line staff who attempt to translate individual needs into causes for collective coordination in public spaces. Based on interviews, observations and document analysis, we then develop a repertoire of inter-, or intra-organizational blockages and facilitators that hamper or sustain cross-regime and cross-sector translations

“Giving a Voice”: Negotiating Political Engagement between Civil Society Organizations and Young Immigrants in a Liberal Democratic Context

Waerniers, Rachel; Hustinx, Lesley

Ghent University, Belgium

Rachel.Waerniers[at]Ugent.be, Lesley.Hustinx[at]Ugent.be

As part of current migration processes, there is burgeoning scholarly interest in the political practices of non-citizens. While some scholars scrutinize the subversive potential of “acts of citizenship” (Isin) by non-citizens, prefiguring radically different modes of political organization, attention should also be drawn to more institutionalized processes of political socialization of immigrants, as aspiring citizens within the receiving nations. In light of critical scholarship that considers citizenship a disciplinary technology of in- and exclusion, advocating full participation on behalf of and by immigrants involves complex processes of negotiation and legitimation of desired/effective forms of ‘becoming political’. To gain a more systematic and in-depth insight in the actual process of political socialization of immigrants, we conducted an ethnographic study of a project of a Belgian NGO specifically aimed at stimulating political engagement among young immigrants. Based on 2,5 years of participant observation and 23 in-depth interviews, we scrutinize what kind of political engagement the organization and the participants aim at. Building on Lichterman and Eliasoph’s (2004) civic action approach, we analyse how different legitimations are constructed and negotiated through different scene styles. We reveal tensions between the styles of the organization and of the participants and within the group of participants itself. In the beginning, the majority of the participants are less directed at radical political actions but instead are focused on having fun, sharing experiences, and helping others in order to deal with the difficult circumstances of their liminal situation. Thereafter, we observe shifting styles through participation in the project.

Service Contracting and the New Politics of Welfare Provision in China

Qu, Yuanyuan; Enjuto Martinez, Regina; Howell, Jude

The London School of Economics and Political Science, United Kingdom

y.qu7[at]lse.ac.uk, r.enjuto-martinez[at]lse.ac.uk, j.a.howell[at]lse.ac.uk

Over the past a few decades there has been a rapid growth of demands of welfare services in China, as well as an increasing recognition of the importance of civic participation. To respond to these, the Chinese government has rolled out a national programme of contracting services to NGO since 2013, which introduces civic forces into welfare provision and local governance. This has complicated the politics of engagement especially at the practical level. Drawing upon an ongoing ESRC-funded research on service contracting to NGOs in China in three sectors, namely, migrant workers, people

living with HIV/AIDs, and with disabilities, this paper presents how local commonality is being defined and contested by the new methods of welfare provision. These include: 1) a top-down governmental implementation of the contracting policy, during which different levels of government and various departments prioritise their own interests; 2) the transformation of social organizations’ targets, mission and vision as they become front-line service providers; 3) the intervention of academic forces, local communities and enterprises, which play a more dominant role when civic organisations have not been well developed; and 4) the marginalization of individual citizens/service users, who seldom had opportunities to make their voices heard.

RS08_06 | Ways forward: Advancing the theory of sociology of engagements

Proto-jurisdictional Engagements: Rethinking Change in Professional Authority via Pragmatic Sociology

Blok, Anders

University of Copenhagen, Denmark
abl[at]soc.ku.dk

Amid sociological discussions on purported pressures facing professional expert authority under new public management regimes, this paper argues the need for grounding and challenging such claims via stronger conceptualization of the situated relations and processes of coordination underlying change in professional authority. Mobilizing on-going empirical studies into professional change in current-day Denmark, the paper pursues this argument at the intersection of two important resources for the sociology of professions, namely Andrew Abbott’s notion of professional jurisdictions and Laurent Thévenot’s sociology of engagements, respectively. While neither theoretical framework pertains explicitly to professional authority, their shared interest in how dynamics of power and legitimacy jointly shape collective action coordination in and across professional work situations and organizations contain the seeds, the paper argues, of a more integrated conceptualization. In particular, whereas Abbott stresses how professions struggle for jurisdictional control and alliances across socio-organizational arenas and ecologies chiefly by way of their science-backed expertise, Thévenot’s distinction of engagement regimes allows one to grasp the equally important role of professionals’ public-political work of moral justification and embodied routines of experience-based judgment. Such a rethinking of professional claims-making and authority via multiple registers of morally laden engagement is particularly useful, the paper argues, when studying how professional groups vie for control over emerging task arenas or ‘proto-jurisdictions’, in which conventions of inter-professional coordination and problem-solving are yet to stabilize. Illustrations are drawn from expansive and multi-sited qualitative studies into professional and political coordination around challenges of urban climate adaptation, lifestyle disease prevention, and innovation management.

Interoperation, Exploration, Serendipity: On the 'Machine Readable' Grammar(s) of Commonality in a Data-Driven World

Hoffman, Andrew Staver

Data Ecologies Lab, University of Washington, United States of America
schrewbz[at]uw.edu

Conceptual and methodological innovations in the pragmatic sociology of critique have expanded the scope of social scientific research beyond analyses of justification and orders of worth alone. Attention is increasingly focused on examining and characterizing the myriad ways that actors engage with the world within and outwith the public, as well as the means through which individuals compose 'common worlds' (Thévenot 2011, 2014). Yet despite the presumption of a limited plurality of 'regimes of engagement,' there exist persistent limitations to this approach. First, while information and communication technologies are said to be central to explorative engagements (Auray 2011) -- and although the material environment and the formatting of information figure prominently in his conceptualization of engagement writ large -- Thévenot's recent articulation of 'grammars of commonality' seemingly privileges the role of dialogical language and/or human attachments in sustaining collectives. Moreover, little work has been done to explicate the contours of a grammar which corresponds to the exploratory regime and the commonality it supports. Together these threaten to foreclose analyses of more socio-technically distributed modes of communicating and differing in an increasingly data-driven world. The present paper serves as a provocation and intervention into this discussion, drawing from ongoing ethnographic fieldwork with a group of researchers and software engineers deploying data scientific techniques in developing an expert system in the biomedical domain. In so doing, it situates the infrastructural work of rendering data and other computational resources interoperable as an instructive site for (1) elaborating upon emerging versions (Mol 2012) of socio-technical commonality and (2) unpacking the theoretical affordances opened up by considering the possibility of 'machine readable' grammars of exploration that are propitious to achieving serendipity.

Public Justification as Agonistic Pluralism

Eranti, Veikko (1); Meriluoto, Taina (1); Sorsa, Ville-Pekka (2)

1: Tampere University, Finland; 2: University of Helsinki, Finland
veikko.eranti[at]gmail.com, taina.meriluoto[at]tuni.fi, ville-pekka.sorsa[at]helsinki.fi

This paper presents a way of combining two influential, but hitherto unrelated, strands of theories about democracy, which, we argue, when taken together, give us a robust, tested

and usable framework for understanding the political in its all different shapes and sizes. These two are 1) the theory of justification and the following theory of sociology of engagements, by Luc Boltanski and Laurent Thévenot (Boltanski & Thévenot 1999, 2006; Thevenot 2015) and the post-foundationalist political theory of Chantal Mouffe, especially the idea of agonistic pluralism (Mouffe 1999, 2000). While the French pragmatic theory provides us with clear tools for understanding political culture, it only vaguely situates the political discussions it usually analyses within the broader framework of democracy and politics -- passing mentions are made to Habermasian public as the locus of political justification. Mouffe defines agonistic pluralism as an understanding of the politics as a struggle where enemies are thought of as adversaries, whose ideas are to be fought but whose right to defend those ideas we do not put into question. For agonistic pluralism, the theory of justification can provide the detailed descriptions of how this "fighting" is done, understanding of what is it that is plural, and why different actors might remain committed to a political arena.

Politicization, Depoliticization, and Grammars of Commonality.

Addressing Plurality in Politics

Luhtakallio, Eeva ; Eranti, Veikko ; Ylä-Anttila, Tuukka

Tampere University, Finland;
eeva.luhtakallio[at]tuni.fi, veikko.eranti[at]tuni.fi, tuukka.yla-anttila[at]tuni.fi

The paper sets the objective to clarify the theoretical axes necessary to understand and empirically address politicization and depoliticization. Examining democracy as a setting for multiple processes of politicization and depoliticization enables to see it as a pattern of commonality, or the "common ground", instead of a stable institution or a structure in which simple chains of cause and effect could be detected. From the viewpoint of democracy as a pattern of commonality, following specific processes of politicization and their conditionings in activist groups and more formal participatory settings is the key to making sense of what and why seems possible, desirable, and feasible to change in a given context. However, the process of politicization is not a one-way street. To fully understand the issue, we must also follow places and practices of depoliticization. Laurent Thévenot has suggested that three grammars of "commonality in the plural" format the processes of working the shared people engage in: the grammar of public justifications, based on competing, yet recognized and legitimate conceptions of the common good, the grammar of individual interests (for terminology see Eranti 2018) based on stakeholder interests, negotiations and deals, and the grammar of familiarity based on intimate attachments to shared "common-places", recognized yet often non-verbalized loci of ease and comfort (Thévenot 2007; 2015). These three modes of communicating and composing the shared and acknowledging difference have proven useful tools to analyze a plethora of contexts in the current complex governance, and thus instances in which "democracy" as a form of governance is forged into being.

RS10 | Practicing the Future: Social, Material and Affective Futures

RS10_03 | Young people practising the future

Practicing The Future In A Time Of Crisis. Young People Facing Social Acceleration

Leccardi, Carmen

University of Milano-Bicocca, Italy
carmen.leccardi[at]unimib.it

At the centre of the analysis proposed lie contemporary processes of social and cultural change, starting from the crisis of the future and the dynamics connected to the redefinition of historicity and memory. Not only the future is shortened, but the present itself contracts – a process whereby “the space of time for which we can calculate our living conditions with a degree of constancy is shortened” (Lübbe 2009, 159). In this latter context, the present itself cedes the way to a simultaneous and, de facto, de-temporalized dimension, provoking questions about how contemporary young people construct their experiences and shape their everyday lives. The paper proposes to consider young people’s ‘situational identities’ as the joint result of social acceleration on the one hand and the processes of contemporary individualization on the other (Rosa 2002). Through these identities – based on the present, and constructed around it – young people construct new biographical and everyday practices to face the growing uncertainties which characterize the future. These practices can be considered as an expression of social resilience which is exercised in order to avoid the risks connected to the loss of manageable life projects. Moving to this particular forms of agency young people succeed in taking decisions even though the medium- to long term future seems closed in a fog bank. In a nutshell, young people are able “to use time against time”: to reconquer agency even though the accelerated contemporary temporal scenario tends to hinder them from implementing their choices.

Young People and the Anthropocene: Futures Past and Present?

Kelly, Peter

RMIT University, Australia
peter.kelly[at]rmit.edu.au

Our present is marked by profound and highly consequential crises in multiple earth systems - oceanic, atmospheric, terrain and capitalist. In *Staying with the Trouble*, Donna Haraway (2016) highlights the crises of earth systems that situate us, all,

‘in the midst of the earth’s sixth great extinction event and in the midst of engulfing wars, extractions, and immiserations of billions of people and other critters for something called “profit” or “power” - or, for that matter, called “God”.’ Neo-Liberal capitalism has gorged itself on the ‘four cheaps’ - food, labour-power, energy and raw materials (Moore 2015) - and is now devouring its young and their futures. Our present is marked by a growing awareness - in various symbolic, discursive and material spaces and practices - that our futures, young people’s futures, have already been used up, consumed, exploited. That the crises that we encounter in our presents both portend more profound crises to come, and foreclose any sense that we can do anything about our probable futures. In this presentation I will develop recent work on a political economy of youth, and the rethinking of young people’s marginalisation, to consider how orthodox sociologies of youth can move beyond human exceptionalism and methodological individualism. The aim here is to make a modest contribution to re-imagining the thinking technologies and knowledge practices that sociologies of youth can bring to the task of ‘staying with the trouble’ that we and young people find ourselves in. In our future presents.

Securing a Future: Youth, Future- making and Temporal Pressure under Neoliberalism

Verdugo Paiva, Marisol Olaya

University of Manchester, United Kingdom
marisolverdugop[at]gmail.com

Beyond assumptions of a self-evident relationship between youth and future, in which the process of growing up appears as at all times future-oriented, the lives and aspirations of working-class young people in two state schools in a deindustrialised city in Chile calls into question the different temporalities at stake in future-making. These young people cope with the uncertainties of structural economic transformations by asegurar (securing) short-term educational and labour-related goals, bringing certainty into the present. Their elaborations and practices regarding future possibilities then draw ethnographic and analytical attention to the interactions between short- and long-term projects of a good life towards which they work in the present. This “temporal pressure” shaping their trajectories illustrates how a focus on futurity navigates the space between creative agency and socially structured possibilities.

Reading Young People's Imagined Futures with Affective Tools

Lyon, Dawn

University of Kent, United Kingdom
D.M.Lyon[at]kent.ac.uk

This paper reflects on a series of interconnected projects about young people's imagined futures that I undertook (with colleagues, Graham Crow, Giulia Carabelli and Peter Hatton) over the last 10 years. We worked with essays written by young (15 to 18-year old), working-class people imagining their futures as if they were already at the end of their lives. The first set of essays had been collected by sociologist Ray Pahl in 1978, on the Isle of Sheppey, Kent, UK. The Living and Working on Sheppey project then gathered a second set in 2010 as well as reanalysing the first. A further project, Imagine Sheppey, departed from the essay format and created audio-visual documents of young people's future orientations in 2014. At the time of writing, I hope to come full circle as I collaborate with a film-maker to trace the original essay-writers and document how their lives have unfolded. We have previously analysed the content and themes of the essays and images, exploring how these young people's hopes and expectations were inflected by the class, gender and other social relations of the day. However, I have long felt that our content and (limited) narrative analysis did not fully capture their sense. As ideas of 'the half-life of deindustrialisation' (Linkon 2018), 'haunting' (Gordon, 2008), and 'affective history' (Walkerline, 2015, 2016) have gained prominence in recent years, we now reread these essays with new affective tools which enhance our grasp of these young people's future accounts.

Avoiding Future Imaginaries Of Professional Failure And Shame: The Relationality Between Temporality And Teleo-affectivity In Interpreters' Professional Practice

Giustini, Deborah

University of Manchester, United Kingdom
deborah.giustini[at]manchester.ac.uk

Practice theory research argued that practices configure temporality, and that future imaginations are mediated by the practices through which that time is experienced. However, few studies examine how teleo-affectivity of practices relate to their temporalities, and particularly to how issues of negative emotions and failure may direct everyday protentions towards avoiding a negative futurity. This presentation explores how future dimensions compose the teleological and affective structure of human activities: future is implied in them because action is always for an end, and imbued with certain emotions. It argues that there is an unexplored relationality of teleo-affectivity and temporality which leaves open what role

they might play in (re)producing or avoiding futures, and how future imaginaries empower agency through performances. To understand this relation, I examine an empirical study of the professional practice of "interpreting", performed globally to allow multilingual communication e.g. in institutional, governmental, and business settings. Interpreters are normatively bound to perform as the voices of their clients, providing seamless communication through simultaneous ("live") translation as if they were invisible in the interaction. This codification of invisibility helps interpreters to avoid failure which, when it occurs, happens in real time and publicly under clients' eyes, with potentially damaging consequences for future reputation, stigma of incompetence, and for the outcome of clients and institutions' practices. My research shows that interpreters inhabit the future through a 'reversed teleology' and 'negative affectivity': rather than pushed by professional success, they work empowered by fearing negative future imaginaries - public failure, loss of assignments and expert standing. Everyday protentions are hence made possible in the interpreting practice by this relational temporality/teleo-affectivity, which interact with long-term futures of career advancement.

Imagined Futures of Consumption: Lay expectations, speculations and protensions

Ehgartner, Ulrike; Welch, Daniel

University of Manchester, United Kingdom
ulrike.ehgartner[at]manchester.ac.uk,
daniel.welch[at]manchester.ac.uk

The paper reports on analysis of data produced from a Mass Observation Directive commissioned as part of a project called "Imagined Futures of Consumption" (funded by the UK's Economic and Social Research Council). Mass Observation Directives enable researchers to present a panel of volunteers (average response n=250) with a brief, lay introduction to the project theme followed by a series of prompts and questions to which they provide open written responses. The project Directive asks the volunteers to "imagine the consumption of goods and services in the future—for yourself, for younger generations and for society as a whole" and frames consumption in lay terms compatible with practice theoretical understandings of consumption. Volunteers are prompted to speculate on questions such as: the degree of change in consumption in everyday life in 50 years-time; change or stability in specific consumption domains; expectations of their own consumption in the future; and expectations of standards of living for future generations. The analysis deploys Mische's (2009, 2014) notion of "dimensions of projectivity" as a starting point to investigate lay expectations and imaginaries of consumption. The teleoaffectivities of social practices in which consumption takes place are also explored (Schatzki 2002; Warde 2005). The research is framed by the wider project. This seeks to explore the place of imagined futures of consumption in the context of the contemporary crisis in political and economic imaginaries and, since the financial crisis, the substantial undermining of expectations of continuously rising standards of living (Ipsos Mori 2011, 2017).

A Social Network Approach of Visions of the Future

Rodríguez Díaz, José A.

University of Barcelona, Spain
jarodriguez[at]ub.edu

In this paper we attempt to identify, visualize and analyze the social structures underlying and shaping visions of the future of young people. We use textual narratives created by University students regarding their visions of social and personal futures in 30 years. We extract and code the most relevant information characterizing each narrative. Then we transform that information into relational matrixes and we use Social Network Analysis tools to see those narratives as social networks. We see narratives as the space where interactions between concepts shape visions of futures. We will use narratives of two groups of undergraduates and a group of Master students extracting information regarding their general positive or negative outlook of the future, their work and professional life, their family life and structure (spouses, children, parents), occurrence of environmental, political and or social crises, actions to deal with environmental decline, social and political reorganizations, Artificial Intelligence and Robots, health, life expectancy, happiness and wellbeing, technological progress and social improvements, the level of connection to virtual worlds or and technologies, space and life in other planets, etc. Differential combinations of items produce diverse scenarios, diverse causal models and paths, as well as diverse levels of life enjoyment and happiness. They are combinations of probable, possible and preferred futures.

Sensing the Future – Money and the Embodied Agency of its Temporal Structure

Schulz, Manuel

University of Jena, Germany
manuel.schulz[at]uni-jena.de

How it is possible that futurity acquires agency in subject's present action? In order to itemize this paradox intertemporal entanglement in social practices, I will focus on money usage from a neo-phenomenological perspective. Money essentially consists in a temporal interlocked context of references, namely in the structural conflation of the possibility of present exchange and the confidence in stabilizing continuity. Thus, money arises as a contradiction of a processing futurity that is reliant on the continuous present realization. The usage of money, I will argue correspondingly, is always an individually carried collective practice of self-sustaining in face of the present as the threatening intersection towards a projected, but inherently uncertain future. From a neo-phenomenological perspective, this social self-perpetuation, though it is based in conscious abstractions, needs a vitalizing realization. It is particularly the bodily sensation as a form of pre-cognitive being-in-the-world which can be seen as the medium of transforming future into present social practice. This process of vitalizing futurity unfolds its efficacy, beside cognitive narratives, by an atmospheric embeddedness that

affects the subject involuntarily. Even the dynamics of mass hysteria on financial markets arise accordingly as an atmospheric driven agency of an euphorogenic or devastating consciously presumed future. It is particularly the subject's character of a bodily sensing entity, I will argue, which enables the consciously envisioned future to realize itself in present action. The vibrancy of atmospheric embedded sensations thus is the medium of enacting futurity; it is where the agency of future takes place in subjective action.

RS10_05 | Enacting Futures

Enacting Drone Futures: Socio-technical Imagineering of the Civilian Drone Industry

Bajde, Domen; Kuruoglu, Alev Pinar;
Nøjgaard, Mikkel; Sommer, Jannek

University of Southern Denmark, Denmark
bajde[at]sam.sdu.dk, alev[at]sam.sdu.dk, mikk[at]sam.sdu.dk,
jaks[at]sam.sdu.dk

This paper investigates socio-technical imagineering - i.e., the (re)production and circulation of socio-technical imaginaries (STIs) - as an enactment of the future. While previous research has foremost looked at STIs as relatively stable formations manifested through "active exercises of state power" (Jasanoff and Kim 2009, 123), we wish to draw attention to the ongoing work of various imagineers who have a stake in the development of technology markets and industries. We thus investigate the manifestations of socio-technical imagineering by firms, consultancies, and other actors who envision technology futures. We use the case of the emergent civilian drone industry to address the following questions: Who are the imagineers that craft and circulate (sometimes competing or conflicting) visions of how drone technology and the development of the civic drone industry will change society and our daily lives? How do these actors enact drone futures? We address these questions through qualitative analysis of the discursive manifestations of socio-technical imagineering (e.g., industry promotion, consultancy reports, media texts). We outline four modes of imagineering through which drone futures are enacted: 1) Presenting the future (relating the future to the present, and establishing the certainty of the future), 2) Questioning the future (establishing and addressing concerns related to drone use), 3) Prospecting the future (establishing the prospect of drones as a technology for good, an efficient and transformative technology of endless possibilities), 4) Enjoining the future (embedding/detaching the drone future into/from other futures).

Epistemological Synergy: Futuring As Sustainable Enactment Through A Public Sociology

Patsarika, Maria (1); Townsend, Scott (2)

1: The American College of Thessaloniki, Greece; 2: North Carolina State University, College of Design, United States of America

mpatsarika[at]act.edu, sttwn[at]ncsu.edu

Public sociology raises issues of the public roles it plays, accountability and integrity of the various epistemologies used, and disciplinary constraints through the ever increasing complexity of social issues at the intersection between local/global. Nevertheless, specializations within and across the social sciences present possibilities of multidisciplinary perspectives and levels of engagement with the public (Bridger and Alter 2010). Negotiating disciplinary boundaries is necessary to remediate “wicked problems” inherent in contemporary and future social ills especially in terms of futuring within the public sphere. Paraphrasing Bell (2009), we address the question “How can social scientists (and others) enter this public sphere working effectively with wicked social problems and questions of futuring across allied disciplines?” We propose a synergistic engaged scholarship (Kleidman 2006) through the crossroads of public sociology and “design as social innovation/transition design” (Manzini 2015, Irwin 2018). This shifts the focus away from the maintenance of each discipline’s identity to leveraging epistemologies within the social “context-at-hand.” Public sociology and social innovation/transition design provide a range of theoretical and applicable perspectives under the rubric of sustainability, tracing connections back to initiatives such as the “Transition Town” movement (Seyfang and Smith 2007). Such practices are envisioned as communal between multidisciplinary experts and “diffuse” local knowledge (Manzini 2015), a form of collective futuring that catalyzes community self sufficiency as an ongoing iterative process. Lastly we will show the application of various methods used to discuss and negotiate different epistemologies in our current work with service learning and public sociology/design as social innovation.

Future-Forging the Networks of Tomorrow: Building the Quantum Internet

Krause, Julian

University of Southampton, United Kingdom
j.krause[at]soton.ac.uk

This paper analyses how the future is mobilised in global efforts to define the use-value and application spaces of the quantum internet, a novel network in the making. Based on a radically different computer architecture, the quantum internet promises an exponential rise in computational capacity and processing power. Recognising the strategic potential of quantum tech, governments across the world have begun investing heavily in this technology. In the burgeoning quantum arms race, China has quickly established a leadership

position, which is causing considerable anxieties in the West. This paper first introduces the fundamentals of quantum computing to a non-specialist audience. It then presents results from a qualitative study of popular science magazines, government and industry publications that investigates how quantum futures are mobilised in the present. It will be argued that actors strategically circulate ‘heavy futures’ in order to gain the upper hand in defining what a future quantum internet will do. Quantum networks are either portrayed as unimaginably destructive or as solving many of the world’s pressing problems. Discourses of quantum tech attest to complex practices of future-forging by which the not-yet becomes materially active in the present; the global quantum arms race attempts to mould technology futures even before they emerge. Reflecting on conceptual and methodological concerns in STS and sociology, the final section of this paper argues for considering future-forging a powerful practice that aims to cement the trajectories that potentially highly disruptive network technologies of the future can take.

Re-imagining Domestic Futures as Collective Temporal Rhythms: A Critical Analysis of Smart Home Technologies

Southerton, Dale

University of Bristol, United Kingdom
dale.southerton[at]bristol.ac.uk

Ideas of the smart home are not new but have been re-energized given recent innovations in digital technologies, algorithms that capture micro data about personal preferences and habits, and digital platforms that offer new ways of provisioning goods and services. This paper explores representations of future domestic lives found in accounts of electronic personal assistant devices and automated kitchen appliances. Such representations reveal three fundamental assumptions about the social world, that: a lack of time persists as a major threat to everyday well-being; technologies are the solution; and, consumption is a matter of individual decision making. Smart homes promise greater individual control, autonomy and automation of the micro-coordination of (routine) actions in objective time (time conceptualised as independent of human activity) and are therefore assigned to the future as inevitabilities. In turn, significant business and policy resources are mobilised, often legitimated as matters of ‘progress’ towards more sustainable (in terms of well-being and resource efficient) forms of social organisation. Insights from social practice theory undermine all three fundamental assumptions about the social world by insisting that: time is not independent of human action; materialities (including technologies) are always contingent on the configuration of practices; and, consumption is shaped (or constrained) by the interconnections of social practices. This paper argues that it is these processes that shape domestic lives today and will do so in the future, that they can be usefully analysed as collective temporal rhythms, and that doing so present very different ‘future potentials’ for smart home technologies.

RS10_06 | Practising Medical Futures

"It will be better than before": The Practices of Future Hope in the Constituting of Personalized Medicine

Krausz, Agate Nira

Ben-Gurion University, Israel
agate13[at]gmail.com

The paper focuses on the politics of hope, a less explored dimension in the constituting of futures. Hope is a set of key practices in the construction process of "Personalized Medicine" as a scientific object. This object is an incomplete one, and as such, the practices of hope enable it to become a whole entity by using imaginaries. Personalized Medicine is a shared field of medical and scientific innovations. It is in the making, and therefore imaginaries are embodied in it. Imaginaries are future possibilities that are a part of social organization and practices of science and technology. Actors of this field use imaginaries, to fill the missing parts of this scientific object. The imaginaries characterize and shape the scientific objects through a wide range of practices of hope, such as creating a "discourse of hope". This kind of discourse effects policy formulation, resource allocation etc. The paper will show how imaginaries create practices of hope by using images and promises of medical and scientific innovations or creating promissory communities to protect us from future potential pathology. The findings are part of my PhD dissertation that is based on qualitative methodology, including semi-structure interviews with professionals in the field of Personalized Medicine, observations in scientific conferences and analysis of scientific and popular papers.

The Narratives of the Future in Fertility Decision: Theoretical and Empirical Insights from Europe

Bazzani, Giacomo; Vignoli, Daniele; Guetto, Raffaele; Minello, Alessandra; Pirani, Elena

University of Florence, Italy
giacomo.bazzani[at]unifi.it, daniele.vignoli[at]unifi.it,
raffaele.guetto[at]unifi.it, alessandra.minello[at]unifi.it,
elena.pirani[at]unifi.it

In the last years, the period total fertility rates (TFR) declined or levelled off in most Western European countries. While explanations of fertility decisions based on structural constraints may account for several country differences in fertility, important questions remain unanswered. For instance, in 2009, Northern countries resumed their economic growth, but their TFR started to decrease substantially. What are the driving forces of this fertility decline after a Great Recession that, in "hard numbers", they really never experienced to any relevant extent? We argue that fertility

decisions under structural uncertainty are shaped by narratives of the future cannot be deducted solely from objective indicators. These narratives rely and react both on relevant others' narratives and on shared narratives of the future, especially coming from the press and the social media, but their influence cannot be predetermined in a single mode. To investigate the narrative of the futures we propose the use of the framework of the Conviction Narrative Theory together with the DBO action model. Decision-making in fertility is a specific social mechanism where personal narratives of the future create possible worlds by merging together structural elements (labour status, family and labour policies, etc.) and shared narratives (parental, peers and press narratives). At the EU-FER premises (ERC n. 72596), we employ both an experimental approach and an online survey to assess the different possible futures underpinning fertility decision across five European countries – Italy, Germany, Poland, Norway, and the UK. First results from the comparative research will be presented during the conference.

Imagined Futures Of AI In Healthcare: The Cure For All Diseases?

Kampmann, David (1,2)

1: London School of Economics and Political Science, United Kingdom; 2: University of Oxford, United Kingdom
d.kampmann[at]lse.ac.uk

While entrepreneurs' promises that Artificial Intelligence (AI) will replace doctors with intelligent machines have attracted immense investments in digital health start-ups, it is poorly understood how those futures of AI are imagined and how they affect contemporary social realities. In the tradition of scholars in science and technology studies who showed how futures are formed in and emerge from specific social and cultural contexts and how future-oriented discourse shaped by values and beliefs can be performative (Jasanoff & Kim 2015), this study uses the UK-based digital health start-up Babylon Health as a case study to explore how entrepreneurs imagine the future of AI in healthcare. Founded in 2013 in London, Babylon has received substantial funding by venture capital investors enabling the company to expand operations quickly. It has also gained political support from the UK Government to provide health services to patients in the UK in partnership with the National Health Service. The AI-based chat-bot at the core of Babylon's services already gives health advice to over 2 million patients in the UK, Rwanda, Saudi Arabia and China and is imagined to autonomously make diagnosis to enable access to healthcare for everyone, everywhere. This study asks how Babylon and its venture capital investors imagine the future of AI in healthcare in the UK, and how this future is translated from the national to the global scale. The sources of data on which this study draws include preliminary interviews with Babylon's employees and venture capital investors, multi-sided ethnographic field work at public events attended by Babylon representatives and publicly available documents from the company's website.

Experiencing The Chronicity of Illness in Switzerland: Women Negotiating The Future of Their Long-Term Conditions

De Araújo, Luna

University of Geneva, Switzerland
luna.dearaujo[at]unige.ch

The chronicity of illnesses affects the lives of people in multiple emotional, material and social ways. As conditions of Modernity – which are partly constituted through current environmental and economic dynamics and ways of life – chronic illnesses and their impairment effects confront contemporary societies with tensions arising from the discrepancies between scientific, therapeutic, socio-economic and individual temporalities. This contribution is grounded in a project which aimed at understanding the narratives of 52 women living with various long-term illnesses and who reside in Switzerland, as well as of local health care providers. It discusses how these women negotiate experiences of their diagnosed condition(s), and analyzes the strategies they adopt in formal and informal care settings in order to live as close to their aspirations as they can. The presentation suggests that, by inscribing therapeutic tools, practices and skills in their day-to-day life, these women learn how to deal with the uncertainty of their future health conditions through routinization. Thus the process of getting used to the temporalities of persistent illnesses both takes place in and constitutes the complexity of personal biographies and individual rhythms. The daily making of chronicity is however more than a matter of individual adaptation to an altered life condition. One of the interviewed doctors pointed out, "I do not use the term chronic. It puts my patients in a situation of failure and gives them no will, no hope". His remark reflects the argument put forward in this contribution, namely that the lifelong making of chronicity is intrinsically relational, embedded in therapeutic interactions, tools, spaces and institutions, as well as in daily opportunities for individuals to take part in society.

RS10_07 | Negotiating Futures

Futures Guidance - Agency for Making Futures

Jokinen, Leena; Minkkinen, Matti

University of Turku, Finland
leena.jokinen[at]utu.fi, mmatti.minkkinen[at]utu.fi

This paper presents findings of several projects and initiatives on futures guidance. The futures guidance framework combines two fields of theoretical approaches: futures studies and sociodynamic guidance and counselling. Futures guidance applies concepts from futures research to career and life guidance contexts. The basic assumptions of futures guidance

start from the notion that images of different possible futures create a space where individuals and social groups can test and simulate their beliefs, values, and decision making in safe environments. Firstly, the paper focuses on methods of promoting futures thinking and learning amongst different social groups like young female immigrants, job seekers, and higher education students. The futures guidance methods and tools are designed to foster individual and group level futures imaginaries and proactive agency as well as consideration on the social and physical environment. Secondly, we investigate concepts related to future orientation from the fields of sociology, psychology and futures studies. The concepts on futures thinking, learning for and from the future, futures consciousness, prospection, projectivity and futures literacy. Our aim is to analyse the interconnections between these concepts and their significance for the futures guidance framework. Our data consists of altogether over 1000 responses to questionnaires, observations and experiences, and workshops with over 50 participants during the years 2010 to 2018. Our research makes two contributions. First, we contribute to the field of futures guidance by discussing different concepts and their relationships. Second, our study gives a practical contribution by providing a set of tools for promoting futures thinking and learning both on the individual and group level.

Activating Imaginaries of the Future in Local Development Processes in European Rural Regions

Stoustrup, Sune

Leibniz Institute for Research on Society and Space, Germany
sune.stoustrup[at]leibniz-irs.de

In the last decades, many rural regions, both in Europe and globally, have been faced with challenges when it comes to both demographic and economic development. As the regions are faced with downwards development trajectories, imaginaries of the future plays an important part in if, how and which actions are taken to overcome these. This contribution will present how the challenges of rural regions are discursively constructed in local media and local participative planning processes, and to which degree "the future", as something that can be changed or not, is portrayed. As these processes sees local residents, policy makers and politicians come together to develop new ideas for developing their communities, we can analyse these visions of "the future" as they appear, are articulated and negotiated. At the conference, the preliminary results from the regions from case studies in the Austrian region Mühlviertel and the German region of Uckermark will be presented. These regions have been faced with both negative developments and perceptions, but have to some extend also either overcame these, or are in the process of negotiating new visions for the future.

Exploring the Water-Energy-Food Nexus in a Changing Society: A Method for Rich Scenario Narratives and Participatory Critical Analysis

Hoolohan, Claire; Larkin, Alice; McLachlan, Carly

Tyndall Centre for Climate Change Reserach, University of Manchester, United Kingdom
claire.hoolohan[at]manchester.ac.uk,
alice.larkin[at]manchester.ac.uk,
carly.mclachlan[at]manchester.ac.uk

Many studies and models regarding sustainability transitions are highly reductive in their treatment of social practices, with integrated assessment models a high-profile example. By poorly characterising the actors and processes involved in transition, and the dynamics of domestic, professional and institutional routines, such studies perpetuate a narrative that technologies offer more probable, feasible and acceptable solutions to global challenges than those requiring transformational changes throughout society (Urry, 2004; Watson, 2012). We develop a transdisciplinary method for scenario development that accentuates the dynamics of social practices involved in the water-energy-food nexus. This method is used to examine the implications of social, technological and climatic developments for innovations that have potential benefits across the nexus. We seek to understand how the effects of such innovations may be amplified and accelerated, and where agency for such achievements lies. We demonstrate that this method promotes critical reflections on purposeful sustainability transitions. It allows stakeholders with different experiences to imagine the future with a broader perspective on socio-technical change. Participatory analysis of narratives grounded in everyday practices helps articulate why technologically-focused solutions to grand challenges are failing society, and unravel the opportunities for systemic change. We also demonstrate that this method increases capacity for integrated management of so-called super wicked problems by increasing capacity for boundary crossing and joined up problem-solving. Specifically, participants develop mutual tacit understandings, stretch normative boundaries of what is possible and actionable, and engage in instantaneous pseudo-experimentation with the possibility to direct onwards action.

Negotiating the Future of Security: The Berlin Future Security Lab (FSL)

Gerhold, Lars; Peperhove, Roman; Tischer, Hagen; Jäckel, Helga

Freie Universität Berlin, Germany
lars.gerhold[at]fu-berlin.de, roman.peperhove[at]fu-berlin.de,
hagen.tischer[at]fu-berlin.de, helga.jaeckel[at]fu-berlin.de

While the field of security was determined by privatization processes for a long time (Baumann 2007), we now face a new period of the mechanization and digitalization of security that will largely take influence on future developments in the context of security. Decisions on how to secure people, areas or societies are delegated to information technologies (Gerhold 2017, Kaufmann 2013). This contribution addresses the question how future developments in the field of security can be displayed, discussed and elaborated in an adequate manner. Based on the theoretical concept of Daase (2010) we define that security culture encompasses those ideas, norms and practices of individuals and organizations that define phenomena as threats and prescribe countermeasures. Therefore, security is the result of a negotiation process between different stakeholders like representatives from politics, civil protection, science and society. As this negotiation processes do not follow explicit rules or take place on specific times or locations we developed the Future Security Lab (FSL) as a new methodological approach. Within the FSL we use scenarios to display how the future of security might look like. Therefore, the FSL is equipped with tools and technologies that display results of security research projects, (e.g. surveillance technologies, empirical findings on technology acceptance e.g.) that were used to create pictures of potential futures. Stakeholders are invited to the lab to discuss the probability and desirability as well as potential impacts and (un-)intended effects of future security technologies within moderated and documented sessions. Within the talk, we present the concept as well as first evaluations of the FSL and give insight to the lab by pictures, videos and a VR.

RS10_09 | Futures, identities and biographies

Disconnected: The Difficult Construction of Future Time Perspectives By Youths In Jail. A Case-Study In Sardinia, Italy

Cois, Ester

University of Cagliari, Italy
ester.cois[at]unica.it

On the basis of a research-action launched in 2017 at a juvenile detention center in the province of Cagliari, Sardinia, the paper aims to investigate the mechanisms of imagination and representation of future implemented by minors imprisoned because of serious crimes for which the probation or work-release measures are not provided for. The narratives collected among a sample of 13 prisoners, aged between 14 and 21, reveal a recurring pattern of "disconnection" in their biographical pathways, which are marked by the expiation of the sentence within a total institution (Goffman, 1961). Four main effects can be identified: a) A fragile projection capacity in the medium term, outside the prison, due to the weight and stigma associated with the deviant past that continues to act as a persistent disinvestment with respect to the possibilities of social reintegration (Carvalho et al, 2018); b) A segregation with respect to the standard life context of their peers, that compromise the usual processes of identification and mimesis that accompany the definition of the self and one's adult image, and that also extend to social applications, due to the prohibition of using social networks such as Facebook or Twitter in prison; c) A scarce possibility of individuation in the formation of one's own specific identity, due to the total control of bodies (Foucault, 1975), preferences, sensory expression, mandatorily homogenized by the organization of prison spaces, with the impossibility of customizing their cells for security reasons; d) An extreme presentification (Leccardi e Ruspini, 2006) imposed by the high turn-over and frequent transfers, which often interrupt the training and apprenticeship projects, jeopardizing the rehabilitation intent to the advantage of the punitive one.

I could, I could have done, I can: The Role of Narrative in Futures-Making and Subject Formation

Pierri, Paola

University of the Arts London, United Kingdom
p.pierri[at]lcc.arts.ac.uk

Social sciences and anthropological accounts around futures and futures-making are marginal, in a field that sees a majority of futurologists, companies and technologists taking the leading role. This paper and presentation argue for social sciences and humanities to reclaim a central role for an explicit

activist and future oriented research approach. I will draw on my practice, using design anthropology with local communities in the UK, to present design as a potential conceptual tool, that could play a role to perform the new task of materialising new and alternative possibilities. I will present a repertoire of existing tools in 'research through design' that focus on 'futures-making' and will draw on my projects and field-work to argue for a practice of design that creates a shared 'space' to enable participants to materially and discursively engage with futures possibilities in a shared language that is not "owned" by any one professional group. I will particularly focus on the role of narrative, and its impact on subject formation, through the weaving together of past, present and future experience and ambitions.

Becoming a Mother. Practicing the Future by First-time Pregnant Women

Niekrenz, Yvonne

University of Rostock, Germany
yvonne.niekrenz[at]uni-rostock.de

The first-time pregnancy is a transitional phase changing a childless woman into a mother. This transition can be described as a phase of becoming, and the changing body symbolizes this becoming. When pregnancy is realized, the body is treated and observed differently. Physical changes represent a new stage in life in the future. The belly carries a special weight during that period. It materializes the status of the expecting mother for the women herself and makes it perceivable for other people in the setting. A pregnant body is a kind of "material future". This leads to the questions of this paper: How do pregnant women enact futures in their everyday practices? How do they anticipate and inhabit the future through bodily affects and sensations? This paper is based on an empirical study including participant observation of prenatal classes and thirteen narrative interviews with women who are pregnant for the first time. Data was hermeneutically interpreted in a reconstructive manner. The study shows: Pregnancy causes feelings of joy and pride as well as such of uncertainty and ambivalence. Pregnancy is not only the pleasurable experience that booklets and magazine for moms-to-be might tell; it is also irritating and changes the daily routines of women in different dimensions. These changes refer to a new future – as a mother. The changing body makes this future imaginable and prepares it at the same time. In their everyday practices, pregnant women try to gain certainty. For example, by changing the way they deal with the challenges of everyday life, buying baby supplies or arranging a child's room, they practice their future social role and are "doing family".

RS11_05 | (De)Constructing precariousness: Theoretical and policy considerations

The Precarious Concept of Precarity Choonara, Joseph

University of Leicester, United Kingdom
joseph_choonara[at]yahoo.co.uk

There has been an extraordinary rise in discussion of precarity in Anglophone academia. This paper traces the roots of precarity as a concept, emerging out of an earlier French sociological discourse, and then permeating through radical networks, informed by Italian autonomism, before re-emerging in the sociological writings of figures such as Guy Standing or Arne Kalleberg, whose main focus is precarity in employment. Precarity in this sense is viewed as a loss of guarantees of ongoing employment that were seen as characteristic of post-war job market in some advanced capitalist countries. The discourse of precarity assumes that this stability of employment has been replaced by a new contingency. However, it can be shown that, despite the far-reaching claims of the literature, precarity in employment is not especially widespread in the UK labour force. Here temporary employment is far from the norm and employment tenure remains extremely stable. This surprising result can be best explained by radical strands of political economy, particularly those rooted in Marxism. In this view, capital does not simply hire and fire labour power, it is also concerned with how can be retained and how it is reproduced in the long run, leading to contradictory imperatives. The resonance of the narrative of precarity nonetheless reflects a long “retreat from class” and the insecurities and manufactured uncertainties present in working life today.

Appropriating and Performing – Student-Migrant-Workers' Strategies of Countering Precarization

Maury, Olivia Penelope

University of Helsinki, Finland
olivia.maury[at]helsinki.fi

Research on precarization and precariousness is gaining width, reaching beyond a mere conceptualization of precarity as the counterpart to standard forms of employment. More broadly, precarization involves the processes of losing the grip over the future. The paper maps the precarious experiences of student-migrant-workers shaped in the intersection between the flexible and ‘hybrid’ (Armano & Murgia 2017) work settings they are involved in and the precarizing effects of the global border regime. The paper asks what strategies student-migrant-workers develop in order to subjectively counter the immediate effects of precarization. The paper is based on a data consisting of in-depth interviews (N=33) with migrants holding a student-visa in Finland conducted in 2017-2018 with focus on the effects of the one-year student visa and its associated work limitations (25h/week) and requirements of sufficient means of subsistence (6720 €/year). The paper brings forth two strategies of handling the precarious situation emerging in the data; appropriating the tools of migration administration and performing the flexible student-migrant-worker in order to secure a successful visa-renewal. The paper suggests that these strategies are constitutive elements of the production of subjectivity of the student-migrant-worker, as the subjective drive to actively shape one’s own life, including one’s education and work aims, is confronted by the constraints of the Postfordist production system and the border regime, hence, despite resistance, resulting in the production of flexible labour-force to capitalize upon. The paper contributes to the analysis of the multiplication of precarious subjectivities emerging in the context of contemporary Postfordist capitalism.

One Council, Two Worlds: Diversity In Staff Experiences of Local Authority Restructuring

Watt, Laura; Rubery, Jill

University of Manchester, United Kingdom
laura.watt[at]manchester.ac.uk,
jill.rubery[at]manchester.ac.uk

Since 2010, as part of the austerity programme, UK local council budgets have been dramatically reduced. To cope, councils have tried to make the delivery of services more efficient through (amongst other means) staffing restructures and redundancies. As demands for further savings continue, local government employees endure ongoing uncertainty around their jobs. This uncertainty goes beyond the risk of redundancy; those who retain their jobs must compensate for those 'let go' which can mean new and increased responsibilities, longer work days, and the pressure of delivering services with less expertise. So how are local government employees managing this type of insecurity? And what effect does it have on other aspects of their life such as family and emotional wellbeing? This presentation draws on findings from a case study of a Greater Manchester authority which has undergone huge staff changes. Based upon semi-structured interviews with over thirty employees, it discusses how the remaining workforce manage new levels of precariousness at work. Our findings show massive diversity in how staff experience restructuring. Some welcome a smaller workforce, regarding redundancies as a necessary way of removing 'dead wood' and thus reducing waste. Others, typically social workers, are at breaking point, unable to cope with a 'cheaper' and so less experienced workforce. We explore possible explanations for these variations in experience, including the different effects restructures have on 'back office' versus 'front line' employees, the age and expertise of employees and how long they have been at the council. As a general point, one should not make generalisations about the effects of restructuring on employees; the experiences of those working even for the same council can be worlds apart.

Precariousness In Relation: Collective Sense-Making As Cruel Optimism?

Briken, Kendra (1); Kirk, Eleanor (2)

1: University of Strathclyde, United Kingdom; 2: University of Glasgow, United Kingdom
kendra.briken[at]strath.ac.uk, Eleanor.Kirk[at]glasgow.ac.uk

Our paper contributes to the debates around precariousness and its connected collaborative and affective relations (Neilson/Rossiter 2003). Distinguishing precariousness as relational, shared and 'being-with' with others, and precarity, the social positioning in regards to material resources (Butler 2004), we were interested in how workers themselves perceive what is seen as precarious work and life. How (if so) are processes of 'othering' constructed in workers' narratives? What is their understanding of precarity? Our aim was to overcome the reproduction of the individualizing moment engrained into neoliberal politics. We were interested in the collective sense-making of precarity, the shared understanding, and the relational lines of precariousness. Choosing group discussions within homogenous sectoral groupings (e.g. retail, logistics), reflects the partisan nature of our research, designed to create space for reflection on struggles and strategies, to develop ideas on what shared grievances and aspirations were. Local examples of action focussed the discussion on if and how the participants could similarly organise and act. Our preliminary findings show that the lack of control over time in terms of when and how long to work, when and if being paid, in essence experiences of arbitrary dismissal and deactivation was the defining characteristic of precarity. Narratives included how workers constructed 'others' seen as more or less vulnerable. We experienced a strong sense of affective relations built in, around, and beyond work, in everyday life. Whether this is due to the social desirability in the group setting, justifying the meaning of work against the devaluing notion of precariousness, or if this is a sign of cruel optimism (Berlant 2011), is what the paper will also discuss with regards to collective organising.

RS11_06 | 'Precarious families'

Precarious Working Lives, Precarious Family And Social Lives? A Qualitative Study Investigating The Interrelationship Of Life Spheres

Bosmans, Kim

Vrije Universiteit Brussel, Belgium
Kim.Bosmans[at]vub.be

In the current political-economical context, labour market flexibility is increasingly presented as a pursuable goal. Certainly among lower skilled workers, this provoked the growth of insecure and precarious forms of employment. The impact of precarious employment on workers' health and wellbeing is a topic of growing interest in scientific research. However, research - especially qualitative research - on the broader impact of precarious employment on the life course, family and social life is rare. Only a handful of studies investigated the impact on family and social life. In doing so, these studies usually adopt the perspective of the 'precarious worker', while a multiactor perspective - involving other household members - would make more sense. Such an approach is largely absent, especially in Western Europe. Therefore, this study adopts a multi-actor perspective while investigating how households understand the interrelationship between two life spheres: (1) the employment constellation at the household level characterised by different forms and extents of precarious employment and (2) the life course (e.g. life planning, family transitions), family and social life of household members. The focus is on households with at least one precarious worker between 25 and 45 years old in Flanders (Belgium). A variety of qualitative methods are used, including in-depth household interviews and solicited diary research with different household members. Preliminary results of this study will be presented.

Working Families And Precarious Life

Dryzaite, Ieva

Vytautas Magnus University, Lithuania
ieva.dryzaite[at]gmail.com

This paper aims to discuss the impact of nowadays employment structure towards working family's possibilities to maintain personal life and paid work balance. It is seemed that working families are more and more experiencing normalization and institutionalisation of precarious work forms in market places and political dimension, and it brings a lot of social problems (such as increasing divorce's or distanced family's numbers, depression, overwork or burnout, late childbirth practices, poverty, lack of mobility and possibility to ensure appropriate life chances to live a "liveable life" etc.) to the field. In this paper I argue that individual experiences which come from efforts to combine paid work and family have not

just personal outcomes, but social as well. That's why it is so important to stimulate interdisciplinary and deeply contextual dialog including such dimensions as family, care, paid work and time. All these dimensions will be discussed in the paper trying to elaborate ideas for further discussions and to stimulate more humanistic narrative about living "a liveable life" and working balance in nowadays society. This paper will include short theoretical framework of precariousness, which will be supplemented and explained with empirical data collected in project "Families, inequalities and demographical processes" (project Nr. 09.3.3-LMT-K-712-01-0020, funded by EU Structural Funds programm 2014-2020) - 80 biographical interviews with various families from Lithuania and Lithuanian family survey data of 3000 respondents. The aim of the project is to identify the mutual interaction of family changes and socio-economic inequalities structures formed in the context of specific aggressive neoliberal capitalism in Lithuania. Key word: precarious work, work feminisation, time, working family, work and family balance, welfare state, occupation, care.

Precariousness in the Memoirs of the Unemployed. Boundaries, Strategies and Trajectories

Kubicki, Pawel (1), Posluszny, Lukasz Grzegorz (1, 2)

(1) Warsaw School of Economics, Poland; (2) Wroclaw University, Poland

The analysis is based on the biographical materials collected in three editions of competitions for memoirs of the unemployed in Poland during 1930s, at the turn of the 21st century and 2018. It includes all published diaries from the first edition of the competition (57 out of 774 applications), 50 from the total of 142 diaries published in the second competition (out of 1,635 applications) and 50 from among 380 works submitted for the last competition. In the given materials we have identified and analyzed the practices and activities undertaken by the memoir authors in the precarious situation of an unemployment, both in the context of looking for a job and doing small jobs, as well as coping with it in everyday life. We wanted to find out how effective these strategies were and what were the results of the chosen paths.

On the one hand, we have traced how the process of remaining in the state of unemployment and 'controlled' precariousness is changing over time, and, on the other hand, how one overcomes it, both in the successful (securing employment and reducing precariousness) and unsuccessful (losing unemployed status, intensifying precariousness) ways. We employed the theoretical notion of trajectory to describe and conceptualize the discussed problem. As a result, we created general three-stage typology of failure, duration and success, and their detailed and more problematic variants. Preliminary results of the study allow to note the specific relationship between unemployment and precariousness, and their mutual reinforcement over time.

The Gendered Experience of Fixed-Term Employment: Putting the Consequences of Precarious Employment in Context of Gender and Household

Teichler, Nils (1); Morgenroth, Nicolas (2); Schels, Brigitte (1,3)

1: Institute for Employment Research (IAB), Germany; 2: Berlin Social Science Center (WZB), Germany; 3: Friedrich-Alexander-Universität Erlangen-Nuremberg (FAU), Germany
nils.teichler[at]iab.de, nicolas.morgenroth[at]wzb.eu, Brigitte.Schels[at]iab.de

This study investigates differences in the effects of fixed-term employment on subjective job insecurity (SJI) by gender and household context. Previous research argues that gender differences in the subjective perception of objective precariousness, e.g. fixed-term employment, stem from gender inequalities on the labour market and, in particular, from the poorer labour market positions of women. Existing findings from diverse national contexts are, however, ambiguous. We argue furthermore that gender differences in SJI are moderated by the existence of partner and children because, then, traditional gender roles are important for the perception of fixed-term employment. We examine two research questions: Do the effects of fixed-term employment on subjective job insecurity differ by gender and household context? Can differences be explained by individual labour market positions and household status? We use the German Socio-Economic Panel Study (SOEP) for a sample of 20- to 45-year-old employed men and women. We identify the effect of fixed-term employment on SJI by applying linear Fixed Effect (FE) probability models in separate models for the household context and interaction-effects with gender. We test whether these effects are mediated by a set of labour market and household resources. Results indicate that women are in general more affected by fixed-term employment than men. Gender differences are strongest in single households. Women's vulnerability is reduced by having a partner and, even more, by having children. Labour market and household resources cannot explain this gender gap across household types. Obviously, temporary employment is worsening existing gender inequalities on the labour market.

RS11_07 | Young workers under precarious conditions

Living with Precarity in Germany and Poland. Comparing the experiences of Young Workers

Trappmann, Vera (1); Mrozowicki, Adam (2)

1: Leeds University Business School, United Kingdom; 2: University of Wrocław
V.Trappmann[at]leeds.ac.uk, adam.mrozowicki[at]uwr.edu.pl

In the context of debates on the meanings of precarious employment, this paper explores the varied ways young workers in Poland and Germany are managing precarity. Biographical narrative interviews with 121 young people - either employed in insecure and low-paid jobs, who were unemployed or who were in precarious vocational educational training (VET) - were conducted and the data analysis revealed four different ways interviewees were coping with precarity. These different ways of coping reflected the varied ways in which interviewees were orientated to work, the meanings attributed by them to precarious employment and the material and cultural resources they possessed. It is argued that despite institutional differences, the ways of managing precarity in both countries are similar and represent a tendency to endure precarity and cope with it by individual means. Simultaneously, the cases of calling precarity into question were more typical of young Poles than Germans. Cross-country differences are explained by the mechanisms of institutional support for young workers and the greater belief in meritocracy in Germany.

Portraits of Young Workers: for a Sociological Understanding of Precariousness

Carmo, Renato Miguel (1); Matias, Ana Rita (2)

1: Instituto Universitário de Lisboa (ISCTE-IUL), Portugal; 2: Instituto de Ciências Sociais, Universidade Lisboa, Portugal
renato.carmo[at]iscte-iul.pt, artmatias[at]gmail.com

The European labour market has undergone significant changes in recent years. One of the most recent trends has been the significant growth of precarious contracts among young people. The low demand for labour and the reduced household income have meant that individuals in the 18-30 age bracket become particularly vulnerable to precarious working conditions. With this presentation the authors aim to discuss the results of a qualitative research analysis based on in-depth interviews conducted to Portuguese young workers with degrees in different scientific areas, living in Lisbon (aged until 32 years old), which found themselves in professional and contractual uncertainty. We will present seven sociological portraits of young workers interviewed within 2016 and 2018. The sociological portraits were able to characterize the evolution of the professional and personal trajectory of the interviewees, within a time interval of two years. With this methodological approach, inspired by the work of Bernard Lahire in *Portraits sociologiques* (2014 [2002]), we sought to understand the social and individual impacts of precariousness on the way of life of young people. Based on the analysis of a varied set of objective and subjective dimensions that reflect the individuals' perceptions about their life paths in the present and the future, it was important to comprehend if precariousness continued to characterize professional trajectories identified in the first interviews, and what their implications in everyday life and the future expectations of young people.

Trapped in Precariousness? State Dependence of Employment Precariousness among Young People in Germany

Jahn, Kerstin

Institute for Employment Research (IAB), Germany
kerstin.jahn[at]iab.de

This study examines whether young people experience path dependence of precarious working conditions resembling descents into precariousness during their labor market entry. As studies reveal, labor market entries of young people have gained complexity and insecurity. They change faster and faster and they increasingly contain phases of unemployment, transition measures and precarious employment. While growing insecurities affect the majority of young people, those with low qualifications and scarce social resources experience especially risky transitions into employment. So far, it has remained an open question whether processes of cumulative

disadvantages start during the labor market entry. This study tests the assumption that precarious employment causes true state dependence in the form of a higher risk for young people in precarious employment to remain in precarious employment. Methodologically, the statistical model differentiates between path dependence as true state dependence and spurious state dependence where remaining in precarious employment is explained by labor market related individual characteristics like educational level or social background. I use data from the German Socio-Economic-Panel (GSOEP 1993-2016) for the analysis. The sample consists of young people in the beginning of their employment careers. An index of seven dimensions of employment operationalizes precariousness including income insecurity, lack of social security protection and job uncertainty. The index permits to analyze true state dependence regarding employment precariousness. The results show that episodes of employment precariousness increase the risk to remain stuck successively in precarious working contexts.

Being Artist in Milan: Young Women Between Entrepreneurship and Precariousness

Naclerio, Emanuela

University of Milan, Italy, University of Turin, Italy
emanuela.naclerio[at]unito.it

This paper aims at bringing a contribution to the current debate on neoliberal subjectivities and precariousness by investigating the case of young precarious women in the performing arts' sector. Scholars in the Foucauldian tradition have analysed how neoliberalism transforms subjectivities into an "entrepreneurial subject" devoted to grow its personal and competitive human capital (Foucault, 2008). Nowadays, the ways workers' subjectivities are constructed are significantly affected by the current process of precarisation, which is not just about work, but about the life of subjects themselves (Butler, 2006). Building on these theoretical frameworks, this paper focuses on the construction of neoliberal subjectivities in the Italian's performing art sector. The findings are drawn on a series of in-depth interviews with performers aged under 35, working in Milan between 2018 and 2019. The analysis contributes to the current debate, firstly by exploring the performing arts' sector, characterised by a high degree of informality in the job market's access, and by narratives that explicitly emphasize self-realisation and competition (Menger, 2014). Secondly because it focuses on young women, who have recently been considered as neoliberal subjects par excellence (Gill, Scharff, 2011). In the discussion, particular attention is given to the forms of resistance to both precariousness and the dominant neoliberal model based on self-entrepreneurship and competitiveness. RS11_09 | Emerging forms of precariousness: Hybrids between employment and self-employment

Fighting The Precarious Conditions Of Platform Workers. Calls For A Renewed Social Dialogue In Europe

Borghi, Paolo; Murgia, Annalisa; Mezihorák, Petr; Mondon-Navazo, Mathilde; Bozzon, Rossella; Digennaro, Pierluigi

University of Milan, Italy
paabor75[at]yahoo.it, annalisa.murgia[at]unimi.it,
petr.mz[at]email.cz, mathilde.mondon[at]wanadoo.fr,
rossella.bozzon[at]gmail.com, pierluigi.digennaro[at]unimi.it

Digital platforms are redefining the structure of the society as a whole, reshaping both economic and social practices (Van Dijck, 2018). The expansion of work organised through online platforms has facilitated the increase of a precarious and hyper-individualised workforce, mainly self-employed. This phenomenon has led unions to reconsider their position on organising digital labour, and has brought to the emergence of other collective actors that support such category of workers (Conaty et al, 2015). The power-resources approach allows to understand how unions are renewing themselves by mobilising existing power resources and developing new ones (Schmalz et al. 2018). In our contribution, we took inspiration from this theoretical framework to analyse how different organisations are supporting platform workers. The study is based on empirical material gathered through a cross-national ethnography (Mangen, 1999) conducted in France, Italy and Slovakia. For four months (September-December 2018) we investigated fifteen organisations, including trade unions, professional organisations, cooperatives and groups of activists. The findings show the different combination of structural, organisational, institutional and societal powers mobilised by these organisations to support gig workers. Finally, how these collective actors are pushing for a renewed social dialogue will be discussed. References Conaty, P., Bird, A. and Ross, P. Employment Quality As A Health Determinant: Cross-Cutting Boundaries Between Types Of Waged And Self-Employed

Gevaert, Jessie (1); Van Aerden, Karen (1); De Moortel, Deborah (1,2); Vanroelen, Christophe (1,3)

1: Vrije Universiteit Brussel, Belgium; 2: Heinrich-Heine-University Düsseldorf, Germany; 3: Universitat Pompeu Fabra Barcelona, Spain
jessie.gevaert[at]vub.be, Karen.Van.Aerden[at]vub.be,
Deborah.De.Moortel[at]vub.be, cvroelen[at]vub.ac.be

The aim of this study was to research differences in mental well-being and general self-rated health between different forms of waged- and self-employment, using the concept of employment quality. Employment quality refers to the conditions and relations of employment and is an understudied component of broader 'job quality'. For that purpose, data from the European Working Conditions Survey, round six (2015) was analysed. We restricted the analyses to the EU27. Latent Class Cluster Analysis was used to construct typologies of employment quality for both the waged- and the self-employed. Then, the association between the constructed typologies, intrinsic job quality and the health outcomes was studied (using logistic regression). The cluster analyses revealed ten types of jobs with clearly diverging levels of employment quality. Workers belonging to low-quality types of work experienced poorer health and well-being. This was especially the case for self-employed with low employment quality. These results remained, controlling for intrinsic job quality characteristics. The findings of this study implicate that employment quality should be taken seriously as a health determinant – and is cross-cutting traditional distinctions between waged- and self-employed.

Perceived Employment and Life Precariousness: A Study in Croatia, Italy and the Netherlands

Bassetti, Chiara (1); Majetić, Filip (2); Rajter, Miroslav (3)

1: Consiglio Nazionale delle Ricerche, University of Trento; 2: Institute of Social Sciences Ivo Pilar; 3: University of Zagreb chiara.bassetti[at]istc.cnr.it, filip.majetic[at]ipilar.hr, mrajter[at]unizg.hr

This contribution presents the results of a quantitative research on perceived precariousness and concealed/vulnerable self-employment in Europe. In particular, the study focuses on four dimensions: income and welfare, work conditions and disempowerment, vulnerability in current life and future-oriented self-perception, and representation and rights exercising. The data are to be collected between February and May 2019 via online questionnaires (one for precarious employees and one for the self-employed, yet with largely overlapping or similar topics and questions). Empirically, the research covers Croatia, Italy, and the Netherlands, as it is part of the H2020 Commonfare / PIE News project, whose activities involve those countries as representatives of Eastern, Southern, and Northern Europe respectively. This also means that the results of the quantitative study will be interpreted on the basis of the qualitative research conducted within the above mentioned project from October 2016 to June 2017 with people in precarious life conditions. The goal of the quantitative study is to offer a typology of precarious and vulnerable workers by way of cluster analysis, yet this is grounded on a deeper understanding of the ways in which employment precariousness and the general deregulation of work arrangements affect people's everyday life, relationships, and long-term plans. The fourth research dimension, moreover, aims to tackle the in/adequacy of traditional union techniques and strategies, and the ways in which people experiencing precariousness regard union representation.

In the Name of Passion: Passionate Work and Precariousness in Food and Beverage Italian Micro-entrepreneurs

Gerosa, Alessandro

University of Milan, Italy
agerosa91[at]gmail.com

Thanks to a sector characterized by a rapid transformation toward an omnivorous taste for authentic experiences and a historically rooted tradition of coffee bars and food, to open a small food or drink business in Italy has become one of the most accessible entry-points to a humbler and labour-intensive variant of the «creative economy». This study analyses micro-entrepreneurs in food and beverage sector in Milan, Italy through ethnographic material composed by 40 interviews and participant observation at events hosted at their businesses, using the concepts of passionate work and precariousness as theoretical lenses. Three main results are discussed: micro-entrepreneurs in their everyday work realize a «passionate sacrifice», as they declare themselves willing to sacrifice economic value for ethical value in the production of the goods or services sold to the customers, that is both a voluntary act that tries to transform labour into attractive labor and an obliged ritual to be a recognized member of the market niche and survive as micro-entrepreneur; to frame their work as fulfilled «in the name of passion» becomes fundamental to identify themselves as a different category from more traditional businesses in the same field and to offset the more manual-intensive component of their job that persists and the stress related to precariousness and the generally low economic earnings; the choice to become a micro-entrepreneur, facing high risks and precariousness, depends on the desire to achieve a satisfying job in comparison with employed labour, considered often similarly precarious but without the benefits of being «employers of themselves».

RS11_10 | Who is at risk of precariousness and where?

Understanding Precariousness in the Journalistic Sphere

Pais, Pedro (1,2); Paisana, Miguel (1,2); Crespo, Miguel (1,2); Foa, Caterina (1,2); Pinto-Martinho, Ana (1,2)

1: ISCTE-IUL Lisbon University Institute, Portugal; 2: CIES-IUL Centro de Investigação e Estudos de Sociologia
pedro.pais[at]obercom.pt, miguel.paisana[at]obercom.pt, miguelcrespo[at]gmail.com, caterina.foa[at]gmail.com, ana.pinto.martinho[at]gmail.com

This communication regards the ambiguity related to the definition of labour precariousness at two different levels: a) the complexity of its theoretical definition and b) the existence and impact of different kinds of precariousness in the journalistic sphere. Quantitative data collected by CIES and OberCom over the course of two years, shows that theoretical difficulties behind the definition of precariousness are mirrored by the reality of the news sector where precarious labour relations are still the reality for many professionals. Collected data also suggests that there are many forms of precariousness: while the vast majority of surveyed journalists are currently working, the overall situation of the sector is very diverse in terms of contractual. Other factors, such as unpaid extra hours and working for several employers are also influential in building a wider conceptual chart about what precariousness in journalism is about. Analysed data supports the idea of the current state of labour precariousness in journalism being an echo of a much wider discussion going on in contemporary economic systems: the wide range of concepts, not all emanating from the academy but also from the private and public / political sphere is a symptom not only of uncertain personal and professional prospects but also of our underlying inability to mitigate labour precariousness through effective and reflected governance. We believe that this uncertainty is particularly nefarious in the journalistic sphere, given the close and historical dependence of democratic societies on a strong, stable and prosperous news sector.

Working Carers In The UK : An Experience Of Precariousness

Allard, Camille Victoire

University of Sheffield, United Kingdom
cvmallard1[at]sheffield.ac.uk

This presentation focuses on the pertinence of using the category of 'precariousness' to understand the struggles faced by working carers in the UK. In the context of an ageing society, with consistent cuts in adult social services (Fernandez, 2013), more people are providing informal support to an elder, disabled or sick relative, while at the same time undertaking paid work. Therefore, they often face acute financial, physical

or mental health problems. These challenges, and the lack of support and recognition at their workplace sometimes push them to drop out of work, become trapped in jobs of poor quality or encounter difficulties with engaging in long-term projects. As both vulnerable conditions of work and care interrelate through working carers' experiences, the concept of 'precariousness' as an 'existential state of unpredictability of living without security' (Hundle, 2012: 288) thus is relevant to capture the relationship between unsupportive work in an uncertain labour market and unpredictable life (Millar, 2017). This presentation will analyse the various structural and cultural factors which can contribute to better understanding and identifying the experience of working carers as indeed being one of 'precariousness'. It will draw from empirical findings from interviews conducted with working carers about the potential workplace support, or lack thereof, that they can expect to receive from their organisations, as well as their abilities to organise themselves and to express their voice. It will also draw on theoretical considerations of precariousness (Butler, 2004, 2009; Millar, 2017). Therefore, this presentation will contribute to expanding our understanding of precariousness, by illustrating it through the experience of working carers.

Precarious Situations of Farming Occupation

Cernic Istenic, Majda

University of Ljubljana, Slovenia
majda.cernic-istenic[at]guest.arnes.si

In the public there are intensive discussions held on the importance of safe, quality produced food to the preservation of health and well-being of the populations as well as the crucial importance of agriculture in food provisioning by sustainable use of natural resources. However, in these discussions the working conditions of those who are working in agriculture and contribute to the food provisioning of the populations are mostly absent while the statistics on farm injuries and accidents from all over the world demonstrate that farming is one among the most hazardous and risky occupations. Moreover, the farming population in the developed countries is hardly ever described as precarious, unless referring to migrant workers. There are, however, multiple groups of people in agriculture whose vulnerable situations could be examined in the frame of precarization. Bearing in mind yet weak public and research interest in this issue, the proposed paper is dealing with the question on how do farm family members experience and resolve their own disability or the disability of their family members due to occupational injuries/illnesses, specifically what social/labour support (institutional, formal and informal) is available to them when labour loss on a farm occurs. The consideration on these issues relies on the results of the interviews conducted with the members of 60 farm families of both genders and across generations in autumn 2018 in Slovenia, the country with specific agricultural context dominated by small family farms, socialist legacies and radical changes in agriculture over the last twenty-five years.

RS12_04 | Strangers, Barriers and Bridges as Social Forms of Collective Life

Roma/Gypsies in Portugal and the Condition of Internal Strange: Distance vs. Proximity

Mendes, Maria Manuela (1,2); Magano, Olga Maria (1,3)

1: ISCTE-Instituto Universitário de Lisboa; 2: FAUL, University of Lisbon, Portugal; 3: Open University, Portugal
mamendesster[at]gmail.com, Olga.Magano[at]uab.pt

In Portugal, since 1526, Gypsies have been subjected to state measures of repression, expulsion, punishment and condemnation. Since his arrival in Europe, they have always been treated with suspicion and a target of rejection. In Portugal, Spain, Germany, Austria, Hungary, France and Britain discriminatory measures were implemented, from the death penalty, deportation to the colonies to the obligation to move from place to place, city to city, and from country to country. Even today in Portugal and other European countries, Romaphobia is a well-established phenomenon in institutions and daily life. They are the "Intern Strange", although they have no other homeland of reference. Simmel (1908), addresses the tense relation of repulsion, distance, but also of approximation between the strange and the non-strange, a situation that contains important dualisms to be unveiled, such as identity vs. alterity and distance vs. proximity. In fact, there is a tendency to emphasize the general qualities we have in common with the foreigner and to accentuate the particularities, but we can also deny the factors of similarity, as is often the case with Gypsies. Through the case studies carried out by the authors, it is intended to explain how Gypsies embody this metaphorical figure and as such indicates a constant relationship of strangeness and tension that marks the history of the interaction between the majority and the Gypsies.

The Mutual (Dis)Comfort When the Stranger Inhabits the School

Resende, José Manuel (1,2); Beirante, David (1); Gouveia, Luís (1); Souza, Lucas Freitas de (2)

1: CICS.NOVA, Lisboa, Portugal; 2: Universidade de Évora, Portugal
josemenator[at]gmail.com, dbeirante[at]gmail.com, lgouveia86[at]gmail.com, souza.lfd[at]outlook.com

"I believe that, not only in school, but in society in general, the first impression counts a lot." The remark is given by Sérgio, a Romanian student. Therefore, the arrival of someone new to a space is a time of confrontation between its person as an outsider and those inside. The figure of the newcomer realizes that it is examined from his first impressions left on others. He who arrives finds strange and causes strangeness. In this sense, what counts is the appearance of first impressions. If counting on someone's look for an immediate and superficial appreciation is returned critically by those who arrive, this disqualification serves also to others as an asset that helps not exposing themselves before the others. Thus, being welcomed and knowing how to welcome is a mutual discomfort from which it is possible to outline multiple tensions. And these disputes, with sometimes vague, obscure, visibility, allow to look at hosting and hospitality towards the newcomer through an economy of mutuality. This talk, based on data collected from 18 interviews, from observations of classes, extended permanence in school space and in contiguous territories to two Secondary Schools, aims to reflect on the notes left by Simmel on the figure of the Stranger. But the purpose is also to go beyond what this German sociologist left us as analytical legacy. The interference of the economy of mutuality in the processes of hosting the guest perhaps allows us to perfect the grammar of hospitality.

Building a 'Bridge' of Justice: Simmel's View To Overcome Otherness Towards a Democratic World

Caetano, Pedro Jorge (1); Mendes, Maria Manuela (2,3)

1: New Lisbon University, Portugal; 2: University Institute of Lisbon, Portugal; 3: Faul-University of Lisbon, Portugal
pedrocaetano[at]fcsh.unl.pt, mamendesster[at]gmail.com

With the purpose of contextualizing in sociological terms the pervasive discrimination that Gypsies/Roma people are continuously suffering in Portugal, we explore here some contributions of Simmel's epistemological analysis, mainly from his texts *Bridge and Door*, *Excursus on the Stranger* and *The Lye*, the latter concerning secret societies. In this sense, it is examined how the spatial and social segregation of the Gypsies fosters the conservation of two perfectly rooted and separated moral orders. On the one hand, the Gypsy moral order, bearing on moral precepts that are based on Gypsy origins and traditions; some of them configuring a device marked by intra-ethnic secrecy as clear identity defence strategies against the assimilationist threat. On the other hand, the wider social order that penalizes gypsy people as an unreliable people. Furthermore, Gypsies also do not trust non-Gypsies. Notwithstanding, and following Simmel's essay on lying, where he called on "enlightenment" to "the removal of the untruths operating in social life" as "entirely democratic in character", we argue that the existence of more social and educational opportunities for Gypsies is indispensable for the creation of a more just and solidary society. In order to investigate the conditions of possibility of a fairer and more inclusive society, we discuss the findings of an empirical investigation using a scenario-based questionnaire in 3 Portuguese secondary schools, with non-Roma students, about the best way to accommodate Roma school children in their own school. These findings point to two broad perspectives: the assimilation and individualization of the Gypsies.

Real Bridges and Mental Borders in a Transylvanian Ethnically Mixed Community

Toma, Stefania

Romanian Institute for Research on National Minorities, Romania
tomastefania76[at]yahoo.com

"The human being is likewise the bordering creature who has no border". Simmel 1997:69 We are overwhelmed through different channels that we are "different" from the "Other", and that the "Other" believes in something that does not conform to our cultural or social norms. It seems that the broader society struggles with different forms of alterity. Being categorized as "different" is more than a frame through which we understand the world, but it is one of the factors which define, cause, etc. different social processes on local level. This article deals with formal and informal strategies of dealing with the Roma/Gypsies in a rural Transylvanian locality. Although, nowadays there are no clear spatial borders between the old Hungarian majority and the Roma communities, the mental map of the local's still bear this separation (Migdal 2004). The physical (river) and symbolic (ethnic) borders are continuously crossed, more or less successfully. While the bridge materializes the illusion that the two sides of the river now form one single locality uniting old inhabitants with the newcomers, more subtle and symbolic bridges ensure a more valuable connection of separated communities. This symbolic bridge is the ritual kinship between Hungarians and Roma through Godparenthood (G. and P. van Berghe 1966, Mintz and Wolf 1950, Goody 1970). Godparenthood relations in one hand extend the social network of the Roma families; on the other hand contribute to the maintenance and reinforcement of social cohesion in the community by granting new content to the work relationships between different ethnic groups.

RS12_05 | Making Sense of Belonging: Nature, Culture and Space

Back To Simmel: A Renewed Approach To Third-Party Reproduction

Delaunay, Catarina

CICS.NOVA, Universidade Nova de Lisboa, Portugal
catdelaunay[at]gmail.com

This paper addresses the attitudes of couples using Assisted Reproductive Technologies (ART) towards the third party involved in their parental project – either a surrogate or gamete donor – through Simmelian concepts (“door”, “bridge”, “stranger”, “third party”). I base my analysis on 66 in-depth interviews with different ART actors (from beneficiaries to professionals) in France and Portugal, focusing in particular on 19 interviews with heterosexual and homosexual couples who used third-party reproduction in Europe and the United States. Neither gamete donors nor surrogates belong to the unit formed by the recipient couple, but they do bring reproductive capacities (oocytes, sperm, uterus) into it that were not initially there. Like strangers, they engender distinctive combinations of both closeness and distance, involvement and indifference. The third-party donor intrudes as a supernumerary into the heterosexual or lesbian couple considered as a bounded group, where all parental positions are already occupied. Chosen almost at random, the anonymous donor becomes connected to the recipient couple via medical staff, but he/she is not “bound up organically” with either spouse. Heterosexual and lesbian couples close the door to the third party: they do not wish to know his/her identity and avoid any situation that could entail proximity and thus lead to discomfort or disruption within the family. Conversely, gay couples wish to connect initially separated parties and build a bridge with the surrogate, overcoming both spatial and emotional separation. They develop friendship bonds and family ties with the surrogate by making their relationship visible and concrete, going far beyond the practical purpose behind its original creation. Simmel’s distinctive concepts and theoretical contributions are both original and fecund for rethinking third-party reproduction.

In-between the Visual and the Subtle. From Simmel’s Concept of Spatial Boundaries to Contemporary State Bordering

Kaden, Ulrike

Universität Leipzig & Macquarie University, Sydney, Australia
ulrike.kaden[at]uni-leipzig.de

Only few sociological-theoretical approaches to state borders exist. An essential contribution is without doubt Georg Simmel’s essay ‘The Sociology of Space’ (Simmel 1908). In this essay, Simmel takes a social-constructivist perspective on spatial boundaries and highlights their ‘sociological function’ in differentiating spheres of power and justice. Simmel’s study of spatial boundaries stands out because it plays close attention to the interrelation between the material and the symbolical, between the visual and the subtle. It provides an idea of state borders as artificial and arbitrary, while, simultaneously, indicating their importance in reproducing and reinforcing senses of belonging. The paper draws on Simmel’s concept of spatial boundaries, including his perspective on political borders as ‘geometrical lines between neighbours’, to gain a better understanding of contemporary state bordering practices. It explores the role of ‘the spatial’ in boundary-drawing processes, and discusses how the reproduction of state borders is linked to essentialist notions of space. More specifically, the paper takes an interest in analysing the moments of tension inherent to state bordering: Far from evident, the shift, extension, or conjunction of state borders indicates the conflictual nature of boundary-drawing. Here, the paper demonstrates how Simmel’s approach offers a promising perspective on how contemporary state bordering processes facilitate the imagination of bounded spaces, and engage in the production of ‘difference’.

Nature and Culture : Simmelian Reading of the greening of cities and its functions

Boudes, Philippe

Agrocampus Ouest, France
philippe.boudes[at]agrocampus-ouest.fr

While this communication focuses on the growing interest for cities' vegetalization, it recalls the actuality of Georg Simmel to think contemporary environmental and cultural stakes. Some writings of this German philosopher and sociologist enlighten the use of natural objects, here greenways, in urban systems nevertheless rooted in a modernity recommending the artificial and the technical. Once exposed the functions played by such urban green infrastructures - with French and european examples -, their Simmelian characterization is discussed: his developments exclude greenways from the technical field and make them natural objects or "cultivated nature". This allows to relate in detail how Simmel comes to define the cultural process and the specific role played by human creations in what he names the "tragedy of culture". However, we can propose a Simmelian reading of the use of nature in the cultural process as a palliative to this tragedy. Greenways are part of this nature and are one of the markers of the limits of technology and of the major role that natural elements take in our modernity.

RS12_06 | Social Spheres and Its Boundaries: From the Secrecy to the Public

Simmel's Formal Sociology and the Analysis of Mass Society

Siisiäinen, Martti

University of Jyväskylä, Finland
martti.siisiainen[at]gmail.com

Simmel's formal sociology understands the social actor as a crossroads of her/his various membership circles. And accordingly, the society can be perceived as a structural configuration of these social circles. Because personal combinations of social circles are unique, all actors in a way have a society of their own. The subject of formal sociology, social forms can be divided to two subtypes: 1. social circles (such as class, institutions, parties, associations, media) and 2. social processes which determine the nature of these circles (e.g. solidarization, (dis)trust, exclusion/inclusion, deprivation, (dis)empowerment). In this paper I will adapt Simmel's theoretical ideas to the analysis of ongoing massification of Western democracies. The main argument of the presentation is that the pluralist political governance, based on citizens' more or less frequent, cross-cutting memberships, transcending class boundaries is transforming towards societies dominated by old and new kinds of overlapping,

class-based memberships. The weakening role of voluntary associations and other intermediating instances between the ruling elite ("the centre") and the "ordinary citizens" ("the periphery") opens a fertile soil for populist mass-movements, the polarization of society and political fluctuations. Simmel's discussion of the importance of cross-cutting voluntary associations and their driving force, middle classes enabling – in ideal case – the inter-class communication and the re-coding of the communication between the "centre" and "the periphery" is still adequate and of topical interest at the present political situation. These theorizations are backed up by empirical studies on civil society transformations.

The Fruitfulness of Simmel's Legacy in the Analysis of Contemporary Conflicts

Nollert, Michael

University of Fribourg, Switzerland
michael.nollert[at]unifr.ch

Besides Karl Marx and Max Weber, Georg Simmel belongs to the classics of sociology of conflict (Turner 1975). Moreover, he is often praised as the father of sociological network theory (Emirbayer 1997). For the analysis of social conflicts, two of his writings are of particular importance. In "Der Streit" (Conflict) (1908a), which can be seen as the counter-thesis to Durkheim's—and later, structural-functionalists'—focus on social harmony (Coser 1956), Simmel argues that conflicts do not have a priori a disintegrative or even a destructive impact on society, as external enemies often promote internal cohesion of communities. In "Die Kreuzung sozialer Kreise" (The intersection of social circles) (1908b; cf. Nollert 2010), he offers an individualization theory of modernity, according to which individuals in modern societies act as bridges between social networks. Inspired by this thesis, some scholars have argued that role conflicts caused by cross-cutting social networks foster social cohesion, as members of such networks develop rather multiple—and, hence, tolerance-promoting—identities than solitary ones (Nollert and Sheikhzadegan 2016; see also Sen 2006). Applying Simmel's theses to current conflicts, the second part of the paper shows, firstly, that conflicts with out-groups (be they real or imagined) lead to in-group cohesion. Therefore, ruling elites often use the rally-round-the-flag effect to divert from domestic troubles. Secondly, it shows how emerging nationalist and religious movements transform liberal societies by replacing universalistic values with particularistic ones. Thirdly and finally, the author's own research on religious (re-)converts suggests that members of close-minded communities tend to evolve solitary identities.

Family Secrecy in the Information Age: A Re-Examination of Simmel's 'The Sociology of Secrecy and Secret Societies'

Barbier-Greenland, Katy (1); Dempsey, Deborah (2)

1: Swinburne University, Netherlands; 2: Swinburne University, Australia
katy.barbier.greenland[at]gmail.com,
ddempsey[at]swin.edu.au

Discovering an unexpected major family secret typically has significant, ongoing personal and psychological consequences for those involved. Reproductive family secrets, such as those associated with conception and birth, are arguably more difficult to keep in an information age. People are now able to access their family history and biogenetic information in unprecedented ways due to factors including more open policy and legislative trends regarding donors and donation in reproduction, and enhanced opportunities to identify and connect with family members online. Further, sales of DNA home testing kits are expected to reach 100 million by 2021, and family history searches are the second most popular use of the Internet. This talk is based on stories from an empirical research project entitled 'Family Secrets, Secret Families'. Secrets discovered by participants included adoption, donor conception, hidden or secret children, and mis-assigned parentage. In the talk, we reflect on Simmel's essay 'The sociology of secrecy and of secret societies' and assess its contemporary relevance for how knowledge, power, truth, silence, disclosure, and trust play out in families with reproductive secrets. We argue that Simmel's insights continue to offer a valuable framework for understanding the power and function of knowledge and information management in family life in the era of the Internet and home DNA testing.

The Politics Of Everyday Life: Simmel And The Public

Borja, Jean-Stéphane

Aix-Marseille Université, France
jste.borja[at]gmail.com

My purpose is to focus on the citizenship and the democratic issue from the perspective of the stranger's experience, and to explore how this ordinary experience can refine the conception of the public. In particular, I would like to consider the creative tension that characterizes the simmelian approach, this movement that carries and creates new forms; and to apprehend it in terms of a daily political and democratic spring. For doing this, I will discuss the concept of public, as it is ideally conceived by J. Dewey: as a set of stranger people, who don't know each other; but also as a "ferment" of citizenship through the process of social inquiry it carries in order to define public problems. Here, I will insist on the fact that any inquiry conveys two kinds of knowledge: concerning a problematic situation ("facts"...); but also in terms of

encounters and relationship (to meet/know each other, to talk with/about, to take news...). I will indeed consider an encounter as a promise rooted in public spaces and moments, where people used to stay in a relative strangeness. And, on this basis, I will underline: 1/ the political potential carried by the interrelations and interactions; and 2/ that this potential is as much conveyed by encounters, as by what rejects and problematizes the relationship, re-injects reserve, distance and ignorance (to avoid a known person, to become a stranger...). In the end, I will show how this reserved and wandering public paradoxically ensures an ideal of publicity, reinforces and "re-potentiates" itself, and expresses a power, i.e. a possible, or what comes to reopen the possibilities.

RS12_07 | Beyond the Social: Life, Spirituality and Individuality

From Modernity To The Postsecular: Georg Simmel On Religion and Spirituality

Warchala, Michal

Pedagogical University of Cracow, Poland
michal.warchala[at]up.krakow.pl

Simmel's relevance for the sociology of religion has been more and more appreciated for the last two decades (cf. Helle 1997; Lee Erickson 2003). He can now be said to stand together with Max Weber and Emile Durkheim as another founding father of the discipline. Moreover, he is sometimes considered a forerunner of both the postmodern reflection on culture and society and of today's "sociology of spirituality" (Varga, 2007). In my paper I would like to concentrate on two aspects of Simmel's thought related to this latter point. The first aspect is his conception of religiosity (or religiousness) as a "bridge" or "third realm" between the subjective sphere of individual experience and the objective sphere of social relationships. This makes religious transcendence the inconspicuous matter of everyday life – much as it is considered in contemporary research on spirituality (cf. the notion of "little transcendences" in Luckmann 1990 and similar concepts in Joas 2014). The second aspect deals with his consideration of art and eroticism as having a special relationship with religiosity. Whereas both domains were usually considered in Simmel's times as largely opposed to the sphere of religion his emphasis on their similarities and continuity between them as forms of life makes him herald much of the 20th century reflection on the matter (Bataille, Lacan etc.). These two aspects together testify, I contend, to Simmel's crucial position as a source of inspiration for today's "postsecular" thought concentrating on the survival of the religious element in the secularized environment.

937

Religious Identity and the Law of the Individual: The Search for the Authentic Self

Sealy, Thomas

University of Bristol, United Kingdom
thomas.sealy[at]bristol.ac.uk

While Simmel's writings on the city, money and culture enjoy widespread attention in sociology, his writings on religion have been almost completely neglected. Indeed, one commentator has remarked that Simmel's essays on religion, which constitute as much a sociology of religiosity as of religion, have been something of an embarrassment for sociology. This paper draws on this neglected area of Simmel's thought, drawing on a reading of Simmel's essays on religion, and distinction between religiosity and religion to demonstrate how it can be fruitfully applied to understanding some forms of contemporary religiosity. To do this, the paper brings together analysis of narratives from an empirical project on converts to Islam with reflections on other trends in the literature in the sociology of religion. This, moreover, is brought into relation with Simmel's law of the individual to reflect on the wider contemporary social context and dynamics between religiosity and religion.

Life-Capital after Simmel and Freud

Markowska, Barbara Anna

Collegium Civitas, Poland
bmarkowska[at]civitas.edu.pl

In *The Philosophy of Money* (1900) Simmel has depicted a world of modern money-economy in which money became a symbolic form of life. He has discovered that a human desires lie in the background of the whole market-exchange but the living being acts according to own individual law. In other words, the most generic desire of attaining a positive balance and possibility of equivalence is a part of process of individualization. As he wrote in the posthumous essay *Life as Transcendence*: "Life finds its essence, its process, in being more-life and more-than-life; its positive is as such already its comparative" (2010: 17). The same one could say about capital, understood in the common way as historical process in which money makes money or value 'makes' value. Thus, we can say that money symbolizes the capitalisation of life. In the presentation I argue that category of desire and life-capital is a key code for understanding the phenomenon of modern capitalism. I will show that Simmel's way of thinking about the money economy and human desire is supplementary with Freud's libidinal economy sketched in the essay *Beyond the Pleasure Principle* (1922). This juxtaposition creates an important analytical framework allow to understand better the dynamic and productivity of our modes of subjectivity. Actually, it signifies a shift from the question "what we are desiring?" to much less metaphysique "how we are desiring?".

RS13 | Sociology of Celebration

RS13_04 | Politics and identity in celebration

Celebration And Politics Of Identity: Rituals, Meaning And Sacralisation Of Martyrdom

Królikowska, Anna Małgorzata; Kowalewski, Maciej

University of Szczecin, Poland
anna.krolikowska[at]usz.edu.pl,
maciej.kowalewski[at]usz.edu.pl

The aim of the paper is to develop theoretical framework for understanding political aspects and political exploitation of processes of martyrdom sacralisation. First, we refer to the theology of martyrdom, looking into the religious perspective. Second, we describe relation between constructing the image of victims and celebrating them in political rituals, reaching, among others, for anthropological approaches to dramaturgy. We underline that in different cultures martyrdom plays an important role in constructing collective political identity and group symbolic (self-)image. Referring to selected examples of events and their victims from Polish history of 20th 21st centuries, we analyse political aspects of martyrdom celebrations in a dynamic perspective (indicating the stage of celebrating, e.g. whether it is the stage of establishing rituals, their institutionalization and so forth) and in their wider discursive contexts: social, historical, media, and political. We also pay attention to a spatial dimension of the celebration. The concept of the "sacral politics" which we develop assumes that the intensification of sacralisation takes place through institutionalization of the practices of commemoration and celebration related to the categories of "martyrdom", "victim" or "political crime".

Dancing to Different Tunes: Festive Gatherings as Grounds for Radical Democratic Citizenship

Woodman, Sophia

University of Edinburgh, United Kingdom
sophia.woodman[at]ed.ac.uk

Social movements tend to be portrayed as serious endeavours aimed at changing the world, but they often also involve festive, carnivalesque gatherings, which connect collective enjoyment with mockery of dominant groups, institutions and repressive social structures. Historically, such gatherings have provided marginalized groups with a space for resisting and inverting existing hierarchies (Bacchanalia, carnival), acted as a

nexus for organizing uprisings (slave and peasant revolts, 'moral economy' protests) and contributed to sustaining indigenous traditions that colonial authorities sought to eliminate (Potlatch, Corroboree). Music, dance and celebration were at the heart of the cultural uprisings of 1968. This paper argues that such grassroots gatherings provide a grounding for radical democratic citizenship as they draw together a potent mix of radical rejection of hierarchy, political resistance as well as dance and music, generating a sense of affective communitas that enables envisioning a different world. Based on ethnographic fieldwork at three gatherings in Scotland, grounded in ecological sensibilities and focusing respectively on alternative medicine, music and reviving seasonal celebrations, the paper explores how these gatherings act as festive nodes in a calendar of alternative lives and livelihoods that take people out of their everyday routines. These events provide opportunities for creating and cementing networks and sharing knowledge about such lives and livelihoods; generating and supporting alternative economies; connecting human and non-human worlds; and an informal politics of deliberation around the norms, values and activities of these communities. The article proposes that the 'collective joy' such gatherings can engender is a constitutive element of radical democratic citizenship.

Heroes To Celebrate: On The Agency Of The Cultural Trauma Of WWII

Lozinskaia, Aleksandra

Independent scholar
lozinskaya[at]gmail.com

My presentation adds to understanding of cultural trauma by reviewing its agency components. I argue that agencies of cultural trauma maintain wider variability than "the victim" and "the audience", to oppose to what Jeffrey Alexander suggests in his theorizing of collective trauma. I build my argument upon the empirical study of revising the meanings of the experiences of WWII. While analyzing the TV-streaming of the Marches for the celebration of the victory in WWII in modern Russia, I focus on the cultural work of journalist interpretations of the war-related stories. I reveal how complexity of the war experiences reduces to the agency of the category of the "celebrated hero". In my interpretation part I employ the approaches of the scholars who studied the range of alternative categories to define experiences of WWII. As I focus on classifications such as "survivor" and "victim", I follow the conceptual schema of the "therapeutic culture", developed by Arlene Stein. Finally, I suggest the revised comprehension of the process of collective establishment of cultural trauma by highlighting the multiplicity of its agency.

RS13_05 | Maintenance and re-invention in celebration

Dressed for celebration

Haugrønning, Vilde; Klepp, Ingun
Grimstad; Laitala, Kirsi

Oslo Metropolitan University, Norway
vildeh[at]oslomet.no, ingun.g.klepp[at]oslomet.no,
kirsi.laitala[at]oslomet.no

How is everyday life re-created for celebrations and public holidays through use of clothing and home textiles? Most Norwegian families celebrate annual holidays such as Christmas and 17th of May (the Constitution Day), as well as days related to the life cycle, such as birthdays and confirmation. Based on a nationally representative survey material about Christmas and other celebrations, we discuss how clothes and home textiles contribute to creating a holiday for women and men, and for young and old. We will look in particular at the relationship between tradition and newness or variation in dressing on one side, and the degree of formality in the dress code on the other. Clothing for festive social occasions is generally thought to be low priority in Norway in favour of clothing for work, sports and outdoor life, but homes are especially decorated for Christmas and expensive folk costumes are used for celebration of the Constitution day. Overall, we know little about the way clothes and home textiles such as tablecloths and napkins are part of creating the festive occasion.

"As Long-Lasting As Possible" Or "Until Death Do Us Part"? Humanist Weddings In Poland And Changing Attitudes Towards Love And Marriage Issues

Rejowska, Agata

Jagiellonian University, Poland
ag.rejowska[at]gmail.com

Humanist weddings are a relatively new phenomenon in Poland (the first marriage was conducted in 2007), however their popularity is still growing. The Polish context is interesting, taking into account the fact of the importance of Catholicism as a cultural religion in this country. Conducted research revealed, that humanist marriage ceremonies are strongly individualized. The old forms (e.g., the conventional structure of the rite of passage) are filled by new, alternative contents (e.g., love is declared by phrases such as "long-lasting as possible" and not by "until death do us part"). As masters of ceremony noticed, the performative "I vow" is increasingly being replaced by "I promise", "I swear" or "I will be for you" which indicates less power of influence. In this way, performative (causative) power of ceremony (understood in accordance with John Austin's theory) declines (which may

indicate that there is an alteration in understanding marriage and its indissolubility). The emergence of secular alternative could be also the manifestation of resistance to hegemony (e.g., the Roman Catholic Church and/or heteronormative culture – a large part of humanist marriages in Poland are concluded by same-sex couples, because of the lack of alternative). The paper is based on research which has been conducted since 2015. So far, the research process has included semi-structured interviews with masters of humanist ceremonies, participatory observations of wedding ceremonies, qualitative analysis of the content of speeches, oaths, scripts and materials made available by the masters of ceremonies (as well as collected during observations) and narrative interviews with the main actors of the marriage ceremonies (young couples).

To Feel or not to Feel like Christmas. Exploring the Festive Emotionality from a Life Course Perspective

Cucu-Oancea, Ozana

Institute of Sociology, Romania
ocucuoancea[at]yahoo.com

A worldwide phenomenon, celebrated today by billions of people around the world, regardless of their religious beliefs, the modern Christmas is often defined by social scientists as a Victorian social construct. More or less consciously, we are moving inside certain festive frames. We are concerned with observing rituals and traditions, we are consumers of seasonal products and services - the Christmas special offers! - and participants of festive events organized in the public space. At the same time, we criticize the "Christmas marketing", we deplore the fade away of the holiday spirit, expressing our sadness that "Christmas does not feel the same anymore". But what exactly is the meaning of "the same" and "anymore" in this statement and what does "feel like Christmas" mean? Is "the holiday spirit" just an overall cliché or also an embodiment of social reality? Although the concept of Christmas Spirit is often mentioned in the scientific literature, there are surprisingly few studies focused on its empirical analysis, and no consensus on its definition yet. Following a social constructivist Grounded Theory methodology, this paper explores the everyday lives of people around Christmas, trying to capture the realities behind Christmas stereotypes and to draw patterns of change in the people's festive emotionality. The paper analyzes longitudinal data collected through solicited diaries, kept by 16 participants, around Christmas time, once every 6-7 years (2004, 2010-2011, 2016-2017), providing a valuable prospective view on the research issue, and a deeper insight into the meaning of the "Christmas spirit" concept.

Re-Inventing the Slava Celebration: The Case of Serbian Immigrants in Sweden

Hadzibulic, Sabina

Uppsala University, Sweden
sabinica602[at]gmail.com

The slava celebration is a unique Serbian Orthodox custom where each family annually celebrates its patron saint on a certain feast day. Besides Christmas and Easter, the slava represents one of the most important celebrations in the life of each Serbian Orthodox family. Its importance lies in an occasion to reveal one's religious affiliation, and especially national identity. With the post-socialist transformation of Serbian society characterized by a newly established relationship between the young democratic state and the Serbian Orthodox Church, the slava regained its recognition. That resulted in a rapid increase of the number of people celebrating it, as well as in a transformation of the way it is celebrated. This paper focuses on the slava celebration among Serbian immigrants in Sweden. The goal is to show how the slava is practiced and interpreted by Serbian immigrant families in Sweden. Additionally, the ways in which the slava affects the identity formation, and the consequences of it for the integration into Swedish society are analyzed. The paper is based on data collected through the analysis of several cases of different generation Serbian Orthodox families living in Sweden.

RS13_06 | From margins to the focus. Metamorphoses of celebration

Cannabis Festivals: Social Protest or a Celebration of Cannabis Culture?

Skliamis, Kostas

University of Amsterdam, The Netherlands
kon.skliamis[at]hotmail.com

Cannabis festivals represent a category of special events in an era where cannabis legalization is gaining momentum. Cannabis festival is a term that is being used in a variety of contexts. In the current study, cannabis festivals are defined as social gatherings organized by civic society movements, where people congregate to oppose to cannabis prohibition, to advocate cannabis law reform and last but not least to celebrate the cannabis culture. A survey (N = 1355) was conducted in four European cannabis festivals in Summer 2016 and May 2017. Cannabis festivals in Amsterdam (The Netherlands), Berlin (Germany), Rome (Italy) and Athens have common features but also maintain and reproduce local, social, and cultural characteristics. Cannabis festivals, as well as their visitors, represent heterogeneous categories. They can be understood as an expression of cultural politics, a

celebration of cannabis culture, or represent a protest movement. The style of the festival—music festival or march combined with music—affects the main reason for attendance by the participants. In cannabis festivals more similar to music festivals the majority of the respondents attended for entertainment while at the cannabis festivals in the form of a march combined with music, the majority attended for protest. In addition to that, increasing age and high frequency of cannabis use are factors that led the participants to attend for protest. Furthermore, regarding residency, locals more often reported “protest/activism” than expats and tourists, who most often chose “entertainment.”

The X-Rust Organization – 25 Years Of Purism

Rajamäki, Soile Marjaana

University of Turku, Finland
rajamakisoile[at]gmail.com

The X-Rust Organization – 25 Years of Purism The X-Rust Organization is a non-profit organization concentrating on keeping electronic music and the culture around it alive and kicking in Turku, Finland, through activities such as organizing events, participating in larger events and festivals, offering information and equipment as well as releasing music. X-Rust was founded in 1993 and registered in 1998, which makes it the oldest techno organization in Finland. Deeply rooted to the underground, main musical focus is on non-commercial and often not so familiar genres of electronic music. 25 Years of Purism is a dive into X-Rust's identity. How and why the organization started? More importantly, how has the members come together, to form a tight group with same musical preferences, or more specific, same musical beliefs? How these musical guidelines, doctrines, passes on? What or who is excluded, and why? This exclusion is explained by the term purism. Through interviews with the organization's founding members and a long time active, former chairman of the board and the Purist of the Year 2016, with an online survey to all the other members, purism is defined and explained when and why it plays such a significant role in X-Rust.

Bullying, Pulling and having a Ride in Transgressive Techno parties. And how to deal with it

Kantola, Ismo Juhani

University of Turku, Finland
ikantola[at]utu.fi

The techno party is commonly understood as a site of good feelings, transgressivity, and togetherness with unknown, anonymous, attendance. Of course, it is also an instance with friends. So while mingling with friends and non-known visitors it is expected you maintain a confident assent to all of the attendance. This is the ideal presumed to be subscribed by any standard visitor of the ball. However, transgressions of this rule of togetherness do take place. How do the organizers of the events deal with this? How do the participants feel in the case, indeed? The paper is based on an analysis of Internet contents on the topic of abuse in partying, clubbing and festive circumstances.

Afterparties: Exploring Festive Sociability in Deviant Leisure Spaces and Times

Moore, Karenza

University of Salford, United Kingdom
k.moore4[at]salford.ac.uk

Sociology has long acknowledged the importance of leisure to our lived experiences, with celebrations evocatively described as the “salt-n-pepper of everyday life” (Rusu and Kantola, 2016). This paper explores temporality, spatiality and sociality as aspects of a specific form of deviant leisure (Smith and Raymen, 2018), namely post-dance music event parties, widely known as ‘afterparties’. Afterparties are absent from the research literature on post-rave dance music cultures, likely due to their largely ‘invisible’ nature which sits in opposition to other visible forms of ‘spectacular’ deviant leisure taking place on street corners, in the night-time economy, and at festivals. Previously I have explored afterparties as a (sub)cultural artefact (Moore, 2015). Here, I explore afterparties through the lens of ‘festive sociability’ as social acts of togetherness which take place in private, domestic spaces. Afterparties profoundly shape participants’ identities. They offer a ‘secret space’ in which participants’ need for belonging is expressed through the collective consumption of illegal drugs and/or the communal appreciation of particular dance music genres or tracks. I address the practical and ethical challenges of undertaking research in the private spaces of youth cultures, drawing on the work of Lincoln (2012) on teenage bedrooms and sociological thinking on spaces and times of music scenes (Nowak and Bennett, 2014). Finally, the negative underside of afterparty attendance is examined through accounts of the aftermath of afterparties, where celebration become commiseration as some party-goers struggle with drug dependency.

RS14_06 | Knowledge, Communication and Imagination

Social Illusions as a Challenge for Modern Sociology of Knowledge

Zemlo, Mariusz

University of Bialystok, Poland
mzemlo[at]gmail.com

Modern man encounters, all the more often, a world of fiction, false realities, imaginations, wishful thinking and the likes. All of these descriptions refer to the state referred to in antiquity as that of illusion (mainly in the Platonic sense). Today's illusions are created in a mass way and they result in us taking part in these illusions (to a lesser or greater extent). This is particularly achieved by marketing institutions, political institutions, ideological organisations, the film industry, corporations connected with virtual reality and gaming and so on. Illusiveness seems to grow in the modern world disseminating throughout society and the experience of individuals it and in many fields of activity. Through this process, modern people live out a life of illusion more than that of reality. For a sociologist of knowledge, it is obvious that this state of functioning corresponds to a proper state of consciousness. Thus, sociology of knowledge can research all fields connected with the construction of illusion and is even obliged to do so. In this presentation there will be a short analysis of the so called "society of knowledge". It will try to answer the question: Does the above name refer to the meanings of the terms used, or is it another illusion put into circulation among the public?

Startup Pitches - a Global Communicative Genre in Economy?

Mojem, Lars Jannik Karlson

Technical University Berlin, Germany
lars.mojem[at]tu-berlin.de

The Startup Pitch is a communicative form that is used to present innovative business ideas and has gained significant importance over the past decades. Originating in the Silicon Valley, it corresponds to a global trend of creating startup businesses that pursue innovative, scaleable and profitable business models. It plays a crucial role for the relationship between startup companies and supporting organizations such as venture capital firms, business angels and accelerator programs. This paper uses the concept of communicative genres (Luckmann) to describe the communicative form of

startup pitches. It stems from within the sociology of knowledge tradition and addresses this phenomenon by analyzing aspects of the broader institutional context (external structure) and typical situative forms of social (inter)action (internal structure) within one single analytical framework. In terms of interactional settings, delivering and interpreting pitches requires a high degree of specific knowledge that ensures the functioning of pitches (e.g. in the context of specific events): both presenters and recipients need to know what makes a 'good' pitch in terms of relevant information, sequential order and the specific terminology used etc. As it addresses innovative ideas, it processes the insecurity resulting from the general contingency of future developments. The paper argues that the startup pitch is a globally prevalent communicative genre. It is carried by a specific constellation of experts and transcends traditional boundaries (e.g. of nation states) by creating itself symbolic boundaries between realizable and non-realizable, innovative and non-innovative as well as profitable and non-profitable business models.

Emplacing the Canonization Process of Urban Models: Richard Florida's Creative Class Theory and the City of Toronto

Keidar, Noga

University of Toronto, Canada
noga.keidar[at]mail.utoronto.ca

In recent years, the interest in urbanism has transformed from an issue of a limited professional group into a discussion of the wider public. Like other issues entering the public realm, a market of ideas has developed around cities, which includes a group of 'influencers' who carry models to new places and are sometimes called 'gurus'. To unpack the canonization process of urban models, I build on Andrew Abbott's Linked-Ecology perspective and examine the forces that enable and restrict 'space-travelers' (Liu, forthcoming) like the 'gurus' to bring professional knowledge to a broad non-professional audience. However, when using this tradition that observes the metaphorical migration of selected 'travelers' between professional ecologies, I add a geographical dimension and examine how ideas and experts are validated through space. The analysis focuses on a case that doesn't follow the expectations, inquiring why Richard Florida, the author of "the rise of the CC" (2002), who migrated to Toronto after his ideas were widely adopted by a vast urban coalition and as part of the University of Toronto's attempt to bring an academic 'rock-star', still didn't succeed to maintain his position in the city as a 'guru'. Using media coverage of Florida's affairs in Toronto between 2003-2018 and interviews with 34 local thinkers and 'city-builders', among them Florida himself, I explain why this seemingly promising match between the 'guru' and the city wasn't sustained. I point to the spatial elements that underlie the ability of professionals and the knowledge they carry to enter new realms and maintain legitimacy.

RS14_07 | Sociology of Sociological Knowledge

On The Boundaries Of "Sociological Methods"

Kressin, Lisa

University of Lucerne, Switzerland
lisa.kressin[at]unilu.ch

This paper focusses on symbolic and social boundaries perceived, adjusted and reinforced within methods teaching in the studies of sociology within Germany, Switzerland and Austria. Understanding mandatory method training as part of the reproduction system of the discipline, the notion of the performative nature of (social) scientific methods is extended to its use in constructing and de-constructing disciplinary identity. Based on collected syllabi and interviews with method professors, this contribution tracks classification processes, boundary drawings and negations through objects, practices and knowledge elements valued as relevant for the introduction of sociology students to the category of "methods". However, as Schuster and Yeo (1986) have shown, scientific methods' claims do not only (de-legitimize) boundaries within and between disciplines but also across the scientific system in general. Following Gieryn (1983), methods are used as a strong resource to differentiate science from non-science. Historical and current debates on the legitimacy of differing ontological, epistemological, and methodological perspectives within German-speaking sociology and its teaching show how the discursive distinction between science and non-science is re-introduced within the discipline of sociology. This contribution will approach questions like, what are "sociological methods"? What role does method training play in the reproduction of the disciplinary order? Which symbolic and social boundaries are being drawn? Which are not? How do these fuzzy boundaries relate to the discipline's constant struggle to defend its own "turf" (Abbott 2010) and legitimacy, facing competing interpretations of the social from all sorts of societal actors, like other disciplines, the media, corporate research etc.?

The Academic and Political Institutionalization of Sociology in the German Democratic Republic

Grüning, Barbara

Milan Bicocca, Italy
barbara.gruning[at]unimib.it

In the light of the social and political context of the GDR-State, the paper aims to investigate how its ideology and policies influenced over time the ways sociological knowledge was produced and disseminated in the political, scientific and academic fields. As the main indicator, the paper will consider the processing of Ph.D. and habilitation dissertations issued from 1951 to 1990. The analysis is based on a list of 1500 titles of dissertations on social science issues. The database contains

important information about: The main topics carried out over time in the social sciences; the gender of the authors; the kind of institution (academic; scientific, political) where Ph.D. and Habilitation dissertations have been issued; their geographic location (central, peripheral); the discipline(s) of the authors. This material provides meaningful cues to identify from a temporal perspective: (i) the differentiation process of sociology from other disciplines in terms of theories, paradigms and methods; (ii) the symbolic, social and political functions attributed to sociology; (iii) the degree of ideologization of sociological knowledge. The co-world analysis will be carried out according to the variables mentioned above: Gender of the authors, places of issues; disciplines. In addition, to reach a better understanding of how sociological knowledge was produced, disseminated and used by sociologists and other social actors I will take into account eight in-depth interviews carried out with scholars of sociology and cultural sciences who worked in the GDR academic and scientific institutions. The main idea of the paper is, therefore, to highlight how the scientific, symbolic and social boundaries changed over time according to the structural transformation of the political and academic/scientific fields.

'Just Enough Research': User Research as the Adaptation and Production of Social Knowledge

Rudnicki, Seweryn

AGH University of Science and Technology, Poland
sew.rudnicki[at]gmail.com

The aim of this presentation is to analyze the field of user experience research as an area of production and utilization of social knowledge. User research is conventionally defined as a field of research undertaken in order to understand humans' behaviours, reactions, habits and needs in order to design better products and services. This approach has been gaining an increasing attention in the last two decades, which may be illustrated by the popularity of the terms like 'user experience', 'design thinking', 'service design', 'interaction design'. User research has been one of crucial elements of this approach and has been extensively referred to and discussed in the field of design and human-computer interaction. In spite of its growing professional popularity, user research has been largely overlooked by sociology as a non-academic field of the production of knowledge on society and its usage for (mostly commercial) purposes. This presentation will attempt to show what kind of knowledge about the social life is generated within user research, how it is produced and used. It will also discuss the social consequences of its popularity as well as the position of sociology as a discipline in the light of the relatively new non-sociological area of expertise on the social. The empirical basis of the presentation is the data gathered in the on-going research project on user research as a social practice (expert interviews, observations and secondary data analysis).

RS14_09 | Global Knowledge and Inequality

Un/Certainty in Borderland-

Discourses and Practices

Bembnista, Kamil

Leibniz Institute for Research on Society and Space, Germany
kamil.bembnista[at]leibniz-irs.de

The main argumentation of this contribution will be that borderlands can be seen as areas of un/certainty if we consider: first, the border(land) as an area of physical and social transformation. Second, the border(land) as a socio-spatial construct, which is un/certain from local actors perspective according to social boundaries, different identity-formations, language barriers etc. Here, the following research questions arise: Which socio-spatial transformation processes are being discussed in time (2007-today)? Are there stronger or weaker feelings of the common spatial units (Germany, Poland) in this border region in time, or can we even observe mixed zones, like interstices? Following the Sociology of Knowledge Approach to Discourse, I consider local public discourses in media in the Polish-German border region as public forums in which ascriptions of meanings with regard to the border (region) are developed, stabilised, but also renegotiated and changed. In our DFG-NCN-funded research-project "Socio-spatial transformations in German-Polish ,interstices'. Practices of debordering and rebordering" we are focusing on local discourses, on space-related knowledge and on practices of both residents and local actors. In this contribution I will put the focus on first results of the discourse analysis on high-circulation newspapers of Germany and Poland which shall illustrate the public discourse on rebordering and debordering tendencies. Additionally, not only verbal data (e.g. newspaper articles, book chapters) will be collected, but also visual depictions of 'borders' or border characteristics.

Transgendering Knowledge. The Case of Ukrainian Minority in Poland

Herman, Aleksandra

University of Warsaw, Poland
olaherman[at]tlen.pl

Field research that I had conducted since 2014 among the Ukrainian minority in Poland allowed to conclude that private family knowledge of minority culture and its memory are relatively feminized, though simultaneously during the institutionalization into public cultural and historical knowledge undergo forced masculinization. The minority culture itself underwent feminization as a result of modernization when the traditional areas of masculine expertise and work have become irrelevant, in contrast to most of the feminine domain. However, the official documentation of the cultural presence and social activity of Ukrainian women had been marginalized, both in the

publications by the minority itself and in the sociological scientific research on the minority. In my paper I will discuss mechanisms and processes of masculinization and feminization of cultural minority knowledge and their social effects. I will also point to some further applications possible to be extrapolated to many modern societies.

Ethnic Boundaries Revisited

Arminen, Ilkka; Segersven, Otto

University of Helsinki, Finland
ilkka.arminen[at]helsinki.fi, otto.segersven[at]helsinki.fi

Already in 1969 Frederik Barth stated that "ethnic distinctions do not depend on an absence of social interaction and acceptance but are quite to the contrary often the very foundations on which embracing social systems are built". However, the practices and discourses concerning ethnic group relations still today rely largely on the integration paradigm according to which the increased amount of contact and interaction between ethnic groups leads towards some form of an integration. Following Barth's provocative suggestion, we are interested in boundary making through which distinctions between ethnic groups are constructed, and note, as Barth suggests "often", not "always". Our data is comprised of ethnic group Imitation Games, in which participants try to imitate membership in one another's social group and identify imitating non-group members from genuine ethnic group members. It is shown that the membership-identifications depend on two issues: the out-group members' ability to cross boundaries and the insiders' ability to make boundaries. Notably, the former shows how ethnic distinctions can be overcome, and the latter how they persist. Using both quantitative and qualitative measures we analyze and detail the factors contributing towards the making and crossing of ethnic boundaries. We show that between different ethnonational groups (Christians, Finnish Swedes, Finnish Somalis, Estonian Russians) different forms of knowledge (linguistic, epistemic, axiological and experiential) step into operation with varying weight. Ultimately, we aim to illuminate the cultural foundations and groupness of the social categories involved in various configurations between different groups.

Global Boundary Making – A Sociology of Knowledge Perspective on Global Categories

Bennani, Hannah; Müller, Marion

Eberhard Karls Universität Tübingen, Germany
hannah.bennani[at]uni-tuebingen.de, marion.mueller[at]uni-tuebingen.de

“People with disabilities”, “indigenous peoples”, “LGBTI people” – those are only some of the social categories that are institutionalizing within the realm of international politics and law. International human rights documents take into account their past and ongoing grievances and translate them into rights and claims. Those specialized sets of human rights rely on the stabilization of categorical boundaries that lump certain people (for example a white “gay” man and an indigenous person who identifies as “two spirit”) by focusing on their common characteristics and experiences and rather ignoring their differences. At the same time, the contrast to the complementary categories – like “heteronormativity” – is highlighted. As global categories they include persons from all over the world into a common realm of observation, comparison and (legal) expectations that transcend regional, economic and cultural differences. While there is a growing corpus of research that addresses categorizations of persons from the perspective of a sociology of knowledge, it is mainly focused on local or national levels. Global processes of categorical boundary making are not systematically taken into account. However, we will argue that the analyses of “global categories” is crucial for the understanding of contemporary processes of globalization. Our paper offers an analytical heuristic for the analyses of global categories that relies on and is illustrated by selected cases like “people with disabilities”, “indigenous peoples”, and “LGBTI-people”.

RS14_10 | Knowledge and Digitalization

Algorithms, Identification of Legitimation Statements, and Questionnaire Design

Cvetković, Vladimir (1); Petrović, Jasmina (2)

1: SSA, Serbia; 2: Faculty of Philosophy, University of Niš, Serbia
vld.cvet[at]vivaldi.net, jasminafilfak1[at]gmail.com

The paper presents and discusses a particular multi-stage approach to use of legitimation statements and mechanisms in analysis of social institutions, relying on Berger’s and Luckmann’s work. In addition to theoretical and methodological considerations the paper particularly focuses on the technical aspects of identifying legitimation statements as propositions and using them in order to construct an instrument for survey style research. Operationalisation of institutions of property and market, which are interdependent

and combine static and dynamic aspects of institutions, was a preparatory step towards designing an algorithm which would then identify propositional forms and their frequencies in which these two institutions are mentioned. The algorithm is applied to a corpus of online, publicly available, text in Serbian language in order to identify a number of propositional statements which were then used to design items/questions for a questionnaire. Test run of the survey is conducted on the population of students of three state universities in Serbia and data processed using cluster analysis, in order to assess how identified propositional statements are structured and how the observed population articulates the shape and role of the two institutions. Finally, the results are discussed in the context of the research design process as a whole, pointing at opportunities and particular issues, including broader consequences, to possibilities for using algorithms to design empirical research grounded in sociology of knowledge.

Big Data, Social Sciences and Politics. Critical Questions For Social Knowledge

Affuso, Olimpia; Coco, Antonella

University of Calabria, Italy
olimpia.affuso[at]unicall.it, antonella.coco[at]unicall.it

The increasing relevance of Big data constitutes a new challenge for social sciences, since it entails transformations in social knowledge production and redefinitions of several boundaries, in particular between different research centres in Europe and in the rest of the world. We focus on the relationship between Big data and social sciences, addressing some emerging breaks and gaps, namely: 1) theoretical-methodological; 2) technological; 3) political-regulative. With this regards, social scientists are required to explore potentialities and limits of new methods based on digital information in comparison to the tradition research methods. Are Big data challenging the role of theory in social research, moving towards the “end of theory”? According to us, we are quite far from this direction since the development of new technologies requires still theoretical knowledge. Furthermore, problems concerning data reliability, which imply the necessity of control and scientific validation, and problems regarding the power of infrastructures appear to be crucial (Leonelli 2014, 2018; Kitchin 2014; Mayer-Sconbergere, Cukier 2013). In addition, we highlight some other aspects relevant to the use of Big data within social sciences, which require the regulative role of politics, such as inequalities in terms of data access, the power of big companies, the risks of personal data abuse, costs and financing of scientific research based on Big data (Giovannini 2014).

The Scenographic Construction Of Knowledge About Control Centres

Schröder, David Joshua

Technische Universität Berlin, Germany
d.schroeder[at]tu-berlin.de

The contribution deals with recent developments in the global field of control centres as places that monitor and control an outdoor area using the latest technology. Looking at those, I address the relation between knowledge and architecture. It can be seen, that such centres mediate common knowledge about them with the help of scenographic spatial design. Especially within the framework of smart city initiatives that aim at a holistic integration of previously separated sectors, they become the bearers of increased expectations of a controllable future. The presentation will use marketing and public relation documents as well as initial ethnographic field data of such smart city control centres to illustrate how expectations are inscribed into their architectural design and how their public perception is shaped through certain scenographic assemblages.

Digitalization and the change of Lifeworlds

Tuma, René

TU Berlin, Germany
rene.tuma[at]tu-berin.de

The increasing relevance of technologies of communication contributes to the transformation of the social structure of knowledge. Sociology of knowledge deals with this phenomenon on all levels, ranging from expert knowledge to everyday knowledge and the undoubted ground of natural worldview. The question is if digitalization effects only the societal variable structures or if it goes even deeper and changes our (inter)subjectivity. So what are those changes caused by digitalization and how are can those be reflected in theory? The presentation takes the Schutz/Luckmann concept of lifeworld concept as a starting point for this debate and uses a number of examples to address possible changes related to our conception of the essential dimension such as time/ space / social relations etc.

RS15 | Sociology of Law

RS15_04 | Democratic Deficit and the Judiciary

Politicians, Judges and the Democratic Deficit in Transnational Institution Building: The Case of the European Unified Patent Court

Lazega, Emmanuel

Institut d'Etudes Politiques de Paris - Sciences Po, France
emmanuel.lazega[at]sciencespo.fr

At the transnational level, the complexity of the relationship between democratically elected politicians and the judiciary includes cases where politicians from different countries are unable to concentrate enough power to build new transnational judicial institutions (such as specialized courts). In such cases, public-private technocratic elites and oligarchic networks of national judges and transnational lawyers try cross-nationally to make up discreetly for the failed politicians by building these very same transnational institutions themselves. These transnational institutions then bear the marks of the democratic deficit that initiated them and of the oligarchic process and capture that created them. This paper presents a substantive area of law in which this process takes place, i.e. intellectual property, particularly European patent law. At the national and at the transnational levels, regulation in this field is developed and enforced by a closed, self-contained public-private legal community. The latter was able to build the recent European Unified Patent Court, a public-private judiciary now part of the European judicial architecture. In many ways this legal sub-system succeeds by reducing the Parliamentary process to a quick ratification that squeezes the legislative process and debates described by Maclean and Kurczewski (2011). It is thus argued that when citizens, in turn, react negatively to this democratic deficit and when national politicians take advantage of this reaction to "scapegoat the judiciary under the guise of the sovereignty of the people and the State", a first step in reconsidering the politicians-judiciary-general public triangle should be to enforce the Montesquieu division of powers. Additional steps are also discussed.

Judicial Appointments In A Democratic Society

Maclean, Mavis

University of Oxford, United Kingdom
mavis.maclean[at]spi.ox.ac.uk

Judicial appointments in a democratic society The UK sees itself as a democracy. Brexit is justified as respect for the will of the people, given new sacred status, but making difficulties for elected members of parliament who must choose either to

do what voters asked for, or behave as responsible representatives of their constituents and act in their best interests. Representative or direct democracy is a dangerous dichotomy, especially under a minority government. We rely on the ability of parliamentarians led by their speaker to maintain the supremacy of the legislature over the executive. Who will be left to pick up the pieces? The judiciary. Their wisdom and independence of thought will be more vital than ever. So, who are they? White middle class men of traditional education and high intelligence, experiences in weighing evidence and making decisions. Satisfactory? Perhaps. But how are they chosen? At no level are they elected. Not a problem, elections produce bizarre results. Not at the senior level does the Lord Chancellor "make soundings". We have an independent Judicial Appointments Commission. But who appoints these members? For the lay magistracy, the pathway is application, We reformed in haste and are repenting at leisure. Recent constitutional change achieved the separation of posers by removing the LC as speaker of the Upper House, head of the judiciary and cabinet minister. Democratic? Maybe, but the influence of the judiciary has been reduced just when most needed.

Glocal Welfare: Global Irritations and Local Decisions

Pennisi, Carlo; Consoli, Teresa; Mazzeo, Francesco

Università di Catania, Italy
cpennisi[at]unict.it, consoli[at]unict.it, fmazzeo[at]unict.it

In the tradition of the theory of action and its evolution in the system theory, the change in complex organizations can occur if contextually intercepts the internal structure of decisions and the external motivation for this change. The most interesting transformation in welfare systems occurs when local administrations re-organize their procedures and contextually re-define the criteria for collaborating with local actors. In many cases this eventually happens when resources are cut (or given under certain conditions) and when local administrators perceive the re-organizations imposed as an opportunity to change consolidated (but partially inefficient) services. The perspective we assume in order to focus these changes is experimented on a specific service to poor family in a Municipality in Southern Italy during the recent economic crisis, and therefore linked to the decisional local structure, to the kind of irritations perceived on both internal and external processes and the ways through which administrative procedures become a communication media between (relatively) autonomous social systems. In this light, what seems remarkable is the emergence of new local decisional structures enforced by the hybridization of existing normative systems, new processes that guarantee and legitimize local decisions according to crossing "uses" of national and European legislation. How these procedures have enhanced re-uses in local administration, and which kind of changes have been introduced that reflect a different communication among actors, the content of the service, the expectations of clients? The results obtained by studying this service for poor families in a Sicilian town, underline the opportunity of enhancing and combining the re-construction of local decisional processes with instruments for their monitoring and evaluation.

Judicial Power And Social Claims: Confrontational Narratives And Constructive Interactions

Polichroniou, Ariadni

National and Kapodistrian University of Athens, Greece
apolichroniou[at]hotmail.com

This paper attempts to contribute to the exploration of the turbulent relation between the judicial power and the claims of social movements and solidarity mobilizations formed within the current conditions of institutional destabilization and social precarity. More specifically, it aims at the close analysis and comparison of three high-profile legal cases that provoked the public interest in Greece in the latest years leading to protestations, campaigns, festivals and various other political and cultural forms of resistance due to serious violations of both the Greek Constitution and the European legal order, namely the case of Irianna V.L. and Periklis (2012-2018), the case of anarchist Tassos Theofilou (2012-2018) and the case of anarchist and hunger striker Kostas Sakkas (2010-2016). In this light, this paper wishes to examine the characteristics, coherence and strategies of the solidarity movements that reacted to the condemnatory judicial decisions of the abovementioned cases, as well as to detect their perception of justice and the basis of their claims towards the overturning of the firsts instance Courts' verdicts. Final goal of this paper is the observation of the dynamic dialogue between the two antagonizing, yet interwoven, narratives of the judiciary force and the social reaction in order to open up the possibility to reflect upon the constantly altering relationship between the legitimization of the judiciary and the claim for social change within the democratic societies of late modernity by processing on the habermasian communicative model, the fraserian notion of recognition and the butlerian approach of the politics of protest.

RS15_06 | Democratic Deficit and Judicial Rower: The Context for Justice

Constitutional Democracy in US

Sullivan, Barry

Loyola University Chicago, United States of America
bsullivan7[at]luc.edu

US constitutional scholars seldom write about constitutional conventions or norms. They tend to focus on "hard law," without regard for the underlying social consensus that is essential to constitutional democracy. But our current constitutional crisis involves violations of norms, not hard law. For example, there is no provision in the Constitution that prescribes a specific process for the Senate to follow in exercising its advice and consent function when the President has made a Supreme Court nomination, but the convention has been for the Senate to conduct hearings and a vote. In the

final year of the Obama Administration, a nomination died because the leader of the Senate Republican majority refused to follow that convention. Likewise, recent presidents of both parties have regularly bypassed Congress and issued "executive orders" to accomplish unilaterally what normally would be done through congressional legislation. Finally, the Supreme Court has reached out to decide issues on the slightest pretext and often contrary to the conventions that it normally invokes to temper its awesome power to strike down executive and legislative action that a majority of the Court deems to violate the Constitution. Constitutional conventions are necessary to any constitutional system. But the enforcement of such conventions requires an underlying social consensus as to what those conventions are and why they are necessary. This paper will explore these recent breakdowns of constitutional conventions, suggest some explanations for why the breakdowns might have occurred, and explore how the conditions that gave rise to them might be altered.

Totalitarian Law as Legacy of the Past and Present-Day Authoritarian Tendencies in Post-Communist Countries

Fuszara, Malgorzata

University of Warsaw, Poland
mfuszara[at]op.pl

Adam Podgórecki (1995) argued that the characteristics of totalitarian law include its subservience, the fundamental principle, the totalitarian principle (vs the constitution), bureaucratization, repression of the judiciary, the empty appearance of legalism, harsh penalties, disregard of the public opinion and "dark social engineering". The law in Poland in 1945-1989 met nearly all of these criteria. I will contemplate whether it is justified – and if so, to what extend – to say that the law in today's Poland and current "reforms" of law are pushing the legal system towards authoritarianism. This tendency met the resistance of great part of the organised lawyers. I analyse the organised resistance on part of the judiciary and lawyers pointing to the significance of intra- and extra-national institutional safeguards against the authoritarian policies.

Democratic Decay in a Seemingly Consolidated Democracy of CEE

Markowski, Radosław

Uniwersytet SWPS, Poland
rmarkowski[at]swps.edu.pl

In Poland the decay in its democratic quality and rapid backsliding into authoritarianism came – quite unexpectedly – not from the allegedly politically unsophisticated and democratically unprepared ordinary citizen, but from part of the elites. The main goal of the paper is to depict and explain this unexpected decline in democratic quality in Poland. I submit that the causes of the contemporary malfunctioning of – what allegedly was supposed to be – a consolidated democracy in Poland derive not so much directly from the socialist blueprint and its seeming continuity among Polish Homo Sovieticus, but indirectly from the successful rejection of this blueprint in the form of "adaptive resourcefulness" be it in their activities in the shadow economy, be it in the underground cultural and academic accomplishments or in the ideological/religious participation in the parishes. All these (and more) had successfully contributed to the dismantling of the communism, yet it simultaneously has contributed to the creation of a number of traits of Poles as citizens that turned uncondusive to democratic quality. In addition, special attention will be devoted to the logic and mechanisms of the supply-side revolt developing in Poland, seeking to answer a general question is it a choice or a fate? The main additional question being: why would political insiders, representatives and leadership of a well-established party benefiting for the last quarter of a century from access to state resources, democratic security, public sector jobs and relative prestige among part of the population decide to abandon a low-risk political democratic behaviour and embark on a very hazardous strategy of a – de facto – coup against the binding constitution?

The Interaction Between The Legal System And The Other Areas Of Human Action

Truda, Giovanna

University of Salerno, Italy
gtruda[at]unisa.it

If the interaction between the justice system and the other areas of human action are thought as mutual action, we think of law in two ways: as a factor of social change or as an object of social change. The law is set as an independent or a dependent variable in respect to society. The choice between the two modalities is indicative of distinct theoretical orientations. Luhmann argues that the evolution of a system depends not only on the complexity of the environment, that is on external circumstances, but also on its complexity, that is, on its internal differentiation. In the climate of increasing social complexity, the law gradually renounces regular behaviour and provides only organizational and procedural rules, which allow the subsystems to self-regulate without the intervention of the legislator. It is necessary to face a different relationship

between the legal system and society. Today, the end of certainties and with the existential precariousness that reduces the ability of institutions to order behaviour in predefined schemes and the institutions themselves are committed to redefining their role to adapt them to pressures outside the system. Is the "media" approach of the law a likely operational response to radical changes? The political transformations of governments in Europe recall a populism that seems rather than responds to the demands of the people: can this undermines fundamental rights? Is it a problem of communication between the systems? or is it just vote and electoral consent chasing?

RS15_07 | Democratic Deficit and the Rule of Law

Rule of Law in Poland. The Difficult Process of Societal Maturation

Skapska, Grazyna

Jagiellonian University, Poland
grazyna.skapska[at]uj.edu.pl

Based on the concept of cognitive and moral development on a large scale, this paper discusses the difficult process of establishing the rule of law in Poland after the collapse of communism. Particular attention is paid to the last couple of years, i.e. to the period that witness an abrupt destruction of institutions aimed at the establishment of the functioning rule of law on the one hand, and the awakening of legal consciousness among the considerable part of society, on the other. One of the important components of this emancipatory process of cognitive and moral awakening presents the visible and rather unexpected growth of professional pride among legal professionals, another the growing popular interest in the constitution and constitutionalism.

Democratic Deficit in the Post-Communist Rule of Law

Kurczewski, Jacek Maria

University of Warsaw, Poland
j.kurczewski[at]uw.edu.pl

This paper draws on empirical findings on attitudes towards the administration of justice in Poland (Kurczewski & Fuszara 2017) putting it in the wider socio-political context of developing democracy in post-communist societies. The universal basic dilemma of democracy is symbolised by both representative and direct people's sovereignty being recognised in the Polish Constitution of 1997. (Kurczewski 2002). The recent attempt by the elected government to take over the constitutionally independent judicial branch had been legitimised by reference to the will of people as expressed through dissatisfaction that was increased by the sudden exposure of the administration of justice to the critical media after the end of the communist rule. The judiciary since 1989 has not only gained independence from government but also cut off links with the people through marginalisation of the lay assessors and corporative splendid isolation. The people's dissatisfaction is, however also felt towards the representatives and parliamentary institutions while judicial independence is considered as of value. This dialectical and dynamic process is an incentive for re-thinking the mutual relations between power, justice and the people to sketch new models for the democratic Rule of Law.

European Integration and Legislative Approximation: The Case of Ukraine

Shevchenko, Lesia (1); Zelinska, Olha (2)

1: Open Society Foundation, NGO, Ukraine; 2: Graduate School for Social Research, Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland
slesya08[at]gmail.com, ozelinsk[at]sns.edu.pl

While European societies are witnessing the rise of skepticism and the desire to disunite the local legal order from the European one, the neighboring Ukraine clearly demonstrates the intention for European integration and declares the willingness to take all necessary steps in this direction. The 2014 EU-Ukraine Association Agreement, among other things, foresees bringing national legislation closer to the EU law. The actual progress of adaptation, however, is not impressive. In 2018, only 8 out of 57 approximation bills became laws. Moreover, sometimes the bills, labeled as approximation, aim at things that are not compatible with European principles, such as protectionism or state aid for the "selected few". We investigate why the adaptation of the national legislation to EU law is so long and uneven. We base the analysis on 10 expert interviews and the materials of the Parliamentary Expert Group - an independent expert community created in 2015 for promoting the implementation of the Association Agreement through influencing the quality of the lawmaking. To understand the progress of Ukraine's legal approximation, we map of the main actors of the legislative process and their interests, and highlight the important institutional factors affecting legislators, including the imperfections of the

legislative process (so called legislative "spam" in Ukrainian parliament); contradictions between national (or sectoral) interests and international obligations; specific party culture, lack of the deputy-constituency connection; the growth of populism in the pre-election period of 2019.

Neither "Rule of Law" nor "Civil and Social State"? A modern legal challenge in Europe

Karalis, Georgios

National and Kapodistrian University of Athens, Greece
gkaralis[at]hotmail.com

Driving force of History is the endless struggle for conquest of Power, strongly connected to Law enforcement in every State. In Europe, the development of legal and political institutions has influenced the World. The once "Great Powers" have influenced catalytically the majority of the legal systems worldwide. In the theory of comparative legal systems, a common European one ("Civil Law") was established after Napoleon's conquests as well as England has established its "Common Law" in all its previous colonies. EU is found on the basis of both legal systems. Its main principles contain values favouring free and equal justice for all. Non-democratic regimes never have been considered as eligible to enter the EU. Freedom of justice, government-citizens relations, political parties, parliamentary democracy, have evolved in Europe, since Enlightenment and Liberalism were born after Renaissance. Modern institutions developed firstly there by interaction and innovation, ie the "Civil" or the "Social" State and the fundamental principles for the "Rule of Law". One of the Three Powers in every Constitution is the Judicial, the pillar of democracy, social and civil rights. In Procedural Law and Courts, public and Private Law coincide towards the improvement of state functionality so as to provide better life standards to its citizens. Public Administration and Governance cannot be separated from citizens' needs. The contemporary administrative and judicial upbringings in Poland and Hungary raise a justified turmoil over the future of democracy in the European Union. Brexit comes as a factor which might lessen democracy in Europe. Contemporary theories in the sciences of Sociology, Law and Sociology of Law need to be used so as to provide viable solutions to this modern challenge.

RS15_09 | Democratic Deficit in Legal Regulation

"The Street Is My Private Space": Being Without Shelter In Leipzig

Schneider, Luisa T

Max Planck Institute for Social Anthropology, Germany
lschneider[at]eth.mog.de

In Germany, the right to privacy and intimacy are basic rights. Privacy is defined spatially as the non-public sphere, the domestic arena, the family circle and private life, and the right to intimacy includes among other things sexuality and sexual life. However, these notions of privacy and intimacy as well as the processes in place to protect persons from intimate partner violence are based on living circumstances wherein the private sphere is separated from the public sphere through the walls of one's home. But how is intimacy and privacy experienced among persons who live under conditions which do not allow for this spatial separation. How do such citizens perceive their legal agency and how do they interact with the state when they are wronged? Through an analysis of policy and legal documents and ethnographic fieldwork, I analyse how privacy and intimate relationships are experienced and lived without regular shelter and examines the role that violence plays in the intimate relationships of unhoused persons. How do they witness, expect, endure and execute intimate partner violence? How do unhoused persons mediate and regulate violence within their relationships? How do they relate to and interact with state laws and law enforcement? Do they take steps to realise their rights and do they seek the protection of the state? And if not which, if any, alternative mechanisms do they employ? I consider three focus groups: unhoused persons; state and legal institutions and intermediaries who provide services (faith-based organisations, NGOs, voluntary and community-based organisations) Based on research in Leipzig, I consider the interplay between the legal-structural, the institutional-political, the social-relational and the intimate-personal and combine anthropology and law.

Brexit, Gender and (the End of) Human Rights

Millns, Susan

University of Sussex, United Kingdom
S.Millns[at]sussex.ac.uk

The UK has long been known for its scepticism about the value of European human rights law and this scepticism has spanned both the UK's relationship with the European Convention on Human Rights as well as European Union Law. Equally feminist scholars have expressed mixed views over the years about the value of human rights (constructed in an abstract and gender neutral fashion) to ameliorate women's substantive inequalities and to address violations of women's human rights in practice. This contribution explores the implications of

Brexit for women's human rights protection in the UK and in Europe. It will investigate the development of fundamental rights guarantees in the European Union and the extent to which this has assisted in addressing violations of women's human rights particularly in the British context. The paper will explore the relationships and tensions between the various sources of European human rights law (including the EU's Treaties, the Charter of Fundamental Rights, the European Convention on Human Rights and the case law of the European Court of Justice and European Court of Human Rights) and will seek to answer the question 'What has the EU done in practice for the human rights of women in Europe and the UK?' The contribution will furthermore explore the consequences and future prospects for the UK's withdrawal from EU human rights obligations, particularly given the longstanding desire of some in government to end the UK's association with other forms of European human rights protection, notably the debated UK withdrawal from the European Convention on Human Rights.

Scotland, Equality Law and Gender

Busby, Nicole

University of Strathclyde, United Kingdom
nicole.busby[at]strath.ac.uk

Equality law inhabits a somewhat undetermined territory within Scotland's current devolution settlement. With limited exceptions it is a reserved area whereas human rights are devolved although the relevant provisions of the Scotland Act 1998 must be read alongside the UK's Human Rights Act 1998. In the Brexit referendum of June 2016, 62% of the Scottish electorate voted to remain within the EU. Whilst some argue that Brexit provides an ideal opportunity to exploit Scotland's indeterminate equality framework by taking bold and decisive action, many ask whether Scotland is really so different from many UK regions that voted to remain. The dominant political response to Brexit's perceived threat to gender equality is for Scotland to be distinct, to go beyond the non-regression principle and become a global leader. Potential is offered by the use of the exceptions to the Equality Act 2010 permitted under the Scotland Act 2016, as well as the Scottish Government's implementation of the socio-economic duty. However, without greater devolved powers in the area of equality, it seems unlikely that Scotland will be able to forge its own distinct path. This paper considers the threats and opportunities that Brexit poses to gender equality in Scotland.

RS15_10 | The Crisis of Legitimacy in Law and Justice

Formal Democratic Legitimacy In The European Union: The Continued Barrier Of Multilingualism

O'Leary, Erin Nicole

University of Chester, United Kingdom
e.oleary[at]chester.ac.uk

The term 'democratic legitimacy', as defined by such academics as Joseph Weiler, David Robertson, Richard Bellamy and Dario Castiglione, encompasses two key elements: formal (or procedural) democratic legitimacy, and social democratic legitimacy; the former being described as internal in nature, the latter external. Formal legitimacy corresponds to legality and thus concerns the democratic institutions and processes of law-making within a legal system. On the other hand, social legitimacy does not take procedures into account, but rather refers to a broad social acceptance of the system. Criticisms of the EU in regard to its 'democratic deficit' centre around its formal law-making processes and voting systems and thus relates to its arguable lack of formal (or procedural) legitimacy. The changes to the law-making process and voting systems brought about by the Lisbon Treaty have arguably increased the level of formal legitimacy overtly evidenced in the institutional workings of the EU institutions.¹ However, there remains the significant barrier to true democratic participation with these processes caused by the EU's multilingual nature. This paper will consider the impact the EU's multilingual nature has on its formal legitimacy by considering the role of language in democratic participation processes. Considering this issue using Western linguistic theories of language reveals the extent of the role language plays in these formal institutional processes and thus allows us to work towards greater formal legitimacy within the European Union. 1. Stephen C. Sieberson, *The Treaty of Lisbon and Its Impact on the European Union's Democratic Deficit*, 14 Colum. J. Eur. L. 445 (2008)

The Court Of Justice Of The European Union: A New Model Of Legitimation Of Justice

Bevilacqua, Stefania Adriana

Sapienza University of Rome, Italy
stefaniaadriana.bevilacqua[at]gmail.com

Following a period of study and work at the Court of Justice of the European Union, I empirically developed a thesis on why its preliminary judgements are accepted, legitimized and applied throughout the territory of the Union, even if the decisions are referred to specific national cases. According to my research, the key of the Court legitimacy is the judicial procedure used within the Court, because it was empirically created to link the judicial power and the European societies. To explain how the social legitimacy works, it will be first described how the procedure takes place in a multilingual and multicultural context that leads to the creation of an impartial area of mutual recognition between different societies. Secondly, I'll stress the method of interpretation of the law created by the judges themselves, since it was developed precisely to make the Court highly responsive to social changes. Finally, I'll show how this method entails the social legitimacy of the decisions especially thanks to the participation of multiple actors: the CJEU judges, the referring Court, the Advocate General, the Member States and the national litigants. They are central actors in the construction of the communication bridge that, thanks to the procedure itself, leads to the legitimacy of the decisions of the Court of Justice in every national legal system of the European Union and their alignment with social needs. The paper aims to highlight these elements, so as to provide a theory on the social and political legitimacy of the European judiciary.

Gender Strategies of the Czech Norm-Makers

Fellegi, Zuzana

Anglo-American Univeristy, Prague, Czech Republic
z_fellegi[at]yahoo.com

Despite the fact that the Czech Republic is the most atheist country in Europe, it is also a very conservative one with a traditional patriarchal perception of gender roles. The situation has been slowly improving after its accession to the European Union and adoption of the EU anti-discrimination and gender acquis. A number of gender progressive norms and programs has been adopted but the overall change of the gender role perception and the gender equality process is rather slow. This paper is based on an interdisciplinary approach combining legal and discourse analysis. It provides a systematic analysis of the gender norms which were proposed and debated in the Czech Republic after its accession to the EU. The legal analysis is combined with analysis of the discourses of the main decision-makers detected from the meeting proceedings of the government and parliament, judicial decisions, expert articles and opinions as well as discourses maintained in the media. Based on the findings, I argue that there is a clear and repetitive pattern where the Czech policy and norm-makers selectively opt for norms which seemingly support women but actually result in effective preservation of the patriarchal family and the traditional gender role division in society. Key words: European Union, European gender acquis, gender equality, gender roles, patriarchal family.

Islands of Innovation: Exploring the Dark Side of Judicial Innovation in Southern Europe

Verzelloni, Luca

Centre for Social Studies, University of Coimbra, Portugal
verzelloni[at]ces.uc.pt

In the last 20 years and, in particular, following the economic crisis, the Southern European countries have introduced a large number of reforms, with the aim of improving the quality, effectiveness and efficiency of their judicial systems. Following this long "season of reforms", despite the fact that on a formal level all the procedural guarantees of due process do exist, justice in southern Europe is still not particularly transparent, effective or efficient, limiting the opportunity for citizens to access justice and protect their rights. However, using the metaphor of a geographical map, if we change the scale of reference, we realize that some courts in southern Europe have become "arenas of innovation", where many local interventions are designed, trialed and implemented. The hypothesis of this paper is that, on one hand, despite the investments made in recent years, the reforms carried out in the southern Europe have only rarely achieved effective, lasting and, above all, widespread results and, on the other, the propensity for innovation of some judicial offices has helped bring out great differences in the ways in which justice is provided in the territory. The paper's arguments are based on the results of a 5-year research project, focused on the 4 main Southern European judicial systems: Greece, Italy, Portugal and Spain.

RS16 | Sociology of Spatial Mobilities

RS16_01 | Spatial Immobilities

Practices of Car Parking and the Construction of Immobility

Kurnicki, Karol

University of Warwick, United Kingdom
karol.kurnicki[at]warwick.ac.uk

My project focuses on practices of car parking in the context of everyday mobility and infrastructure production in three European cities. The practice is enabled by an oriented towards an object. By analysing it, I am interested in exploring the role of materiality in social practices, material relations unfolding in processes of (im)mobility and their consequences for social life in cities. In this presentation I talk about the ongoing fieldwork in London and Warsaw. In its course, I combine field visits and observations, interviews and digital data analysis. Specifically, I would like to discuss how is parking construed in social media and how it is performed by drivers in natural urban setting. In so doing, I will confront the hypothesis that parking becomes visible mainly in instances when it is problematic – both when a driver cannot find a parking space or when parked vehicles cause delays or obstructions. The interaction between drivers and their cars as well as cars and their surroundings – as observed during fieldwork and conveyed through digital means – will be my main points of interest. Additionally, building on the ongoing research, I would like to propose a conceptualisation of immobility as a practical achievement characterised by strong ties of material objects, specific embodied knowledge and connectivity between various levels of urban life. By conceptualizing car parking as a practice, I will attempt to bring together concepts from mobility studies and social studies on infrastructure.

The Young Women Who Stay Behind. Spatial Immobility And Proximity As A Resource In French Rural Areas

Orange, Sophie (1); Renard, Fanny (2)

1: University of Nantes, France; 2: University of Poitiers, France
sophie.orange[at]univ-nantes.fr, fanny.renard[at]univ-poitiers.fr

Within a French rural context where an increasing number of local businesses are closing, it is usually necessary for young people to obtain qualifications and to move to towns or cities in order to find an employment. However, a certain number of young women settle down near their families after leaving school. The aim of this presentation is to use the concept of “capital of autochthony” to analyse supports and resources

that help these young rural women, who do not have a high level of economic and cultural capitals, to find an employment or to reconcile their family and professional life. Capital of autochthony allows these young women to deal with the scarcity and insecurity of jobs, the maternity constraints and a low income. We suggest that proximity can be considered as a resource for those sedentary young women to deal with domestic assignment and to avoid disqualified jobs by entering the self-employment sector. This presentation draws on a study based on in-depth interviews (n = 35) and ethnographic observations conducted in western-central France with young rural working-class women who have continued to study, live and work in the place where they grew up. Finally, we suggest that if the capital of autochthony can alleviate the lack or weakness of central capital in access to certain markets (e.g. employment, real estate, matrimonial), it does not allow to fully compensate this deficit.

Who Is Staying Behind? Characteristics Of Lifetime Stayers And Movers In Germany

Skora, Thomas

Federal Institute for Population Research (BiB), Germany
thomas.skora[at]bib.bund.de

In the course of the “mobility turn” in the social sciences, calls have been made to also pay greater attention to immobility. However, studies on people who have never left their place of childhood (lifetime stayers) are still scarce. Gaining a better understanding of the characteristics and living conditions of these stayers is of high relevance, as staying turns out to be ambivalent from an individual and societal perspective: While spatial immobility is typically perceived as a shortcoming that hampers career progression, policy makers consider staying to be advantageous for rural communities. This paper aims to address this research gap by drawing on data for the years 2000 to 2016 from the German Socio-economic Panel (GSOEP; n=292,199 observations from 39,657 individuals). Based on the native-born population, it examines i) the spread and ii) the socio-demographic and socio-economic characteristics as well as the well-being of lifetime stayers in comparison to movers. Lifetime stayers are respondents who still lived at the place of their childhood at first wave and have not migrated across county borders afterwards. Analyses are stratified by age groups. First findings reveal that the proportion of lifetime stayers decreased between 2000 and 2016. Nevertheless, in 2016, nearly every second middle-aged adult still lived in the region where she/he grew up (46% of people aged 35–64). Staying at the place of childhood is negatively associated with income and occupational status. However, stayers seem to be compensated by a higher level of satisfaction with regard to leisure activities.

RS16_02 | Spatial Mobilities: Practices and Decision- Making Process

An "Everett Hughes" In The Engine: The Moral Organization Of Everyday Spatial Mobility

Cacciari, Joseph (1,3); Aguilera, Anne (2,3);
(2,4)

1: Université Paris-Est Marne-la-Vallée, France; 2: Institut français des sciences et technologies des transports, de l'aménagement et des réseaux; 3: Laboratoire Ville Mobilité transport; 4: Laboratoire Dynamiques Économiques et Sociales des Transports, France
joseph.cacciari[at]enpc.fr, anne.aguilera[at]ifsttar.fr,
leslie.belton-chevallier[at]jifsttar.fr

Constraint or choice? Rational action or produces of habits and social norms? Social practices of everyday spatial mobility are often analysed by researchers from the perspective of these opposition couples. A brief review of the scientific literature on the subject even shows that these dichotomies tend to be routinised: they are no longer, or only slightly, questioned in their foundations over time and as investigations accumulate. However, these pairs of notions lead to impasses in the knowledge of the social fact of daily spatial mobility, homogenizing and decontextualizing practices, for example. These pairs of notions can also make us lose sight of the internal complexity of what "mobility" means for everyone along the biographical trajectory. The objective of this presentation is to suggest some ways to take a step aside which, although far from revolutionary, could contribute to the re-examination of these pairs of notions that form the basis of most research in the field and the epistemological obstacles that they may present to the researcher. To this end, the presentation will draw on the achievements of other fields of sociology, and in particular on E. Hughes' long-standing reflections on the moral organization of work activities, with the aim of assessing the possible effects of their transposition to research on the social practices of spatial mobility.

Are You Ready To Move? A Study On Individuals' Propensity Toward Spatial Mobility, Evidence From Italy

Bocchino, Matteo; Fantechi, Federico

Gran Sasso Science Institute, Italy
matteo.bocchino[at]gssi.it, federico.fantechi[at]gssi.it

Spatial mobility is an important feature of our society. People move around. Old people do, young people as well, both male and female. Starting from a sociological approach which puts the individual perspective at the centre of the process, our contribution does not focus on the actual experience of

mobility, rather it focuses on the individual propensity toward mobility. Regardless of any actual past or present practice of spatial mobility, we explore the individuals' propensity on the idea of moving away from their life-context. Thanks to a wide multi-functional Italian survey designed and conducted by Professor A. Marradi - which counts more than 4,000 respondents - we have been able to develop an index to measure this individual perspective, namely "Propensity Index for Spatial Mobility". For the study, we have employed robust quantitative techniques to investigate the influence of socio-demographic factors alongside other relational, educational, cultural, and geographical features. Our results are partially aligned with what affirmed by the most influential research paths on spatial mobility. However, our results also indicate that some of the traits usually connected with high levels of spatial mobility are actually related to lower scores on the Propensity Index for Spatial Mobility. We conclude suggesting that the actual experience of spatial mobility is not always directly correlated with the individual propensity to move. This is the case, for examples, of people with high levels of education. In our vision, the index we propose could become a useful tool for researchers to investigate spatial mobility. Indeed, by taking into account the individual dimension of propensity, we could be able to explore its role in successful (or not) experiences of mobility.

Mobilities, Migration and More: Reconsidering the Agendas in Rural Youth Research

Nugin, Raili

Tallinn University, Estonia
nugin[at]tlu.ee

Drawing on fieldwork in six Estonian rural areas in 2010-2019, the paper calls for a nuanced understanding of processes of mobility and migration in rural areas. Based on qualitative in-depth and focus-group interviews with rural youth and key stakeholders, several phenomena will be pointed out that need to be dealt with in order to adequately grasp the dynamics of mobility. It will be argued that when speaking about the mobility of rural youth, we must not concentrate only on their migration intentions, place attachment or migration from rural places. Nor should we limit our research to young people who are in the years of their transition to adulthood. Rather, we should pay attention on their mobility practices from their early childhood, see the connections between mobility practices and class, but also the intertwining of the local context with the mobility practices and its impact on mobilities in further life. Mobility may depend on, but may have impact to several aspects, such as spatial arrangement of the village, social hierarchies in the community and the symbolic position of the location. Though access to mobility in rural context has become widely spread among all social strata, it tends to remain class specific regardless to the distances it embraces. Also, the aspects of belonging and place attachment can be class-specific and may be intertwined with mobility practices.

Migration, Commuting, or a Second Home? Insights From a Vignette Experiment

Petzold, Knut

Ruhr-Universität Bochum, Germany
knut.petzold[at]rub.de

In the last decades, more complex and circular types of residential mobility arose while one-way relocations declined. Existing studies that address migration and commuting as being substitutes often suffer from problems of endogeneity or face lacking data about decision-making on different types of residential mobility. By contrast, I investigate decision-making on migration, commuting, and establishing a secondary home by using a factorial survey experiment, which allows accounting for both endogeneity bias through randomisation and complexity in decision-making through variation of numerous competing factors. Hypothetical job offers were presented to a sample of academic staff of a Swiss University in order to examine the relations of the intended types of residential mobility and their drivers. I argue that the more competing relevant factors are the more becomes establishing a second home an alternative as it can compensate for unilateral costs of both one-way migration and daily commuting. Analysis shows that the migration intention is mainly caused by migration costs and the commuting intention is mainly caused by transition costs. Establishing a second home is indeed the more intended the more costs compete and the less migration nor commuting are clearly preferred. Hence, intentions for migration and commuting are in a linear negative relationship but stand in an inverted U-shaped relation to the intention for a second home. In sum, circular types of mobility can be understood as being substituting for one-way relocations, but substitution must be considered imperfect due to the still remaining mobility costs and its discontinuous nature.

RS16_03 | Spatial Mobilities in the Life Course and Mobility Biographies

Towards a Mobility Biography Approach to Long-distance Travel and 'Mobility Links'

Mattioli, Giulio; Scheiner, Joachim

TU Dortmund University, Germany
giulio.mattioli[at]tu-dortmund.de, joachim.scheiner[at]tu-dortmund.de

Over the last 15 years, biographical approaches have gained a foothold within transport studies. 'Mobility biographies' research explains changes in travel behaviour over the life course as a function of changing residential, employment, and household/family (and other domain) biographies. It has thus contributed to highlight how different scales, temporalities and forms of spatial mobilities (e.g. residential relocation and commuting) co-evolve over the life course. Yet, so far, most of this research has focused on (largely short-distance) daily travel behaviour and has relied on socio-psychological understandings of travel habits. In this theoretical paper, we propose to extend the mobility biography approach to long-distance travel (LDT), arguing that this requires some adaptations. Given the nature of much LDT – as infrequent, non-habitual, pre-planned 'breaks from routine' – greater emphasis should be placed on life-long socialisation dynamics, i.e. how intensive patterns of LDT develop (or not) over the life course. Notably, the 'mobility links' (Frändberg, 2014) between LDT and other forms of long-distance mobility (e.g. migration, multilocality) can be self-reinforcing, leading to the institutionalisation of LDT at the micro-social level, with associated structuration effects (Giddens, 1984). A better understanding of such links is crucial, given the societal, economic and environmental relevance of increasing levels of LDT. In the paper, we focus in particular on two mechanisms underlying such 'mobility links': the acquisition of mobility-related skills and competences, and the development of spatially dispersed social networks over the life course. We critically review empirical findings on these mechanisms, bringing together research from diverse fields (e.g. tourism, (trans)migration, multilocality, and social networks). We conclude by discussing future directions for research at the intersection between transport, mobilities and sociological studies.

Practices Of Temporary Mobility And The Maintaining Of Friendships

Tippel, Cornelia

ILS - Research Institute for Regional and Urban Development, Germany
cornelia.tippel[at]ils-forschung.de

Within the ongoing transformation of the sphere of work, work-related spatial mobility has been assumed to be a crucial characteristic of biographies and careers (Sheller/Urry, 2006). At the same time, this work-related spatial mobility has become more complex. Particularly when studying project work, spatial mobility is often temporary since the next project is at yet another place. Nevertheless, people in project work aim at maintaining social ties such as friendships and thus the increasing complexity of social ties on different spatial scales is emphasised by a range of scholars (Larsen et al., 2006; Brickell/Datta, 2011; Cronin, 2015). In the light of these conditions, the proposed contribution presents qualitative findings from semi-structured interviews looking at work-related temporary mobility as well as its related practices of maintaining social ties. In doing so, it questions the concepts of circular mobility and migration and its distinction while presenting a rising type of mobility in-between both concepts. This type of mobility is mainly aiming at maintaining friendships and is often not based on a fixed place or residence. Rather, it includes staying at friends' places, subletting rooms or flats at sharing platforms to maintain several options at places with relevant social ties. Thus, it complements classic concepts of social networks and emphasises the often neglected geographies of friendships (Bunnell et al., 2012). Moreover, it encompasses a distinct form of belonging, mainly based on social ties at several places than at one fixed single place.

Understanding the Reconstruction of Personal Networks Through Residential Migration Trajectories

Ganjour, Olga (1); Widmer, Eric D. (1); Viry, Gil (2); Gauthier, Jacques-Antoine (3); Kaufmann, Vincent (4); Drevon, Guillaume (4)

1: University of Geneva, Switzerland; 2: University of Edinburgh, UK; 3: University of Lausanne, Switzerland; 4: Federal Institute of Technology (EPFL), Lausanne, Switzerland
olga.ganjour[at]unige.ch, Eric.Widmer[at]unige.ch,
Gil.Viry[at]jed.ac.uk, Jacques-Antoine.Gauthier[at]unil.ch,
vincent.kaufmann[at]epfl.ch, guillaume.drevon[at]epfl.ch

This study examines how residential migration trajectories influence the spatiality and composition of personal networks. The adaptation of personal networks to residential migration is framed within a theoretical approach emphasizing individualization and personalization of relationships. Ego-centered network analysis combined with sequence analysis of residential trajectories are used to capture the relation between residential migration trajectories and personal

networks of individuals from two birth cohorts in Switzerland. A typology of personal networks is constructed by taking into account both the composition and spatiality between ego and her/his significant alters. A series of regression analyses test the association between the types of personal networks and residential migration trajectories. Results discussed with respect to three mechanisms shaping the reconstruction of personal networks of individuals who moved away from their place of birth: addition of spatially close significant alters, selection of spatially distant significant alters and substitution of spatially distant significant alters by spatially close alters. Results show that individuals who passed large distance from their places of birth are embedded in large and diversified personal networks, including spatially distant members of family of origin, friends and local nuclear family, friends. Conversely, settled individuals, who lived close to their place of birth are included in small and homogeneous networks with the presence of local nuclear family and friends. We conclude that addition has the strongest effect on the reconstruction of personal networks due to residential migration in comparison with selection and substitution.

The Increasing Instability Of Employment-related Mobility Biographies In Neoliberal Europe: A Cross-cohort Comparison

Viry, Gil

University of Edinburgh, United Kingdom
gil.viry[at]jed.ac.uk

This paper examines whether intensive forms of employment-related spatial mobility and their instability over the life course increased in Europe over the past decades. While some scholars argue that deregulated labour markets and increased employee flexibility resulted in greater instability of mobility behaviours, the existing literature on the relationship between spatial mobility and neoliberalism suffers from four shortcomings that this research aims to address. First, it moves beyond methodological nationalism by comparing four European countries: France, Germany, Spain and Switzerland. Second, it moves beyond cross-sectional studies by analysing mobility behaviours over the course of individual lives as mobility biographies. Third, it examines both labour migration and employment-related travel, and fourth, it goes beyond particularly mobile population, such as a global kinetic elite, to study national populations. Using retrospective survey data and sequence analysis, the study compares the mobility biographies of three cohorts born in the 1950s, 1960s and 1970s. Results show that younger workers more often experience intensive forms of employment-related mobility than their elders. But mobility is increasingly experienced as short, repeated episodes, resulting in more unstable mobility biographies. The proportion of Europeans being highly mobile for their job is stable, confirming earlier findings. Spain is an exception with longer experiences among younger workers. Recent neoliberal reforms may accentuate the instability of mobility biographies, raising concerns about life disruption among young generations.

RS16_04 | Migration: Belonging and Social Ties

Mobility, Belonging and Home- making. The Transient Homes of Globally Mobile Professionals

Spiegel, Anna

Bielefeld University, Germany
anna.spiegel[at]uni-bielefeld.de

Today, mobility and transience have become a constitutive pattern of the highly skilled postmodern workforce. Yet, how mobile professionals negotiate the meaning of their homes and their sense of belonging in 'liquid times' (Bauman 2007) is still an underresearched research question. The purpose of this paper—based on ethnographic research on German and American expatriate managers conducted in China, Germany and the US—is thus to contribute to this research desideratum by examining how mobile professionals make sense of the transience of their current homes, how transience is reflected in their home-making practices, and how they use symbolic objects to create a sense of belonging to the various places in their mobile careers. It thus explores the relationship between home, mobility and everyday cosmopolitanism. The paper argues that for mobile professionals the home becomes a critical place where belonging is constantly negotiated not only because of new multi-local spatialities but also because of new transient temporalities. Due to the practice of extended work contracts, the everyday life of the mobile managers is characterised by a 'permanent provisionality', that is an incongruence of the initially imagined and the actual time horizons of their mobility. The paper shows how this 'permanent provisionality' is worked into the material and social textures of expatriate homes. 'Permanent provisionality' produces homes without emotional attachments (evacuation homes), homes which are only references to true, but distant homes (nostalgic homes), homes celebrating their transience (flexible homes), and homes that frantically try to ignore their transience (local homes). The 'transient home' thus oscillates between celebrating and avoiding cultural difference, between mobility and immobility. It is a materialisation of the paradoxes of practiced elite cosmopolitanism.

Types of Labour Migration: Settlers, Circulars or Searchers? The Characteristics of Latvian Labour Migration Patterns

Supule, Inese

Univeristy of Latvia, Latvia
inese.supule[at]biss.soc.lv

The 2004 EU extension and migration flows within Europe have fostered debates about CEE migrants' intentions to settle or return to their countries of origin, and their attachment to the

destination country and attachment to the country of origin. Based on a quantitative analysis of survey data (N=6209), this article presents a typology of labour migration patterns among migrants from Latvia. The statistical analysis of the data had several sequential steps. A factor analysis was used for finding out two factors that measure two underlining dimensions: attachment to the host country and attachment to the country of origin. K-Means cluster analysis was used to derive four patterns of labour migration: (1) bi-nationals, (2) settlers, (3) the footloose, and (4) circulars. The method of binary logistic regression analysis was used for exploring characteristics of those belonging to particular patterns of labour migration. Data analysis confirms that theoretical assumptions about migrations patterns are relevant in the case of Latvian migrants. This article enhances an understanding of the characteristics of Latvian labour migration patterns and the characteristics of individuals in each category. The results of the study indicate that if compared with migration patterns of Polish, Romanian, and Bulgarian migrants in the Netherlands, the main trends among Latvian migrants are quite similar. Keywords: Labour Migration; Latvia; Transnationalism; Integration; Central and Eastern Europe

Moving Attachments? How One-off, Repeat And Multiple Migrants in Europe Relate To Places

Torunczyk-Ruiz, Sabina; Salamonska,
Justyna

University of Warsaw, Poland
storunczyk[at]psych.uw.edu.pl, jj.salamonska[at]uw.edu.pl

The implications of mobility for place attachment have been given increased attention in the last decades. However, the question how different mobility patterns affect place attachments has so far not been investigated, even though migration scholars have recognised that people may maintain attachments to multiple places. In this paper, we examine how diverse mobility patterns affect attachments to places in the countries of origin and of destination, focusing on migrants in Europe. We distinguish between one off migrants (who migrated only once), repeat migrants (who migrated at least twice to the same destination country) and multiple migrants (who migrated at least twice to different destinations). We expect that these groups of migrants relate to places differently, including cities and countries of origin, cities and countries of destination and the European Union. We analyse data from the European Internal Movers Social Survey (EIMSS), based on questionnaires with British, French, German, Italian and Spanish migrants residing in these destination countries. The total sample amounted to 5,000 participants. We find that multiple movers are less attached to their cities and countries of origin than one off migrants but are more strongly attached to the European Union. Repeat migrants do not significantly differ from one-off migrants in the levels of their attachments to the country of origin or country of destination. Altogether, these results suggest that not only being mobile itself but also multiple spatialities of mobilities matter for the strength of attachment among migrants. The implications of these results will be discussed.

Carceral Junctions: Boundaries, Barriers and Belonging in Danish “Departure Centres” for Refused Asylum Seekers

Kohl, Katrine Sypli (1,2)

1: Vive - the Danish Centre for Social Science Research, Denmark; 2: Centre for Advanced Migration Studies (AMIS), University of Copenhagen
ksk[at]vive.dk

The two Danish ‘departure centers’ represent a new type of control in relation to migrant mobility. The aim of these centers are to motivate refused asylum seekers to go “home” by segregating them in remote locations without access to money, loved ones or meaningful activities. According to the Danish authorities, it is safe for them to return to their home countries. However, very few asylum seekers have gone “home”. The paper uses data from participant observation and qualitative interviews with asylum seekers in departure centers and applies a narrative approach to explore their accounts of boundaries, barriers and belonging to understand why some leave and some stay. According to the participants, their home countries are not safe, nor necessarily are they where they belong. They are immobilized by Denmark’s refusal of their asylum claim, their fear of returning home, and the registration of their fingerprints (the Dublin regulation). Many refused asylum seekers decide to go elsewhere in Europe, hoping to obtain a residence permit or a good undocumented life. Others do not. Those who stay may have close family members in Denmark, have children who they think belong in Denmark, or they are reluctant to start over in a new country after spending years paving their way into Denmark by studying Danish, forming social bonds and courting the immigration authorities. In spite of many barriers, some refused asylum seekers manage to learn Danish, adapt to Danish culture, and to uphold and create social relations. Through political protests and social media appeals, they succeed in practicing a strained claim of belonging in Denmark.

RS16_05 | Spatial Mobilities: Consequences for Social Status and Civic Engagement

Is Weekend Commuting Really Paying Off? A Panel Analysis of Germany

Stawarz, Nico; Rüger, Heiko; Skora, Thomas

Federal Institute for Population Research (BiB), Germany
nico.stawarz[at]bib.bund.de, heiko.rueger[at]bib.bund.de,
thomas.skora[at]bib.bund.de

Second homes and weekend commuting are frequently used strategies for dealing with large distances between the place of work and the place of residence. In the literature, it is expected that work-related spatial mobility is positively associated with career achievement. The positive effects are assumed to be due to (i) spatially mobile workers having a larger job search area, (ii) career gains being greater if people commute to specific destinations with many job opportunities, (iii) spatial mobility serving as a mechanism to accumulate human capital. So far, surprisingly little attention has been paid on the relationship between work-related multi-local living arrangements and career mobility. Therefore, our main question is whether the start of a weekend commuting episode is associated with an income increase. We apply fixed effects panel regression models to data of the German Socio-Economic Panel (GSOEP). We use information about the distance between the primary home and the workplace (≥ 150 km) and the frequency of commuting (weekly or less often) to operationalise work-related multi-locality and the individual monthly gross income in euro as an indicator of occupational success. Our results show that in the year in which the commuting episode started, the income rises by about 9 percent (or 200 euros). Two years after the onset of commuting, the income is on average 20 percent (around 415 euros) higher than before the onset of commuting. The paper will also explore how these results are linked to other mobility decisions (like relocation) and other characteristics (like gender).

Returns and Non-returns of Internationally Mobile Students and Intergenerational Social Mobility: Friends or Foes?

Bahna, Miloslav

Institute for Sociology, Slovak Academy of Sciences, Slovak Republic
miloslav.bahna[at]savba.sk

Observations of positive selectivity of international student mobility (ISM) participants with regard to class, support seeing ISM as strategy of distinction. Indeed, international students returning to their home country seem to generally profit from the distinction their education and contacts offer at the local labour market. However, research from European countries as diverse as Slovakia and Denmark suggests that around a half of ISM participants do not return to their home country after their graduation. Does having international education provide an advantage also in this case? And how is intergenerational transfer of social status affected by the decision to stay or return after experiencing ISM? The data for our study are from the Brain drain 2014 survey which was carried out in Slovakia in late 2014 and early 2015. The survey asked parents of students who graduated in 2012 or earlier from a University abroad about their children and themselves. While the occupations of ISM returnees and non-returnees do not differ significantly, the similarity of occupational status of graduates and their fathers is higher among those, who returned home after graduating abroad. As non-returns are also positively selective with regard to class, this results in lower occupational status of non-returnees when compared to returnees with the same family background. Indeed, using structural equation modelling, we show, that, compared to ISM returnees, intergenerational reproduction of occupational status is weaker among non-returnees. This suggests that many of the various capitals of a graduate's family are location-specific and are not internationally transferable.

The Link Between Spatial and (Upward) Mobility of Higher Education Staff: Approaches for Identifying Causal Effects

Kohrs, Silke

Technical University Dortmund, Germany
silke.kohrs[at]tu-dortmund.de

In recent years, the relevance of spatial mobility in the academic field has steadily increased. According to many studies this phenomenon applies to students as well as to academics and researchers, concerning movement within countries and across borders, for short- and long-term periods. Moreover, intensified social changes such as globalization and the development of communication technologies let assume that this trend will proceed. Based on the current state of research I will discuss the role of spatial mobility and the link between spatial and (upward) social mobility of academics in

Germany. Does mobility determine a 'successful' academic career and are there differences in the various ways of spatial mobilities (e.g. commuting or moving house)? Special attention is paid not only to the link between spatial and social mobility, but also to causal effects. Besides these conceptual issues, another main approach is to present methodological challenges resulting from quantitative analysis of intragenerational social mobility and linked working places, focussed on career paths for scientists and researchers. Further, in the matter of analysing causal effects there are particularly conditions on data (e.g. longitudinal structure) and variables (e.g. attitudes as well as 'objective' facts concerning the academic life course) to be addressed. The presentation will be completed by an outlook on how different methods, such as sequence pattern analysis and modern causal analysis, can be used and on potential opportunities and disadvantages depending on the conceptual considerations.

Does Weekend Commuting Hinder Civic Engagement? Findings From Germany

Rüger, Heiko; Skora, Thomas

Federal Institute for Population Research (BiB), Germany
heiko.rueger[at]bib.bund.de, thomas.skora[at]bib.bund.de

In this paper, we investigate the relationship between weekend commuting (i.e. the use of an occupational secondary residence in connection with commuting, usually on weekends) and civic engagement. Since such a multi-local living arrangement means time-consuming and often stressful commuting ("commuter's strain hypothesis", Newman et al. 2014) as well as periodic absence from the main residence, possibly associated with a feeling of being uprooted ("re-potting hypothesis", Putnam 2000), we expect a negative effect on civic engagement. We apply fixed effects panel regressions to longitudinal data for the years 1997-2015 from the German Socio-Economic Panel (GSOEP) which is representative of private households in Germany (N=120,349 observations from 25,391 individuals). Weekend commuting is measured by using information about the distance between the main residence and the workplace and the frequency of commuting. Civic engagement is measured by the frequency of (i) volunteer work in clubs or social services and (ii) participation in a citizens' group, political party or local government. The results show that after the onset of a weekend commuting episode employees are significantly less regularly involved in volunteer work than before the onset of commuting. However, there seems to be no effect on the aspects of political participation considered here. In addition, our results shed some light on the question of whether possible changes in the forms of civic engagement (e.g. whether activities are carried out locally or non-local) have led to a change in the relationship between mobility and engagement over time.

RS17_01 | Reconfiguring territories: Mobilities, representations and belonging

Rural Development and Internal Migration – Employing Path Analysis for Assessing 2007-2013 Rural Development funds' Impact on Rural Emigration in Hungary

Horzsa, Gergely

Corvinus University of Budapest, Hungary
horzsagergely[at]gmail.com

This presentation summarizes findings of a research that aimed to evaluate the effects of EU rural development funds (EAFRD) on emigration among rural settlements of Hungary in the 2007-2013 period. This case is relevant because in Hungary 1) contribution of EU funds in development was the highest among EU countries 2) ratio of non-urban dwellers and rural-urban social gap is one of the highest in the EU 3) increasing rural areas' "population preserving capacities" is the central, well-defined aim of the current rural development strategy. Furthermore, development policy evaluation analyses according to various authors rarely provide valid results. Availability of reliable settlement-level data on in- and outmigration and on development funds spent allows a detailed analysis. For the investigation of development-migration interactions, a settlement-level database was developed on per capita rural development funds and various socio-economic background variables, the latter ones grasping relative change in values during the 2007-2013 EU budget period. Having high measurement level scale variables and the lack of any control groups, linear regression-based path models were estimated on different subsamples of Hungarian villages and by using various rural development financial sources (fund spent via different 'axes' of rural development). Results suggest that short-term direct and indirect effects of rural development funds on various labour market outcomes can be identified, however, their effects vary highly between settlements with different spatial-economic and social backgrounds. Results regarding outmigration reinforce previous authors' arguments on development programmes in many cases trailing different migration results from what is expected by policymakers.

Rural-Urban Connections, The Mobility Transition And Its Social Representations. A Comparative Analysis Of Cases Study in Spain

Oliva, Jesus; Lopatnikov, Daniel

Public University of Navarre, Spain
jesus.oliva[at]unavarra.es, daniel.lopatnikov[at]unavarra.es

The daily mobility and particularly the widespread use of private cars, have led to an increasingly interrelation between rural and urban areas. Many economic processes, residential patterns and labour strategies hybridize both realities through these mobilities. Everyday automobility link peri-urban or remote rural regions to urban dynamics and let its residents to combine some opportunities and advantages of these two environments. These strategies allow key groups for rural areas, such as young people and women, to settle in the countryside. Furthermore, in contrast to the former Fordism commuting patterns, current displacements show a complex range of possibilities and motives, as well as much more personalized times and spaces. However, in spite of the centrality of automobility in the socio-territorial transformation and the fundamental role it also plays for the social mobility of rural groups, we still do not understand well how these mobilities become rural cultures. In other words, how are defined the social representations about the city, the countryside and their connections by diverse rural generations and lifestyles through these strategies. Against the background of the mobility transition to a new shared, no conventional or autonomous paradigm, the paper explores these senses in different case studies developed in rural Spain. The analysis social narratives obtained in-depth interviews to expert informants and selected sociological profiles reveals the symbolic and material relevance of rural-urban connections to explain the rural change. The findings confirm the impact that mobility transition and the way it will be regulated will have on rural future

The Role of New Residents in the Reconfiguration of Peri-urban Territories

Sanz Tolosana, Elvira (1); Rivera Escribano, María Jesús (2)

1: Public University of Navarra (UPNA), Spain; 2: University of the Basque Country (UPV/EHU)
elvira.sanz[at]unavarra.es, mjesus.rivera[at]ehu.eus

In the recent past, Spain chose a growth model heavily dependent on the building sector and housing development. This model of development contributed to intensify the sprawl of many cities beyond the urban space itself. In so happening, peri-urban space has acquired a relevant role in the territorial restructuring of the country. This has been the case of Pamplona, the capital city of a region in northern Spain. In fact, the peri-urban area of this city has experienced an important population increase as the effect of urban to rural migration. In so happening, the sprawling of Pamplona is involved in a process of metropolisation that reaches longer and longer distances. Furthermore, the orography and traditional habitat of the area resembles that of bucolic images of the countryside: small villages and hamlets, hills, rivers, and so forth. Thus, the resulting metropolitan space can be characterised as a plurality of interstitial ruralities where ex-urban residents and urban life play a key role in the configuration of these spaces. This paper looks at the way different profiles of ex-urban population moves to interstitial ruralities and how rural and urban dimensions converge in this space to finally give rise to a new territory.

Rural-Urban Inequalities, Mobilities and Spatial Justice in Rural Greece

Papadopoulos, Apostolos G.; Fratsea, Loukia-Maria

Harokopio University, Greece
apospapa[at]hua.gr, fratsea[at]hua.gr

In the majority of the cases, rural areas are considered as areas where economic opportunities, access to services and employment positions are lacking, while there is need for more targeted policy interventions to mitigate economic inequalities. Numerous socioeconomic problems (e.g. demographic decline, low education, low-skilled employment, etc.) are attached to rural areas, while poor infrastructures do not allow for optimistic prospects for the vast majority of them. The demographic decline and social marginalization of many areas lead to rural abandonment. During the period of austerity, Greek rural areas gathered the attention of urban dwellers and young people who were seeking for alternative life opportunities or for sustaining a quality of life in alignment with their middle-class status. In this way, the perceptions of the rural were (re)constructed on the basis of new entrepreneurial/employment opportunities connected to environmental values and sustainable development goals. This narrative of 'rural regeneration', linked to the 'return to agriculture and countryside' movement, was contested by the harsh reality of the country's regional inequalities,

peripheralization and insularity. This paper based on research material collected in the context of the IMAJINE project ("Integrative Mechanisms for Addressing Spatial Justice and Territorial Inequalities in Europe IMAJINE" received funding from the EU Horizon 2020 Research and Innovation Programme, under Grant Agreement No. 726950), sheds light on the facets of the 'rural regeneration' narrative against the 'austerity' narrative in an attempt to uncover the complexity of the issues related to rural-urban inequalities, mobilities and spatial justice in Greece.

RS17_02 | Dynamics of territories: Rural visions, identities and social innovation

Beyond Rural Idyll? The Role Of Alternative Food Systems In The Transformation Of Rural-Urban Relations

Goszczynski, Wojciech

Nicolaus Copernicus University, Poland
goszczynski[at]umk.pl

In the minds of many, rurality is inseparably connected with the construction of the past. The rural idyll, strongly embedded in the ideological context, constitutes one of the extremes of the axis determined by classic European dichotomies distinguishing nature from civilisation, the soul from the body, the woman from the man, and the countryside from the city. This typically European division of narration about the past into two opposite parts determines boundaries, defines strangeness, reconstructs the present. In these perceptions, the concept of the rural idyll plays a special role. The vision of agriculture, the countryside, the rurality and nature distinguishing the corruption of the city from the strength, and vitality of the province has been developed from ancient times. By acting, we transform the world around us. Doing that we use the city-made, provided sets of desires distinguishing what is desired from what is rejected. This indicates the double face of the rural idyll which, referring to the past, may at the same time be a powerful instrument for shaping space, relations and culture, simultaneously being one of the mechanisms of excluding those who fail to match the elite vision of the world. Food as a powerful social and cultural mediator plays a special role in this process. It leaves us with the open question about ways in which new sets of rural-urban food arrangements such as alternative food networks shapes relations between rural as an imagined place of production and urban as a place of consumption. Main goal of the paper will be to answer those questions when using field research results about alternative food systems.

'Pastoral Visions': A Visual and Spatial Analysis of Poundbury, Dorchester, UK

Clancy, Laura

Lancaster University, United Kingdom
l.clancy2[at]lancaster.ac.uk

In the 1980s, Prince Charles began his assault on modernist urban architecture, claiming that the style had destroyed British heritage and blighted regional landscapes. Instead, in his book *A Vision of Britain* (1989), he argued for the reconstruction of neoclassical architecture, which rejected urbanisation in favour of a conservative version of the pastoral. This presentation will explore Charles's vision through a visual and spatial analysis of his model town Poundbury in Dorchester, UK, built using the architectural principles set out in *A Vision of Britain*. It will argue that although Charles's criticisms are positioned as a commentary on architecture, his vision of Britain is concerned not only with the technicalities of architecture, but also with the management of the citizens populating it. Poundbury may be framed as an eco-town of the future (Finn, 2008), but implicit in Charles's vision is a return to the class hierarchy of aristocratic landowner, farm managers and peasant workers. Charles's intense disapproval of the 'creeping cancer' of modernist architecture (*The Prince of Wales*, 1989: 77) relies on a historical and reactionary understanding of "Britishness" (or, more accurately, "Englishness"), rooted in pastoral nostalgia of the "green and pleasant land". My analysis of Poundbury reveals how it stages a conservative, traditional understanding of rurality and 'Little England', based on relations of feudalism, imperialism, pre-industrialisation, anti-urbanisation, and classed, raced, and gendered hierarchies.

"They've Stolen The Fair's Identity To The Farmers!" Festive Sociabilities, Conflicts Of Belonging And Power Struggles In a French Village (1980-2015)

Schnapper, Quentin (1,2,3)

1: Ecole Normale Supérieure (Ulm), France; 2: PSL Research University; 3: CESAER (INRA)
quentin.schnapper[at]ens.fr

This communication is based on an ethnographic fieldwork conducted in a French suburban village (4 000 inhabitants) that has undergone major transformations over the last decades: population growth, increase in upper- and middle-class employees and in commuter migrations towards the neighboring town. These evolutions have set off political struggles for the local government taken over by a socialist teacher in 1995 against an outgoing lot of farmers. This communication focuses on the power struggles that take place outside and across the local government. We'll study the conflict that has raged in the local fair between upper- and middle-class employees linked to the socialist mayor and a

group of old farmers former councillors or supporters of the majority defeated in 1995. We'll show that power struggles cannot be disconnected from symbolic struggles for the definition of the legitimate ways of belonging to those territories. In doing so we'll also discuss commonsense interpretations that see these local conflicts as binary oppositions between "old/rural" and "new/urban" inhabitants. We'll first describe the farmers' trajectories, how they revived the fair in 1980 and the transformations of their association in the 1990s which relies more and more on working-class people and catholic employees. We'll finally go back to the conflicts surrounding the fair to show that these conflicts imply a disqualification, a politization and a hardening of the agricultural and popular forms of belonging to the village promoted by the farmers. Oppositions between "local people" and "foreigners" are above all a product of symbolic and power struggles that harden/obfuscate the belonging diversity to those territories and the local alliances between social groups (here between farmers and catholic volunteers).

The Performative Dynamics Of Spatial Spread In Social Innovation Across Disadvantaged Rural Regions

Baxter, Jamie-Scott

Leibniz Institute for Research on Society and Space (IRS), Germany
jsb[at]vandelvelt.com

There is a growing body of evidence supporting the claim that social innovation is well placed to drive social change and address today's most pressing global challenges. More recently, the literature shows how social innovation is at work in disadvantaged rural regions (e.g. Bock 2012, Christmann 2014, Richter 2016, Noack and Federwisch 2018). Social innovation can be described as a process through which social change emerges as social practices and relations are intentionally reconfigured and spatially spread (e.g. Ayob et al. 2017, Howaldt et al. 2014, Moulaert et al. 2013). However, there is a gap in knowledge attending to how and under which conditions social innovations spread spatially, especially across rural regions. This contribution presents results from the ongoing Marie Skłodowska Curie, ITN research programme, RurAction, through which social innovations in disadvantaged rural regions across Europe are under investigation. I will present initial results from empirical research collected and analysed through a qualitative hybrid mapping method which draws on recent theoretical advances, in particular Karen Barad's 'Performative Posthumanism'. Barad's work is cut together with insights from the 19th C. sociologist Gabriel Tarde providing an original framework to investigate the spatial spread of social innovation. Early analysis reveals how specific material-discursive practices travel between, interact with and co-constitute territories, overcoming typical rural-urban borders. It is within such practices, according to Barad, where boundaries and exclusions are performed leading to either the repetition of stubborn dualities or, the novel reconfiguration of space.

RS18_01 | Urban Futures: Visions, imaginaries and narratives (1)

Migration and Diversity in the Entrepreneurial City: Setting the scene for the new urban imaginaries

Oliveira, Nuno Filipe

CIES-IUL ISCTE Instituto Universitário de Lisboa, Portugal
filicastro[at]gmail.com

Drawing from field work in Lisbon and Buenos Aires, the paper examines how processes of revitalization of the inner-city have been consistently linked to cultural diversity mobilization. Ethnographic and qualitative research was carried out in specific urban spaces where culture-led regeneration is underway. The selection of such spaces was premised on the idea of avoiding the usual suspects in urban studies such as the big capitals of the northern hemisphere. We argue that migration cultural traits are brought into such processes through cultural mediatory mechanisms that are specific to entrepreneurial city model. We integrate in our analysis a wide range of actors involved in urban governance, from municipal authorities, through immigrant organizations, to migrant entrepreneurs and gentrifiers, in order to provide a comprehensive interpretation of such mechanisms. Findings show that cities pursue similar strategies of coping with migrant-driven cultural diversity implying three main dimensions: aestheticization, place marketing and “ethnic showcasing”. We raise some conceptual and policy related questions about new regimes of visibility and forms of social organization of difference specific to the entrepreneurial city.

City Narratives as Part of an Inclusive or Exclusive Urban Public Sphere

Klijnhout, Karen; Janssen, Susanne

Erasmus University Rotterdam, Netherlands, The
klijnhout[at]eshcc.eur.nl, s.janssen[at]eshcc.eur.nl

While cities are often studied as space and places, my research examines the urban public sphere, and the way narratives about the city create social and symbolic boundaries. I aim to map and qualify underlying assumptions about culture and cultural diversity in discourses about cities and city culture and assess how such conceptions and assumptions sustain or contest existing social boundaries. To do this, I first analyzed party programs, debates, and (social) media coverage during the 2018 local elections in four Dutch cities (Rotterdam, The Hague, Dordrecht, Gouda), as well as cultural policy

documents. This included looking for stories about the city and city culture. In all four cities, I found a commonly shared narrative of pride. The city narratives of the smaller cities- Dordrecht and Gouda- refer to their historical buildings and celebrate the jubilees of their long-standing city rights, and mention their waterways as important features for their identity and attractiveness. Their focus is on history and continuity, and is local. Alternatively, the large cities have a more modern city narrative that is globally focused. Rotterdam connects this story to the world harbor, and The Hague to the international court of justice. They also describe cultural diversity as an important feature of the city. City narratives thus appear to differ in their openness towards change and global influences, and thereby in their inclusion of new cultures in the city. In my further research, these narratives about the cities will be compared to visions on the city shared by young people and urban artists within these cities.

Tools Of Persuasion In Urban Redevelopment Videos

Leino, Helena; Laine, Markus; Raento,
Pauliina

University of Tampere, Finland
helena.leino[at]tuni.fi, markus.laine[at]tuni.fi,
pauliina.raento[at]tuni.fi

Many cities all over the world have recognized the increasing importance of different social media channels for branding purposes. New digital media outlets and global interactivity in communication offer unforeseen opportunities for this communication – which includes urban image making and city branding. The employment of still and moving imagery in the delivery of the message feels natural in our era of “visual paradigm” where photograph and film have taken over from written texts the role of primary educator” (Lutz & Collins 1993: 4). As James Throgmorton (1993) has argued, planning is constitutive and persuasive storytelling about the future. According to Leonie Sandercock (2003), one needs to understand the work that stories do, and to recognize the moral ordering involved in the conscious and unconscious use of certain plots and character types. Yet little in this literature is said about the concrete mechanisms of this “persuasive storytelling” – about what visual elements support, or unfold, the story and how it is told. How is the viewers’ attention steered, how are desired impressions and images of a particular place created, and how place is contextualized with global processes deemed worthy of pursuing at a local level? We challenge this relative silence with a sample of visionary (re)development videos about European cities, by exposing techniques employed in persuasive communication practice. We ask: what kind of residents, issues and goals the videos provide to the public? Which groups are included and which marginalized in the future visions of the city?

Urban Planning Visions as Imaginaries of Sustainability and Welfare

Hildingsson, Roger (1); Johansson, Håkan (2); Khan, Jamil (3)

1: Lund University, Dept of Political Science, Sweden; 2: Lund University, School of Social Work, Sweden; 3: Lund University, Environmental and Energy System Studies, Sweden
roger.hildingsson[at]svet.lu.se,
Hakan.Johansson[at]soch.lu.se, Jamil.Khan[at]miljo.lth.se

Visions of a socially inclusive and environmentally sustainable city represent efforts to address the most challenging topics for European cities. Growing populations, increasing inequality and extraordinary social and demographic diversity push for new solutions on social inclusion and redistribution. At the same time, unsustainable patterns of consumption and resource use cause extensive environmental change, urging for ecologically sustainable solutions and practices at the urban level. This paper analyses how cities seek to envision their futures as a place of good living providing both welfare and sustainability within planetary boundaries. We compare visions of urban sustainability and welfare in three Swedish cities (Stockholm, Gothenburg and Malmö). Based on document analyses of urban planning, we analyse how time, space, and expressions of the good life are envisioned and planned for, and how such urban visions address the ideological divide between developing a city that is sustainable and one that provides social welfare for all. The paper seeks to contribute to current debates on the transformative and performative power of urban visions and imaginaries. Drawing on debates on 'the power of imagination' (Hajer), 'real utopias' (Olin Wright) and utopias as a method for imagining the reconstitution of society (Levitas), we approach urban visions as acts of political storytelling aimed at establishing shared imaginaries of urban sustainable welfare. While being formed by actors with particular interests and agendas in relation to ideological positions, we discuss how such visions mobilise ideas, people and resources to plan for and envision urban futures, and to experiment with ways to shape city developments and transform urban environments.

Imagining a Good Life in Stoke-on-Trent: The Role of 'Absence' and Memories of the Past in Shaping Everyday Utopian Futures in an Urban Post-Industrial Landscape

Venn, Susan Helen; Burningham, Kate

University of Surrey, United Kingdom
s.venn[at]surrey.ac.uk, k.burningham[at]surrey.ac.uk

At the heart of any form of prosperity lie the desires, aspirations, needs and capabilities of ordinary people, which help to inform ideas of what constitutes a good life. Yet it is clear that visions of a good life, and good work are also shaped by aspects of environmental and social landscapes. In this paper we will present findings from a case study exploring what a good life means to ordinary people living in the post-industrial city of Stoke-on-Trent. In our selection of Stoke-on-Trent our goal was to understand the motivations and expectations of ordinary citizens for a good life living within a culturally diverse and socio-economically disadvantaged area where its strong sense of identity is closely linked to its past, and is both a help and a hindrance to living well. Drawing on focus groups with a diverse range of residents we will suggest that social, material and cultural traces of an industrial past are implicit in shaping imagined future post-industrial landscapes in three different ways. Firstly by invoking a nostalgic longing for a recreation of an absent industrial past, secondly by a rejection of and breaking from the past to create an entirely different future, and finally through acknowledgement of a lost past, but with a desire to utilise and reshape it into a new future. Understanding how different future narratives emerge within post-industrial urban landscapes such as Stoke-on-Trent is key in identifying those aspects of the city that its residents value, and also in terms of facilitating future discussions around what is needed to achieve a good life in the city.

Deciding Together: Forms of Participatory Budgeting in Finnish Cities

Ertiö, Titiana; Rask, Mikko

University of Helsinki, Finland
titiana.ertio[at]helsinki.fi, mikko.rask[at]helsinki.fi

Participatory Budgeting (PB) practices have been adopted in Finnish cities as responses to reforms that create opportunities to include citizens in managing their municipality's finances. In this paper, we explore how different types of PB create opportunities for citizens and public managers to develop both project ideas as well as their capabilities. The main argument of the paper elaborates on the co-creation concept and posits that the more and manifold opportunities to engage with the public, the more diversified capacities are built. Moreover, these capabilities are likely to outlive the PB practices and continuously create new opportunities for engagement. PB cases in Helsinki and Vantaa as well as the crowdfunding campaign in Tampere will serve as empirical examples to the backdrop presented. The types of co-creation activities observed in PB and participatory processes by large re-shape visions of municipality renewal and social inclusion.

Developing Common Visions? Elaborating Conception of Cohesion with Help of Deliberative Procedures in Disintegrated Urban Spaces – ZuNaMi Approach

Brandt, Kevin (1); Zimenkova, Tatiana (2)

1: Hochschule Rhein-Waal, Germany; 2: Rhine-Waal-University of Applied Sciences
kevin.brandt[at]tu-dortmund.de,
Tatiana.zimenkova[at]hochschule-rhein-waal.de

Heterogeneous urban spaces, facing phenomena of global migration, disintegration and exclusions might as well bear specific potential for social inclusion and cohesion. The area of the old industrial town of Dortmund is a well-known locus of social disintegration and socio-spatial segregation in Germany. The presented paper reports on the conceptions of cohesion and solidarity and ideas of inclusion, developed by the citizens of Dortmund within the research project "ZuNaMi" ("Developing cohesions narratives together"), which creates, tests and applies instruments for developing shared narratives of societal cohesion in a heterogeneous multicultural urban setting. The design-based research project ZuNaMi invites citizens of Dortmund to participate in – and co-create the – deliberative process, in which they are brought together in artificially heterogeneous workshops, facing the "others" they would due to spatial and social disintegration unlikely meet in regular everyday situations. In workshops with limited regulation, participants are called to discuss cohesion narratives, given that the framing and normativity of "cohesion" conception is left to their own consideration. The deliberative practice itself is being observed and analyzed. The

paper concentrates on the question how is the conception of cohesion articulated in the workshops and mind maps, produced by the participants as well as on the mechanisms of production, articulation and development of the visions of urban solidarity and social inclusion. Using extensive sequential analysis of the workshops we detect, how the conception of social inclusion, cohesion and solidarity emerges in interactions of city citizens, united by the common living space and disintegrated by socio-economic segregation.

A Review Paper On Social Sustainability In Urban Road Transportation In Abuja, Nigeria

Ahijo, Tukur Mohammed; Whitton, John; Charnley-Parry, Ioan

University of Central Lancashire, United Kingdom
TMAhijo[at]uclan.ac.uk, JWhitton[at]uclan.ac.uk,
IParry[at]uclan.ac.uk

In this paper, we discuss the concept of social sustainability in urban road transportation planning in the city of Abuja, Nigeria. Our paper reports the early findings from a survey of road users at public transport hubs in the city. Social Sustainability is the least studied of the three sustainability 'pillars' because of its diversity, complexity and ambiguities. In addition, much of the work on Social sustainability has been carried out in more developed nations, so reconceptualising the term for West Africa is not without challenges. The city of Abuja planned to have a population of over 1.6 million people, expanding through a series of satellite towns to 3.2 million. The 2006 census estimated the population at 1.4m with a growth rate of 9%. In 2014, the Global Cities Institute projected that Abuja will have a population of almost 7m. A survey in 2008 recorded an average daily passenger traffic of 1.4m, the average daily passenger numbers for bus travel was just under 8 hundred thousand. With increase in population in the city, and the opening of more districts, there will be an increase in demand of public transport and a significant social impact to those communities currently on the proposed routes of new roads. We discuss social sustainability as comprising the themes of – equity, social inclusion, human rights, gender equality, community and public participation in decision-making, and stakeholder engagement. We discuss the difficulties faced by commuters in accessing urban road transport, the quality of service, public engagement, and the decision-making process of the transport sector.

RS18_03 | Urban Futures: City-ness, rights and utopias

Counter-Establishment Evaluation to Learn About Radical Policy Futures

Silver, Daniel; Richardson, Liz

University of Manchester, United Kingdom
daniel.silver[at]manchester.ac.uk,
liz.richardson[at]manchester.ac.uk

Utopia is commonly seen as an imagined ideal that is so far away that it should not be considered attainable. Recent scholarship (Wright 2010; Levitas 2013; Cooper 2014; Srnicek & Williams, 2015) brings the location of utopia closer than how it had been positioned previously (Sliwinski, 2016). Wright (2010) insists that 'real utopias' in civil society should be seen as sites of knowledge production about concrete alternatives to the capitalist system. Srnicek and Williams (2015) explain that one of the most important features of contemporary utopian thought is to combine immediate impacts with an orientation to the future to destabilise established political discourses. This paper brings together scholarship on utopia and policy evaluation to introduce a new form of counter-establishment evaluation and identifies the potential to create new civic epistemologies. There are very few contemporary normative ideas about how evaluation should be 'embedded in the architecture of governance' (Jacob et al, 2015). Counter-establishment evaluation can evidence the ways in which social action in civil society causes tangible improvements to people's lives and then use this evidence as the basis for broadening the scope of policy learning beyond dominant discourses of political economy.

The Human Rights City: An Idea And A Practice

Grigolo, Michele

Nottingham Trent University, United Kingdom
michele.grigolo[at]ntu.ac.uk

In this paper I discuss the idea and practice of the human rights city. The human rights city is not an academic invention. It comes from human rights practice. Over time, however, several municipalities have subscribed to the idea (in the form of declarations, laws and policies) of turning the city into a space which is governed through human rights. Drawing on a sociological perspective that combines Bourdieu and Foucault, I view this as a social process in which different social agents and discourses are involved and that produces a 'distinct' urban practice of human rights. To begin with, I explore the genesis of the human rights city and present it as a conceptual tool that contains and makes sense of different ways in which human rights are articulated and implemented in cities. Concrete examples are offered to illustrate some core issues emerging from the practice of human rights cities, focussing especially on urban policy and the case of Barcelona. Some attention is also given to the nexus between human rights (in

the city) and the right to the city. Eventually, while the idea of the human rights city has potential for promoting social inclusion, the analysis of how human rights are developed in practice invites attention to multiple uses of rights in cities and the subjection of human rights to the logic of government that drives municipal views of and engagements with human rights.

On The Edge In Aberdeen, Manchester and Swansea: What Place Do The 'Peripheral' and 'Peri- Urban' Have In Our Imaginaries Of The City And Why Does It Matter?

Ebrey, Jill Elizabeth

University of Manchester, United Kingdom
jill.ebrey[at]manchester.ac.uk

This paper will first of all interrogate the idea of the city. What does it mean for a place to be understood as a city? Can 'city-ness' encompass the rural, the semi-urban, the 'rurban', lying on its boundaries? How is the rural-urban binary negotiated in the identity of 'edge' communities? Drawing on empirical qualitative research undertaken on the peripheries of three large cities, Aberdeen, Manchester and Swansea, this work will consider whether places on the edges of cities might be understood as part of that city, or merely its residue, its 'left behind'. The paper will go on to consider whether dominant imaginaries of the metropolis unconsciously marginalise places on their periphery? Whilst the research locations in question were in the late nineteenth and early twentieth centuries thriving industrial hubs, their identity to a large extent determined by what they produced (paper, cotton thread and copper), by the twenty first century they had often become relegated to the realm of the invisible, 'ghosted places' almost, as more resources and attention seemed to gravitate towards their metropolis. Whilst cities might look towards the future, are their peripheries, in the absence of a 'peripheral vision', encouraged to look back to a time when their communities were supported by good jobs and thriving social and cultural infrastructures?

RS18_04 | Urban Futures: Resisting marginality

Lighting Up Hoole: An Exploration Of Community-Based Volunteering, Belonging And Future Visions For Places On The Periphery

Bennett, Julia

University of Chester, United Kingdom
j.bennett[at]chester.ac.uk

Hoole, a suburb a mile north of Chester Cross, was lit up for the 19th year in a row on Saturday 24th November 2018. Just before 6pm Father Christmas made his way down to the open-air stage where he was joined by local children and the Lord Mayor and Lady Mayoress of Chester to flick the switch and light up Hoole for another Christmas Season. The Christmas Lights switch on may seem unexceptional, but the lights in Hoole are not paid for or organised by any official body. The local community and businesses have been organising this event for the past nineteen years, funded largely by donations from local businesses and run entirely by volunteers from the businesses and the community. The staging of the event poses questions around how the people in this community 'do belonging' (Bennett, 2014); how the concept of a 'community heritage' develops (Smith, 2006); and whether the council's focus on the city centre in its support for businesses is detrimental to the identities of peripheral localities. Drawing on a variety of qualitative data from a research project focused on this event, this paper proposes some potential futures of a mixed residential and retail area of Chester. Underpinned by an Actor Network Theory (ANT) approach, the paper explores how this annual community-run event intertwines assemblages of people, place and practices in the diversity of experience, production, and consumption of place (Bennett, 2017; Low, 2017). It suggests that belonging can be understood as an (re)emergent set of practices, oriented towards the future.

Ethnic enclaves reimagined in the global city: An ethnography of co- ethnic socio-religious networks on London's Old Kent Road

Zschomler, Danny

Goldsmiths, University of London, United Kingdom
sop01dz[at]gold.ac.uk

This paper presents the findings of an ethnography of the prosperity theology movement on the Old Kent Road, an inner London neighbourhood which has become a hotspot for this phenomenon with a high density of Black Majority Churches. Considering the phenomenon's past, present and future, it contributes to research concerning ethnic enclaves in the city.

In the context of urban marginalisation and major threats of austerity urbanism and urban redevelopment of the area driven primarily by the forces of gentrification, particular attention is paid to the role of immigrant and urban religion in structuring the lives and identities of migrants from West Africa and in fostering their integration into the broader society. I argue that the churches respond to the devaluation of their ethnic minority populations within London and the British society as a whole, as they resist the imagination and positioning by the majority population and public discourses as well as prevalent structural inequalities that create barriers for their social inclusion. The re-imagining, re-engineering and re-positioning of the members is key to the goals and motivation of the pastors who act as agents of change counteracting their members' marginalized position and mobilising them to take their rightful place in the city. They strive collectively to reimagine and reposition themselves in society and from the periphery of urban life to the centre through various reactive and proactive strategies – thus envisioning a more inclusive future by operating from the 'bottom-up', where those actions afford new meaning to physical and social spaces.

Reviewing Informal Settlements in Romania

Hossu, Iulia-Elena

Romanian Institute For Research On National Minorities,
Romania
iulia_hossu[at]yahoo.com

Data from different World Bank and UNECE studies (2009, 2012, 2015) focusing on Europe speak about the need to reverse the precarious condition of informal communities by conferring legal status to such settlements. Accordingly, in most cases such communities are disconnected from urban development plans. In this sense, the Romanian case is quite a special one on this map of informal settlements. The state does not have an up-to-date register concerning the rightful owners for each property. One of the implications of this situation was the failure of implementing several European infrastructural projects. The National Land Cadastre and Registry Program to be implemented between 2015-2023 was conceived to amend this situation across the whole country. The aim of this paper is first to follow the history of the formation of these communities and the concerning legal solutions that are currently being circulated in the Romanian public space. Then, by presenting a case study on an informal urban settlement in Romania, the author highlights the need to develop and implement public policies that are correlated with realities on the ground. The study is based on materials derived from a qualitative research in an informal community, during the year 2018. Keywords: informal settlements; legalization, inclusion; Romania.

Loosing The Binding Force Of Democratic Norms In Eastern Europe. A Case Study Of The Justice Reform In Poland

de Vries, Henning

Bielefeld University, Germany
henning.de_vries[at]uni-bielefeld.de

The self-understanding of the European Union as an organisation of democratic states is under attack. Justice reforms in Poland, Hungary and Romania are in conflict with the democratic principle of the independence of justice. In the case of Poland, the European Commission eventually reacted by initiating an infringement procedure. This procedure ought to enforce the obligations of the EU-member state. At least the Polish government gave in and took central points of the justice reform back. But how is the infringement procedure capable of reinstalling the binding force of democratic norms? For answering this research question the sociological theory on legal procedures has to be considered as theoretical framework. Legal procedures are able to institutionalize and in doing so limiting conflict. The participants create an institutional arrangement by identifying themselves with certain roles like the unreasonable defendant. To take-over their roles the participants have to accept the rules of procedure. This describes the establishment of norms within a procedure. However, this institutional arrangement does not explain how legal procedures are capable of enacting the binding force of democratic norms against states in the aftermath. I propose to analyse the different steps of the infringement procedure. This will light up the way in which the infringement procedure reinstalls the binding force of the norm of the independence of justice within such an institutional arrangement.

Tolerance in Russia: Street-Level Bureaucracy and Implementation of Ethnic Policy

Sarkisyan, Nikolay

University of Oslo, Norway
nickolay.sarkisyan[at]gmail.com

A common approach to ethnic policy in Russia is top-down focusing on the central decision-makers with only few works considering regional variations. I seek to illustrate the policy bottom-up. This paper deals with work practices of street-level bureaucracy in the domain of diversity management in today's Russia. The national policy on ethnic issues might be clear-cut and comprehensible, or, conversely, ambiguous and incoherent, whereas a state official at a regional department of ethnic affairs is under pressure to make the personal sense out of whatever decree s/he is bestowed with. The organizational conditions of the state bureaucracy in Russia generating red tape, binding informal networks between co-workers, and daily routines eventually define the policy's implementation. Bureaucracy rank-and-file in ethnic diversity management in Russia do not share a common understanding of policy's substantial goals, of basic terms such as tolerance. Instead, they impart their own personal meanings to it. Implementation of ethnic policy in Russia is about pursuing careers, taking the first job available in the prestigious state sector, and pushing papers on time as stipulated by regulations. The paper is grounded in the qualitative methodology. The empirical basis of this paper is participant observation at one of Russian regional state departments in diversity management and interviews, collected from officials and diaspora activists in various regions of the country in 2013-2018. This paper seeks to contribute to microsociological analysis of the nation-building.
